I confess I am one of the believers in the mine, and have always been so. I want you to appoint directors whom you think will not lapse into a policy of vacillation, such as we witnessed in the old board—to-day accepting the advice of one party; suddenly changing round and accepting another policy at the suggestion of another party, and, as Mr. Smith very properly said at the previous meeting, "the whole thing being tainted with suspicion." I do not say that the directors are dishonest men by any means. I would not pass the slightest imputation upon them, but they were much too easily led by those who may or may not have had personal or private objects in view. I ask you to appoint those in whom you have confidence, and to appoint none else. Mr. Smith has been good enough to put my name forward. I do not want to accept the position, but I still want you to use your own judgment; but be careful to get the management of the company into firm and strong hands, and if you do that you will do all that I can wish. (Cheers.) It is competent for any member of the Elmore Company to put before you names for the new board of directors. I think that is practically the whole of the formal business that will have to be done to-day. (Cheers.) Mr. Gretton wishes me to make the same remark for the other directors that I have made for myself. We all place unreservedly our resignations in your hands, because we have only the interests and success of the company at heart.

Mr. HARDING: The first part of the business to-day is to elect the permanent directors. Will they be elected one by one, or will Mr. Smith, or some other gentleman, submit a list?

VIEWS OF THE LIQUIDATOR.

Mr. J. H. A. SMITH: Mr. Chairman and Gentlemen, in answer to Mr. Harding I am prepared to submit a list to-day. I will put the names as you wish either singly or collectively, but that is going a little in advance. Gentlemen will no doubt have received a circular I sent out about a week or 10 days ago. The keystone of the policy of your old committee has been that everything that was done in the Elmore Company should be done in the spirit of perfect and mutual confidence between your board and the shareholders. No doubt, when this company achieves the success which we all hope it is now about to do, there will be the same sorts of rumours, and the same familiar suspicions, and the same critical remarks passed upon it as assailed the old company from the day of its birth until the day that I buried it; but I trust we shall be in this condition at least, that, having selected our own directors (which we never had the opportunity of doing in Alturas), and by our own free suffrages—having elected our own directors on the basis that we know they are the right and proper men to take the position we ask them to do, we shall be able to treat any such rumours and suspicions with utter contempt, satisfied that the directors will lay before us all the facts which it is material we should know, and that our interests will be looked after by a body of men whose integrity is unimpeachable, and who have no interest to serve but the interest of the Elmore Gold Company, Limited. (Cheers.) Those were the views which animated your old committee, and it is in pursuance of these views that I sent out my circular, because in many of these cases the process of election of a new board is of a very haphazard kind. I speak with knowledge, because I have attended many shareholders' meetings, and it is the practice for one gentleman to rise in one part of the room and propose a director, and for another gentleman to rise in another part and propose another, and the whole thing is settled as a kind of compromise — the shareholders not knowing whom they are electing or what are the interests supporting them. (Hear, hear.) I thought, then, that if I put before you the names of gentlemen willing to serve as directors you would have the opportunity between the time of receiving my circular and attending this meeting of satisfying yourself whether you could find better men for the position which I should suggest be offered to these gentlemen. Having given you that opportunity I do not think it necessary for me to dilate upon the personal qualifications of these gentlemen. You have seen them all before, because they have taken part in the various meetings of the old Alturas Company, and it would be superfluous for me to make any remarks upon their qualifications. I have had a letter from a gentleman, who suggests various qualifications which he thinks desirable. He sends me his proxy, and he says, "we require personal supervision of the mine periodically," and then he goes on to say "the interests of the directors should be wholly and solely those of the shareholders."

FUTURE MANAGEMENT.

I am entirely in accord with that gentleman, and think it should be an understanding with our directors that when they are elected they should select one of their body to visit their mines with or without an expert, as they may determine among themselves; but, of course, not in a way to interfere with the workings. You can have no greater misfortune than to attempt to work a mine from a board room in London, but a director visiting the mines familiarises himself with the staff and with the people in the district. They will know that they are not to send what reports they please and what accounts they like to the board in London, who are to know nothing but what they are pleased to tell them, but that they have a living body of men to deal with who will take the trouble to come out and see for themselves what is going on, and will gather (you will understand perfectly what I mean) from the sentiment that is prevailing in the locality as to whether your affairs are being directed in a straightforward manner. (Hear, hear.) Had there been such supervision formerly many of the mistakes and misfortunes of the old board would have been avoided. I trust the directors who may be elected to-day will give us an assurance before we part that this consideration shall have their attention, and that some gentlemen shall go to the mines and satisfy themselves that the individuals who are conducting our operations are men of fair reputation in the locality; that the books are well kept, and that the whole of the surface operations are being well maintained and conducted on this principle, and if they think it advisable to get the assistance of an English or an American mining expert to advise them, let them do so, and this may be particularly necessary when they shortly receive the proposals from their superintendents.

A RESOLUTION.

With these few remarks I shall propose "That Messrs. John Ramsden Armitage, John Humphreys Gretton, Thomas Henry Leak, and Francis Vaughan Williams, be, and they are hereby elected directors of the company—it being understood that a fifth director shall only be elected by the shareholders assembled in general meeting, but that nothing in this resolution shall be deemed to invalidate the right of the board to fill any vacancy arising in their number from death, resignation, or other disqualification." I am very anxious that the shareholders should still keep in thorough touch with the board, and that the board should look to the shareholders for support. I have only submitted the names of four directors, and my resolution proposes to leave the fifth vacancy open." I had hoped to have been in a position to name to you a gentleman who

would have satisfied all requirements, but I am not in that position. Five or six gentlemen have communicated with me, and suggested that they would be prepared to undertake this fifth position, but I do not wish to take upon myself the invidious task of deciding amongst these rival candidates, and I have not been able to submit their names to the gentlemen who have been so kind as to send me their proxies. Therefore, I should prefer that we should not appoint a fifth director to-day, but that we should go on a little while and see how the company proceeds. In the course of events one man will come forward, who from his large holding, his business qualifications, or his local knowledge, will prove a desirable director, and then you can elect him; but I want that election to be kept in your hands. I have spoken of four gentlemen, and with their full concurrence I have made the addeudum to my resolution: that is to say, we may lose a member of the board by death or other disqualification, but we do not wish to take that election out of their hands, or to prevent them from appointing a sufficient number of directors to carry on the business of the company.

GRACEFUL ACT ON THE PART OF THE OLD BOARD.

I would like to add that I have been very much pleased by what I consider a graceful act on the part of Mr. Forman, the late chairman of the company, Mr. Frank Hodgkinson, and Mr. Smedley (a member of the original board), who have sent me their proxies to support the nomination of these new directors. (Cheers.) I think that is a very graceful act, and it angurs well that men, about whom some hard things have been said, should come forward to support their successors in this way—successors who, I trust, will profit by their errors, and will make Elmore as successful as Alturas has been unfortunate. (Loud Cheers.)

Mr. WILSON: I second the proposition. I am not acquainted with each gentleman, but my confidence in Mr. Smith is such that I am sure he would uot have submitted those names to you unless he had been perfectly certain that they were the right men to put into that particular position. I, therefore, have great pleasure in seconding the motion.

Mr. BIDEN: As an independent shareholder I should have been glad to have heard Mr. Smith say something about the qualifications of these gentlemen. We know Mr. Armitage, because he has been connected with the mine for some time, and Mr. Gretton has also taken an active interest in the affairs of the company. Mr. Leak I forget for the moment, and Mr. Vaughan Williams I do not remember as having taken part in any of our discussions. I shonld be glad to hear somcthing about these gentlemen and their qualifications.

SHOULD THERE BE A MINING EXPERT ON THE BOARD?

There is, however, one element of weakness—we have no practical mining engineer on the board. Either we must have a practical engineer on the board, or we must have a consulting engineer. I would rather have a mining engineer on the board, because he will always be present at the meetings, whereas if you have a consulting engineer you have to summon him specially, and if he were in regular attendance he would be able to detect somethiug wroug which might pass by ordinary directors.

Mr. SMITH: Do you wish me to go over the whole of the names, or to make a selection?

Mr. BIDEN: I leave that to you.

QUALIFICATIONS OF NEW DIRECTORS.

Mr. SMITH: These gentlemen have knowledge of the business management of companies. I am sorry I cannot agree with Mr. Biden as to having a mining engineer on the board, because I look upon that as a misfortune. One of two things must happen—if there is a diversity of opinion between the manager abroad and the consulting engineer at home—if you adopt the advice of the latter you displease the former, and if you take the view of the former, you displease the latter. I say—if you have not confidence in your mine manager, get rid of him, and employ somebody else—(cheers)—but to have dual control like that would, I am satisfied, only lead us into trouble. (Renewed cheers.) Personally, I could not support a gentleman on that qualification. Those I have named are men who have a good business knowledge, particularly in regard to companies, and whose financial position and integrity are unimpeachable. Those are the qualifications I have sought for this company, and it is because these gentlemen possess them that I have submitted their names to you. (Cheers.)

MR. ARMITAGE'S POSITION.

The CHAIRMAN: I have, somewhat under pressure, allowed my name to be brought forward. I had made up my mind some time ago that I would have nothing more to do with company management, and I had a decidedly unpleasant experience in conuection with the Alturas Company. I do not want to be egotistical, but I went abroad last February, after I had entered a stroug protest against a policy that was being adopted during my absence, and which has practically proved the ruin of the company. I came home and attended one meeting, and felt myself so utterly helpless that I retired from the board, and you could not have induced me by payment to take office again. As I put it to Mr. Smith—I have some travelling expenses to pay in connection with this matter, and all that I ever will accept until the mine has either proved a success or a failure (I believe in its success) will be covered only by those travelling expenses. (Cheers.) I have a certain personal pride in trying to pull this thiug through, and if I have any part in that I shall feel amply repaid. I do not at all care about the fees in the matter; the satisfaction of knowing that Alturas, now Elmore, is a good thing, and that I have been somewhat instrumental in putting it right, will be a sufficient reward. If I consulted my own convenience in the matter, I tell you again I should boldly decline office on any terms whatever, but the personal pride comes in as an important factor and induees me to take office if it is your wish to appoint me.

MR. ARMITAGE AN ACQUISITION.

Mr. HARDING: Since I came into the room, in more than one quarter it was hinted to me that Mr. Armitage had been a member of the old board, and the question was whether it was desirable to elect on the new board any gentleman who had been, unfortunately for some of us, connected with the old board. I answered that, whilst we were investigating a variety of matters in connection with the consultative committee, Mr. Armitage's name was continually before us, and always in a favourable manner. Not a word, not a hint of anythiug on the other side came before us with reference to Mr. Armitage. He had left the board conscientiously a considerable time before, and our fear was (speaking as a member of the consultative committee) that it would be impracticable to persuade him to take a seat on the new board. That difficulty has, to our comfort and joy, been overcome. Mr. Armitage yielded to a very strong pressure, which was put upon him, and we feel greatly satisfied that he has accepted office, and the feeling of the meeting (if they knew as much about these matters as we did) would be one of great comfort and consolation that we had such a gentleman among the members of the new board. (Cheers.)

The CHAIRMAN, in reply to a question, said that all new appointments were snbject to confirmation at the next meeting.

The resolution was carried unanimously.

A GLIMPSE INTO THE FUTURE.

The CHAIRMAN: In thanking you for the confidence you have reposed in us, I can only say it will be the earuest endeavour of my colleagues and myself to carry out what we kuow to be your wishes. You have very wisely left the question of experts on the board for another time. I have my doubts as to the efficacy of such an appointment, but, fortunately, we have not come into anything like a collision about it. I think by the time we are able to meet again (I am sorry it is so short as July or August next) we shall have a better story to tell you, though I do not think we can do very much in that brief interval. The preliminary work will take three or four months, *ride* the manager. We shall seriously consider the recommendation of Mr. Smith to get in touch with the manager on the other side. How that will be done you must leave to our careful consideration. We shall not act hastily, and, on the other hand, we shall not defer the consideration of such an important matter beyond what is necessary. We are now practically awaiting the first communication in reference to the new departure from the manager. When that comes will be the time for taking these matters into consideration. I hope, geutlemen, that when we meet again, and I do not care in how short a time it may be, we shall have something very cheerful to communicate to you. I believe the mine to be valuable, and that it is only a question of going ahead, and keeping people from it who are liable to play with it for their own purposes. (Cheers.)

Mr. WILSON: Have we cleared out the whole of the staff with the exception of the manager, or are the same men at work?

The CHAIRMAN: We have no information on the question of the men. The manager has made certain changes, but our information is incomplete, for we have had no communication except by wire.

Mr. WILSON: What about the Tip Top claim?

The CHAIRMAN: Mr. Verden will answer you.

Mr. WILSON: Are we to have half-yearly meetings?

The CHAIRMAN: The articles of association provide for them.

Mr. WILSON: I suppose we shall receive reports from the manager, and that they will be published, because the shareholders will be anxious to know what is goiug on before the three or four months have expired.

The CHAIRMAN: It is exceedingly difficult to decide what to do. I am quite sure the board will not want to conceal from you anything that it is desirable that you should know, but when matters are in embryo it is a little dangerous exposing them too much, and I would ask you to place confidence in the board and not force them prematurely to divulge their plans. My fear by doing so is that we should play into the hands of other parties who might like to work the Stock Exchange for their own purposes.

Mr. HARDING: Will the auditor be elected at this meeting?

The CHAIRMAN: Accordiug to the articles, the duty of appointing the first auditor devolves upon the directors, and after that it remains in the hands of the shareholders. We have arranged with Mr. Biggs to open up and post the books to date for a specific sum. Mr. Biggs is well qualified for the post, and I believe that there is a feeling he should be appointed. The question of terms had better be discussed *in camera*.

Mr. HARDING: I should have proposed Mr. Biggs, but will abstain from doing so.

VIEWS OF THE SOLICITOR.

Mr. VERDEN (Kerly, Son and Verden): I do not think it would be well to go into the questions about the titles of the property. That matter is now being attended to by an eminent firm of lawyers in New York, who will take care that the interests of the company are well protected. It would not be right to enter into any details or discussions of that matter, and I hope you will leave it entirely to the board aud their legal advisers to do what they cousider right in your interests. The same remark will apply to the case of the Tip Top property. (Cheers.)

"THE USUAL TELEGRAM" ABSENT.

Mr. BAKEWELL: I beg to propose a vote of thanks to you, sir, for your conduct in the chair, and particularly for your kindness in undertaking the important office of director at such a crisis in the company's affiairs? I aut sure we must feel refreshed, first, by the confidence we have in you, and, secondly, by the absence of the usual telegram read at mining meetings of the discovery of a bonanza. (Laughter.) That discovery has yet to be made, but if it be made it will be in an honest way by the present directors. I hope you will carry the vote of thanks unanimously to the chairman as some recognition of the personal sacrifice he has made in accepting the onerous office he now fills. (Cheers.)

Mr. BIDEN seconded the motion, which he hoped would include the chairman's colleagues.

The motion, as amended, was carried by acclamation.

The CHAIRMAN, in returning thanks, expressed the fervent hope that in a short time the directors would have important and satisfactory news to communicate.

NEW COOK'S KITCHEN.

CALL OF 3s. 6d. PER SHARE,

ADVENTURERS in New Cook's Kitchen held a sixteen-week meeting on the mine on Thursday under the presidency of the purser, Mr. Walter Pike.

The accounts showed:—Labour costs, 987*l*. 11s. 7d.; merchants' bills, 229*l*. 0s. 11d.: total debits, 1,216*l*. 12s. 6d. The sales of tinstone produced 465*l*. 3s. 6d., leaving a loss on the 16 weeks of 751*l*. 9s., and a balance against the mine of 807*l*. 7s. 2d.

Capt. W. THOMAS, in answer to questions, said they had had 5*l*. a

ton less for their tin than last time, and they had scarcely any copper at present. It would not be worth anything if they had it.

Capt. JOSIAH THOMAS said they had had boring machines opening up the western part all the time, and this would lay open good ground for stoping. The falling off in the stuff raised was accounted for by the fact that they had not been able to stope at all during the past 16 weeks. They had the lode, however, at one point, and there it was worth 40*l*. a fm., being nearly 20 fms. long and 15 fms. high. That piece of ground was, without doubt, worth a great many thousands of pounds. In about two months they hoped to be able to materially increase their returns, but could not do it in much less time than that.

A call of 3s. 6d. a share was proposed by Mr. GEORGE WILLIAMS, seconded by Mr. FRANK HARVEY, and agreed to.

SOUTH CROFTY.

CALL OF 5s. PER SHARE.

A FOUR-MONTHLY MEETING of the shareholders in South Crofty Mine was held on Thursday—Mr. H. J. Lean (the purser), being in the chair.

From the statement of accounts it appeared that the labour costs had been 2,300*l*. 17s. 5d.; merchants' bills, 1,110*l*. 14s. 4d.; total debits, 3,411*l*. 11s. 9d. Tin sold, 33 tons 13 cwt., for 1,796*l*. 19s. 8d.; extra carriage, 5*l*. 16s. 11d.; total credits, 1,804*l*. 7s. 4d. This left a loss on the 16 weeks' working of 1,607*l*. 4s. 5d., and a balance against the mine of 1,725*l*. 11s. 3d.

Capt. JOSIAH THOMAS said they could not do better than drive these three levels westward.

Mr. GEORGE WILLIAMS inquired whether the loss would be so much next time?

Capt. THOMAS said they would raise more tin, all being well, but he could not tell what the price of tin would be. He hoped it would improve. Last time they sold 30 tons 11 cwt., and this time 33 tons 13 cwt. With three boring machines going, if they got a good lode in the western end, their returns would considerably increase.

Mr. GEORGE WILLIAMS moved a call of 5s., producing 1,450*l*.

Mr. TAYLOR seconded, and the motion was adopted.

Mr. WICKETT mentioned the matter of the subscription to the Miners' Hospital.

Mr. F. HARVEY proposed that the subscriptiou be increased from 2*l*. 2s. to 4*l*. 4s. a year.

This was carried, and the meeting closed.

HAMBLEY FREEHOLD GOLD MINE, LIMITED.

THE STATUTORY MEETING—THE CHAIRMAN MAKES A VERY SATISFACTORY STATEMENT.

THE first ordinary general meeting of the shareholders of this company was held at the Cannon Street, Hotel, on Thursday, the 16th May—E. Foster Webster, Esq., C.I.E., in the chair.

Mr. NEWMAN GOLDMAN (secretary) read the notice convening the meeting.

THE PRESENT POSITION AND FUTURE PROSPECTS.

The CHAIRMAN: Gentlemen, this meeting, I have no doubt you are well aware, has been convened in pursuance of the requirements of the Companies Act, which makes it incumbent upon the directors to summon a general meeting of the shareholders within four months of the registration of the company. Consequently, at this early stage in our history it is not possible for us to present you with any statement of receipts or expenditure, or to lay before you any report. But we are very glad to have the opportunity this morning of meeting the shareholders and stating to them what our present position is, and what our future prospects appear to be. and the announcement which I shall make presently will show you our prospects are of a very brilliant character.

AN ADJACENT PROPERTY.

It will be necessary, for a clear understanding of the matter, that I should make some reference to the present position of the Sam Christian Mine which is adjacent to ours. These two mines, the Sam Christian and the Hambley, are identically the same as far as the geological formation goes, and what has been proved with regard to he veins upon the one may quite reasonably be expected to occur upon the other. Mr. Hambley, our managing director, has addressed a letter to me in which he says, speaking of Sam Christian :—

"Dear Webster,—We are still uncovering veins, and I am stronger than ever in my opinion regarding the nature of the property; I feel very sure that 12 months from this we shall have a very different tale; the gold is below, and as soon as the shaft is down, and we are able to extend drives and cross-cuts, we are, I believe, going to discover some very rich shoots. Those people who think that Sam is numbered among the dead are going to be greatly surprised. I have more faith in the future of Sam to-day as a rich vein mine than ever I had before."

When work was commenced at Sam Christian a few months ago we were, most of us, under the impression that it would be a placer mine, and the gold to be won would be got by hydraulicing only. Mr. Hambley, however, was of opinion that the gold would be discovered in veins, and he held that the only way to discover them was to persevere in hydraulicing, stripping the ground down to the bedrock. Very shortly after this work was commenced the correctness of his surmise was proved. We came upon

NUMBERLESS VEINS.

I say numberless advisedly, as I have information that at one point in the property between 60 and 70 veins have been discovered, and with reference to another portion of our property (the California flat), Mr. Hambley says the whole ground is a network of veins. At California flat we have sunk 60 ft., and the veins are improving in character. The veins of the Sam Christian have been traced through that property on to the Hambley property, and if the veins on the Sam Christian hold down there is every reason to believe they will hold down in the Hambley.

THE FINANCIAL POSITION.

We are at present in a particularly favourable position financially. In the first place the nominal capital of the company is small for a mining concern, 72,500*l*. We have an exceedingly large working capital. Every one of our shares was eagerly subscribed for in a few days, in fact we had to issue letters of regret as we could not supply all that were asked for. Our monthly expenses are very small indeed. They come to about 200*l*. per month, or say about 2,500*l*. a year. We are engaged in sinking costean pits. We have already more money than we can possibly spend on this work during the present year, and so far as the directors are able to say

THERE IS NO INTENTION OF CALLING UP ANY MORE MONEY.

Now in the course of this work of costean pits, Mr. Hambley reports that he has discovered about 13 veins, some of which bear visible gold, and on the 6th of the present month we received from him the following very encouraging telegram :—

"Cut vein Hambley, 6 ft. wide, showing gold."

I am very glad to say that we have just had time to receive letters with respect to that subject which I have now to lay before the meeting. Mr. Hambley in a letter dated May 2nd writes as follows :—

"You will, I am sure. be pleased to learn of the discovery of a large and persistent vein on the Hambley Freehold. We discovered this vein by following the gold in the surface, and immediately above where the vein was located the surface panned 65 pieces of gold. This vein is fully 6 ft. wide, and has been cut in two places, and at both places it shows gold. This vein is so situated as to render its being worked in the most economical manner without the aid of shafts, pumps, or hoisting machinery, and, I believe, can be mined and milled for $2 a ton. We have discovered in all about 13 veins running through the hill, but only two carry gold at the point of intersection. It will take some time to throughly prospect this vein, but as soon as possible I intend to have samples taken and sent to London."

I think it is not easy to overestimate the importance of that statement. Mr. Hambley reports that this vein is a persistent one: that it shows visible gold, and is so situated that you can work it without shafts, pumps, or hoisting machinery, and it can be mined and milled for 8s. a ton.

IMPORTANT LETTER FROM MR. HAMBLEY.

Well, after the receipt of that letter, which was a private one to myself, the board of directors received another one which is also so important that I will read it *in extenso*. I may mention that it arrived by yesterday's mail from America.

May 1st, 1889.

The Board of Directors Hambley Freehold Gold Mines, Limited, London, E.C.

Gentlemen.—I have pleasure to submit the following brief particulars of the result of the work in progress on your property. In my last letter I informed you that we had intersected five veins. Since that date the work of prospecting has been uninterruptedly carried on. A costean ditch has been cut at right angles across the backbone of the ridge of hills traversing the property, in which we have intersected, in all, about 12 veins, varying in thickness from 4 ins. up to 15 ft. Out of the rough pan tests made of these veins at the points of intersection two only were found to be auriferous. One measuring 10 ins. showed colours of free gold by panning; and situated about 100 ft. distant, and on the top of the hill, we discovered the other vein, which at that point yielded a very good show of gold in the pan. This has the appearance of a strong masterly and persistent vein, and at the point of intersection measures 9 ft. from wall to wall, and dipping right into the hill. About 20 ft. on the strike of this vein a costean pit was sunk, and intersected it at this point, measuring about 2 ft. wide, and showing still better traces of gold. The vein has also been traced on its eastern strike, but we have not yet thoroughly explored it. This, I consider, a very encouraging discovery, and immediate steps will be taken for opening it up in length and in depth, which can be done by means of adits. The position of this vein is everything that can be desired for prosecuting active and cheap mining operations, being situated on the top of a hill, quite 150 ft. above the general level of country below, and if we find it sufficiently encouraging by further prospecting to justify its immediate development, this can be done by means of adit levels driven on its course. I must point out to you the advantages of working on this system, and a vein of this size yielding only 2 or 3 dwts. a ton could be very profitably worked. The strike of the vein is east and west, with a southerly dip, and the character of the quartz is identical with that of the little veins on the Sam Christian property. Samples shall be taken out and sent to London for assay. In doing this, however, I must point out to the board that large veins of this description contain gold not evenly distributed from wall to wall, but in bunches or shoots, and therefore it will be next to impossible to obtain the average value throughout of this vein until we are able to excavate several tons, and obtain therefrom proper quartered down samples. Several tests by panning prove to me that this is the character of the vein, and I may say that this is not peculiar, as most veins of its size contain the metal in the same un-uniform condition

A tunnel will be started to-morrow to intersect this vein at about 40 ft. from surface, and I hope to be able in the course of a few weeks to submit more definite particulars. Seeing the very short time we have been at work on the property, I am sure the board will be very pleased with the result so far obtained.

I am, Gentlemen,
Yours faithfully,
EGBERT B. C. HAMBLEY.

I do not think anything could be more satisfactory. It seems to me beyond all dispute we have a great deal of gold on that property. The analogy of the Sam Christian property seems to indicate that these veins will continue in depth.

WE HAVE A SKILFUL MANAGER

to develop the property, and we have more than ample funds with which to work it. The board of directors may fairly congratulate the shareholders upon having made a most valuable discovery, and I hope you will hold on to your shares and not let them be sacrificed. If there are any questions you would like to ask I shall be very happy to answer them as far as I am able. (Cheers.)

No questions being put, the meeting was brought to a close by a vote of thanks to the chairman.

Letters of allotment to applicants for shares in the Deli and Langkat Tobacco Co. have been posted.

GRIQUALAND WEST DIAMOND MINING COMPANY, DU TOIT'S PAN MINE, LIMITED.

Notice is Hereby Given, that a MEETING of the SHAREHOLDERS of the Griqualand West Diamond Mining Company, Du Toit's Pan Mine, Limited, will be held at the Offices of the Company, at Kimberley, South Africa, on TUESDAY, the 25th June, 1889, with a view to the consideration and, if deemed expedient, adoption of a working agreement with the De Beers Consolidated Mines, Limited.

Proxy forms for use at the meeting in Kimberley can be obtained at the London office of the Company, 5, Copthall Buildings, Moorgate Steret.

By order,
THOMAS J. SEEL,
Secretary.

London, 16th May, 1889.

IMPERIAL RUSSIAN GOVERNMENT CONVERSION LOAN.

Issue of £49,120,783 12s. 4 per cent. Bonds (2nd Series).

Or 1,241,992,000 francs,—593,672,176 Dutch florins, — 1,003,529,536 reichsmarks, — U.S. $239,083,460, — 310,498,000 metallic roubles, nominal Capital.

Created by virtue of the Ukase of His Majesty the Emperor of Russia, under date of the 26th April 8th May, 1889.

THIS Loan is issued in Bonds of the Russian Railways, and will be applied exclusively to the conversion and the re-payment of the 5 per cent Railway Loans of 1870, 1872, 1873 and 1884.

Holders of the above-mentioned 5 per cent. loans have the right to convert all their bonds (except any previously drawn) into the New 4 per Cent. Stock, and any bonds not converted will be repaid at par before the end of the year, 1889.

His Excellency the Minister of Finance will give at least three months' notice of the bonds to be paid off, which will cease to bear interest from the date fixed for their redemption; in pursuance of this arrangement, and in conformity with the Ministerial notice of the 27th April 9th May, 1889, all bonds of the 5 per cent. loan of 1884 (seventh series), outstanding after the conversion list is closed, will be paid off on the 15th August next.

Messrs. N. M. ROTHSCHILD and SONS are authorised to receive bonds of the above-mentioned 5 per cent. loans for conversion into the new 4 per cent. loan.

Allotment will be made in full.

Applications for conversion will be received until Friday, the 24th inst.

The 5 per cent. bonds to be converted must be listed on forms which can be obtained on application, and must be deposited within 21 days, furnished with the talon and coupons not yet due; interest at 5 per cent. will be allowed on these bonds from the date of the last dividend to the 1st July next, from which date the 4 per cent. bonds will bear interest, the first quarterly coupon being due the 1st October, 1889.

In the conversion every £1,000 of the 5 per cent. bonds will be equivalent to £1,090 6s. 6d. nominal capital of the 4 per cent. bonds. The exchange will be effected as nearly as the smallest denomination of bond—viz., £19 15s. 6d. (500 francs) will permit, and any fractional difference, together with the interest allowed on the old bonds, will be regulated by a cash payment to the subscriber.

The 4 per cent. bonds, both principal and interest, will be free from all Russian taxes.

The loan will be divided into bonds of £19 15s. 6d., £98 17s. 6d., £197 15s., and £494 7s. 6d., with coupons payable quarterly, on the 1st January, 1st April, 1st July, and 1st October in London, at the offices of Messrs. N. M. Rothschild and Sons, and in Paris, Berlin, Frankfort-on-Main, Amsterdam, Brussels, New York, and St. Petersburg, at the exchange of £19 15s. 6d. = francs 500 = reichsmarks 404 = Dutch florins 239 = U.S. $96.25 = gold roubles 125.

A sinking fund will reimburse these bonds at par in 81 years, by half-yearly drawings on the 1st January and the 1st July, and re-payment will be made three months later, at the same places as those fixed for the payment of coupons. The first drawing will take place on the 1st January, 1890.

Application must be made on the form attached to the prospectus, and accompanied by a deposit of £5 per cent. in money, or an approximate amount in convertible bonds, unless subscribers prefer to deposit the whole of their bonds when making application. The failure to deliver the 5 per cent. bonds when required will render the deposit on application liable to forfeiture.

Subscription lists are also opened in Paris, Berlin, Frankfort a/M., Amsterdam, St. Petersburg, &c.

New Court,
14th May, 1889.

THE LIQUIDATORS of WEST MOODIES GOLD AND EXPLORATION COMPANY, LIMITED, OFFER for SALE a Gold Crushing and Amalgamating PLANT, with steam power of the newest approved type, specially designed and adapted for transport, and working on the South African Goldfields. Now at Durban, ready for immediate delivery and erection.—Apply to Morley and Shirreff, 53, Gresham House, E.C.

MINING.—To be SOLD, cheap, a HORSE-WHIM, and all appliances for raising mineral, &c., including 100 fms. of best quality steel-wire rope.—Apply, Whiteway and Foot, Land Agents, Ashburton.

SALE OF WEST GODOLPHIN MINE. BREAGE, CORNWALL.

A. J. TANGYE is instructed by the Directors of the above Mine to OFFER FOR SALE BY AUCTION, in one Lot, as a going concern, at the Account House, on the Mine, on THURSDAY, MAY 23rd, at Three o'clock precisely, the whole of the valuable MINING PLANT, Machinery and Stores of the West Godolphin Mine, in good working order and condition, including 60-in. Cylinder Pumping Engine, 9 ft. stroke, equal beam, with 3 boilers and fittings, 16-in. horizontal condensing Drawing and Capstan Engine, 150 fms. of 9, 12, 13, and 14-in. pumps, with poles, windbores, door and H pieces to match, 130 fms. 6, 7, and 12-in. pitch pine roads, 60 fms. bucket rods, 200 fms. 4-in. steel wire capstan rope, 200 fms. ¾-in. steel wire winding rope, capstan shears, balance box, waggons, strapping plates, ladders, rail iron, smith's tools, several wood buildings, 24 ft. 4 ft. breast iron water wheel, 16 head axle with stamp heads, lifters and frames complete. Dressing machinery, dry tube, office furniture, and other requirements for carrying on mining operations.

The above Mine is situate in Breage Parish, about 6 miles from Hayle wharves and railway station, and about 7 miles from Camborne.

For further Particulars and Conditions of Sale apply to the Secretary, D. Julyan, Esq., 7, Union Court, Old Broad Street, London, Capt. T. Hodge, Camborne, or the Auctioneer, Chapel Street, Camborne.

Dated May 14th, 1889.

SECRETARY.

John Lancaster, Esq.

ABRIDGED PROSPECTUS.

THIS Company has been formed to carry on the business of white lead manufacturers, and to acquire and extend the works, plant, machinery, &c., at Possilpark, Glasgow, and to purchase the goodwill, buildings, and leases, together with the patents of James Ballantyne Hannay for an improved method of manufacturing white lead.

The immense saving introduced by the new method may be readily appreciated from the following description of Mr. Hannay's process:—

Lead ore direct from the mines is placed in a furnace with live coke, and, by the action of a blast of air, is driven into vapour and oxydised to sulphate of lead, which is collected by a special condenser, washed with dilute acid (to remove accidental impurities), and dried. Having been condensed from vapour the white is obtained in a state of fineness exceeding that obtainable by the ordinary method of white lead grinding.

The process of conversion is instantaneous and continuous.

As the men are shovelling the ore into the furnace at one end, the pumps are drawing off the wet white lead at the other, when it is simply washed and dried, and can be sent into the market within 48 hours. It will thus be seen that instead of a period of three or four months, and the employment of expensive chemicals and labour as required by the old process, the ore is converted by the new process into wet white lead at once, and the materials employed are coke as a fuel, and air as an oxidiser.

No skilled labour is required.

The Glasgow works, which will be acquired by the company, are now in operation, and are capable of turning out 2,500 tons per annum of the improved white lead for the market. The process has been thoroughly developed, and has been in practical operation for the past two years, while the product has had a most favourable reception from many eminent firms in Great Britain and abroad, being now largely used by such important consumers as the Midland Railway Company, Caledonian Railway Company, North British Railway Company, Glasgow and South Western Railway Company, Cunard Steam Ship Company, Messrs. Caird and Co., the P. and O. Steam Navigation Company, Denny Bros., Fairfield Shipbuilding Company (Messrs. John Elder and Co.), Irrawaddy Flotilla Company, Earles Shipbuilding Company, Messrs. Bass and Co., Burton; Brown, Marshall and Co., Limited, Boustead and Co., Singapore; Lorimer, Rome and Co., Melbourne, &c. The Admiralty made a purchase of a considerable quantity, which they have had in use for about 18 months. The quantity of white lead used by the Admiralty alone is at present about 700 tons per annum, according to the tenders which they annually invite.

The present price of lead ore is about 8*l.* 10s. per ton, and, adding railway carriage and manufacturing cost (which even on a small scale is under 2*l.* per ton), the actual cost of producing white lead by the new process is thus under 11*l.* per ton. (See Messrs. Bainbridge, Seymour & Co.'s report). White lead made by the old process is at present selling at about 18*l.* 10s. per ton, and assuming that Hannay's product is only sold at the same price there would remain a gross profit of 7*l.* 10s. per ton.

After allowing the large sum of 2*l.* 10s. per ton for the formation of a reserve fund and the extra expenses incidental to the development of a new business, office expenses, directors' fees, &c., there would still remain a net profit of 5*l.* a ton.

This calculation is a very moderate one, as, on account of its superior qualities, which have been readily appreciated by some of the largest consumers, the improved white lead has seldom been sold under 28*l.* per ton, at which price the demand has been in excess of the production.

It is intended to increase the works at Glasgow, so as to turn out 12,000 tons of the improved white lead annually, on which a net profit, as above shown, of at least 5*l.* per ton should be made equal to 60,000*l.* per annum, or 30 per cent. upon the capital of the company.

In addition to the large profits above estimated, negotiations already pending justify the hope that the foreign and colonial patents and licenses will be sold for more than the entire capital of the present company.

The sum to be paid to the vendors under the contracts below mentioned has been fixed at 150,000*l.*, payable as to 100,000*l.* in cash, and as to 50,000*l.* in fully paid-up shares; for this consideration the vendors make over the patents and the goodwill, leases, buildings, works, plant, machinery, &c., at Glasgow, and the rights of patents for the whole world, and also defray the entire cost of the formation of the Company and the subscription of its capital. There will, therefore, remain 50,000*l.* for extension of works, and working capital. Sir Henry W. Tyler, and Mr. E. J. Pape, two of the directors, being interested with Mr. Hannay in this contract, have not voted as directors in respect of it.

Sir Henry Roscoe, M.P., F.R.S., LL.D., the scientific adviser to the board, has inspected the works, and after a careful examination of the process while in actual operation, has made the following report, which the directors consider conclusive evidence of the great value of the property the company acquires.

10, Bramham Gardens, Wetherby Road, S.W., 13th May, 1889.

To the Directors of the White Lead Company, Limited.

Gentlemen,—At your request I visited and carefully inspected on Saturday last the Caledonia White Lead Works, Glasgow. I found that the process of manufacture of Hannay's White Lead, as there carried on, is accurately described in the official and other reports which you handed to me. The essential points by which this process is distinguished from all previous ones, are:—

1. Simplicity, rapidity, and cheapness of production.

2. Uniform and superior quality of the product as regards colour, covering power, and permanence.

3. The innocuous nature of the manufacture, and the non-poisonous character of the product.

The direct and economic production of pure finely divided, non-transparent white sulphate of lead from galena has been frequently attempted, but hitherto without success, until Mr. Hannay completely solved the problem. In my opinion, Hannay's process is one of great scientific interest, as well as one of very great commercial importance.

I am, yours truly,
HENRY E. ROSCOE.

The directors also invite a careful perusal of the accompanying reports (referred to in the above letter) from Prof. T. E. Thorpe, Ph. D., F.R.S., Chemist to the Royal School of Mines, South Kensington; from Mr. Thomas Sopwith, M. Inst. C. E., Managing Director of the well-known Linares Lead Works (perhaps one of the highest authorities in the lead trade), and from Messrs. Bainbridge, Seymour and Co., Engineers, Westminster.

All these gentlemen have visited the works at Glasgow and seen the process in full operation.

The originals of these reports, as well as the other documents referred to, can be inspected at the offices of the Company's solicitors.

The following contracts have been entered into, namely, a contract dated the 12th day of April, 1889, and made between Hannay's Patents' Company, Limited, of the first part, James Ballantyne Hannay, of the second part, and Edward James Pape, of the third part, and two contracts dated the 14th day of May, 1889, and made between James Ballantyne Hannay and Edward James Pape of the one part, and the Company of the other part. The vendors will provide all the preliminary expenses, including brokerage, and the charges for the formation of the Company, and the issue of its capital down to the first allotment of shares; and in connection therewith they have entered into agreements with third parties for guaranteeing the subscription of the capital, to none of which agreements the Company is a party; there are also numerous trade contracts on hand which cannot conveniently be specified. Applicants for shares will be deemed to have accepted the above statement as sufficient notice, within section 38 of the Companies' Act, 1867, and to have waived their right to any particulars of these agreements and contracts whether under that section or otherwise.

The above-mentioned contracts of the 12th April and 14th May, 1889, together with the memorandum and articles of association, can be seen at the office of the solicitors of the Company.

Applications for shares should be made on the accompanying form, and forwarded to the bankers of the Company, together with the amount payable on application. If no allotment be made the deposit will be returned in full, and when the number of shares allotted is less than that applied for, the surplus will be credited to the amount due on allotment, and the balance remaining (if any) will be returned to the applicant.

It is intended to make application to the London Stock Exchange for a quotation and settlement of the Company's shares.

Prospectuses and forms of application may be obtained from the bankers, brokers, solicitors, auditors, and at the office of the Company.

London, 15th May, 1889.

Just Published, Price 4s.

A DICTIONARY OF EXPLOSIVES. By MAJOR J. P. CUNDILL, R.A. (one of H.M. Inspectors of Explosives). This Dictionary is based on a Course of Lectures delivered at the School of Military Engineering, by MAJOR CUNDILL, and is the most complete work of the kind before the public. It contains an analytical description of every known Explosive to date, supplemented by valuable information as to the use of Explosives in general. As a work of Reference it will be found invaluable, and should be in the hands of all Engineers. To those engaged in the superintendence of explosions, or blasting in mines, the book will be an inestimable boon. The book is strongly bound in boards, cloth sides, leather back, and interleaved to admit of additions. Published by the Royal Engineers Institute.

WATER-GAS PROVED A COMMERCIAL SUCCESS. A SAVING OF £10,000 PER ANNUM IN ONE WORKS ALONE.

THE BRITISH WATER-GAS SYNDICATE, LIMITED.

WATER-GAS.

The following extract from the *Times*, of January 2nd, 1889, relative to the manufacture and application of Water-gas, is reprinted for general information.

WATER-GAS.

"For many years past attempts have been made at intervals to produce what is known as water-gas—that is, gas resulting from the decomposition of water. Experimentally there have been several successes, but practically and commercially up to the present time, as far as we are aware, these have been only failures. These failures have mainly arisen from the difficulty experienced in separating the water-gas from the other products. This difficulty has now been overcome, not by one invention, but by the combination of the best features of several inventions having for their object the manufacture of water-gas. What is more, the patented inventions which have been combined in the new process are not those of one inventor or of one country, but represent several inventors and several nationalities—namely, England, Germany, America, and Sweden. The amalgamation of these various patents and the beneficial results which have accrued therefrom came about by reason of the exigencies of manufacture of corrugated boiler flues and press-flanged steel frame plates for railway rolling stock at the Leeds Forge Company's Works, Leeds. The metallurgical operations carried out there demanded fuel of a higher calorific intensity than could be obtained from either the generator gas of the Siemens' producer, or ordinary coal gas. Mr. Samson Fox, the managing director, therefore turned his attention to water-gas, and, having carefully considered the whole question, decided upon putting down a water-gas plant at the Leeds Forge. The works were begun on September 29th, 1887, and on March 29th, 1888, plant capable of producing 40,000 cubic ft. of water-gas per hour was started, and has since been in constant operation with perfect success, and without interruption. The gas produced gives every satisfaction, not only for metallurgical, but also for lighting purposes, the whole of the works being supplied with it.

"Water-gas is the result of a chemical re-action which takes place in passing steam through incandescent carbonaceous matter, and may be considered as the practical result on a wholesale scale of the ordinary laboratory experiment of decomposing water by passing steam through a highly-heated iron tube. In the water-gas apparatus the fuel, which at Leeds Forge is coke, is raised to a high temperature in a generator by the aid of an air blast. The blowing is continued for about 10 minutes, by which time the fuel has reached a dull red heat. During this period what is known as producer-gas is given off, and this is led away to a range of Lancashire boilers, where it is utilised in raising steam for the engines in the works. At the end of 10 minutes the valves are reversed, the air-blast being stopped, and the further exit of producer-gas to the boilers prevented. Steam is then admitted at the top of the generator for four minutes, and, passing down through the incandescent fuel, becomes decomposed, and a fixed gas results. This gas as formed passes away to a scrubber, where it is treated much in the same way as ordinary coal-gas. From the scrubber it passes to the gas-holder, where it is stored for use for metallurgical purposes in the works, such as heating and welding. For indoor illuminating purposes a portion of the gas is conducted from the gas-holder to the purifiers, where its purification is effected by means of oxide of iron. It will thus be seen that the process consists of alternately blowing the generator hot and making gas, and that a run of gas is made every 15 minutes, during which time the yield from each generator is about 17,500 cubic feet of producer-gas and 5,000 cubic feet of pure water-gas for heating and lighting purposes. The gas is also used most successfully for driving gas engines.

"The metallurgical purposes to which the water-gas is applied at the Leeds Forge are various. In the first place, it is used in the heating furnaces in the plate mill, where the steel ingots are rolled into plates for the manufacture of Fox's corrugated boiler flues. It is also used in welding these tubes and heating the plates for Mr. Fox's flanged frame-plates for railway rolling stock, and for his flanged boiler-fronts, besides which it is utilised in various other similar operations throughout the works. In the application of water-gas to the manufacture of Siemens' steel there is a marked improvement in the quality as well as the quantity of the product. With this gas 30 charges of steel per furnace per week can be turned out, as against 11 charges per furnace per week from furnaces of equal capacity using gas from Siemens' producers. Besides being used for metallurgical purposes, the offices and various parts of the works are lighted with water-gas, the burners employed being arranged on the Fahnejelm system. Burnt in the ordinary way, the water-gas gives a blue flame, but by suspending a comb composed of thin magnesia rods in the flame the filaments are quickly heated to a white heat, producing a bright glow light of high illuminating power, but which is neither unpleasant to the eye nor prejudicial to the sight. The heating power of water-gas was very great, as was demonstrated upon our recent visit to the Leeds Forge Works, where we inspected the method of its manufacture as well as that of its use in the various departments. To give one instance only, a piece of copper wire placed in an ordinary coal-gas flame was only made red hot. A similar piece of wire placed in a water-gas flame issuing from a similar burner was quickly and perfectly fused.

"An important consideration in the adoption of any new system is, of course, its cost; and in this respect water-gas comes out well. Its production per ton of fuel is about 30,000 cubic ft., and with fuel at 8s. per ton, labour at 3s. 6d. per man per day, and the production going on continuously, it is found that the gas costs slightly less than 4d. per 1,000 cubic ft. The experience of nine months' working at the Leeds Forge has led to the conclusion, based on carefully-ascertained data, that the saving effected on the whole works is about £10,000 per annum. Looking at the advantages of water-gas for illuminating purposes, it is to be observed that, besides giving an agreeable light, it does not develop any noxious fumes, nor does it produce smoke; health and cleanliness being thereby preserved, and paintings, furniture, and decorations remaining uninjured. For lighting mansions this would prove a boon, while the producer-gas can be utilised for heating purposes. Similarly, a mill-owner laying down a water-gas plant for lighting his factory will obtain gaseous fuel for steam-raising purposes practically for nothing. For small towns also the lighting could be carried out with water-gas, the producer-gas being used for steam-raising and manufacturing purposes generally. Although the installation of this water-gas plant at the Leeds Forge is the first in England, the system is being largely adopted in America and on the Continent, both at steel works and for illuminating purposes."

In addition to the above extract, the following papers have recently commented favourably on water-gas.

REPORTS OF MEETINGS.

THE MYSORE GOLD MINING CO., LIMITED.

£264,450 EXTRACTED FROM THE MINE—2¼ TONS OF GOLD EXTRACTED—JUSTICE TO CAPT. PLUMMER—MORE THAN A QUARTER OF A MILE OF LEVELS DRIVEN BY DRILLS IN SIX MONTHS—30 STAMPS AT WORK—PROBABLE SALE OF PART OF SETT—VIEWS OF MR. JOHN TAYLOR.

THE ordinary general meeting was held at the Cannon Street Hotel on Thursday. There was a crowded meeting.—Sir Charles Tennant, Bart. (chairman of the company), presided.

The notice calling the meeting was read by the SECRETARY (Mr. W. H. Rowse), and the report of the directors was taken as read.

A GRACEFUL ALLUSION.

Mr. WALTER JAMES: Before, Mr. Chairman, you commence your address, will you allow me to say something which rises uppermost in our minds, and express the pleasure we all feel at seeing Mr. John Taylor, and to congratulate him on his recovery from his long and serious illness. (Loud cheers.)

The CHAIRMAN: I think that is a very appropriate preface to our meeting, and I beg to endorse the sentiment you have so gracefully expressed. (Cheers.)

POSITION OF THE MINE.

The CHAIRMAN then proceeded as follows:—With your permission I will, as usual, hold the report as read, and beg to move its adoption. Since the last accounts were published the capital account has been increased to 175,000*l*., by the issue of 25,000 shares of 1*l*. each, at a premium of 1*l*., all of which has uow been called up. The small number of unissued shares not yet dealt with are too few to divide *pro rata*, and the directors propose to take a favourable opportunity of selling them, which will result in a substantial addition to our next profit and loss account. The sinking fund has been increased by 2,000*l*., making now 4,000*l*. It is proposed to go on adding to this fund. The liabilities, which stood at 13,713*l*. on 31st December last, are now reduced to a sum not exceeding 2,000*l*. Machinery and plant, with buildings, materials and stores, now represent 84,180*l*., or an increase (after deductiug a proper amount for depreciation &c.). of 7,249*l*., and we do not look for any important addition to this account being required.

CAPITAL ACCOUNT COMPLETE.

I may here state that we have no inteution whatever of adding to the capital of the company. (Cheers.) The item of preliminary expenses has been lessened by 733*l*. 18s. 8d. The balance it is proposed to write off out of profits during the next (say) three years. The revenue account for the year shows the sales of gold to be 73,349*l*.—an average monthly production of 6,120*l*., as against 4,226*l*. for the previous year. It will be in the recollection of the shareholders that in my address to them of May of last year I pointed out that we had been pushiug on extraction to the neglect and detriment of development, and that we had decided to make a change in this respect. That change has been thoroughly justified by results. We have been enabled thereby, in a much shorter time than we anticipated, to open up very large reserves of rich ore, as indicated by Capt. Plummer. And this is, to my mind, one of the most important features in his able and interesting report, a report which you have, I am sure, all read with great satisfaction and pleasure. But for this wise restriction of output, our production for 1888 might have been considerably more. The profit for the year is 22,964*l*. This sum, added to the balance brought forward from 1887, enabled the board to declare two dividends of 10 per cent. each during last year, and after setting aside 2,000*l*. to the sinking fund, 733*l*. 18s. 8d. for preliminary expenses, and other items, leaves a balaucc to credit of profit and loss of 3,902*l*. 3s. 1d. It will be interesting to notice that the total gold produced from the property up to 31st of December last has been 55,341 ozs., of the value of 215,111*l*. Adding to this the production for the first four months of this year, up to April, we have a grand total of 67,877 ozs., of the value of 264,450*l*.

2¼ TONS OF GOLD.

The actual weight of the gold is about 2¼ tons. (Cheers.) When we last met, on the 19th January, I ventured to express a confident opinion that the next few months would show a great improvement in our returns, and the facts have even exceeded our anticipations. The returns for the last four months of 1888 gave us 5,775 tons of quartz crushed, yielding, with the tailings, 5,667 ozs. of gold. The first four months of this year have given us 9,148 tons crushed, yielding 12,535 ozs. Taking gold at 4*l*. per oz., and ours is so pure as not to fall very short of this figure, we have thus a value of 50,140*l*. against 22,708*l*. The return for April has been 2,600 tons, yielding 3,576 ozs., and 296 ozs. from the tailings, together 3,872 ozs., or about 15,100*l*., the largest we have yet had either from ore or tailings. The board thought that shareholders would be pleased to have an idea of the results of the operations for the first three mouths of this year, and so a preliminary statement made up to the 31st March was incorporated in the report. The figures show an estimated balance of profit for the first quarter of 1889 of 19,080*l*.

DIVIDENDS.

Since the issue of the report the April return, to which I have just alluded, has been announced. The board has declared an interim dividend, payable to-day, of 2s. 6d. per share, and will declare such further interim dividend during the year as the profits will justify. We propose making such arrangements as will enable us to hold our annual meeting earlier—I hope in March—and then declare our final dividend for the present year. The details as to the works carried on in the mines will be fully explained by Mr. Taylor. I must, however, express the board's great satisfaction with the energy and zeal displayed iu the development of the mines by Capt. Plummer and his assistants. The work douc by the rock-drills has been most satisfactory, if not unprecedented. More than a quarter of a mile of levels have been driven north of Taylor's shaft during the six months ending 31st March last. The milling operations have gone on satisfactorily.

30 STAMPS AT WORK.

Since February of this year 30 stamps have been at work the whole time, and 30 have been partly employed. The season has been almost unprecedentedly dry, which has interfered with our stamping as well as our tailings operations. It will be seen that Capt. Plummer indicates that, as soon as Rowse's shaft is completed through to the 466 north of Taylor's, and the winding engine erected, there will be no difficulty in supplying the stamps with quartz to keep them all running. Considerable additions have been made to the tailings machinery, and we have now at work 17 pans, from which Capt. Plummer anticipates very profitable results. Works of development and explorations are being systematically carried on at McTaggart's, Schaw's, Tennant's, and Henty's shafts, and iu all these sections good payable quartz is found. I am glad to say that, on the whole, the health of the people employed has been good. They are under the care of a competent medical man and an assistant. The establishment has now become one of considerable magnitude. There are employed 40 Englishmen, 46 Italians, 997 natives; total, 1,083.

PROPOSED SALE.

Great attention has been paid to all sanitary matters by the mining board, which was established when Lord Ribblesdale visited the property last year, and already most beneficial results have followed the arrangements made by him on that occasion. With reference to the closing paragraph of the directors' report, you are doubtless aware that there is a mile of property on the run of the vein north of Tennant's shaft, and between it and the Ooregum property, which it is impossible for this company to develop without largely increasing its capital, aud as the company possess, in addition to this, over 6,000 ft. between Tenuant's and the south boundary, the directors have been disposed to entertain a proposal for the purchase of about 3,500 ft. between the northern boundary and Tennant's, still leaving to this company about 8,000 ft. on the course of the Champion reef. The terms have not yet been definitely fixed, but the board, having a high opinion of the value of the block, will only entertain such terms as they believe will be advantageous and satisfactory to the shareholders. A special meeting will be called to consider the matter wheu negotiations are sufficiently advanced.

GRATIFYING TELEGRAM.

I have the pleasure to read to you the following telegram, which has just been received:—"Taylor's shaft: Depth 553 ft. Tennant's shaft: Depth, 230 ft.; lode, 2 ft. wide, assaying 10 dwts. Schaw's shaft: Depth, 319 ft.; lode, 4 ft. wide, assaying 2 ozs. 8 dwts. This is a great advance upon any former assays from this shaft, which is 2,166 ft. south of Taylor's shaft. Plummer's shaft: Depth, 396 ft.

Rowse's shaft: Depth, 135 ft.; old workings. Sinking bottom 466 north of Taylor's: Depth, 567 ft. on the slant; lode, 3 ft. wide, assaying 3 ozs. 19 dwts. This is the deepest point yet reached upou the vein or upon the Colar goldfield. Rise back of 400 against Rowse's shaft: Holed to 296. Rise back of 296 against Rowse's shaft: Holed to old workings. The 466 north of Taylor's on west branch: Driven 36 ft.; lode, 6 ft. wide, assaying I oz. 6 dwts. Rather lower in assay, but considerably wider. The 466 north of Taylor's: Driven 675 ft.; lode, 3 ft. wide, assaying 1 oz. 19 dwts. The 400 north of Taylor's: Driven 622 ft.; suspended, beeause of the rise being put up in the baek of this level against Rowse's shaft. The 296 north of Taylor's: Driven 652 ft.; lode, 6 ft. wide, assaying 2 ozs. 3 dwts. The 236 north of Taylor's: Suspended. The 296 south of Plummer's: Driven 95 ft.; lode, 5 ft. wide. assaying 13 dwts. The 236 south of Plummer's: Driven 238 ft. The 152 south of McTaggart's: Driveu 396 ft.; lode 2 ft. wide, assaying 11 dwts. The 220 south of Schaw's: Driven 73 ft.; lode 3 ft. wide, assaying 13 dwts. The 180 south of Tenuant's: Driven 82 ft.; lode 1 ft. wide, assaying 3 dwts. The 180 north of Tennant's: Driven 80 ft.; lode 1 ft. wide, assaying 5 dwts. Working eight stopes; average width of lode 3 ft.; and average quality, 1 oz. 16 dwts. 50 stamps working. 17 pans working. May return between 3,000 ozs. and 4,000 ozs. Reserves are slightly increased. All going on most satisfactorily." I think you will agree with me that this is a most satisfactory message. With these remarks, I beg to move the adoption of the report. (Loud cheers.)

FEELING OF ORIGINAL DIRECTORS.

Capt. MCTAGGART (deputy-chairman): Gentlemen, I can hardly tell you with what pleasure I rise to second the adoption of this report here presented to you, nor can I adequately represent the feelings of your directors, most of whom have been associated with this enterprise from the commencement, and through good and evil report had been consistent believers in its ultimate suecess. After what you have heard from your chairman, and after what you will hear from your manager, Mr. John Taylor, I veuture to think there will be no critic left so captious as to venture to suggest that the success of this mine is not uow finally established. There is so much that is interesting awaiting you that I do not propose to take up any of your time any longer, but will content myself with formally seconding the motion for the adoption of the report.

The CHAIRMAN: I think, before puttiug the resolution to the meeting, I had better ask Mr. Taylor to give us the latest information as to the position and workings of the mine.

WELCOME TO MR. TAYLOR.

Mr. JOHN TAYLOR, who was loudly cheered on rising, said: Gentlemen, allow me first, if you please, to thauk Mr. James for the kind words which he has spoken, and you all for the welcome you have given me on my return to work. I have had a long illness, but I trust the only ill-effect it has left is a slight weakness at present in my throat, and I must ask your indulgence if I am uot able to make you hear as well as I shonld wish—otherwise I trust that I am quite well again. (Loud cheers.) It is now exactly 12 months since the last annual meeting, at which the report and aecouuts were placed before you, was held, and although I then deseribed the workings at some considerable length, and did so again at the *interim* meeting in January last, it may be perhaps aceeptable that I should, even at the risk of repetition, bring to your notice the more important developments which have taken plaee during the period. The last annual meeting was held on the 17th May and this is the 16th May, so that we are within a day of 12 months sinee we presented our aecounts before. It is not necessary that I should speak specially of any of the workings other than those at Taylor's shaft, with the exception of Schaw's shaft.

IMPORTANT IMPROVEMENT AT SCHAW'S SHAFT.

At Sehaw's shaft, as your chairman has told you, an important improvement has taken place, as described in the telegram which he has read. This shaft, as you are all aware, is very elose to the southern boundary —363 ft. only from it, and it has now been sunk to a depth of 319 ft., aud the telegram mentions that it is 4 ft. wide; worth 2 ozs. 8 dwts. per ton. I told you at the meeting in January, when that shaft was only down 241 ft., that Capt. Plummer had stated in one of his letters that the quartz eontained all that could be desired to induce the opinion that the lode would improve as the shaft was deepeued. I mention this to show how Capt. Plummer's prediction has come true, aud the chairman has alluded to the statements he makes as statemeuts that are always exceeded by the actual results produced. (Cheers.)

PROBABLE RESULT FOR MAY.

Therefore the 4,000 ozs. given as the probable result for May may be looked upon as a pretty safe one, and I shall hope to see it much nearer 4,000 ozs. thau 3,000 ozs. This discovery of Schaw's which has been made was fully anticipated, but we may anticipate as much as we like in mining, and it may not eome true. This discovery is of the utmost importance, because Schaw's shaft is the pioneer working in the southern portion of the property, and. as Sir Charles has mentioned, it is fully 2,000 ft. away to the south from our great mine at Taylor's shaft. I will say uo more upon that poiut, but simply remark that 2,000 ft. is a great distance, and we may assume that there is a very considerable improvement in depth. That is what I wish you all to understand—that this playing at mining at a depth of 150 or 200 ft. has proved to be of no use. The ancients, where there was good quartz at these depths or anything like them, knew how to take it away, and as a matter of fact did take it away. We have always repeated—let us get deeper, and we shall find the quartz rich where the ancient workers were unable to reach it.

TAYLOR'S SHAFT.

Taylor's shaft is the chief point in the past year's operations. This great development of length of rich rock to the north of that shaft, and in the neighbourhood of the new shaft, you will see on the section, to which I will presently refer, and it has been named after your secretary, Mr. Rowse. A year ago, almost at the time of the meeting, you will remember that a discovery was made in the 236-ft. level to this extent that the lode increased from a few inches in width to 3 ft., and I think it was mentioned as worth only half an ounce. You did not think much of it at the time, but I told you what I anticipated from it a year ago. That was the commencement of the drivage upon this rich pay-shoot, which has now extended such a great length, and since that time four levels have been driven upon the course of the Champion reef, and have all persistently passed through rich gold quartz. At the 236, the second level from the surface, (the top one being the 173)—in the 236-ft. level we had 150 ft. of pay rock. The 296 level below it a year ago was driven 215 ft. north from Taylor's shaft. It has now been driven 652 ft. north, and 437 ft. of that 652 ft. was driven in the 12 months, of which 401 ft. have been in rich quartz. (Cheers.)

A SIGNIFICANT POINT.

You may not have caught the statement in the telegram, but it is very important—that the lode in the end is 6 ft. wide, aud is stated to be worth 2 ozs. 3 dwts. We would have thought a great deal of a lode only 3 ft. wide and worth as much as that, but when you come to double that quantity you will uuderstand its significance, partieularly when you remember that the cost of the development is the same whether the lode be 3 ft. wide or whether it be 6 ft. (Cheers.) To go deeper—the 400-ft. level has now been driven 662 ft. north from Taylor's shaft, and of that 552 ft. have been in rieh lode. The average has been over 4 ft., and the quartz has run from 1 oz. to upwards of 4—a splendid lode all the way. The at prsent deepest point in the uine (though it will shortly not be so, because you will have seen an intimation that a fresh driving has been commenced at the bottom at Taylor's shaft) has been driven 665 ft. north, of which 475 ft. has been in rich lode over 3 ft. wide. The telegram tells you it is worth nearly 2 ozs. within 1 dwt.—1 oz. 19 dwts. to be strictly correct. That you see by the plan is a piece of ground extending from the 466, and we know not how far below—practically to the 236, and possibly above, because we had gold quartz above it for a length of more thau 400 ft. (Cheers.) Below the 466-ft. level a winze has been sunk to a depth of about 40 ft. on the slant of the lode. This is the deepes t point, as the chairman has told you, in the Mysore Mine and the Colar goldfield, and, I suppose, auywhere in India—of course except in the collieries which are deeper—but the deepest shaft we know of for gold miuing is in your mine.

A 4-OZ. LODE.

The lode in the bottom there is 3 ft. wide, and worth 4 ozs. practically—3 ozs. 19 dwts. (Cheers.) Now, gentlemen, what is our encouragement to continue the development in length and depth of this property lying to the north of Taylor's shaft? That encouragement must be evident to you all, and need not be enlarged upon. With a view to more rapid opening up and improved ventilation of the mine a shaft was commenced not very long ago called "Rowse's," startiug from the surface, and in order to quicken the work rises were put up from the 400-ft. level, the 296 and the 236. This is a matter of underground surveying, which has to be very carefully done to make these poiuts meet; but you can see from the plan what has been done. In the 400-ft. level, a considerable distance above the 236, the shaft has been made good, and has been sunk from surface to a depth of 135 ft., and we shall in the early future have these points together, and soon be able to have this shaft to assist in taking away the large block of ground I have pointed out. (Cheers.) There is another very important point in connection with this part of the mine —a statement to the effeet that there was quartz left in the old workings in some places 2 ft. or 3 ft. wide, being worth 4 ozs. to the ton or more. What I want to point out is that

THE WHOLE DIP OF OUR PAY-SHOOTS IN THE MYSORE IS TO THE NORTH.

We are not yet far enough to have had the advantage of all this dip, and, therefore, I look with the utmost confidenee to the continuance of this pay-shoot for a further length. You will readily understand from what I have said how spleudidly this development has taken place, and you will also have realised the efforts that Capt. Plummer and his assistants have made to that end. I most heartily endorse what the chairman has said as to their labours. I think they all have

WORKED LIKE MEN.

We hear that the climate has been exceedingly hot, and our thanks are eertaintly due to Capt. Plummer aud all his assistants for what they have done. I think I have said enough, geutlemeu, to make it clear to you how extremely satisfactory is the present condition of our property, and how brilliant its prospects are for the future. (Cheers.) I need not tell you that it has been very pleasiug to me to make sueh a statement of facts as I have had to do to-day. I have not travelled beyond the facts at all. (Cheers.) I have made no prophetic statement, because I have thought the facts to be quite suffieient in themselves. (Loud eheers.)

The CHAIRMAN: If any gentlemen wish to make any observations we shall be glad to hear them now.

VIEWS OF SHAREHOLDERS.

Mr. WALTER JAMES: I think that after the addresses we have had from you, sir, from the deputy-chairmau, and from Mr. Taylor, uothing could be more satisfactory than this meeting. The telegram which gives the improvements and the values of the different parts of the mine is more than eheering to us. This mine, Mr. Chairman, to my miud, has long passed out of the reason of doubt. For a long time we have considered it a great mine, and now we may take it to be a "grand old uine." We formerly looked for all our improvements in the northern part of the mine, and now we see we are improving also in the southern part. There have been several letters in the papers within the last few days, and there was one which asked Mr. Taylor for an explanation on a point which did not ask for much explaining. The writer, calling himself "Provincial," remarks that the results do not quite tally with the assay. (Laughter.) I take it that we do not expect them to do so, because the assays are but tentative, and the results are practical, and unless Capt. Plummer has a large staff, like people have in the tea trade, or the wine trade, who do a good deal of bleuding, he could not work up to one standard. Therefore, the assays are tentative, but the actual results are those upon which we must place relianee. Although on the last occasion we seemed disposed to congratulate ourselves if we had 1 oz. to the ton all round, we are now getting unmistakably beyond it. You have been able to give us a better report than we have had, and we ought to be extremely satisfied.

The CHAIRMAN: I will now put the resolution, "That the reports and the balance-sheets to the 31st December, 1888, be received and adopted."

The resolution was put to the meeting, and carried unanimously.

DIRECTORS RE-ELECTED.

The CHAIRMAN: My next duty is to ask you to be good enough to re-elect our two retiring directors, Mr. Mark Shephard and Mr. Robert Henty, who retire by rotation. I have great pleasure in moving the re-election of those gentlemen.

The Right Hon. Lord RIBBLESDALE: I beg to second the motion.

The motion was carried unanimously.

Genl. BERESFORD: I beg to propose that the remuneration for the directors for the coming year be 1,500*l*. We ought to be thankful and grateful to them for their exertions, and for having brought this mine to the brilliant success it has attained. (Cheers.)

A SHAREHOLDER: I beg to second the motion. We all know, and our experience tells us, that in many companies we have to pay directors 1,500*l*. or 2,000*l*., without anything like the satisfactory results which these directors have achieved; in fact, many of us have experience of having to pay that sum to directors without a dividend at all. (Laughter.) Therefore, I think we may congratulate ourselves on the state of affairs connected with the Mysore Company.

The motion was carried unanimously.

The CHAIRMAN: We are extremely obliged to you for the manner in which you have voted this remuneration, and we shall give to the company the same careful, constant attention that we have done hitherto.

THE PROPOSED SALE.

Mr. BROWNJOHN: We should like to hear something about the sale of a part of the property.

The CHAIRMAN: I hope and believe that we shall have an opportunity of calling you together to consider the proposal with a view to selling a portion of the property which I have referred to—a portion of our northern property, but in the meantime I think it is wiser to say nothing about it. We shall call you together as soon as we possibly can, and take you into our confidence about the matter.

THANKS TO MR. PLUMMER.

A SHAREHOLDER: Before we part I am sure the meeting will agree with me that we should accord a vote of thanks to Mr. Plummer for the great attention he has given to the mine.

Mr. URWICK: I second that motion with great pleasure. I had, a year or two back, in a measure, to defend Capt. Plummer from attacks that were made upon him, because I gathered from his reports that he was doing his best for the mine in a miner-like manner. Therefore, when he was attacked I felt it my duty to support him. I have great pleasure, in the state of prosperity to which the mine has come, in seconding that motion.

The CHAIRMAN: Without passing a resolution to that effect formally, I am quite sure you will all be very desirous that we should communicate to Capt. Plummer the handsome expressions of your favour which have been given at this meeting to-day. (Cheers).

Mr. W. H. BEAUMONT: I beg to propose that Messrs. Turquand, Youngs and Co., the retiring auditors, be re-elected at a remuneration of 50 guineas.

Lieut.-Col. LINDSAY seconded the motion, which was carried unanimously.

The CHAIRMAN: That closes the business of what I cannot help thinking has been a very satisfactory meeting. (Cheers.)

GRATITUDE TO DIRECTORS.

A SHAREHOLDER: I hope, gentlemen, we are not going to separate without passing a cordial vote of thanks to our chairman and his colleagues for what we may call their very splendid administration of the affairs of this company. I am perfectly certain that every one of you will be only too glad to receive that motion with acclamation. It is unnecessary to put it, because I am certain there will be no contrary voice.

The CHAIRMAN: I am very much obliged to you.

The proceedings of a most encouraging meeting were then brought to a close.

THE NUNDYDROOG GOLD MINING CO. LIMITED.

THE LODE WILL BE FOUND—NO CAUSE FOR ALARM—ENCOURAGING TELEGRAM—STRONG FINANCIAL POSITION.

THE ninth ordinary general meeting was held at the Cannon Street Hotel, yesterday, to receive the reports and accounts; to elect directors and auditor, and for other general business. Captain W. Bell McTaggart, chairman of the company, presided.

Mr. W. H. ROWSE (secretary) read the notice calling the meeting, and the report of the directors was taken as read.

A TEMPORARY CHECK TO PROSPERITY.

The CHAIRMAN: Gentlemen, I rise to move the adoption of the report and accounts which have been submitted to you. This report, which has now been in your hands for some days, contains a record of what has been done in the past year, and also a slight foreshadowing of what we may expect in the current year—that is, the year that is coming. The record of the past year, I think you will agree with me, is of a very satisfactory character. A reasonable profit has been made, and the directors have been able to distribute to you two dividends. The mines were opening up well, and a career of unlimited prosperity appeared to be before the shareholders of this company. As regards, however, the working of the past year, each of you will have read carefully, and with great interest, Capt. Plummer's report, and no doubt each of you will have formed his own opinions as to the future of the company. Your manager, Mr. John Taylor, will presently (as he always does lucidly and fully) explain the exact position of the mine, but before he does so it may assist you if I give you a brief outline or sketch of the exact position. You will remember that when we began to drive north to open up the mine we came upon a cross-course, and that cross-course interfered with the lode not at all. We proceeded to drive north to open up more stopes and reserves, and we came to a second cross-course. This cross-course, unfortunately, has interfered with the lode—in fact, for the moment it has destroyed its continuity, and the lode has heaved either to the one side or to the other, and now Capt. Plummer tells you he is driving cross-cuts to look for it. Although it may sound a serious thing to say the lode is lost, I wish you to understand that you are in the most favourable of all circumstances to find it again. If the lode had merely dwindled away, and got smaller and smaller, and poorer and poorer, and eventually disappeared altogether, and if there was no record of its being found or worked upon further north, then, indeed, the outlook would be bad, but here you have that lode, which is full of vitality and rich, suddenly snapped off by some heave of the land, or convulsion of nature. These heaves or slides cannot force a lode very far out of its true course. The width of your property is not 100 ft., but at least two-thirds of a mile; therefore, it is almost impossible that the heave of land can have put it outside your boundary. Moreover, as it has broken off short, and where we left it it was rich, in all probability it will be rich once more when we re-find it.

CAPT. PLUMMER'S VIEW.

Capt. Plummer is strongly of opinion that we shall find it, and find it shortly. He writes continually to that effect, and has put it also into his report, and in one of his letters he says: "I stick to the opinion, and have always held it, that it will be found to make north of the cross-course." Therefore, gentlemen, this temporary missing of the lode is not one that needs seriously cause you any anxiety, but at the same time there are always gentlemen who take a gloomy view of matters, and it may be urged—supposing that you do not find the lode again; suppose you do not find it in three or six months, or find it at all—what then? Now, gentlemen, the worst side of the question is that side that should always be looked at carefully and weighed deliberately. I will assume that such a horrible thing as this does actually take place. Now, gentlemen, there is no need to doubt that throughout the whole of your property, which is two-thirds of a mile in width, the Champion lode does run. The Champion lode is in the Ooregum Mine, immediately to the south, partly in your ground, and you are working on it, and there are old workings through your property, and further to the north is the Nine Reefs Mine, which is opening up in a very satisfactory manner. Therefore I think it is absolutely impossible to suppose that this Champion lode does not run through your property, even if you have to go away from the present workings to look for it. Supposing we have to do that (and in fact we are doing that already, and have been for some time) what is your position financially? I am happy to say it is exceedingly good.

FINANCIAL RESOURCES.

We have, first of all, cash in hand, some 6,000*l*., including gold in transit; uncalled capital, 9,000*l*., and reserves of ore which Capt. Plummer informs us amount to 2,750 tons. These reserves of ore are actually in sight—as we say in mining language—and it will be only reasonable to assume them to be worth as much as the ore that has been taken out. Last year the average value of that ore was 1 oz. 15 dwts., but if we only assume 1½ ozs. to the ton, that would give us a reserve in solid gold of from 15,000*l*. to 16,000*l*. Your mine also is fully equipped, and very little will have to be spent on machinery. You have permanent buildings, and a staff, not only able, but thoroughly acquainted with the ground, and with the property. Therefore, if you had to begin *de novo* on other portions of your property, your position would be this:—You are provided with buildings; you are provided with an efficient staff; you are provided with the greater part of your machinery, and you have some 30,000*l*. in cash and reserves to go on with. I venture to think, taking the most gloomy and worst possible view that can be taken of your prospects, your position is one which the shareholders in many mines—I may say in most mines—might well envy. To turn to a more cheerful point of view, as I say, Capt. Plummer and we all here are perfectly satisfied that

THE LODE WILL BE FOUND,

and found in a very short time indeed. Having thus given you a faint outline of the facts, I can now leave Mr. Taylor to deal more technically with the mining details; but before I sit down I will read the following telegram which has been received from Capt. Plummer:—"Drills doing better; the 370 cross-cut has been driven 56 ft. (that is, the one in search of the lode); Webb's shaft, 422 ft. down. Taylor's, 377 ft.; both still barren (the new shaft which is to the depth of 47 ft.); prospects hopeful, and all going well." I will detain you no longer, but before I ask Mr. Taylor to address you, I will, as a matter of form, move the adoption of the report and accounts. (Cheers.)

Mr. SHAW KENNEDY (director): I beg to second the motion.

VIEWS OF THE MANAGING DIRECTOR.

Mr. JOHN TAYLOR: Gentlemen, the record of our past year's operations, I think you will all have gathered from the report, to be a very satisfactory one. It shows a substantial improvement on that of the previous 12 months. A much larger quantity of quartz was raised, the gold was considerably in excess, and the average value of the vein had increased as greater depth was obtained, and the deepest part of the mine had been the best. For the year 1888 the value of ground per fathom was 101*l*., as against only 75*l*. in the year 1887. (Cheers.) No doubt a much larger quantity of quartz would have been raised had it not been for this disturbance of the vein spoken of by the chairman by the cross-courses, and particularly the northern cross-course which Capt. Plummer and the chairman have described pretty clearly. These cross-courses have been a trouble to people managing mines before. In this case I think we need not anticipate very great trouble, because I do not think it possible from the position of things as known further to the north that the heave or dislocation can be a very great one. In one case, in Devonshire, the vein has been cut off and heaved to a great distance, and found again as many as 80 fms. off. 80 fms. is utterly out of the question here, because we know where the vein is further to the north. The effect of these cross-courses is, as a rule, to disturb the lode, throw it out of its course, but not of necessity at all to impoverish it. Close to the cross-course it may impoverish it or make it richer, but it disturbs it, and renders mining for the time a complicated matter and a matter of time. In this instance we have Balaghat Mine at no great distance to the north, I believe, undoubtedly working on the

Champion reef. We have it, as mentioned by the chairman, further to the north, undonbtedly the same reef, in the Nine Reefs property 1½ miles away, and you are aware that sonth for miles this great Champion reef extends. It is not a small vein which is at all likely to be thrown away and disappear.

GROUNDLESS ALARMS.

Any such supposition as that, or any such fear as that, must be removed from your minds entirely. It is not, as far as my experience tells me, within the bounds of possibility. Capt. Plummer, as yon will have anticipated, and as you gather from the last paragraph of his report, believed that the lode would have been met with before this time, because he hoped to send us the good news in time for this meeting. We may, therefore, fairly expect to receive it before long. The telegram the chairman has read is satisfactory at two points, one especially, that in regard to the rock-drills they are doing better, and we may assume, therefore, that they are more nearly approaching I hope what we are doing with these drills in the Mysore Mine, which is exceedingly good work—as good work as we could expect in any country of the world with other than first-class labour.

ROCK-DRILLS AND HARD QUARTZ.

The rock-drills are being worked to a great extent by natives on low wages under the supervision of Europeans, and their work has been extraordinarily good. It was a very important matter to us in Nundydroog, because here it appears we have the honourable position of being in the hardest rock in the Colar goldfield. We have been told that of two or three mines on the field, but I think we have really now in our mine actually the hardest rock in the field. It is heart-breaking work, and therefore to know that our drills are assisting us is most important. The other point in the telegram, which is also of immense interest to us, is that Capt. Plummer tells us the

PROSPECTS ARE HOPEFUL, EVEN AT THE SHALLOW DEPTH OF 40 FT.

to which he has sunk at the northern end of the property. He has told us that the stuff met with is stained with iron, that stones of quartz have been found, and that the presence of a reasonable quantity of water indicates that the old workings are not far from it. I do not think it necessary that I should go into any more particulars. Your chairman has spoken about my enlarging upon the mining works, but I do not think it necessary. The mine plan is a very simple matter, as you see it on the wall before you. The blue marked on the section shows the ore ground that has been taken away and the levels that have been driven, and I hope that the considerable portion of white paper left will, between now and your next meeting, be filled up by the draughtsman, to show you the drifts north of the cross-cut. According to the telegram I think we may look for very important things with regard to the northern workings, and also with regard to picking up the vein north of the cross-course. (Cheers.)

QUESTIONS.

The CHAIRMAN: Would any gentleman like to ask any questions, or to make remarks on the subject-matter before the meeting?

Mr. PROBYN: Where is the north shaft? You spoke of the northern boundary. Was it there?

Mr. TAYLOR: Yes, near the northern boundary. There was evidence of old workings on the surface towards our northern boundary and upon apparently the line of the great Champion reef, and it is there that Capt. Plummer has commenced his fresh search for the vein; and as I think I have shown he is very clear on the point that we are near a vein from the indications that have been mentioned.

A SHAREHOLDER: What is the distance north from the north shaft to Taylor's shaft?

ADDITIONAL CONFIRMATION OF MANAGER'S VIEWS.

Mr. TAYLOR: The property is over 3,000 ft. long; take 500 ft. from that and say it would be 2,500 ft. to 2,700 ft., or half a mile. I might mention that this morning there is confirmation of what we have said. The information is not so recent as the telegram, but I have had the pleasure of having a conversation with Capt. Plummer's son, who has come home for a holiday, and I asked him with regard to his difficulty we have had in finding the lode. He tells me he has never gathered from anything his father has said that he had the slightest doubt but that the lode would be found. (Cheers.) Mr. Henry Plummer only arrived in London last night direct from India.

The report was unanimously adopted.

ROUTINE BUSINESS.

The CHAIRMAN: Two of the directors retire in accordance with the articles—Mr. Shaw Kennedy and Mr. Orlando Webb—and I move that they be re-elected directors.

Mr. FERGUSSON (director) seconded the motiou, which was carried unanimously.

Mr. KENNEDY: On the part of Mr. Orlando Webb and myself, I beg to thank you very much.

Mr. PROBYN: I beg to propose "That Mr. William Wainwright be elected auditor of the company for the current year, at a remuneration of 10 guineas."

Genl. SCOTT-ADYE seconded the motion, which was carried.

The CHAIRMAN: That concludes the bnsiness, and we thank you all for your attendance. We are glad to see so many shareholders present to pay us a visit at our aunual meeting. (Cheers.)

The proceedings then closed.

THE RUSSELL UNITED MINES CO., LIMITED.

ENCOURAGEMENT TO PROCEED.

AT a general meeting of the shareholders held at 2, Drapers' Gardens, E.C., on Wednesday, Mr. T. Stephens in the chair.

Mr. E. ASHMEAD, the secretary, read the notice convening the meeting, when

The CHAIRMAN, in a clear and lucid manner, explained to the shareholders the recent improved and encouraging prospects of the mine. The lode in the 80-fm. level having passed through a run of continuous tin ground for nearly 19 fms.; assaying from 25 lbs. to over 50 lbs. of tin to the ton of stuff, and shows every prospect at present of holding on productive. The chairman further explained that the capital being exhausted, pending any further reconstruction or increase of capital, it was desirable that a sum of 600*l.* should be raised to open up and prove the extent of the recent discovery, and with that view the shareholders had been invited to consent to a voluntary contribution of 2d. per share. In reply to this he was pleased to say that the holders of 71,568 shares, out of a total of 73,235, had already consented, and he hoped the remainder would do the same. It was resolved to accept the voluntary contribution for the 71,568 shares, and to request the respective shareholders to pay the same to the Alliance Bank on or before the 24th inst.

The following report, dated the 13th inst., was read from Capt. WM. GEORGE, the manager: During the past fortnight the 80-fm. level has been extended on the course of lode 2 fms. 3 ft., or equal to 18½ fms. since the tin was first met with. The lode continues similar in character to that last reported, and is at present worth 8*l.* per fm. The rise measuring 2 fms. 4 ft. above the back of this level is now worth 6*l.* per fm. Seeing the end has continued to open such a length of profitable ground, and that at no time more promising for further continuance than at present, while the rise is also laying open profitable ground for stoping. I advise both points being continued, believing there is yet a good future before us.

After a few questions from shareholders, which were answered from the chair, a very cordial vote of thanks was accorded to the chairman and directors (whose services have from the commencement been gratuitous), and the meeting terminated.

MASON AND BARRY, LIMITED.

A COMPANY WITH A GOOD DEAL OF LAW—THE FRENCH GUARANTEE TAKES FRENCH LEAVE.

THE eleventh annual general meeting of the shareholders in Mason and Barry, Limited, was held on Monday at the City Terminus Hotel—Mr. F. T. Barry presided.

PRESENT POSITION.

The CHAIRMAN, in moving the adoption of the report, said he thought they might all feel satisfaction that, notwithstanding the recent collapse in the copper market, the balance-sheet submitted by the directors on that occasion was much more favourable than those issued by them during recent years. The increase of 20,000*l.* in the current liabilities was principally caused by an advance in the estimate for Government dues in Portugal, owing to the higher price at which the produce of the mine had been sold during 1888. On the credit side there had been a considerable reduction in the estimated value of the several stocks of ore and precipitate. Their investments stood at 239,762*l.*, against 101,562*l.* at the 31st of December, 1887. They had placed a portion of the sum received as dividend on the La Sabina shares to a sinking fund, with the view of gradually writing down those sums in the balance-sheet. With regard to their claim for re-payment of overpaid income-tax, he regretted to state that they had not yet been successful. A similar claim by the Cape Copper Company had been brought before the Court of Queen's Bench and decided in favour of that company, and they themselves had no alternative but to bring their claim before the Court.

LAW.

They proposed to carry forward the large sum of 42,297*l.* for the reason that they had not yet received due payment for the last shipment of precipitate made from the mine in 1888 (but not delivered until Jannary, 1889), shown in the balance-sheet, as amounting to 42,090*l.* Referring to the contract entered with the Société des Métaux for the sale of their shipments of copper precipitate during the years 1888, 1889, and 1890, he stated that it was negotiated by the directors on the absolute condition that the payments for copper precipitate delivered by them under the contract shonld be guaranteed by the Comptoir d'Escompte, and in pursuance of that understanding they received a letter of guarantee, which he read. The whole of the copper precipitate they delivered to the Société des Métaux during the year 1888 was duly paid for as the respective invoices became due. Since 1st January last they had delivered to the Société des Métaux two shipments, amouuting respectively to 42,090*l.* and 14,507*l.*

UNMET CLAIMS.

The payments for these deliveries matured on March 19th and 15th ult. respectively, and were not met. There was a third shipment, value 42,000*l.*, which the Société des Métaux ought also to have paid for, but as the company had again possession of this shipment he would not embrace it in his present statement. He then referred to the legal steps which the directors had taken to enforce payment of the amounts due to the company. The Société des Métaux he stated had not attempted to dispute their liability, and judgment had been duly signed against them for the amount of 42,090*l.* The Comptoir d'Escompte had disputed the right of the company to demand from them payment under their letter of guarantee, and were attempting to obtain exemption from the jurisdiction of the English law courts, notwithstanding that this jurisdiction was expressly accepted in their letter of guarantee, which he had read. The case had already been before Mr. Justice Mathew, who at once decided against the Comptoir d'Escompte, and on Thursday last the appeal made by the Comptoir against this decision was heard in the Divisional Court of Queen's Beuch, with the result that judgment was again given in favour of the compauy, the Comptoir d'Escompte being ordered to pay the costs of the appeal.

DECISIONS *v.* CASH.

The directors were confidently advised that this decision would be upheld should the case be taken to any higher tribunal. The directors were acting under the best legal advice, aud they would do their utmost to compel payment of the sums due to the company. Referring to a memorial which had been presented to the directors by certain shareholders last December, suggesting that the capital should be divided into one-half five per cent. mortgage debentures, to be repaid within 25 years, and the other half to be in ordinary shares, the chairman read the letter forwarded in reply to the memorialists regretting that the board could not accept the suggestiou. He afterwards said he thought the shareholders would agree with him that uuder the altered position of the copper market they stood in a more favourable position through being entirely free from any fixed charge for debentnre interest. Referring to their prospects, he said that if no arrangement were come to betweeu the holders of the present stocks of copper and the pro-

ducers, so as to regulate the amount sold to the requirements of the market, probably their dividends would be very small duriug the period that it would take to absorb the present accumulated stock, but during that period he supposed that most mines would reduce production so as not to part with their copper at an abnormally low figure. He felt convinced, however low copper might go, that when the present stock had been consumed it would again advance naturally to a price of nearer 50*l.* a ton than 40*l.* At any rate, their company was so far in a favourable position that they had a large amount invested in solid, high-class securities, and they could afford to wait until the price of copper ruled higher.

The resolution was seconded and adopted, and a dividend of 9s. a share was afterwards declared, making 9 per cent. for the year.

The retiring director, Capt. T. B. Heathorn, and the auditors were subsequently re-elected.

IMPORTANT LETTER.

Paris, April 10th, 1888.

Messrs. Mason and Barry, Limited, 87, Cannon Street, Loudon.

Gentlemen,—In consideration of your entering into a contract with the Société Industrielle et Commerciale des Métaux for the sale to them of certain precipitate, we guarantee the due payment in sterling to you in London of all sums of money which the Société shall become liable to pay in respect of all precipitate which must be delivered, pursuant to such contract, during the years 1888, 1889, and 1890. such guaranteed payments to be made upon presentation at No. 52, Threadneedle Street, in the City of London, of each invoice of such precipitate. And we agree that this guarantee shall not be affected by your giving time to the Société for payment, accepting or renewing any bill of exchange, or partiug with or exchanging any security, or forbearing to sue them in respect of any claim arising out of snch contract, nor by your doing or omitting to do or suffering or permitting any act to be done which would, apart from this stipulation, discharge us or otherwise affect our position as sureties.

But we are not liable for any payment which by reason of your having given time without our approval shall become payable after the 31st day of December, 1890.

And for the purposes of this guarantee and of any legal proceedings arising thereout we hereby elect domicile at our said office, No. 52, Threadneedle Street, iu the City of London, and agree that the law of England shall be applicable to and shall govern this guarantee, and that Her Britannic Majesty's High Court of Justice shall have jurisdiction over any dispute that may arise upon or in respect thereof.

I remain, Gentlemen, yours faithfully,
Comptoir d'Escompte de Paris,
Le Directeur,
P. Pro. le Sous-Directeur,
A RENAUD.

BRITISH WATER-GAS SYNDICATE, LIMITED.

THE COMPANY A WONDERFUL SUCCESS—WORKS ESTABLISHED FOR THE MANUFACTURE OF PLANT—THE CHAIRMAN STATES SOME REMARKABLE FACTS CONNECTED WITH WATER-GAS.

THE statutory meeting of the British Water-Gas Syndicate, Limited, was held at the Cannon Street Hotel, London, E.C., on Tuesday, under the presidency of Samson Fox, Esq.

Mr. THOS. H. OWENS (secretary) read the notice convening the meeting.

1,400 SHAREHOLDERS.

The CHAIRMAN, who was received with cheers, said: Gentlemen, I am very pleased to see so many of our shareholders here to-day, and I may tell you that it is the very largest meeting of my partners in business that I have ever met. I have been in business a long time myself, but I have never had the opportunity of being a partner in a concern where at least 1,400 other partuers are interested, and as this is our statutory meeting, when we may take a look at each other, and hear what one has to say on the subject of our business, who has been so long striving to bring it about, I will venture now to open out on the general question, and will tell you, first of all, what we have doue since we so successfully floated the parent company and the sub-companies, and then afterwards mention to you what other contracts have been made; and, finally, show you our real position with regard to the future of our property. (Hear, hear.) I may tell you at once that I have come here to-day not to deal with any question regarding the price of the stock. It is a question that I know very little about. I have never had any experience in either buying or selling stock, and if you were to take me along the street and ask me to point out the London Stock Exchange I could not do it, for I have never seen it to my knowledge. And I may tell you still further, that my entering into this company has been guided, I may say solely, by my judgment of the nature of the investment that has been offered to me; and I have never yet gone into any question where I did not feel myself somewhat a master of the subject that was to form the basis of the investment. (Cheers.)

THE PARENT COMPANY AND ITS OFFSPRING.

Now, on the 1st April—not a very propitious day to enter upon a big question like this—(laughter)—but, all the same, I do not think we have turned out fools—(cheers)—ou the 1st April we offered to the public the parent company, which was to consist of capital subscribed to the amount of 300,000*l.* Included in the property so purchased by the public there were something like from 16 to 20 patents. These patents are the outcome of many first-class men's hrains in this and other countries. We, first of all, floated the parent company, and the result was that the capital was applied for eight times over—showing that we had something to offer which in itself commanded the deep attention of most thinking investors. We then, after a little while, floated the Yorkshire Company with a capital of 151,000*l.* This was subscribed for about six times over. We then floated Notts and Derby with the same capital as Yorkshire—viz., 151,000*l.*—and this was subscribed eight times over, showing that these sub-compauies had some favour in the minds of investors. The other day we floated the North British Company with a capital of 301,000*l.*, and this was applied for 10 times over. (Cheers.)

AMOUNT REALISED BY SALES TO SUB-COMPANIES, 453,000*l.*

Now, I am going to give you a few figures which will show you to what extent the property that you subscribed for on the 1st April has yielded to the parent company. The amounts already secured to the parent company are—for Yorkshire, 101,000*l.*; Notts, 101,000*l.*; North British, 251,000*l.*—making a total of 453,000*l.*; and you paid for the property, which has been so sold, 217,250*l.* (Loud cheers.) Of course it is only right to tell you that the above amounts accrue to the company, less the agreed-on amount payable for promotion in each case, as the board, iu the interests of the shareholders, has decided not to accept the risk of promoting in any case. It would be neither right nor proper for me, in your interest, to go further into matters of this character at a statutory meeting, but in due course all the accounts will appear. (Cheers.) In addition to the three companies, the figures of which I have just given you, we have fixed concessions which amount to 201,000*l.*—150,000*l.* being in cash. The further contracts entered into, on which substautial deposits in cash for the carrying out of them have been paid to us, amount to 1,000,000*l.* sterling. (Loud cheers.) Thus we have 1,000,000*l.* sterling in the contracts, on which we have deposits, and which we have agreed to sell at certain prices; we have 201,000*l.* on two fixed concessions; aud 453,000*l.* on companies already floated, bringing out a total of

1,654,000*l.* IN SIX WEEKS' TIME.

(Loud applause.) Having now given a full explauation of the operations of the parent company in regard to the business that it has done in selling the property belonging to you, I will proceed to give you some little explanation as to the sales in each case, and which still remain to be dealt with by the company. We propose to stand firm to deal with this question of water-gas all over the United Kingdom, and in no case will we fall back aud deal with any other question or party. (Hear, hear.) We are a party of ourselves, and we are determined to go straight away on the linc that we started upon. To do that it will be necessary that one section of us shall give up talking about the finance of water-gas. It is requisite that something should be done on a pretty large scale for the purpose of showing people who have invested their money in water-gas that it is a reality, that it has in it all that the newspaper has said for it, and that it has in it what will be a great benefit to mankind and a march of progress iu the world at large. (Cheers.)

ESTABLISHMENT OF COMMODIOUS WORKS.

In order to do that it was necessary to possess ourselves of works, and to-morrow we come into occupation of works near Glasgow, fitted with a foundry 150 ft. long by 50 ft. wide, capable of making castings up to 15 tons weight, with cranes, and cupolas, and blowing power and every other requisite; we have also fitting, turning, erecting and pattern shops, drawiug offices, and everything required for carrying on a successful and profitable bnsiness. We have taken care to guard the interests of the parent company with the sub-compauies, so that all the forethought and all the penetration and inventive power that we may possess amongst us may be applied from the one centre and be transmitted through these works of ours, and handed out to the country through our sub-companies—this we have secured by making all our plant ourselves. (Cheers.) We have works in Glasgow from which I could throw a stone to a coal pit, and a small town around us where there is yet, I believe, no system of lighting. I should like very much before long to be able to tell you (aud I do not think it will be difficult) that at these works a water-gas plant has been started where the coal, almost from the pit's mouth, goes into the generator, and that the gas is sent along from the generator through a small tube up into the little town close by. If we could send it that distance, no doubt we could carry it much further—that, however, is a point upon which I have to speak later on. These works, I may mention, are fully going. The wages were paid last Saturday; the parent company pay the wages next Saturday; and as we are ready with our drawings at the head office at Leeds to be sent down to the works, and a gentleman is ready to go and guide the making of the patented parts, there will be no difficulty whatever that at once we let the works now in hand get finished and paid for, we receiving the cash after what is turned out to-morrow, we can go steadily on with the manufacture of our water-gas plant. Now, you see that we are on the threshold of manufacturing, and we shall very soon be able to show something that we have talked a good deal about here in town, and that something will be in the shape of a plant capable of making about 2,000 ft. of gas per hour night and day. Within a month I should say you will see some evidence of the power of water-gas iu some shop window here in London. (Cheers.)

THE HISTORY OF WATER-GAS.

I should like to tell you how it was that water-gas ever came to be developed to this standard. It came about iu this way: Some years ago, in connection with my business at Leeds, I granted a license to a certain firm in Germany to manufacture corrugated boiler flues on my patent system. At that time I felt it was necessary to have a much better medium for forming the welded joint than we already possessed; and, in consequence, on handing a license over to my German friends, one gentleman, whom I am proud to have here to-day, whose acquaiutance I made in connection with that work, at once, from his own theoretical knowledge, decided that as they were not likely to get into a big business all at once, it would be better to fight the question of the use of water-gas for such purposes. Of course, I could make no objection, but I could not fall in with that view and adopt the same system at Leeds at that time, because I had a large amount of work on hand, and saw that there was no necessity whatever for two firms to be struggling with the question of producing pure water-gas. I, therefore, asked them to go into the question; to allow me to help where I could; to keep me informed all about it, and when we all considered that the matter was in a fit state to be adopted generally, that then I should bring it over to England. I brought it over to England, and commenced work with it on a commercial scale, and the results have been such that I have never regretted the time spent in overcoming initial difficulties and the annoyances on many occasions that almost drove us to despair. You must understand that the manufacture of a gas apparatus is not merely the work of a mechauic, but of a man who knows a good deal of general science and of chemistry. It is necessary to

watch on the one hand simplicity in mechanical construction, safety in the adoption of the system, and, at the same time, look at it from a commercial point of view. Nobody without these qualifications could be trusted to carry out successfully a matter of this kind. Well, we got to manufacture water-gas safely, and without the aid of scientific men, so that we could leave the ordinary working labourer, the man of intelligence, in his black clothes to work night and day for us, we scarcely having to go near him.

GASEOUS FUEL *v.* SOLID FUEL.

As soon as we had arrived at that point we came away, and began to make experiments on the value of gas as against solid fuel. We all know that solid fuel is the one thing we have to fall back upon, but we came to a point where we could fairly compare the advantages of a gaseous fuel in this form over solid fuel. I propose to mention to you, first of all, the advantages of water-gas in connection with domestic purposes, because I suppose most of us here to-day have looked more into the domestic question than into the manufacturing question, and it will, therefore, be advisable for us just to look at the question from that point of view. From experiments made, we find that in the ordinary open hearth used in our rooms and houses solid fuel gives to the room about 3 per cent. of the heat emitted from the coal, whereas with fire places fitted for the use of water-gas—I have, at least, 20 of them myself—from 80 to 90 per cent. of the heat of the gas gets into the room. Now, as we do not require more than a given amount of heat, and as we have got an apparatus, and fuel in this particular form which may be used so as to give 80 to 90 per cent. of what it contains to our rooms, you can at once see what an enormous field this opens to us. There can be no question about it, that as time goes on this question will be dealt with in the near future in a large measure by people who are able to pay for the change.

OTHER ADVANTAGES.

No doubt there are other advantages—for example, if you use coal gas in your houses, either for lighting or heating, you must be prepared to allow it atmospheric air of 10 times its own quantity—in other words, if you burn 1,000 cubic ft. of coal gas in any room for any purpose, you must be prepared to give it at least 10,000 cubic ft. of atmospheric air. On the other hand, if you are using water-gas—we all know that the niches of doors and windows have been made on the practical experience of the use of coal-gas—you have only to supply 2,000 cubic ft., instead of 10,000. On that account the rooms in my house at Harrogate, and office at Leeds, are so cheering and comfortable after burning water-gas for hours that I am perfectly satisfied that, if for no other reason than the advantage derived in this way by the hard-working man in his home in the winter time, water-gas must surely be very largely adopted. There are other advantages. There is the question of dirt and dust arising from the use of solid fuel. In my house we have no coal scuttles, no brushes, no shovels—the whole thing conveys itself to the point required. I therefore hold the opinion that later on, before a servant will take service in any place, she will say,

"IF YOU PLEASE, MA'AM, DO YOU USE WATER-GAS?"

(Laughter.) There is another feature about water-gas which I think I ought to refer to, because it is a serious one in one respect, and it is right that people should have information on the point—I refer to the poisonous nature of water-gas. Water-gas, or any other gas that we consume, or use for heating or lighting purposes, is highly charged with other poisonous gases. Of course there are questions of degree between one and another, and I believe that if you were to be killed by gas at all, and wanted it quickly, water-gas would just beat all the others. (Laughter.) But there is a safety about it after all. We have discovered that water-gas is perfectly safe when properly managed. No man would like to get to the wrong end of a fowling-piece when it was being fired off; and in the same way we have to get to the butt end of water-gas in using it. (Hear, hear.) My experience in adopting water-gas in my own home was this: Of course I have a gas holder, and I carefully watched the fall of the holder during the time the gas was burning. I counted the number of lights, and took the time they were burning, but could not for the life of me make it anything like my estimation of the quantity of gas that ought to be burned, and so I gave orders that a certain valve was to be shut, and let the gas holder stand so many hours to see if it went down. No. I then went a little further through the purifiers to the next valve. No. I then went up to the gas meter. It was still tight. I shut off every light in the house and put on the gas, and I lost equal to 320 cubic ft. in a night. Now, as a practical man, I had taken more than ordinary precautions, but wherever I thought that the tubing of the house could possibly require renewal, I had it renewed. Having done this twice, I then got it perfectly tight. I calculated that I had been paying so much a year for gas that had been oozing through the extremely small niches of the fittings, on account of the gas that we were using not being sufficiently pungent to tell its own tale to us. We have, however, made water-gas smell as strongly as possible. We use a liquid that is highly volatile, and that liquid is acted upon to the main pipe of the purifier, and the result is that wherever any leakage exists, if you walk within 10 ft. of it, you will know all about it. The first night we had to shut down the whole thing, because of the leakage not before discoverable, and go on with lights and candles, as we had cut the other gas off entirely. We were completely choked with the smell. By making the gas smell strongly, it is so pungent that there is no possibility of a leakage existing without your knowing all about it. Consequently I have gone to bed at my own house perfectly satisfied with the lights in certain parts of the house burning, and there has been no necessity whatever to shut off the general valve of the house. I trust my own family and everybody in the place to the good fittings I have had made for the purpose.

WHY WATER-GAS MUST MAKE ITS WAY FOR LIGHTING PURPOSES.

If you will allow me I will now tell you why I think water-gas must make its way generally for lighting purposes. Taking it from a commercial point of view, we all know it is much cheaper. It can be produced for less than 4d. per thousand cubic ft. There are other reasons why it will succeed in large towns. We know that it is a fixed gas; we know that it will bear compression equal to about a ton to the square inch; we know also that it does not suffer from low temperature—that at a temperature of 200 below zero it remains a fixed gas. These are conditions which, when properly taken hold of, make it almost a certainty that water-gas will be used very largely in the future—almost universally because, no matter how our opponents cry against us, we have shown something that had not been shown before. There is that almighty question of the advantages from a monetary point of view, and there is also the advantage of requiring a pipe of only 1¼ ins. in diameter on account of the compression that you can give the gas. Instead of taking 2,240 lbs. to the square inch (representing the ton) if I take 200 lbs. only, which is ordinary working pressure in our steam boilers and compressed air machinery—if I take that same pressure, and we are all alive to the joints, and fittings, and valves, &c., that are required to conduct it safely at 200 lbs. to the square inch—if I take 200 lbs. and put it through a 1¼-in. pipe it will convey the same amount of water-gas as one of your 36-in. mains in the street. Now, a 36-in. main costs, to lay it down in the street with all its attendant fittings, 40 times more money than your 1¼-in. pipe, and therefore, if you take hold of a capital account and get the same result in conveying your gas for 40 times less cost, the saving will be in that proportion. There will be a great change from that shortly, in connection with the question of conveying gas in large cast iron pipes *versus* small 1¼ in. wrought iron pipes. I believe we shall yet see corporations pulling up those pipes, selling them for old metal and putting down 1¼ in. pipes.

WATER-GAS FOR MANUFACTURING PURPOSES.

I will now explain one or two features in connection with the power of this gas for manufacturing purposes. A most exhaustive report has been made by Sir Douglas Fox, and, indeed, there is hardly a point in connection with water-gas that has not been dealt with by him. The report is dated 28th March, 1889. The principal point, however, that I have to deal with is that on the 20th February he found we were making gas (including interest on plant and depreciation) for 3.61d.: on 25th February for 3.35d.; on 20th March for 3.57d.—an average of 3.52d. per thousand cubic ft., including interest and depreciation. I did not see Sir Douglas Fox and his men. They came into the works whenever they chose, and stayed as long as they liked. They have dealt with the question chemically and mechanically; they have dealt with every feature that ought to be known about it, and although the report is rather an expensive document, still, it is so satisfactory to anybody who chooses to go into the question that there is no doubt we have done right to bring an independent person to deal with the question on all points that can concern its future progress. (Cheers.)

WATER-GAS AND IRON AND STEEL MANUFACTURES.

As you will doubtless have read in the newspapers, the use of water-gas for the manufacture of iron and steel has shown itself to be very much in advance of the use of gas made from ordinary fuel—in fact, we may say at once to use ordinary fuel direct for your purpose is wrong. Ordinary fuel seems to have been intended by the Almighty to be used in connection with water, and the elements of water so acted upon by the fuel give you a far higher result than any you can get direct from the fuel. This is about the proportion: Where 10,000 ft. of gas can be made only from a ton of coal (and that is a good result), that same ton of coal used to decompose water will give you 35,000 ft. of gas of a very much higher heating power. At the Höerde works in Westphalia we have given the chance to many inquiring persons to see water-gas in operation on a much larger scale than we have it at our own works at Leeds. The results in every case have been perfectly satisfactory; and very well they might be, because it is there applied to puddling furnaces, to reheating furnaces, to a large furnace that heats the armour plates, and also to the Siemens' furnaces. These works have four blast furnaces, and 6,000 or 7,000 people are employed. They have gone into it on a large scale, with a result that has justified all that they have done. I propose now to give you some figures which I know to be correct. Puddling furnaces are turning out 14 tons of puddled iron in 24 hours. I have never seen a puddling furnace heated by coal that could do more than 6 tons in 24 hours. Furnaces for heating bars for a small bar mill turn out 20 tons per furnace every 24 hours. We have not anything in this country that can do more than half of it. Then we come to the large armour-plate furnace—and does anyone suppose that this firm would risk armour-plates in a furnace 12 ft. by 20 ft., fitted with a speciality of this kind, if they were not perfectly satisfied of its success? At one time the mass of metal in it is some 40 or 50 tons; would they risk that amount of metal if they were not perfectly sure by experience that it was all right? Then we come to another use that they have put it to—the melting of steel in crucibles. In Sheffield and in this country generally we melt steel in separate small holes in the floor. In some instances possibly it is put into an oven, but these cases are not numerous, as it is quite a new idea. At Höerde they have a furnace which holds 38 crucibles, and water-gas is put on to them, with the result that instead of getting out something like three charges in 24 hours they get out five complete charges in that space of time; so that the plant power is very much increased by using water-gas in connection with steel. (Cheers.) Now, I am afraid I am wearying you—(cries of "Go on")—but I wish you, as my partners, to understand something of the question that we are going to fight for during the next few years.

IMPORTANT FIGURES.

I will give you a few figures which are at the root of the reason why this gas will find its way into our steel works. Coal for the Siemens' gas furnace, at Höerde, used to cost 8s. 6d. per ton, used in a Siemens' generator; but now, with the water-gas generator, the coal that is required to be used costs only 5s. 6d. per ton, so that the quality of the fuel may be dropped down very considerably. You use a commoner or poorer class of fuel. The coal used of this 8s. 6d. quality amounts to 8.4 cwt. per ton of ingots, but of this lower quality, costing 5s. 6d., only 6 cwt. per ton of ingots is required. The output of the furnace under those circumstances is, for the Seimens' gas with 8s. 6d. coal, four casts per 24 hours, while water-gas and the 5s. 6d. coal gives you six casts per 24 hours. That of itself is sufficient to cause our large steel makers to come and discuss the matter seriously, as they are doing, with me and those connected with me. The largest firms in this country are seriously discussing this question with myself and those about me, and it may be interesting to know that the amount of steel melting that is going on in this country at the present time is

at the rate of about a million tons per annum. So that there is something for water-gas to do. (Cheers.) Going back for a moment to the question of coal-gas, it may be interesting to you to know that in this country there are nine millions of tons of raw coal used for the purpose of making coal-gas, and when you consider that a ton of coal will make three and a half times the amount of water-gas that it will of coal-gas, you may imagine what the money profit will be when these changes take place.

LEEDS FORGE.

I have said very little about—in fact, I have not mentioned the Leeds Forge Company, but I ought to mention it, because it has been dwelt upon in various sections of the Press, which no doubt many of you have read. I am prepared to prove that every word that is said about the advantages and the increase of profit, or economy, resulting from the use of water-gas, is true. (Cheers.) A gentleman said to me the other day, "They say that that 10,000*l.* is not correct, and I said the first time I met you I would ask how it was." Well, before I had got half through my story he said, "I see you are right; it is so." There is no doubt we have a fine future before us. (Cheers.) Now, the general question of water-gas is this—eight weeks ago I was about the one individual interested in it in this country; to-day there are 10,000 people who either have a share in its success or its failure, or have tried to have, and consequently there is no doubt that as the matter goes on, there will be a considerable accession to that army of people who believe in this new fuel and this new lighting power, and it is our business and duty, and intention, to do away with the use of solid fuel, if possible. It is nasty, it is dirty, and it is difficult to deal with. You have now got a fuel which is made out of this one uncontrollable commodity, coal, and the other uncontrollable commodity is water, and nobody can possibly ever put a ring round you and say you shall not have these raw materials to carry on your business. (Loud cheers.)

IMITATORS.

I think I should now say a few words on a question which has been laid before the public within the last few days. When success is achieved by anyone there are always those who would fain imitate, and an attempt has been made to imitate us; but by whatever art or scheme such people attempt to tread in our steps they will still have to make pure and cheap water-gas. Nobody knows how to make that as we do; nobody has yet had the experience, the failure, the trouble, and the annoyance connected with getting our apparatus so that it can do it; and whilst those who would put themselves to the front in the newspapers and elsewhere as being able to do what we can do, we know perfectly well that they can do nothing of the kind. (Cheers.) They have got to begin with their experiments, the burning out of their linings, the destruction of the faces of their valves, the breakage of connections, and every imaginable thing that has happened before water-gas came before the public as it really exists. Water-gas is not the work of any one brain. It began with a man named Bright, and another named Strong, and they, with all the force of their brains, carried it to a certain point. Then it came along to my friends in Germany, and they saw there was a good deal in it, and took hold of it. One gentleman here, Mr. Blass, has worked for four years in connection with it, and to him is due very largely the further additions that have made it safe to work, and of commercial value. (Cheers.) Mr. Blass knows all about water-gas; he knows it theoretically and practically, and he is allied with me in the determination of carrying it to a grand success. I can only say that the subject is one that if we were to try to tell you to-day what we shall know to-morrow we could not do it. There are so many features connected with it which have yet to be fought, and which are being fought; but we know that we are so far on the way with our knowledge of the subject, that we have no fear whatever of taking hold of this subject and carrying it forward to a success, which no one will ever catch us up in. We believe that the real understanding of this subject is the only sure way to make the capital productive that is put into it, and to make water-gas a lasting benefit to mankind. The chairman resumed his seat amidst loud and prolonged cheering.

VIEWS OF GRATIFIED SHAREHOLDERS.

Mr. DUNLOP: I am rather astonished that certain gentlemen who had something to say from the legal point of view about water-gas have not put in an appearance to-day, but the possibility is that the statement the chairman has made has reduced them to silence. (Laughter.) I do not understand water-gas as an expert, but I claim, as a commercial man and a man of business, to understand questions when they are put before the meeting as you have put them before us to-day. You have, sir, not been dealing with matters of speculation. You have not been reducing us to mere theories, but you have asked us to refer to these matters which are under consideration as matters of experience and matters which refer to results actually obtained by yourself and others who have used water-gas upon the Continent; and without entering into any long harangue, I beg leave, as one of the shareholders of this fortunate company, to express the great satisfaction with which I have listened to your statement, and to thank you for the great frankness with which you have dealt with all the matters that have been raised on this subject. I have seen water-gas in actual use, and am confident that we have in its introduction, perhaps late in the day—but it is never too late to mend—the introduction of a material which will do much to promote not merely the happiness of mankind, but to increase the commerce, the industry, and the progress of the whole human race. (Cheers.) I consider that the statements you have made, particularly with reference to the prospects of this as a syndicate company, are of a most satisfactory and reassuring character. I believe we all have great expectations, but it does not always happen that great expectations are realised, but in this case they have been more than realised. Certainly the figures which you have submitted to us are figures which should rejoice us exceedingly, and unquestionably they do.

MR. FOX THANKED.

Mr. JOSEPH GUEDALLA: I do not think we should bring this meeting to a conclusion without passing a most cordial vote of thanks to the chairman for presiding on this occasion. I think you will agree with me that this is no ordinary meeting, and that this is no ordinary company, and I must say that a more interesting speech, whether taken from the historical or the scientific point of view, it has never been my good fortune to hear. (Cheers.) I have no doubt we came to the scientific point of view in a prepared state of mind after you had exhausted your statement of our excellent financial prospects. I happen to know as a fact, having recently had the pleasure of being a guest of Mr. Fox at Harrogate, that he has trusted those whom he loves best to water-gas.

MR. GUEDALLA NOT A HERO.

Having slept in a room lit with water-gas, I do not claim to have done anything specially heroic. (Laughter.) I can only say that the smell is not exactly pleasurable, but I am assured that it makes the use of water-gas perfectly safe. It may be that the board hereafter will be able to issue facts which will dispel the hallucination which appears to prevail as to its great danger. The magnificent speech we have heard from our chairman will greatly help in that direction, and he, as a chairman, unlike most of his contemporaries, does not know his way to the Stock Exchange. (Laughter.) It is my belief that long after the antics of the "bulls" and the "bears" have passed into the oblivion from which they ought never to have emerged, when the scientific history of this great question and its introduction into this country comes to be written, there will be found in big letters on that history the honoured name of your chairman, Samson Fox. (Cheers.)

DEMOSTHENES AND HIS DISCIPLE.

A SHAREHOLDER: For a special reason I will take the privilege, for such I regard it, of seconding the resolution. That special reason is this, that for many years I have had the pleasure of knowing Mr. Samson Fox. I have known him as a mechanician and a scientist, but until to-day I did not know that he added to his varied qualifications the one of being so admirable an orator as he has displayed himself to be to-day. (Cheers.) Being myself a chairman and director of public companies, I have had always the reputation of being a fairly good speaker—(laughter)—but I never heard the speech like that of the chairman to-day. In addition to the other lessons he has taught me, from a financial point of view, I have gleaned some hints in the direction of oratorical style. (Laughter and cheers.)

The motion was put to the meeting by Mr. GUEDALLA, and carried by acclamation.

The CHAIRMAN: I may tell you that this is the first meeting over which I have ever presided in the City of London, and I hope that what I have said to you will, at least, have the effect of making you feel that I am sincere in the industry which we all have a part. (Cheers.)

THE SPECIAL MEETING.

A special meeting was then held to make sundry alterations in the articles, of which notice has been given.

The CHAIRMAN: I feel satisfied that the Stock Exchange knows better than we do, and therefore I will beg you to make the alterations proposed in the six special resolutions which will be submitted to you, the first of which I now move.

Mr. HAY seconded the motion.

The CHAIRMAN proposed the resolution No. 2, which Mr. ALGAR seconded.

The CHAIRMAN proposed resolution No. 3, which was seconded by Mr. WILLIAMS.

The CHAIRMAN proposed resolution No. 4, which was seconded by Mr. WADDINGTON.

The CHAIRMAN proposed resolution No. 5, which was seconded by Mr. ADAMSON.

The CHAIRMAN proposed resolution No. 6, which was seconded by Mr. TERRY.

All of them were carried unanimously.

Subsequently the CHAIRMAN put the whole of the resolutions *en bloc*, and they were carried.

The proceedings of an enthusiastic meeting were brought to a close.

IMPORTANT CIRCULAR.

11th. May—I have great pleasure in informing you that, in my capacity as Chairman of the British Water-Gas Syndicate, Limited, I have this day concluded the purchase of the Addington Iron Works at Addington, near Glasgow. These extensive works, which belonged to the representatives of the late Messrs. John Gray and Company, are connected by siding with the Caledonian Railway, and are taken over as a going concern, consisting of foundries, smiths, and erecting shops, also pattern and machine shops, with all the tools, fixed plant, and stock of material, and arrangements have been made to immediately divert these works to the manufacture of Water-Gas plant on a large scale by the syndicate, in order to comply with the immense orders for plant which are being received daily from every part of the country. This is in addition to the works acquired by this syndicate from Mr. Wilson, of Stafford (which were taken over as a going concern, as per prospectus), and will enable this syndicate to supply the subsidiary companies with their plant, and also the counties not already represented by subsidiary companies, or which have been sold privately. In conclusion, I have only to add that I hope you will be able to attend the statutory meeting called for Tuesday next, when it will give me pleasure, as your chairman, to lay before you the progress which your directors have made since the formation of this syndicate.—SAMSON FOX, C.E.,

---

GUNNISLAKE CLITTERS.

CALL OF 4s.

THE usual four-monthly meeting of the adventurers in Gunnislake Clitters Mine was held on Monday afternoon, at the purser's office, West Street, Tavistock—the chairman (Mr. J. J. Dawe) presided.

Mr. Skinner produced the four-monthly accounts, which showed an adverse balance from the last account of 271*l.* 19s. 1d.; cost of labour, 1,547*l.*; and merchants' bills, 554*l.*: making a total expenditure of 2,478*l.* 19s. 9d. The receipts amounted to 893*l.* 12s., leaving a balance against the mine of 1,588*l.* 7s. 9d.

Considerable discussion ensued, in the course of which it was stated that about 250 tons of copper ore had been raised since their last meeting, but was not realised.

A call of 4*s* per share was made, and the meeting adjourned after a two hours' sitting until Monday week next.

RIO TINTO CO., LIMITED.

A DIVIDEND OF 17 PER CENT.—LARGE WRITING DOWN—DIRECTORS SEE A PROFIT EVEN AT PRESENT PRICE OF COPPER.

THE sixteenth ordinary general meeting of the shareholders of this company was held at the Cannon Street Hotel on Monday, the 13th May, for the purpose of receiving the directors' report and statement of accounts, for the declaration of a dividend, and for other purposes —Mr. Hugh M. Matheson, chairman of the company, presided.

Mr. R. J. FENNESSY (secretary) read the notice convening the meeting, and also the minutes of the previous meeting.

THE ARRANGEMENT WITH THE FRENCH COMBINATION.

The CHAIRMAN said: The continuance for the whole of 1888, and for the first two months of 1889, of the high prices for copper secured under this company's contract with the Société des Métaux has produced results of quite an exceptional character, and, but for the great change which took place in March last, when the Société des Métaux suspended payment, going subsequently into official liquidation, it would have been in our power to pay a higher dividend. But the collapse of the copper market, which followed the catastrophe in question, made it advisable for the board to strengthen the company by large writing down. When we reported to you this time last year the contract into which we had entered for the sale of the copper, we informed you that we had taken proper mercantile precautions to ensure its due fulfilment. The Société des Métaux being a wealthy company in good credit, with which we had previously done large business, we should have been quite justified in making the contract without any guarantee. But we thought it was prudent to require of them a guarantee which should be to our satisfaction. We had accordingly obtained a deed of guarantee from the Comptoir d'Escompte, one of the highest financial institutions in France, enjoying a great reputation, expressed in the clearest and most emphatic language. It is now, unfortunately, too well known that the Comptoir d'Escompte has gone into liquidation. Upon the failure of the Société des Métaux to take delivery of the monthly supply of copper tendered in the usual manner on 1st April, we gave all due notice to the Comptoir as well as to the Société des Métaux, reserving all legal rights. It is some satisfaction to report that we were paid in cash for every ton of copper delivered. What may ultimately come out of our contracts is a question we are not in a position to answer; but you may rest assured we shall do our best in your interest. The pyrites delivered to consumers in Great Britain, Germany and elsewhere, under contracts for both sulphur and copper, amounted to 393,149 tons. The copper contained in this pyrites amounted to 7,830 tons. You will have observed that the copper made on the spot amounted to 18,522 tons of 21 cwt., against 17,813 tons in the previous year. The stocks of copper remaining on hand at Huelva and at the company's works in Wales, chiefly in the form of matte and precipitate, and to be made into refined copper, was 4,600 tons metallic, and was all taken over at cost price.

THE ACCOUNTS SPEAK FOR THEMSELVES.

The total gross profits of the year, with the balance brought from 1887, amounted to 1,142,777*l*. 11s. 5d. You will all, I am sure, be of opinion that such an exceptional year of profits ought not to be allowed to pass without somewhat freely writing down property and plant, and making the company as strong as possible. We therefore decided to write off on this occasion 254,905*l*. In regard to the remark in the report of the auditors, to which a good deal of attention appears to be given, your directors are not disposed to accept the dictum of gentlemen whose knowledge of this great property is confined to a study of the figures of the balance-sheet. We who have to manage this business, and have devoted almost our entire time and strength to your affairs, have, necessarily, to take a broader view; and we prefer to keep the amount carried forward at our own disposal, until we are enabled to decide what it may be most advisable, in the company's interest, to do with it. On the policy of regularly writing off the cost of the mines out of the shareholders' profits, it must be remembered we are dealing with a property that has an exceptionally long future before it. As a matter of course, reasonable and regular writings off have been, and will be, provided for. During a period of low prices it would be madness to use the money of the shareholders in providing for posterity.

A POSSIBLE ARRANGEMENT.

It is generally known that efforts are being made to bring about some arrangement by which the large stock of the Société des Métaux may be judicially put upon the market in fixed periodical quantities over a series of years, and thus lead to a steady market, desirable both for consumers and producers. Nothing is yet definitely arranged. We have all along taken part in negotiations with this view, and should some such plan prove to be practicable, we shall not hesitate to go into it on your account—of course under proper advice on legal points. At the same time, your directors have no hesitation in affirming that your property, as it is now developed, is in the most favourable condition to produce its copper at such a price as will leave a margin of profit even at the lowest prices we have yet witnessed; while at the same time a continuance of such prices would inevitably lead to a diminution of the production at large, with in all probability an increase of consumption. Mr. James Osborne has resigned the position of manager for the company in Spain, and has been appointed consulting engineer to the board. Mr. William Rich has succeeded him as manager. All the company's operations are being carried on with efficiency. Gentlemen, I beg to conclude by moving that the report and accounts now presented be received and adopted. (Hear, hear.)

The Hon. T. C. BRUCE seconded the motion.

SHAREHOLDERS ARE SATISFIED WITH THE BOARD.

Mr. THORPE: May I ask what course the board are taking with respect to the tendering to the delinquent companies the monthly stocks of copper? Of course, as a lawyer, I am perfectly aware that your course would be to tender them so much and sell it against them, and I have been given to understand that either by this company or by some other companies this course is being pursued, and is the cause of the lamentable drop. You will be aware, by that very lucky and very just decision in the Courts last week, you do not require to do that. If you feel at liberty I would like you to tell us—and I do not ask you to answer my question if you think best not to—that by arrangements with your own solicitors, and the solicitors of what I may call the defendants, the practice of putting copper on the market has come to an end. If you feel at liberty to say that this has been done the smaller companies will follow the example of the big ones. I must say I very much like the way in which you speak and act. It seems to me to be very honest and straightforward, which is a very unusual thing in mining companies. (Laughter.) You have a very large stock of copper, which cost you 6*l*. 5s. a ton, and therefore I apprehend that at the present price we shall not exactly starve, and I hope, in view of that very flourishing party of bears, you will give us all the cheering news you can. If you can give us this, it will be a satisfaction to us and all concerned.

THE SMOKE QUESTION.

Mr. ACTON DAVIS: I should like to ask whether the smoke question, referred to in the last report, is going on in a satisfactory manner to the company and the Government of Spain. I notice in this report a new departure which is to be commended—a statement of the stock of copper which you say is taken at cost price. This, should the worst happen, will make the cost of copper only 730,000*l*., whereas the stock taken in the inventory is 868,000*l*. I think the board should remember that in their report of 1884 they practically pledged themselves to do away with the item of the extension of development, and I think, therefore, the auditors were bound in duty to draw the attention of the board and the shareholders to that fact. At the same time we all recognise that the responsibility of the policy most emphatically rests with the directors, and not the auditors. Perhaps the board had that in view when carrying forward the large balance of 200,000*l*., and I think they are strongly to be commended for that very conservative and proper action, as it will help our shares more than having a considerable amount carried forward to profit and loss account.

THE CHAIRMAN ANSWERS QUESTIONS.

The CHAIRMAN: In regard to the question of Mr. Thorpe—whether some arrangement could not be made between our solicitors and the solicitors of the other party to prevent putting copper on the market—I think he can hardly expect me either to answer that question, or go into the subject. We must recollect we were regularly receiving from the buyers 90,000*l*. or 100,000*l*. on the first day of every month, and we handed them the warrants of the company. It would have been impossible for the company to withhold all copper from the market, but we are doing our best to put forward all we have, in a judicious manner, and we are also doing our best to promote some arrangement for the putting of that great quantity held by the Paris people on the market at proper intervals, so as to give confidence to the trade and lead to a steady market, which we all desire. The drop in price necessarily followed immediately upon the failure of the Société des Metaux, and, therefore, we had nothing whatever to do with that. It took place, moreover, before we were in a legal position to sell a ton. The thing has rather mended since then, and I have no doubt, with the demand that exists for copper, we shall not see a bad market. With regard to the smoke question—I am not yet able to say that we have got from the Government everything that we hope to get. The thing is still *sub judice* and we are doing our best to promote an arrangement. We do not dream of giving up the legal rights of this company, the Government having sold to us, with the property of the mines, the right to calcine, and every step that we can take is being taken to assert these rights, and to bring about a suitable adjustment of the difficulty. I am very glad that Mr. Davis, who has sometimes criticised our actions, is in accord with us in the steps we have in your interest. I can assure you the very utmost attention is given to your interest, and we are doing all we can to carry forward the work of this company to the satisfaction of the shareholders. I beg to move that the report and accounts now presented be received and adopted.

The motion was carried unanimously.

ROUTINE BUSINESS.

The CHAIRMAN: I now beg to move "That a final dividend of 14s. per share, making, with the interim dividend paid in November last, 34s. per share, or 17 per cent. for the year 1888, be now declared payable on the 3rd proximo, free of income tax."

Mr. JOHN M. MACDONALD (director) seconded the motion, which was carried unanimously.

The CHAIRMAN: I now beg to move that the retiring directors, Mr. G. A. Schroeder and Mr. J. A. Crawford, be re-elected directors of this company.

Mr. JOHN MACFARLAN (director) seconded the motion, which was carried unanimously.

Mr. GENT proposed the re-election of the auditors, Messrs. Turquand, Youngs and Co., which was carried unanimously.

THE SPECIAL MEETING.

The SECRETARY read the notice.

The CHAIRMAN: This meeting is simply for the purpose of amending the articles to avoid a very slight difficulty from the loss of a document by a holder. The chairman then moved the following resolution:—

"That the articles of association be altered in manner following:—(*a*) The following article shall be substituted for article 133. '133. The Company shall not, notwithstanding any notice or knowledge they may receive or have, be bound to recognise any legal or equitable right, title, or interest whatever, to, in, or in respect of any shares or stock represented by a share warrant, except the following rights:—(A) An absolute right in the bearer for the time being of any coupon so advertised as aforesaid for payment, to such amount of dividend or interest on the share warrant whereto the same coupon shall belong as shall have been as aforesaid declared payable upon presentation and delivery up of that coupon. (B) An absolute right in the bearer for the time being of the share warrant and the unadvertised coupons to the shares or stock included in the same share warrant, and all benefits thereof other than the dividends or interest which shall have been as aforesaid declared payable on the same shares or stock.' (*b*) The words 'but they shall under no circumstances issue any new share warrant for any shares or stock for which

a share warrant shall have been previously issued, unless and until the share warrant so previously issued shall have been first delivered up to them to be cancelled' in article 140 shall be omitted from article 140. (*c*) The following article shall be inserted after article 140, namely:—'140A. If any share warrant or coupon has been or shall be lost or destroyed, the board, if such loss or destruction be proved to their satisfaction and if in their absolute discretion they think fit, may in the case of any such coupon which shall have been advertised for payment as aforesaid pay the dividend payable in respect of such coupon to such person as may in their opinion be entitled thereto, or may issue a new share warrant or coupon in lieu of the warrant or coupon so lost or destroyed, but every person to whom any such payment or issue shall be made shall previously pay to the company all expenses connected with such issue or with the investigation of the evidence of such loss or destruction, and shall also previously give to the company such an indemnity as shall be satisfactory to the board.' (*d*) There shall be added on to article 154 the following words, namely:—'All dividends unclaimed after having been declared may be invested or otherwise made use of by the board for the benefit of the company until claimed.'"

Mr. G. A. SCHROEDER seconded the motion, which was carried unanimously.

Mr. DOUGLAS proposed a vote of thanks to the chairman, and the proceedings then closed.

NEW AKANKOO (GOLD COAST) MINING CO.

£5,000 IN RESERVE—A CHEERY OUTLOOK—THE NEXT MINING "BOOM"—WILL IT BE ON THE GOLD COAST?

AN extraordinary general meeting of the above-named company was held at Winchester House, on Wednesday, for the purpose of considering, and if deemed advisable, passing the following resolutions, with or without modification:—

That the articles of association of the company be altered in manner following:—"(*a*) The following article shall be substituted for article 17, namely, 'The directors may from time to time with the sanction of three-fourths of the holders of the preference shares present either in person or by proxy at a meeting or meetings constituted exclusively of such holders, and with the sanction of a majority of the holders of ordinary shares present either in person or by proxy at a meeting or meetings of such holders of ordinary shares, borrow for the purposes of the company any sum or sums of money not exceeding in the whole 30,000*l.*, and at such rate of interest as they may from time to time think fit.'" "(*b*) The following article shall be substituted for article 31, namely, 'The instrument of transfer of any shares in the company may be in the usual common form.'" "(*c*) In article 56 the words 'one-tenth' shall be substituted for the words 'one-fifth.'", "(*d*) The following words shall be added to article 82, namely, 'Any director interested in any contract entered into by the company shall disclose the nature of his interests therein to the board.'"

C. J. Tolputt, Esq., presided.

The notice convening the meeting was read.

A MISAPPREHENSION CORRECTED.

The CHAIRMAN: Gentlemen, you, of course, understand that this is a special meeting for the purpose of making such alterations in the articles of association as are required by the Stock Exchange committee. I am sorry to find that a most unfounded misapprehension has occurred to many of the shareholders who evidently have not carefully read the circular we sent them. They have jumped to the conclusion that this meeting is called for the purpose of enabling us to borrow money. Nothing of the sort. We have not the slightest intention, and hope will never require, to borrow any more. We have at present 5,000*l.* in reserve, and which I hope to keep in reserve. It will go very much against the grain with us if we touch it at all. The chairman then formally moved the first resolution, as above, reading at the same time the article as it originally stood.

Mr. FERGUSSON seconded the motion, which was carried.

The CHAIRMAN proposed the second resolution, which was seconded by Mr. COLEMAN and carried.

The third resolution was moved by the CHAIRMAN, seconded by Mr. FERGUSSON, and agreed to, as was also the fourth resolution, on the motion of the CHAIRMAN, seconded by Mr. COLEMAN.

PRESENT POSITION AND PROSPECTS OF THE COMPANY.

The CHAIRMAN: I may take this opportunity of adding a few words to our circular as regards the present position and prospects of the company. I am very glad indeed to say that since this circular was issued we have received much better news from the mine than we expected in so short a time. You will doubtless have seen by a telegram, which the papers were good enough to print, that we have actually commenced crushing, and have got 15 stamps to work. I was myself most agreeably surprised when I received that telegram. Mr. Henry has shown a wonderful amount of energy and activity. He has written us the most business-like letters that I ever remember receiving from the mine, giving us full details or what was wrong and what he was doing to set it right.

121 OZS. IN 10 DAYS.

The recent telegram advised you that we had 121 ozs. in the 10 days. Those, of course, are taken from the plates, as they would not have stopped the mill to clean up for 10 days. We shall not know what the actual crushing is until we get the returns. Mr. Henry says he picked up 14 ozs. of gold, which he melted into a bar, and forwarded with this shipment, which will account for the difference between 121 ozs. and 135 ozs. he says he has shipped. We have at the present moment three levels open from the shaft.

AN EXCELLENT REEF.

We have an excellent reef, and would not wish for a better one. In the report we sent you recently we have not given you our own opinions entirely. I have lately seen no less than four outside people who have visited the Akankoo Mine, and who have given me full confirmation of all our own reports as to the value of the reef. From an independent gentleman I learned what has not been mentioned in our own letters—that our last crushing of 70 tons of quartz gave 75½ ozs. of gold. We have had some difficulty in getting into what I may call systematic working out there. We have never been able to get regular monthly returns showing the work done, the number of men employed, and the yield of gold from the quartz. I hope now, however, that we shall get all that.

IMPORTANT AND CHEERING STATEMENTS.

I do not wish to be too sanguine, but I may tell you that at the present moment we are not spending more than about from 500*l.* to 600*l.* a month—or rather less than half what we used to spend and get nothing for it. We may take, I think, some little credit to ourselves for having done our best to cut down expenses in every way—(cheers)—or at any rate, to see that we get some return from them. I have made a rough calculation, and I find that we require only 400 ozs. a month to give us the interest on our preference shares, and 5 per cent. on the ordinary shares. Now, that is not a very large amount. If we can only keep 20 head of stamps by and by in full work, doing, say, 1½ tons a day—which is very moderate work for stamps—25 days running would give us 750 tons. So that between our minimum prospect—400 ozs.—and the maximum power of the stamps, we have a large margin for profit. (Cheers.) Mr. Henry, I may say, has improved our return of gold. Previously the gold only gave us a fraction over 3*l.* 10s. an oz. It is a little mixed with silver, though not much, and it is not so good as some of the gold from the mines above; but the last return gave us 3*l.* 13s. and a fraction, which shows that Mr. Henry is treating the gold better than it has been treated before. Taking the yield at 400 ozs., and calculating on the basis of 3*l.* 12s. 6d. per oz.—that would give 1,450*l.*, and, deducting 600*l.*, it would leave us 800*l.* a month margin for profit.

THE MILL.

Now, our trouble, I am afraid, will be for some little time our stamp mill. I did not feel at all happy about the foundations of those stamps, but it appears from the last letter we received that the foundations of the engines were more in fault than those of the stamps. The driving engine has been put 6 ft. further back, and placed on a good concrete foundation, which ought to have been the case with the stamps originally. The mill was originally built on a slope and the ground gave way a little and the green timber that was used for the foundation has rotted. However, from Mr. Henry telegraphing that he had got 15 head at work, we gather that these 15 are pretty safe, and it is only the five that are doubtful.

TRIBUTE TO THE LATE MANAGER.

I must say a few words with reference to the death of our very excellent manager, Mr. Ramsay, a fine young fellow who served us uncommonly well, and whose untimely death we certainly have very great reason to regret. The past season has been an exceptionally unhealthy one out there, and I am afraid his death was partly owing to the very unsuitable house he had been living in. The iron houses originally sent out were made by people who had no idea of the climate, and although they might have done exceedingly well for the Highlands of Scotland, they were utterly unsuited for Africa. He is the only European we have lost out there, and our experience of the last three years is that the climate is not so black as it is painted, so long as people will take ordinary care of themselves, and keep from drink—indeed, we prefer to engage teetotalers as far as possible. (Hear, hear.)

THE GOLD COAST LOOKING UP.

I think I may say that the prospects of the Gold Coast generally are looking up. Africa has been called a dark continent, but a great deal of light is being thrown upon it in various directions, The Congo expedition, Stanley's wonderful expedition in search of Emin Pacha, &c., have thrown, and are throwing, considerable light upon this dark continent. I always feel as if we were engaging, to a certain extent, in a pioneering expedition ourselves—seeking to introduce a little civilisation into that part of the country. The Governor of the Gold Coast has lately paid a visit to the mines, and I look for some benefit to be derived by the colony from that visit. He promised the manager of a neighbouring mine that he would send a favourable report of what he had seen home to the Government. The Essaman Company are working successfully, and the Gie Appanto Company expect to start crushing almost immediately. They are working on the same line of reef as the Essaman Company. Other concessions have been bought up by speculators, and I think when the speculative public want

ANOTHER FIELD FOR A MINING BOOM,

they will most likely select the Gold Coast of Africa. (Cheers.) The riches of this territory have been described by Burton and Cameron in their report upon the Gold Coast, which ought to be in the hands of everybody interested in African mining. They state that the total output since the year 1471 amounted to between 6,000,000*l.* and 7,000,000*l.* We know for a positive fact that the natives, although they have washed over the Gold Coast pretty carefully, have never gone down more than 120 ft. or 130 ft. They have left splendid reefs there because they could never get below water level, and all that country is left for us who have the pluck and energy to work away at it. (Cheers.) We shall close our accounts to the 30th April, and I hope sincerely that we shall start from the 1st May with regular monthly returns. We have been waiting for them a long time, but I think now we see our way to getting them. (Applause.)

A VIRGIN MINE.

COL. LE CHAMPION corroborated the chairman's statement as to the richness of the Gold Coast. Notwithstanding the enormous yield of gold produced by this mine, it was still a virgin mine, as the natives could never work below about 120 ft. on account of the water. He thought they should continue the main shaft at present, because they had a fair amount of capital behind them, and from inquiries he had made he thought they might make a good gold-bearing shaft out of the present shaft.

After a few remarks from Major LANGLEY and Mr. JAMES the meeting closed with a vote of thanks to the chairman.

THE UNITED STATES GOLD PLACERS, LIMITED.

ALL THE SHARES WILL BE TAKEN—ANXIETY FOR SURPLUS ALLOTMENTS—A PROPERTY TO LAST.

AN extraordinary general meeting of the members was held at the Great Eastern Hotel, Bishopsgate Street. on Monday, for the purpose of confirming the following special resolution, passed at the extraordinary general meeting of the company, held on the 24th day of April, 1889:—

"That the United States Gold Placers, Limited, be re-constructed under section 161 of the Companies Acts, 1862, by the transfer of its property and assets and liabilities as a going concern to a new company intended to be formed (the draft of whose memorandum and articles of association is now submitted and signed by the chairman of this meeting for the purpose of identification) upon the terms set forth in a draft agreement to be made between the liquidator of the United States Gold Placers, Limited, of the first part, the said United States Gold Placers, Limited, of the second part. and the new company of the third part (the draft being also signed by the chairman of the meeting for the purpose of identification), and that the liquidator be, and he is hereby authorised to enter into an agreement in accordance with such draft, or as near thereto as may be."

THOMAS GILBERT, Esq., chairman of the company, presided.

Mr. WILLIAM SCOTT (liquidator) read the notice calling the meeting.

GREAT RESULTS ANTICIPATED BY THE END OF THE YEAR.

The CHAIRMAN: Gentlemen, this is simply a formal meeting for confirming the resolution passed on the 24th of April, and it will need very few words from me before I put it to the meeting. I had expected to have received a letter to-day from Mr. Madden with a further report, but the mail has not arrived. It may come to-morrow, and as soon as I receive it I shall send it out to all the shareholders. I hope to have some really good news, and now that the company is so far established I have not the slightest doubt in the world (we have all very large interests in the matter) that we shall have very great results this year, and at its close we shall meet in very much better form than we do now. I propose to have a meeting before the year is out, and that in future we shall have our meetings regularly and our reports monthly, so that whatever is to be known about the company will be known by you all. That being so I think we may look forward this year not only to everything being done in a perfectly business-like way, but done in such a manner as will give satisfaction to every shareholder. We have, as you know, passed through a period of very great trouble and anxiety during the last year or two, but I hope a similar period will not be experienced by us again. That is a matter of the past, and I will not enlarge upon it. I believe that matters are now upon a right basis, and that we shall go on to very great prosperity. I beg to move the confirmation of the resolution which you have heard read. (Cheers.)

A SHAREHOLDER: I beg to second the motion.

The CHAIRMAN put the motion to the meeting, and it was carried unanimously.

The CHAIRMAN: I think that is really all our business. You see exactly where we are. The feeling of the shareholders generally, and their hearty sympathies, were with us at the last meeting, but since then the proxies that have been sent to us are half as many again as I had had at that meeting, and the letters I have received from country shareholders I could not read to you because their contents are so complimentary that I should blush. (Cheers and laughter.) More satisfactory letters I could not possibly receive from gentlemen I have never seen, and it is very encouraging to find that one's efforts, be they small or be they great, are welcomed in such a way by men to whom one is quite unknown. (Cheers.) I am convinced that what I may truly call the enthusiasm with which the country shareholders have taken to this re-construction scheme proves beyond all doubt to my mind that they are as convinced as I am, that we have here a very valuable property—a property which is undoubtedly rich in gold, a property which must, if economically worked, pay very large dividends, and a property not to be developed for one year, but for years.

A PROPERTY TO LAST.

In fact, the high bar we have, as shown by the very able speech which Mr. Deacon delivered at the last meeting, will last for 10 years. If it takes 10 years to work out the bar, I think we may congratulate ourselves, one and all, that we have a property unequalled on the markets of this country. It has been stated again and again that our placers are unequalled in America, that there is perhaps no such property in America, and that, though possibly it may be equalled, there is none better than the placers on the San Miguel River. I will not go into past matters; suffice it to say we have started the ship afresh, and it is bound for the good port of dividends. (Cheers.) The directors who will now manage the company's affairs will represent with their own holdings and that of their friends over 50,000 or 60,000 shares.

The SOLICITOR (Mr. Chave): 61,000.

The CHAIRMAN: They will represent with themselves and their friends shares to the extent of 61,000, and if it is not good enough for shareholders to entrust the business of their company to men like that, I do not know what is. Gentlemen, I thank you all for your attendance, and I hope that at our next meeting we shall be in better spirits than we are now.

GOOD STEERSMAN AND CREW.

Mr. WILSON: Before we part, I beg to propose a cordial vote of thanks to the chairman. He mentioned just now that he was capable of blushing, and I am glad of that, because it is rarely indeed that the chairman of a public company has so much modesty left. (Cheers and laughter.) We have, as directors, a thoroughly practical body of working men who are guiding the ship, and in the chairman we have a steersman fully capable of directing its prow to the port to which he made reference. (Cheers).

Mr. LAKEMAN seconded the motion, which was carried by acclamation.

A SHAREHOLDER: When do you propose to send out the forms of application?

Mr. SCOTT: To-morrow morning.

ALL THE SHARES WILL BE TAKEN.

The CHAIRMAN: I might mention that I have letters from shareholders expressing their willingness, and even anxiety, to absorb all the shares that may not be taken up in the ordinary way. Some want 300 or 400 more shares than they have already, or are actually entitled to. I thank you very much for your kindness. Mr. Scott has reminded me that we have applications from gentlemen who are not shareholders in this company, but those applications will not be dealt with until after every shareholder has had the chance of taking the shares that may be left. I may say that as far as applications go I could place the whole of the shares with the outside public, but every shareholder shall have the prior opportunity. (Cheers.)

A SHAREHOLDER: How many are applied for by shareholders? I myself have received applications for over 5,000 shares from friends.

The CHAIRMAN: Our application forms have not yet gone out. I do not think there will be so many as 5,000 shares unapplied for. I had hoped there would be, because I want to get as many as I can myself. (Cheers.)

The proceedings then closed.

THE VAAL RIVER DIAMOND CO., LIMITED.

CAPITAL FULLY SUBSCRIBED—£20,000 FOR WORKING CAPITAL—OPERATIONS PROCEEDING.

THE statutory meeting was held at Winchester House, on Monday, for the purpose of complying with the requirements of the Companies Act, 1862—the Right Hon. Sir Edward Thornton, chairman of the company, presided.

Mr. WM. CURTIS-THOMPSON (secretary) read the notice convening the meeting.

POSITION OF THE COMPANY EXPLAINED.

The CHAIRMAN said: You are aware, gentlemen, that this meeting is purely formal, and has been called solely for the purpose of complying with the requirements of the Companies Acts, 1862 to 1863. The Vaal River Diamond Company, Limited, was registered on the 18th of January, 1889. Of the nominal capital of 50,000*l*., 42,500*l*. were offered for public subscription. By the terms of their contract the vendors received 7,500*l*. in fully paid shares, and 22,500*l*. was payable to them in cash. There thus remained to the company 20,000*l*. for working capital. The company consists of 355 shareholders, of whom 334 are public shareholders, and 21 are holders of vendors' shares. A few legal difficulties had to be overcome at Cape Town with regard to the transfer of the claims and farms, and thus the completion of the purchase was not effected till the 15th of March last. From that date the properties have been legally invested in the company, but of course until then no arrangements or preparations for working the mines could be made. Now, however, Mr. Williams, who resides on the property, has been appointed general manager of the mines. A mining manager has also been appointed, Mr. Norman O. Craig. The latter has entered the company's service with the highest credentials. Your directors have also full confidence that Mr. Williams will prove invaluable as general manager, for he is familiar with the workings, and has resided on the spot for many years past. Mr. T. J. Anderson is acting as managing director at the Cape, and has already given proof of his energy and zeal on behalf of the enterprise. Betwen 50 and 60 Kaffirs have been put on the ground to prepare floors, remove *débris*, and generally to make ready for active work, so that in fact operations have already commenced. Indeed it is expected that everything will be in full working order about the end of next month. Mr. Anderson has succeeded in purchasing in the neighbourhood of the mines, on very advantageous terms, the machinery and plant which will be necessary for immediate use, and he hopes to be able to obtain any further articles, which experience may prove to be requisite. This course is entirely approved by the company's consulting engineer, who is well acquainted with the resources of those countries, and has convinced your directors that by this means considerable economy will be effected not only in money but in time.

A SHAREHOLDER UNDER A MISTAKE.

Mr. COOPER: May I ask when you received that news from Cape Town?

The CHAIRMAN: The report is my own statement. It did not come from Cape Town at all. (Laughter.)

Mr. COOPER: The property was given over in March. What was being done between March and April?

The CHAIRMAN: Orders were sent to begin work.

Mr. COOPER: Could not that have been done before?

The CHAIRMAN: We could not begin to work until the property was ours. (Laughter.)

A SHAREHOLDER: The statement of the chairman was, to my mind, most satisfactory.

A SHAREHOLDER: Was all the capital subscribed?

Mr. SEARLE (director): Considerably over-subscribed. (Hear, hear.)

THE SPECIAL MEETING.

An extraordinary general meeting of the company was next held for the purpose of considering, and if approved of, passing the following resolution:—

"That the articles of association of the company shall be, and the same are hereby altered in manner following, that is to say: That the words 'Every director of the company appointed under the last preceding clause shall within six months after his appointment' in the 61st clause of the articles, be cancelled, and the following words substituted in lieu thereof: 'Every director of the company appointed under the last preceding clause shall within one month of the incorporation of the company.'"

NO QUOTATION.

The CHAIRMAN, in moving the resolution, explained that the alterations were principally required to get a settlement which had

been promised. A quotation they could not get, because the capital was too small.

Mr. J. S. PRINCE seconded the motion, which was agreed to, and the meeting ended.

THE NORTHWICH SALT CO.

OPPOSITION AT THE FIRST OVERCOME BY PROVED RESULTS—THE PROPERTY NEAR THE RAILWAY AND CANAL—THE SALT UNION'S SUCCESS IS ALSO THE NORTHWICH COMPANY'S SUCCESS.

THE statutory meeting of this company was held on Wednesday last at the Cannon Street Hotel—Mr. Edward Lloyd Clarke presided.

The SECRETARY (Mr. Atkinson) having read the notice convening the meeting,

The CHAIRMAN said: Ladies and gentlemen, as doubtless you are all aware this meeting is more of a formal character than otherwise. It is called in compliance with the Act of Parliament which requires that a meeting shall be held within four months within the date of registration. As, however, only three months have elapsed since the formation of the company, you will agree we are well within the limit of the Act. I am very proud to have the opportunity thus early of congratulating you personally upon the success of the valuable property you have at Northwich.

AT AN EARLY STAGE

—a very early stage—in our history we had adverse opinions to contend with. Those opinions were freely promulgated in the neighbourhood of Northwich, no doubt many of them being circulated from interested motives. But, further, facts are stronger than opinions. Facts are stubborn things, and it is facts that we are going to bring before you to-day. I am happy to say that at a very early stage of our proceedings we were able to contradict those opinions and statements in the best possible manner, and that was by the discovery of a very strong and copious find of brine. When we got down to 126 ft. traces of brine became apparent; a few feet lower down a gush took place, and immediately rose 80 ft. in the bore. Afterwards we decided to go lower still, and the brine rose with increased vigour, until it appeared like a fountain, a proceeding which has not taken place in the neighbourhood of Northwich for some considerable time.

STRENGTH OF THE BRINE.

This brine was tested by the eminent contractor, Mr. Tummins, and it gave the full test of 2 lbs. 10 or 11 ozs. to the gallon, which was considered very satisfactory, and from calculations, careful calculation made by him, he found that the pressure was 100 lbs. to the square ft., showing an abundant supply. He also proved clearly that it was not merely a local find, but from the density and strength of the brine it evidently had travelled over a great space of salt rock, and the height to which the brine rose, and continued to rise, gave the enormous pressure which I have mentioned, and which is all we so far wish to know. But in order to fully test the value of your property, the directors deem it a judicious expense to go down still further before providing for the necessary works and plant, in case salt rock should be found as well as brine. This we did. One went down a matter of 60 or 70 ft. lower in hard rock, still expecting traces of salt, and then came upon pure crystal. We have penetrated the rock to a depth of between 60 ft. and 70 ft., and that was considered ample for all possible requirements.

A PRACTICALLY INEXHAUSTIBLE SUPPLY.

And now we are pleased to be able to inform you, ladies and gentlemen, that, in addition to the rateable fund of brine, which is practically inexhaustible, we hold undisputed proof that the property has the richest bed of salt rock, not only in the centre of Cheshire, but, I may say, the richest deposits in the world. We then pushed on with the works. We have got the first set of the works in an advanced state. We are employing a number of men, some 60 or 70 navvies, besides artisans, and we have the foundations all laid. The shaft is in course of construction, the necessary out-houses, engine houses, and various offices are also in course of construction. Then, too, the railway siding on the Cheshire line we have acquired on very moderate terms. We have also secured the wharf on the canal, where we are now landing stuff from the works. It is my great pleasure to inform you further that very shortly indeed we shall have the line running completely around the works, thus affording every facility for transit for export trade as well as the inland trade.

THE MANCHESTER SHIP CANAL.

The Trent and Mersey Canal, which runs along our wharf, is supposed to be very shortly in direct communication, or will be, with the Manchester Canal, fourteen miles distant, at Warmington. We anticipate one port of call, thus giving us a decided advantage even over the Weaver transit down at Liverpool, which has been used up to now by the salt trade of Cheshire. I shall be very pleased not only to afford the fullest information, but answer any question which any of you may be pleased to put. In addition to the salt of brine, we have the good luck to possess a very plastic bed of clay. The ground is also free from gravel and easily worked. We have already the matter of brick-yards, and we anticipate making the greatest part of our bricks on the premises. The excavation for works which are to be made will dispose of the clay and the brick-yards combined, and will be killing two birds with one stone in our progress. (Hear, hear.) We have already, as I say, two yards in full work, and we hope of saving from 13s. to 14s. per 1,000 bricks. So far, we have been handicapped in getting bricks. There is a great demand for bricks at Northwich, and the cartage is heavy. We shall save, in addition, 5s. in cartage.

EARLY COMMENCEMENT OF OPERATIONS EXPECTED.

We anticipate the first set of works will be in full operation in from three weeks to a month, and some very eminent and scientific experts distinctly affirm that we cannot fail to declare a good dividend, which I need hardly add, will be our great aim to secure for you. (Applause.)

Mr. FROME asked the chairman if he could give any information as to the strength of the brine. Was there any doubt as to it being of the full strength?

The CHAIRMAN: I am pleased to be able to answer that question in a very summary manner. The brine has been tested repeatedly by Mr. Tummins, and he found on the first test that it gave 2 lbs. 10 ozs. to the gallon. The average of the brine in the Northwich district is from 2 lbs. 7 ozs. to 2 lbs. 9 ozs. It is very rarely above 2 lbs. 9 ozs. Subsequently we had our brine tested, and he, Mr. Tummins, gave the result at 2 lbs. 11 ozs. to the gallon.

RAILWAY FACILITIES.

Mr. FROME: In the prospectus it was stated that the railway ran alongside the Cheshire Railway, and that the company would be able to send this salt direct to the Cheshire line. Since the issue of the prospectus it has been stated that this is not the case, and that there is a piece of ground which would entirely prevent that statement being realised. Will you, sir, give us some explanation upon the subject?

The CHAIRMAN: I am pleased to be able to answer the meeting satisfactorily upon that head. The misapprehension has arose through a printer's error. With the aid of this map I can explain, perhaps, the facts. From this you will see that we are in direct communication with the Cheshire line. Instead, however, of having a double line we have decided to have a single line.

Mr. BROWN: I should like to know how soon we shall be able to supply salt to the market.

The CHAIRMAN: We anticipate, unless some breakage or mishap occurs, to have one set of pans at work within three weeks or a month. Within a month, therefore, we hope to have our salt ready for sale.

Mr. BROWN: You say a month?

The CHAIRMAN: Yes, a month unless anything unforeseen occurs.

APPLICATIONS FROM LARGE FIRMS FOR 1,000 TO 1,200 TONS OF SALT MONTHLY.

Mr. HUDSON: In the prospectus it was stated that some of the largest firms in the salt trade would take 1,000 tons of salt from our company; I wish to know if that has been confirmed?

The CHAIRMAN: I have had personal application from one of the firms in question. It is one of the largest firms in Manchester, and I had an offer to this effect—that if we were in a position to supply them they would take from 1,000 to 1,200 tons a month, and the order could be increased.

In reply to Mr. AUSTIN,

The CHAIRMAN said the firm he had mentioned were not only dealers in rock salt, but they were also dealers in different kinds of manufactured salt. Not being in a position to accept the contract the board did not go into details.

Mr. HUDSON asked if the directors still had every confidence in the company's property?

The CHAIRMAN; I have great pleasure in answering that question. I have the fullest confidence in the value of the company's property.

Mr. HUDSON: And that it will bear out the hope expressed in the prospectus?

The CHAIRMAN: The property has been pronounced by Mr. Tummins to be of incalculable value.

Mr. W. HUDSON: Then all the hopes raised in the prospectus will be carried out?

HANDSOME DIVIDENDS.

The CHAIRMAN: Yes, we may confidently anticipate the realisation of very handsome dividends.

A SHAREHOLDER said he should like to know whether the directors intended to run amicably, as regards the price of salt, with the Salt Union, or whether they intended to cut against it, with the object of bringing down the price of salt.

The CHAIRMAN: As regards that question, I am entirely in the hands of my colleagues. We do not wish to cut the salt trade down, but we want our share of the business, and the Salt Union's success is, I may say, our success. We must not forget that we are following upon the heels of the Salt Union. That union has secured a practical monopoly. Your question I must decline to answer in full. The subject will have full deliberation, but you may depend upon this—that we shall be pleased to do our best for the interests of the shareholders.

THE SALT UNION.

Mr. HUDSON: Has any approach been made to the Salt Union?

The CHAIRMAN: You are giving me a rather difficult question to answer. You must allow me to parry it, and say that whatever we do will only be done after mature and careful consideration. If there are no further questions, all I have to do is to thank you for your attendance, and to repeat the pleasure I have in meeting and personally congratulating you upon the success which has already attended our efforts, and the bright prospects we have in the future.

THANKS.

Mr. HUDSON proposed a vote of thanks.

Mr. FROME said: I am sure it has been a great pleasure for me to hear such a satisfactory account of the company's work. It is quite clear that we have got over the initial difficulties, and I hope next time we meet we shall hear something very satisfactory in regard to a dividend. I have much pleasure in seconding the resolution proposed by Mr. Hudson.

The resolution was unanimously passed, and, the CHAIRMAN having briefly acknowledged the compliment, the proceedings terminated.

THE HOPCRAFT FURNACE COMPANY, LIMITED.—The letters of allotment and regret in the Hopcraft Furnace Company have all been posted. The issue has been a great success, several thousands of separate applications for shares having been received.

HOLLOWAY'S PILLS AND OINTMENT.—Travellers to and from distant climes would do well to bear in mind that these changes and the altered diet and surroundings of their lives entail manifold risks to health. Occasions are sure to arise in which they will need a remedy such as these renowned Pills and Ointment, and no traveller by land or sea should ever fail to have a supply at hand. Then he may truly be said to have a physician always at his call for the various emergencies of travel. Chills and fevers should be promptly treated, and the printed directions should be carefully studied at the commencement of any illness, for Holloway's remedies can be safely used in all climates.

THE AVALA QUICKSILVER MINES, LIMITED.

(Continued from following page.)

of the Company's properties. As during development the average ore has actually yielded 1 5-10 per cent. of quicksilver, and as the price of quicksilver has been taken much below the actual market price, there is a very large margin of safety on the above calculation.

Chief Councillor and General Director Bilharz, who had himself visited and examined the mine some time since, in his endorsement of Herr Fisher's report, writes: "As to the calculations showing the supply of ore-yielding returns, I am pleased to see that you proceeded with an exceptional scrupulousness, which cannot often be found in similar reports, and which ought to be all the more a guarantee for the buyer, that the profits showu in the estimates will be realised with the greatest certainty,"

Herr Fischer says: "I consider Avala a splendid property in its mining wealth, with a great future, and certain, with development, as sketched by me in my report, to return lucrative profits to the shareholders.

Herr Hofmann concludes his report as follows: "There can be no question that a most profitable future is in store for the Avala Mine."

Herr S. Gikits, mining engineer to the Servian Government, says: "The development of the mine will ensure, with the greatest certainty, large yearly profits, increasing in proportion to the extent of the capital invested in the working."

The board have had the advantage of a report by Mr. Alfred Davy late of Davy Brothers (Limited), the well-known consulting engineer, of Sheffield. who visited and inspected the Avala Mines in February last before he agreed to join the board. Mr. Cardinall, another of the directors, has also visited the property within the last few weeks, accompanied by Mr. P. Coulson Bunn, mining engineer, of London, who has been at the Almaden Mines in Spain, and is familiar with quicksilver working. They state that they were highly impressed with and satisfied of its value, and Mr. Bunn, in his report to the directors, says he believes "the Avala will yield splendid profits, and develope into one of the finest quicksilver miues in the world."

On the property at "Suce" a vein of galena, rich in silver (and which has also been found to carry gold), has been opened by a tunnel, driven 50 ft. across the strike. 12 ft. from the mouth of this tunnel a shaft has been sunk to a depth of 10 ft. the bottom being in ore, from which samples were taken, which have been assayed by Messrs. Johnson, Matthey, and Co., with the following results:—

	Gold.			Silver.			Lead.		
	ozs.	dwts.	grs.	ozs.	dwts.	grs.			
A.....	6	12	0	69	5	0	42·5 per cent.	}	per ton of 2,240 lbs. of ore.
B.....	3	12	0	115	10	0	62.5 „		
C.....	0	2	0	90	10	0	50 „		

Other assays have been made and the dressed galena has been found to contaiu as much as 140 ozs. of silver per ton.

Herr Bilharz, having himself taken from the "Suce" property large samples of ore and had them assayed at Freiberg, states that the Freiberg establishment would buy the ore at £31 10s. per ton.

The bulk of the quartz found in the property carries nickel and cobalt, both of which are valuable.

These great mining properties, with everything to hand favourable to mining—cheap labour, very easy carriage, ample wood and water—have, in the opinion of the directors, a great future before them. The Company will themselves work the Avala Quicksilver Mines, and test and develop the rest of the property, and then sell or let to sub-companies.

The property held under the lease, together with the surface, can this year be acquired by the Company under the Servian mining laws as freehold, in perpetuity, and that held under the grant can be acquired after five years also as freehold in perpetuity.

The Government taxes are small (9s. 6d. yearly for every 100,000 square metres of mining ground, and 1 per cent. of the produce), and all machinery and materials used for the mines or works are exempted from import duty, and there is no export duty on the produce.

The price, as asked by the vendors, for the whole of the properties, is £130,680, of which £24,000 will be taken in fully-paid shares, and the balance in cash.

The contract of purchase is dated 19th March, 1889, and made between Georg Weifert, Stojan Markovitsch, Ljubomir Kleritj, and Sima M. Losanitsch, the vendors (the first two of whom will join the board after allotment), of the one part, and Charles Stevens, as trustee on behalf of the Company, of the other part.

Mr. Christmas, who acted as solicitor for the vendors in the preparation of the contracts of sale to the Company, will join the board after allotment and adoption of the contract by the Company, at the request of and as representative of the vendors.

The vendors will provide all the preliminary expenses of the formation and bringing out of the Company, and the issue of its capital, and they have reserved to themselves the right to enter into, and have entered into, contracts and agreements with third parties for this purpose, and for guaranteeing the subscription of part of the capital of the Company, and for payment to them out of the purchase-money, and there are also other agreements between part owners and parties interested in the property and the purchase-money to none of which the company is party. As these contracts and arrangements may, technically, be contracts within the meaniug of section 38 of the Companies' Act, 1867, applicants for shares shall accept the above as notice thereof, and waive any fuller compliance with such section with reference thereto.

The memorandum and articles of association, the agreement of purchase, the various reports on the property and relative plans and maps, and all the other documents referred to in this prospectus, may be seen at the offices of the company.

Applications for shares should be made on the form accompanying the prospectus, and forwarded to the bankers of the company, together with the amount payable on application.

Where no allotment is made the deposit will be returned in full, and where the number of shares allotted is less than that applied for the surplus will be credited to the payment due on allotment.

Prospectuses and forms of application for shares can be had from the bankers, the brokers, and at the offices of the compauy.

SECRETARY AND OFFICES (*pro tem.*).

GEORGE PHILLPOTT, Esq., 79½, GRACECHURCH STREET, E.C.

THIS Company has been formed to purchase the Avala Quicksilver Mines and Reduction Works, and the mining rights over about 8,500 acres (13½ square miles), situated in the heart of the famous ore-producing zone of Mount Avala, about 15 miles from Belgrade, the capital of Servia, and within 2 miles of the Ripanji Station on the main line of the Servian State Railway.

The properties, which adjoin, are held under two titles from the Servian Government. The first property, in which the Avala Quicksilver Mines are situated, extends over about 1,036 acres (upwards of 1½ square miles), and is held under a lease for 50 years, from July, 1884. The other property is held under a grant, which gives the exclusive right during five years, from November last, to prospect, mine, and work quicksilver, galena, and all other minerals over about 7,500 acres, or 12 square miles. The company has the right to convert this grant into a lease for 50 years.

Reduction works, capable of producing 40 flasks of quicksilver per week, were erected for the purpose of practically proving the property, on a freehold site of about 5 acres, distant 800 yds. from the railway station. They will now be enlarged with shaft furnaces of the latest and most approved construction, to enable the works to turn out about 10 times the present production.

The lease and grant both carry with them the right to the use, free of charge, of timber and water belonging to the State, the supply of which is ample for all mining purposes.

Since the year 1885 the vendors have carried on extensive mining explorations, with most satisfactory results. Last year the reduction works were completed, since which time about 700 flasks (53,500 lbs.) of quicksilver have been produced, which have fetched in Vienna and London the highest market price. Messrs. James and Shakespeare, the metal brokers, have sold the last 200 flasks, and report that this quicksilver is equal to Spanish and commands an equivalent price.

Very favourable reports, in great detail, have been made by Dr. V. Groddeck, director of the famous Mining Academy of Clausthal; by Prof. Kleritj, of the University of Belgrade; by Mr. L. R. Nettre, an experienced Californian mining expert; and twice (in 1885 and 1888) by Herr Raphael Hofmann, mining engineer of Vienna, who was recommended to the directors by Herr Ritter von Friese, chief of the Austrian Government Mining Department, Vienna, and Herr Böckh, chief of the Hungarian Government Mining Department, Buda-Pest.

The reports above-mentioned, and also a report by Mons. Pierre David, a French mining engineer, were submitted in January last to Herr Heinrich Fischer, mining engineer to the Government of Saxony, and assistant managing director of the renowned Freiberg mining establishment, with a request that he would examine and report on the whole property to be acquired by the company, with the advantage of all the previous reports before him. Associated with Herr Fischer in his examination was Herr S. Gikits, mining engineer to the Servian Government.

Herr Fischer's report (with Herr Gikits's endorsement) is most favourable, and the report was submitted to and approved by Herr Fischer's superior, Herr Oscar Bilharz, chief councillor and general mining director to the Government of Saxony, and head of the Freiberg Mining College, and formerly managing director of the great Veuil Montagne Works, in Belgium. Herr Bilharz has, in fact, an European reputation, and his opinion is entitled to the utmost confidence.

All these reports and the relative maps and plans can be seen at the Company's offices. A may of the properties and a plan of the workings of the Avala mines, showing the present developments, accompany the prospectus.

In the Avala Mines, at the point known as "Schuplja Stena," the lode has been opened by a shaft, the bottom of which is 325 ft. below the outcrop, and by two adits, "Jerina," 790 ft. in length, and "Erbstolln," 2,600 ft. in length. Through this latter adit, which drains the mine to the surface, the ore is extracted and delivered at the mouth of the tunnel, thus avoiding all expenses of hoisting and pumping. The lode at this point has been opened by various levels and crosscuts, which, with the adits, measure about 12,000 ft. in length. Between the above-mentioned adits there is exposed a body of cinnabar or quicksilver ore, which can be extracted and treated at once, measuring 164 ft. in width, 196 ft. in depth, and 96 ft. in length along the course of the body of the ore, which has been proved by borings for 2,460 ft.

The body of ore exposed, which the company will immediately proceed to work, is calculated by Herr Hofmann at 87,750 tons, and to yield quicksilver of the value of £327,000. This yield will steadily grow with the working from the present length of 96 ft. along the lode to its extent of 2,460 ft., and assures a constant and almost inexhaustible supply of ore.

At "Rupine," about 1,200 ft. south of Schuplja Stena, a second lode has been opened by a tunnel 500 ft. long, and developments thus far made give rich indications of cinnabar ore of continuous character.

At "Mala Stena," about 1,200 ft. further south, there is the outcrop of a third lode of quartz, carrying cinnabar.

At "Ripa-Dragnschitza" there is a cinnabar lode which dips to the north, traversing about 5,700 ft. of the Company's property. The end of this lode to the south, just outside the Company's property, has been opened, and proved to contain rich ore.

At "Suce," in that portion of the Company's property held under the grant, indications of cinnabar ore have already been discovered in the outcrop.

During the development of the Avala Mines it has been proved by actual workings that the average cinnabar ore has yielded about 1 5-10 per cent. in quicksilver, and all the experts agree that as the workings get deeper the ore will increase in richness. In the oldest and best known quicksilver mines in the world, at "Idria," cinnabar ore yielding only 7-10 per cent. is worked with success, and the New Almaden Mines in California work at a profit cinnabar ore yielding only 5-10 per cent. When these are compared with the ore of the Avala Quicksilver Mines, yielding, even from the upper workings, about 1 5-10 per cent., it will be seen that the Company acquires a property of great value, which, judging from the experience of the famous quicksilver mines of the world, is likely to last for centuries.

Specimens of cinnabar ore, taken personally from the mine in July last by Mr. St. John, H.M. Minister at Belgrade, and forwarded by him to London to the Commercial Department of the Foreign Office, have been assayed by Messrs. Johnson, Matthey, and Co., of Hatton Garden, with the following results:—

No. 1	yielded	10.0	per cent.	quicksilver.
No. 2	„	20.3	„	„
No. 3	„	30.2	„	„
No. 4	„	76.8	„	„

These specimens were of course selected, but the results are extremely valuable as indicating the exceptional richness of the deposit in certain portions of the lode.

Herr Fischer, who, of all the experts, has made the most cautious estimate of the Avala Mines, calculates the ore exposed as being of the value of £222,240, taking the yield of quicksilver at only 1 2-10 per cent. and the price at only £6 per flask—the actual price per flask recently obtained by the Company being £8 7s. 6d. With a production, upon the completion of the proposed extension of the reduction works, of 300 flasks of quicksilver per week, and taking quicksilver at the average price per flask for the last ten years—6*l.* 17s. 6d.—and after deduction of a very high estimate for cost of production, the net profit would be over £50,000 per annum, without taking into account any profit to arise from any other part

* Will join the Board after allotment.

THIS Company is formed for the purpose of acquiring the property and business of the well-known and prosperous breweries, carried on by the Bauernschmidt and Marr Brewing Company at Baltimore, Maryland, United States of America.

The property is erected on a site of about three acres in a most desirable position, contiguous to the railways, and in close proximity to water frontage.

The sales of the Breweries have steadily increased year by year since 1880 to the extent of several thousand barrels in each year, the actual sales for the year 1887 being 39,634 barrels, and for 1888 being 43,732 barrels—together 83,366 barrels—the net profit for the two years ending March, 1889, being at the rate of over £19,500 per annum.

The population of the City of Baltimore, which is situated about midway between Washington, the capital of the United States, and Philadelphia, the second largest city in America, now exceeds 600,000, and is rapidly growing, and the consumption of Beer, especially Lager Beer of this Brewery, is increasing at a great rate, it being a well-known fact that Beer is rapidly becoming the national drink in the United States.

During the past year, in consequence of the rapid growth of the business, a modern Brew House has been erected, in addition to the existing plant, from which it is completely isolated by a distance of about 50 feet, thus forming a building separate and distinct, and operated independently of the old Brewery. This new Brew House will be in operation in the present month, equipped with every modern improvement, including ice machines and ice house, so that the brewing may be carried on at the minimum of cost with the highest efficiency.

The capacity of the new Brewery will be about 125,000 barrels per annum, which will increase the present capacity more than three-fold, and a very large increase of profit must therefore arise from the great extension of the business without the expenditure of any further capital.

Taking, however, only the actual average net profit made for the two years ending March, 1889, viz., £19,500 per annum, the following is the result :—

Profit		£19,500
Debenture interest at 6 per cent. on £50,000 ...	£3,000	
Dividend on preference shares at 8 per cent. on £70,000	5,600	
		8,600
		£10,900

equal to a dividend of over 13 per cent. on the ordinary shares, after providing a yearly sum of £1,800 for the estimated expenses of management, and it is anticipated that within two or three years at most, by the extension of the business, and with the increased facilities and capacity of the new Brewery, the profits will be more than doubled, and that the dividend on the ordinary shares will not be less than 25 per cent.

American Lager Beer Breweries possess great advantages over others, as Lager beer is very suitable to the climate, and there is the special advantage applying to Baltimore, that it has a very large German population, with whom Lager beer is, as is well known, the favourite drink.

As the Company acquires the whole of the stock-in-trade and book-debts of the business free of liabilities, no working capital is necessary, but the directors have by way of precaution made provision in the capital for a sum of £10,000, in case it should be required.

The successful issue in London of the various American Brewery Companies, on the boards of most of which are well-known and experienced English brewers, and the prices at which these securities are quoted on the Stock Exchange, show the high estimation in which American brewery investments are held.

The foregoing figures as to outputs and profits are derived from statements furnished by the vendor, as to the correctness of which the directors have every confidence, but it is stipulated in the contract of purchase that the purchase shall not be completed, and no money will be paid until the auditors of the Company (Messrs. J. R. Ellerman and Co., of Moorgate Street, London), who have had large experience in brewery accounts and audits, have reported thereon to the satisfaction of the directors. Mr. Ellerman is now on his way to Baltimore for this purpose.

The price, as fixed by the vendor, to be paid for the entire brewery and new Brew House and extension, and all premises and buildings connected therewith, and including machinery, plant, horses, waggons, stock-in-trade, book debts, and goodwill, is £180,000, payable as to £50,000 in Six-per-Cent. Mortgage Debentures of the Company, £25,000 in Preference Shares, £15,000 in Ordinary Shares of the Company, and the balance in cash. The Company does not take over any liabilities.

The Brewery premises are held under lease expiring in the year 1900 at a ground rent of 250*l.* per annum, with the right, at the expiration of the lease, to purchase the freehold for $20,000 (4,125*l.*).

The following contract has been entered into, viz., a contract, dated the 20th day of May, 1889, made between Jesse Warren Lilienthal, of the one part, and William Alfred Chalmers, as trustee for the Company, of the other part, reciting a contract, dated the 11th day of May, 1889, between the Bauernschmidt and Marr Brewing Company, of the one part, and the said Jesse Warren Lilienthal, of the other part.

The vendor will provide all the preliminary expenses of the formation and bringing out of the Company, and the issue of its capital, and he has reserved to himself the right to enter into, and has entered into contracts and arrangements with third parties for this purpose, and for payment to them out of the purchase money, and there are also various trade contracts and also other arrangements between part owners and parties interested in the property and the purchase-money, to none of which the Company is party. As these contracts and arrangements may technically be contracts within the meaning of section 38 of the Companies' Act, 1867, applicants for shares shall accept the above as notice thereof, and waive any fuller compliance with such section with reference thereto.

Copies of the memorandum and articles of association, the agreements and documents above referred to, and the detailed statements of output and profits, may be seen at the offices of the Company.

Applications for the preference and ordinary shares should be made on the form accompanying the prospectus, and forwarded to the bankers of the Company, together with the amount payable on application. Where no allotment is made the deposit will be returned in full, and where the number of shares allotted is less than that applied for, the surplus will be credited to the payment due on allotment.

Prospectuses and forms of application can be had from the Company's bankers and brokers, and at the offices of the Company.

TELEGRAPHIC ADDRESS—

QUINLAND—LONDON.

THE MINING MARKET.

CITY, FRIDAY EVENING.

THE NEW MINING EXCHANGE—IMPROVEMENT IN SOUTH AFRICAN MINES—DIAMOND SHARES BETTER—STRANGE DULNESS IN INDIAN SHARES—RIO TINTOS FIRMER—MISCELLANEOUS FOREIGN SHARES DULL AND OFFERED—TIN SHARES BETTER.

THE feature of the week has been a negative one—stagnation. Buyers have not put in an appearance, and the "bears" have had it all their own way. There has been a general complaint of want of business, but a slight distraction has been afforded by the opening of the New Mining Exchange, which was successfully inaugurated at mid-day yesterday. The door was opened with a golden key, and let us hope that it is symbolical of the good fortune that may attend its 51 members. We hear that to-day there have been several fresh applications for membership, and also for copies of the rules and bye-laws. If the members of the mining fraternity hang together (of course we mean it metaphorically) the Mining Exchange will be a success, and if they do not they will illustrate the truth of the old saying—that the strength of a chain is only to be measured by its weakest link. We give in detail all the circumstances connected with the happy auspices under which the New Exchange was so successfully opened.

There has been a decided improvement in South African shares, the rise in several cases being substantial. The general feeling about them is that this improvement will be still further accentuated in the coming week.

Diamond shares have also risen—of course in sympathy with gold concerns hailing from the same Continent.

The dulness of the Indian market has been the theme of general comment. The facts we published last week were most striking, and the apathy of the public in not seizing the splendid opportunity afforded them of investing money in this field appears to us to be inscrutable.

Copper shares have been decidedly better. Rio Tintos on the week show a substantial rise. Copper itself is firmer, and it is hoped that we now know the worst. The present stocks, although apparently large, do not measure more than six months' supply, in an active state of trade such as we have at the present time. A rise to 50*l*. or 60*l*. per ton is not at all unlikely.

Miscellaneous foreign shares have been dull, and sales of Yuruari and Consolidated Esmeralda have been pressed. The selling orders of the latter have, according to all appearances, come from the States. Be the news good or bad, foreign mines of low-priced descriptions have been decidedly forced for sale.

In the Home market, the only feature to note is the improvement in certain tin shares, notably Carn Brea and Tincroft, on the declaration of their respective dividends of 7s. 6d. and 5s. each. Wheal Agar was not so fortunate, for at the meeting to-day a call of 1*l*. per share was made.

AFRICANS.

There has undoubtedly been more business doing in African shares during the week than in all the other mining descriptions put together. The principal rises have been in City and Suburban, Jubilee, Jumpers, Langlaagte, Salisbury, and Wolhuters. The market closes firm, with every appearance of going several points higher. The following have risen : Piggs, $\frac{1}{16}$; Johannesburg Waterworks, $\frac{1}{8}$; Moodies, $\frac{1}{8}$; Bankets, $\frac{1}{8}$; Blaubank, 1s. ; Central Langlaagte, $\frac{3}{8}$; City and Suburban, $1\frac{1}{8}$; Crown Reefs, $\frac{3}{4}$; Dornkop, $\frac{1}{16}$; De Villiers (Robinson), $1\frac{1}{2}$; Durban Roodepoort, $\frac{7}{8}$; Evelyns, $\frac{1}{4}$; Ferreiras, 20s. ; Geldenhuis, $\frac{1}{4}$; Goldfields of South Africa, $\frac{9}{16}$; Goldeu Kopje, $\frac{1}{8}$; Heriot, $\frac{1}{2}$; Henry Nourse, $\frac{1}{8}$; Johannesburg Pioneer, 20s. ; Jumpers, $1\frac{3}{4}$; Langlaagtes, $\frac{5}{8}$; Langlaagtes Block B, $\frac{1}{4}$; Mainreef United Roodeport, $\frac{1}{4}$; Nabob, $\frac{1}{16}$; New Grahamstown, $\frac{1}{8}$; Randfontein, $\frac{1}{8}$; Royals, $\frac{1}{2}$; Salisbury, $2\frac{1}{2}$; Simmer and Jack, $\frac{3}{8}$; Stanhope, 20s. ; Van Ryn, $\frac{1}{8}$; Western Langlaagte, $\frac{1}{4}$; Wemmers, $\frac{5}{8}$; and Wolhuters, $\frac{5}{8}$. The only fall being in Republics, 1s. ; Revolver, $\frac{1}{8}$; Crœsus, $\frac{1}{8}$; Knights, $\frac{1}{16}$; Main Reef, $\frac{1}{16}$; Modderfontein, $\frac{1}{16}$.

Copper.

There is but very little doing in Copper shares, and prices generally are a shade lower, the principal fall being Masons, which closed 6 1/4, 6 1/2 last week, and this evening are qnoted 6, 6 1/8. The following have risen :—Cape Copper, 1/4; Copiapo, 1/8; Libiola, 1/8; and Rio Tinto, 7/16; whilst a fall is shown in Mason and Barry of 1/4; Namaqua, 1/4; Panulcillo, 1/8; and Tocopilla, 3d.

Australians.

No business doing appears to be the order of the day as regards Anstralian shares. and prices therefore are lower all round. A fall has taken place in British Broken Hill of 1/4; Cumberland, 1s.; Day Dawn P.C., 1s.; Etheridge, 3d.; Moruya, 1/16; and Mount Morgan, 1s. No rise in price to note.

Diamonds.

The market for Diamond shares has been inactive, but prices remain remarkably firm, and in several instances a slight rise has taken place.

A rise is shown in Anglo-African, 3/8; De Beers, 1/4; New Jagersfontein. 1/2; South African (Pullinger), 1s.; Read's Drift Land, 1/8; and Burma Ruby, 3/16; whilst a fall is registered in Bultfontein, 1/8; London and Orange Free State Exploration, 1/4.

Anglo African	4 7/8	—	5 1/8
Bultfontein, New Shares	3 1/2	—	3 5/8

Read's Drift Land Co.	1 7/8	—	2
Burma Ruby Mines	1 5/16	—	1 7/16pm

Indians.

There have been but few transactions in Indian shares this week, and prices are generally lower all round.

The following show a fall :—Balaghat, 17s. 6d. paid of 6d.; Ditto (fully paid), 2s.; Glenrock, 3d.; Goldfields of Mysore, 1/8; Indian Consolidated, 6d.; Mysore Reefs, 6d.; Ditto West, 6d.; Nundydroog, 1/16; and South-East Mysore, 1/16. Other prices remain as last quoted.

Foreign Shares.

A fair amount of business has taken place in several of the Foreign shares, but in many instances there has been a slight fall. Those chiefly dealt in have been Balkis, Callao Bis, Colon, Dickens Cnster, Consolidated Esmeralda—these shares had a sharp fall on the reported shutting down of the mine—Denvers, New California, New Emma, Victory and Yuruari.

A fall is registered in Balkis of 1s.; Barretts, 3d.; Carlisle, 6d.; Colon, 1s.; Colorado Silver, 6d.; Consolidated Esmeralda, 1s. 6d.; Elmore, 3d.; Flagstaff, 3d.; La Trinidad, 7s.; Monte del Oro, 6d.; New Organos, 3d.; ditto Spitzkop, 3d.; Palmarejo, 1s. 6d.; Potosi, 3d.; Ruby, 3d.; San Christian, 7s.; Venezuelan, 1s.; Victory, 6d.; Viola, 2s.; and West Argentinc, 6d. The only rise to record is in Frontino and Bolivia of 6d.

The following list shows the principal changes which have taken place :—

	Last Week.			This Week.

LATEST FROM THE MINES.

Indian Mines.

Indian Gold (Glasgow).—The following information has been received from the mines, viz. : Crushed 286 tons, which yielded 33 ozs. of gold ; stamps only, which means that the concentrates, blanket sands, &c.. arc reserved for further treatment.

Colonial Mines.

Blue Spur and Gabriel's Gully.—The following cable has been received by a correspondent of Mr. Charles C. Rawlins, the well-known mining engineer and Fellow of the Geological Society of London, who is at present in New Zealand :—"Please inform Sir Walter Buller have examined Bluc Spur. The amalgamated properties have been opened out. Are working all right. There is an immediate prospect. I am certain of 10 per cent. dividend on 100,000*l*. You must not sacrificc your shares. You will be quite safe. Wrote fully by last mail."

Gympie Great Eastern.—A cablegram from the mine, dated 23rd May, gives the result obtained during the past month, viz. :—"24 days, 600 tons, 1,067 ozs. ; value, 3,730*l*. ; profit, 2,670*l*."

Midas.—The following cable is from the mine : "Yield for week 135 ozs." (553*l*.)

Mount Albion Silver.—A special telegram from the managing directors in Qneensland announces an important and rich find of cupreous, argentiferous ore averaging about 300 ozs. silver, and also containing 50 per cent of copper per ton ; 66 tons silver-lead bullion, containing, 20,000 ozs. silver, and 37 tons ore containing 11,000 ozs. silver have been forwarded to England during the last month.

Mount Leyshon.—A cablegram from the mines dated 20th instant states :—"Engine repairs not yet finished ; will cable re-starting ; mine is improving."

Foreign Mines.

Carlisle.—Mr. John B. Ball, of the firm of Messrs. Ball, Baker, Rowe and Co., has been elected a director of the Carlisle Gold Mining Company, Limited, to fill the vacancy cansed by the dcath of the late Mr. F. J. Bladon.

Denver.—A cable has been received from the manager at the mines, viz. :—"The 1,050 cross-cut reached main lode, showing 2 ft. good ore ; 200 level rich ; our prospects are very favourable."

Dickens Custer.—The directors notify that Mr. MacDermott of

Messrs. MacDermott and Duffield (London agents for Messrs. Fraser and Chalmers at Chicago), is now at their mines. having been instructed to make an exhaustive report thereon. The board has this day made a call of 6d. per share, payable on the 6th June.

Douro Developing Syndicate.—The directors have declared an interim dividend of 50 per cent. on the paid up capital of the company, free of income tax, payable on and after Tuesday, 28th May.

Douro.—The manager cables that he has cut vein 5 ft. wide, composed of decomposed quartz, and that the main lode is 20 ft. ahead.

Goldfields of Uruguay.—The directors have received a cablegram from the mines stating that the mill will start crushing on the 20th May. This is extremely good news for the shareholders. First results will be awaited with great interest. From all accounts the company appears to have an almost unlimited supply of quartz.

Mexican Mineral.—Interest warrants for interest due 24th instant to the share and debenture-holders of the Mexican Mineral Railway Company, Limited, have been posted, and are payable at the London and County Banking Company, Limited, 21, Lombard Street, E.C.

New Hoover Hill.—The directors have sold through Messrs. Pixley and Abell the bullion obtained during the month of April, weighing 173 ozs., which realised 582*l.* 15s. 10d.

Stafford.—Mr. H. B. Tilden, the manager at the mines, telegraphs under date the 21st May, particulars of the cleau up for the first two weeks in May: Crushed 70 tons which yielded 31 ozs. of gold."

United Mexican.—Telegram: "San Cayetano property: Gross returns for week ending May 18th, $6,600; expenses for week ending May 11th, $8,100; profit for week ending May 11th, $200. El Cubo Property: Gross expenditure, including capital expenditure, week ending May 11th, $3,020."

Home Mines.

Carn Brea.—At Carn Brea meeting, on Monday, a dividend was declared of 7s. 6d. per share, the first for very many years, and a handsome credit balance was carried forward.

Devon Consols and Devon United.—The prospects of these companies are referred to in our leader columns. Those of Devon United have considerably improved since the meeting.

Drakewalls.—The directors have made a call of 6*l.* per share. In a circular the directors state:—The opening up of the large body of ore cut into in sinking the shaft below the 132-fm. level has progressed steadily, but has necessitated a very considerable expenditure at surface in the needful arrangements required to enable the company to deal quickly and economically with the ore. For this purpose two additional calciners, with double flues, have been erected, two tramways laid down, and an elevated one in course of construction, to connect them with the shaft, thus saving both time and expense in the transit of the ore to the dressing floors and calciners. This work, when complete, will prove of great benefit to the future operations.

Morgan Gold.—The result of the crushing cleaned up on Saturday, the 18th inst., was as follows:—480 tons yielded 219 ozs. 3 dwts. 1 gr. of gold, being an average of 9 dwts. 3 grs. per ton of ore.

Tincroft.—A dividend of 5s. a share was declared.

Tregurtha Downs.—Sold on the 18th inst., for the fortnight, 8 tons 7 cwt. of tin ore at 56*l.* per ton, realising net, 466*l.* 1s. 6d.

Wheal Agar.—At the meeting to-day a call of 1*l.* a share was made.

Wheal Owles.—At the 16 weeks' meeting, held on the mine, the purser (Mr. R. Boyns) in the chair, the accounts showed a loss on the four months' working of 130*l.*, and a balance now in favour of the mine of 1,634*l.*, 22*l.* owing for lords' dues. There is cash at bank 863*l.*, and cash at bank on deposit 800*l.*, what, we believe, no other bank in Cornwall has. The management prefer Cornish meetings to those in London. The breeze of criticism is not quite so keen.

Metals.

Copper has been in good consumptive demand, and prices in sellers' favour. The market for warrants has been inactive, but firm. G.O.B. Chili bars have been obtainable at about the same price as G.M.B. Business done from 39*l.* 5s. to 39*l.* 17s. 6d. cash; to-day sellers ask 40*l.*; buyers offer 39*l.* 15s. cash; three months was done at 39*l.* 17s. 6d.; 40*l.* was paid for a warrant Chili, Edward's 97½ per cent., and a warrant for Schwager's done at 39*l.* 16s. 3d. Australian still nominal. We quote English tough, 44*l.*, 45*l.*; best selected, 45*l.* to 46*l.*; strong sheets, 50*l.* to 51*l.*; Indian sheets, 47*l.* 10s., 48*l.*; yellow metal sheets, 4¾d.; sheathing, 4⅞d.; ore, regulus, &c., 7s. to 8s.

Tin has been quiet. Straits declined from 93*l.* to 91*l.* 7s. 6d. cash, closing sellers thereat; three months done at 92*l.* 5s.; three months has ruled about 15s. over spot, and Australian 5s. premium over Straits. The Dutch market is quiet. Banca, 55½fl.; Billiton, 55¼fl.; English ingots, 95*l.*; bars, 96*l.*

Tin Plates are quiet, and ordinary coke quoted at 13s. to 13s. 3d., Liverpool.

Spelter is steady, and ordinary brands quoted 18*l.* ex ship here. Specials, 18*l.* 2s. 6d. to 18*l.* 5s.

Lead steady. Soft Spanish, 12*l.* 15s.; Soft English, 12*l.* 17s. 6d. to 13*l.*; L. B. China Pigs, 13*l.*; Sheet Lead, 13*l.* 15s.

Quicksilver steady. Rothschild's price is 8*l.* 10s.; Seconds, 8*l.* 4s. to 8*l.* 5s.

Antimony dearer; 52*l.* to 53*l.*

London Coal Exchange.

Wallsend:—Hetton, 16s.; Lambton, 15s. 6d.; Hetton Lyons, 15s.; Wear, 15s.

London Metal Exchange.

4.30.—Closing official report.—Copper: G.M. Brands, cash, 40, ⅜; three months, 40, ⅜; best selected, 45, 6; strong sheets, 51, 2; English tough, 43½, 4½. Tin: Fine foreign, cash, 91⅝, 2⅛; three months, 92⅜, ⅝; Australian, 91⅞, 2⅜; English ingots, 94½, 5. Spelter, 18.

Glasgow Pig Iron Market.

3.15.—Business at 43s. 4d., 43s. 3d., cash; 43s. 6d., 43s. 5½d, one month; closing buyers, 43s. 3d., cash; 43s. 5d., one month; sellers ½d. more. Market dull, fair business. Middlesbro' done 38s. 3d., cash; closing buyers, 38s. 3d., cash; 38s. 5½d. one month; sellers, 38s. 3½d., cash; 38s. 6½d. one month. Hematite done, 48s. 3d., 48s. 2½d. cash; closing buyers, 48s. 3d. cash; 48s. 5½d. one month; sellers, 48s. 3½d., cash; 48s. 6½d., one month.

THE NEW SPITZKOP, LIMITED.

Report of the Directors.

21st May.—At the meeting held on the 10th of October last, the shareholders were informed that there were lawsuits then pending at Pretoria against the liquidators of the old company, involving claims amounting in the aggregate to the sum of 38,056*l.* One of the suits was an action brought by the diggers—Silo, Tate, and Stanley—for a claim of 11,000*l.* under an award in their favour given by the Government Referee, and the other was an action by which your late agent, Mr. Franck, claimed 5,806*l.* 9s. for salary, and 21,250*l.* for damages, being the alleged value of his shares in the old company. Your directors have now the pleasure of informing you that those suits have been determined in a manner they think highly satisfactory. The case of the diggers was heard before the full Court, who dismissed the claim of 11,000*l.*, but awarded to the diggers a sum of 798*l.*, being the supposed value to the company of water races made by them, and 80*l.* for the supposed value of buildings erected by them. The amount of that judgment and costs was at once remitted by your directors to South Africa. In Mr. Franck's action the liquidators were completely successful, and obtained the unanimous judgment of the Court in their favour, with an award of costs against Mr. Franck, which has however, not yet been paid. These results were not obtained without a large cash expenditure, owing chiefly to the two journeys made by your solicitor, Mr. Matthews, to South Africa, and the many months he had to remain there attending to your interests. You were also informed at that meeting that your manager, Mr. Heanan, had estimated that an expenditure amounting to 25,000*l.* was necessary to develop your property, and a suggestion was then made that fresh capital should be issued to meet that expenditure, and a resolution passed approving of the proposal. Since then Mr. Heanan has been at work making further careful surveys of your property, and maturing his plan for its development; and he has now furnished the board with estimates of the cost at which his plans can be carried out, and of the probable returns, which your directors consider highly satisfactory, and in which they have every confidence. Not wishing, however, to commit you to a further considerable expenditure without giving you a full opportunity of forming your own opinions, they thought it best to summon Mr. Heanan home for the purpose of personally explaining his views, and also for the purpose of selecting the machinery and plant required, should the necessary funds be voted. Mr. Heanan's opinion, after a very thorough examination of your property (7,280 acres in extent), is that it is extremely valuable, and capable of being worked so as to yield large profits, and he attributes the small returns hitherto obtained to mismanagement. The board do not, however, desire to influence your decision beyond pointing out to you that, failing the necessary funds being subscribed, all your sacrifices hitherto will have been in vain, and others will reap where you have sown.—Morgan Lloyd, Chairman.

The Spanish Exhibition.—This exhibition, at West Brompton, will last until October. It will consist entirely of the arts, manufactures, textile products, fabrics, metallurgy, ironwork, lace, wines, cigars, sports, pastimes, and national costumes of Spain, and will be held on the same site, and on similar lines to the previous Italian and American exhibitions. The mining exhibits will be of particular interest to our readers.

WEST ARGENTINE GOLD CO., LIMITED.

TERMS OF RE-CONSTRUCTION.

22nd May.—(1.) That the West Argentine Gold Company, Limited, be wound up voluntarily. (2.) That the liquidators be authorised to sell all the assets of the company, including all properties, concessions, mines, buildings, machinery, royalties, shares in subsidiary companies, &c., to a new company, with a similar name, for 150,000 shares credited with 15s. 6d. per share paid thereupon, the new company taking over all liabilities and debts, including the present debenture debt, and all agreements with *employés* and others, and all other obligations, whether to the local Government or to other companies. (3.) Each shareholder in the present company to be entitled to apply for, and obtain, three new shares for every two now held upon surrendering the same to the liquidators within fourteen days from the date of the confirmatory meeting, such applications to be accompanied by cheque for 6d. per share. A further payment of 6d. per share will be payable on allotment. (4.) No further call to be made until 1st October, 1889, when a call of 6*l*. per share may be necessary; the balance to be called in sums not exceeding 6d. per share per call, but it is not expected that any further call will be required for some time. (5.) In addition to the proportion above mentioned, each shareholder will be at liberty to apply for any shares still remaining, either at par or at a premium. The highest tenders will be accepted. In the event of any shares not being so taken up by present shareholders the same will be allotted to a syndicate which has contracted to take up if so required by the liquidators any balance of new shares (15s. 6d. per share credited) not accepted by existing shareholders, and they will deposit 1,250*l*. as security for due fulfilment of the agreement. It will be seen that the above scheme, if adopted by the shareholders, will afford the new company upwards of 30,000*l*. capital, which will not only enable the company to continue work on the Carolina lode, but will render the development of some of the valuable mines in the Seventh Department possible. The most recent letters from the manager are very encouraging, both as regards the Carolina vein and the mines in the Seventh Department.—W. P. OWEN, Secretary.

EXTRACT FROM MANAGER'S LETTER, DATED 29TH MARCH, 1889, RECEIVED 13TH MAY, 1889.

New shaft: "The winze below adit to connect with the shaft is progressing very favourably; it is now down about 45 ft. The clean off on 22nd gave 66 ozs. amalgam from 47 tons, or about 33 ozs. of gold. This proves that the stuff from the winze is better. If the reef is struck before 15th April we can probably calculate on 200 to 250 ozs. for April, and 300 ozs. in May." N.B.—Reef was not struck till early in May. Crushings for April, 275 tons 97 ozs. gold. "According to my opinion you have no deep workings in Carolina, and the ore may improve. Hundreds of mines are investigated which offer worse features than the Carolina. We have taken out gold and may get out more at a profit. We have 30 head of stamps almost erected; with economy and less administration expenses the ore may pay at 10 dwts. You have plenty of reef matter which may turn out well in depth." VII. Department, San Antonio.—We have a mill trial of the vein 300 yds. north from the brow of hill giving 8 dwts. The San Antonio is a strong lode with, up to the present, good prospects; if the ore found on surface continues you have a most valuable property. I can hold out very fair hopes of success, and I can guarantee to do it cheaply. Costs at San Francisco, provided administration expenses are divided between Carolina and San Francisco, ought not to be above 7 dwts., if so high. Average mill trials over the whole vein have given 12 dwts., and for a distance of about 60 ft. ore which will mill from 2 to 3 ozs. can be found. The San Antonio therefore holds out excellent hopes for success if the ore continues in depth as on surface, of which there is every likelihood.

THE old "Jamaica Coffee House" in St. Michael's Alley, Cornhill, which dates from the time of Elizabeth, and was burnt down in the great fire of London, has been rebuilt and opened by Messrs. Rose and Co. Legal difficulties since the death of Mr. Darcey, surmounted at length through the tact of Mr. Joseph Barrett, C.C., the solicitor in the matter, have alone prevented the transfer of the lease before. This historical City site is valuable to the antiquarian. It was here that the West India merchants assembled, like those of the East Indies did at "Garraways," which has long since disappeared with the old "North and South." The "Jerusalem" has been re-built, and "Lloyds" and the "Baltic" are still represented.

QUICKSILVER MINES.—Of these there are only a few in active working, and they have been in a position to keep up the price of the metal. Fluctuations, which have happened during the last ten years, were speedily regulated by the demands of the market, and the owners of the quicksilver properties carried on a prosperous business. It is generally believed that Messrs. Rothschild with their great mines at Almaden in Spain, enjoy a kind of monopoly, and establish with the produce from that country the standard for quality of quicksilver, at any rate in Europe. The oldest and most extensive mining operations are those under the Austrian Imperial Government at Idria in the Duchy of Krain, where quicksilver was discovered in the year 1497, and continuously worked since then. Twelve different lodes have been opened to a considerable depth, and such masses of the precious ore have been extracted, that the Idria Mining Exchequer has had net profits of 200,000*l*. and more in a year. Many millions sterling of revenue have flowed from this source into the treasury of Vienna. The highest market price, however, has always been obtained by the Spanish quicksilver of Messrs. Rothschild, and consequently the produce from Idria depended for its sale on the London quotation. The quicksilver mined in California supplies the American demand and cannot influence the European market much. The opening of a fresh quicksilver mine in Servia, a country especially rich in every metal, is consequently of great importance to the trades requiring quicksilver, and it will certainly prove to be so, as the produce recently imported direct to England from Avala, a property assumed to be equal in extent and value to Idria, has been pronounced by the eminent metal brokers of London—Messrs. James and Shakespeare—to be equal to best Spanish, and to command an equivalent price. As it may be expected that Avala, from its high percentage of cinnabar ore will furnish net profits similar to Idria, and as it has been ascertained that this Servian quicksilver stands side by side with that of Almaden, a very prosperous future may be held out for the Avala Mines, which are now offered to the public a sa lucrative investment and dividend-paying concern.

BRITISH MINING INTELLIGENCE.

DRAKEWALLS (23rd May).—The lode in the engine shaft is still of a highly promising character, and continues to produce 24 tons of arsenical mundic per fm.; 2½ ft. has been sunk in the past week. We are rising and stoping in the back of the 147 west.—H. RODDA.

EAST BLUE HILLS.—The report this week is very encouraging. The mine is opening out much better than was at one time anticipated. The Baldu lode in the 30-fm. level west is worth 12*l*. per fm., and the stope in that level is valued at 15*l*. per fm. The lode cut in the 30-fm. level cross-cut north above the heave is also producing tin, and showing indications of improving. This level will open up a long piece of tin ground, and this is considered important. On the Pink lode there is no change to report, but the agents are hopeful of something good as the level is extended eastward.

EAST GRASSINGTON.—The following report, dated 15th May, has been received from the manager:—The lode in the 47-fm. level west is improving, and is easier for progress, being to-day fully 2½ ft. wide, carrying soft sugary spar, sulphate of barytes and lead ore, worth 12 cwt. per ton. A stope in back of the level is worth 8 cwt. of lead ore per fm. In the drivage west of No. 2 sump below Amy's workings, the lode is large and easy to work, the filling matter being limespar and gossan with blue and grey lead ores, worth 20 cwt. per fm. In the same level east the lode is somewhat narrower, and worth 12 cwt. of lead ore per fm. A stope in back of the 37-fm. level west is worth 10 cwt. of lead ore per fm. Excellent progress continues in opening out the water level east. Harris' shaft: This shaft has been sunk, cased and divided to a depth of 48 fms. 2 ft. below surface. We are now cutting the platt at the 47, and will proceed cross-cutting the lode as fast as possible. On surface all is going on well, and we will weigh a parcel of pig lead off on Monday next.

GAWTON (14th May).—The rise in the back of the 105 east continues to yield 10 tons of arsenical mundic per fm. The lode in the 95 east is 6 ft. big, and yielding 11 tons of arsenical and sulphur mundic per fm. The lode in the winze sinking below the 12-fm. level east is carried 5 ft. wide, and yielding 11 tons of mundic per fm. All the stopes throughout the mine continue without change.—G. ROWE.

GLYNDWR LEAD.—The working capital having been secured, arrangements are being made for the erection of the necessary machinery to drain the limestone measures and ore ground that is reported will yield 7 tons of lead ore to the fathom. Simultaneously with the completion of the drainage, cross-cuts will be put out to reach, in new ground, the old Maes-y-Safn lodes which have given in the western ground more than 300,000*l*. profit. The opinion prevails that if judiciously and vigorously developed it will be one of the best dividend-paying mines in this country.

GLYNDWR LEAD.—The reports from all quarters continue to confirm the great mineral wealth of this property. Situated as it is in the limestone measures equi-distant from the now celebrated Halkyn on the north, and the Westminster and rich Denbighshire Mines on the south, the development of these great parallel courses of ore will assuredly add another to the many brilliant successes that have been won in this renowned district. One of the directors went over the property last week, and was perfectly satisfied with the reports given him by practical men well acquainted with the workings of this particular mine, and the extensive runs of ore, both in the limestone measures and on the parallel lodes, which are underlying towards them, and which the present engine shaft will enter in depth.

GREAT FORTUNE.—Forking has at last commenced below the adit level, and water drained 9 ft. in two days; so far the engine is doing its work fairly well, and the agents expect shortly to be in better tin ground.

GREAT FORTUNE.—The engine shaft on the branches is now drained 4 fms. below the adit. The blue burrow copper ore shafts are also drained the same depth, and the engine pumping well. The aggregate value of the points in operation are reported to be worth 34*l*. per fm.

MARKE VALLEY (22nd May).—In Bellingham's shaft the granite continues hard, and still having to timber the south side. The progress in sinking has not yet come up to our expectations; sunk last month 1 fm. 3 ft. Having intersected the south part of the lode at the 25, we have commenced driving west on its course; when cut through it was 5 ft. wide and worth 10*l*. per fm., but since then the storm rather disordered the lode for a short distance. It is, however, again forming more regular, and is now 3 ft. wide, worth 5*l*. per fm., with every probability, as it is extended under the ground driven through in the 15 west, of a further improvement. The end is favourable for driving, now set at 4*l*. per fm. There is one stope at this level at 55s., worth 4*l*. per fm. In the 15 east the lode is 2 ft. wide, composed of capel and quartz, carrying a little tin, but not yet to value. The water is issuing from the lode very strong, and as we have now very nearly reached the point where the junction of the two lodes should be met with, although a slight difference in the bearing of the south lode would increase this distance to be driven; we think, however, this increase of water indicates our being very near. The granite on the north side, as well as the elvan on the south, continues of a favourable character; the end is now being driven, at 4*l*. 10s. per fm. The 15-ft. west is still being driven in the lode, which is worth 7*l*.; set at 5*l*. per fm. There are two stopes in the back of this level worth 7*l*. and 10*l*. per fm. One stope in bottom of midway level west worth 9*l*. per fm., and two in the back each worth 6*l*. There is one stope being worked below the adit on south part of lode west worth 6*l*., and two stopes below the adit east worth 6*l*. and 7*l*. per fm. We have four men clearing the adit east, where we are laying open ground for further stoping.—W. GEORGE, F. RENALS.

MELLANEAR (22nd May).—The north part of the lode in Gundry's engine shaft sinking below the 150-fms. level, is 5 ft. wide, presenting a very strong and promising appearance, yielding stones of copper and tin ores, but not sufficient to value. The part of the lode carrying in the 150-fms. level driving east of Gundry's shaft is 5 ft. wide, yielding low quality tin stone, about 18 lbs. of black tin per ton, and some saving work for copper ore. The lode in the bottom of the 140 east of shaft is 8 ft. wide, yielding 3 tons of copper ore per fm., and is also worth 9*l*. per fm. for tin. Some of the tin stuff is very rich indeed, but the ground is wet and spare for sinking. There is no change in any other part of the mine.—JOHN GILBERT.

MID-DEVON.—Report for week ending 11th May:—Surface: Pumping machinery continues to do good duty. A shaft: Water drained 44 ft. below the 80; influx to shaft still abates. C shaft: The 50 No. 3 stopes worked on by six men has improved in yield of ore,

and now equals 5½ tons per cubic fm. The surroundiug strata is exceedingly eongenial and mineralised throughout. It eontains all the neeessary properties essential to a continuous yield of ore in this lode.—J. NEILL.

MID-DEVON (18th May).—Surface.—Pumping wheel: One of the cast-iron couplings that was fixed to axle in January last to streugthen it has cracked from about two-thirds its length; I have now had wrought iron bands made for it, which temporary repair may possibly earry it on until arrangements are made for a new axle. A shaft: Owing to the frequent stoppages to repair couplings the water has risen in shaft, and at 2 p.m. to-day it was 35 ft. below the 80. C shaft: The 50 east No. 3 stope worked on hy five men now yields 6 tons of eopper ore per cubic fm.; strata sueh as indicates a continnous good yield.—J. NEILL.

MORGAN.—The secretary writes:—Mr. Pender, the new general manager of the Morgan Mine, who succeeds Mr. Howard Hill, is expected to arrive in England from the United States about the middle of June. The secretary also reports receipt of intelligenee to the effeet that the complete shipment of the uew machinery, ordered three weeks ago. will be made to-day from Messrs. Fraser and Chalmers' Works at Chicago. Great eredit is due to Messrs. Fraser and Chalmers for their very prompt exeeution of this order.

PRINCE OF WALES.—The report from Capt. George, who has recently inspected the mine, is not yet to hand, but it is satisfactory to observe that all operations, both underground and at surface, are proceeding vigorously. The re-ereetion of the drawing engine is now eomplete, which the agent writes is a good job done. The values of the varions points are unchanged.

PRINCE OF WALES.—The sinking of the shaft below the 155-fm. level is proceeding favourably, and the part of the lode carried maintains its value of 16*l.* per fm. The 135-fm. level east is improving, and is now worth fully 9*l.* per fm. The winding engine, after the recent repairs, is working well. The special report of Capt. Wm. George having been issued to the shareholders it is only neeessary here to state that he fully approves of the outlay that has been made in the tin dressing arrangements, and that he eonsiders the mine is now plaeed in a thorough state of effieieney, and the shareholders may now expeet profitable results.

PRINCE ROYAL.—The pumping engine has gone to work, and the latest report is that it is working very well and forking fairly. It will not take long to drain the mine to the bottom, where the sinking will be resumed in a good lode.

PRINCE ROYAL.—The engine is working well and the water drained 10 fms. below the adit, and it is expected in about a fortnight the mine will be drained.

ROMAN GRAVELS (17th May).—We started pumping at 8.30 last night, and everything worked most satisfaetorily; pumping will now go on regularly forthwith. The 20 tons of blende sold yesterday realised 88*l.* 10*s.*—A. WATERS and SON.

Telegram from Mr. Arthur Waters, Friday morning:—"Engine started at 8 30 last night, everything working splendidly."

ROMAN GRAVELS (23rd May).—The engiue and new pitwork are doing very good duty indeed. The water at the new south engine shaft is about 7½ fms. below the 95-fm. level, and is at present forked at the rate of, say 3 ft. in 24 hours. This, considering the extensiveness of the workings whieh are being drained, is quite as fast a rate as we could wish for. We hope to reaeh the 110-fm. level early next week.—A WATERS and SON.

SOUTH CONDURROW (14th May).—The lode in the hottom of Marshall's shaft is about 2 ft. wide, but it is without tin to value. The 102 end west yields low quality tin stone. The rise in the back of this level yields a little tin. The 93 east of King's is worth 8*l.* per fm. The back of the 80 east is worth 6*l.* per fm. The baek of the 70 east is worth 20*l.* per fm. The 60 end east is worth 8*l.* per fm. The lode in the bottom of the 60 east is worth 15*l.* per fm. The 50 end east is worth 10*l.* per fm. The 40 end east is worth 10*l.* per fm. The stopes throughout the mine are without material alteration to notiee.—W. RICH, W. WILLIAMS, H. KING.

SOUTH DARREN (16th May).—The stope iu the 142 west is worth 2 tons of silver lead ore per fm. The stripping in the same level is worth 15 ewt. of silver lead ore per eubic fm.; other plaees are much the same as last week. On Saturday next we intend to sample 25 tons of silver lead ore for sale on the 24th inst.—J. MITCHELL.

SOUTH DARREN (23rd May).—The following bargains are let for one month:—To stope in the 142 west, by six men, at 3*l.* 15*s.* per fm.; lode worth 2 tons of silver lead ore per fm. To strip in this level, by four men, at 3*l.* 15*s.* per fm.; lode worth 15 ewts. of silver lead ore per fm. To stope in the 142 east, by four men, at 3*l.* 15*s.* per fm.; lode worth 15 ewts. of silver lead ore per fm. To drive aeross the lode in the 130 west, at 5*l.* 15*s.* per fm. The lode here is like it is in the 142, very wide. We have driven 10 ft. into it, and are not yet through it. It has contained a little lead nearly all through. and one braneh was worth 10 ewts. of silver lead ore per fm. In the 142 the best part of the lode was on the south side, and if it is the same here the best part of the lode is still to eut. To drive the 110 east by four men, at 7*l.* 5*s.* per fm.; this end is looking kindly, and eontains more lead. To drive a cross-cut in the 100 west by four men, taken for 1 fm. at 5*l.* per fm. The object of this is to ascertain if the drivage is on the hest part of the lode. It has just be en started, and is producing good work for lead. To sink a winze iu the 90 west by four men, at 7*l.* 10*s.* per fm.; this is to come down on the stope we were working in the 100, in whieh the ventilation was rather bad; there are about 4 fms. to sink. When it is through it will open a communieation in the 100 level 30 fms. nearer the end thau at present, and will greatly improve the air there.—J. MITCHELL.

TIN ERA (14th May).—There is no change in the deep adit cross-cut north, but every effort is being made to get under the tin-bearing ground worked on in the level above, and from which good returns have been made.—R. KNOTT.

VAN (23rd May).—I am pleased to be able to report that the 135 south level upon the hanging of the lode fully maintains its value, viz., 40*l.* per fm. The cross-cut south at the 120 east clearly indicates that we should go deeper; the lode in the forebreast is about as nice and favourable a lode as can be seen, but the indications eougenial to the production of lead proceed from the sole of the level, *i.e.*, the strong issue of gas and water. Van Hill: We continue to drive the level into the hill by four men upon a very favourable joint.—Capt. WILLIAMS.

WEARDALE.—Report on Weardale Company's mines for week ending 11th May:—Ore raised for the week, 76 tons; ore dressed for the week, 89 tons; ore and slag smelted, 138 tons; producing 71 tons of pig lead.

WEARDALE.—Report on Weardale miues for week ending 18th May:—Ore raised for week, 74 tons; ore dressed for week, 92 tons: ore, fume, and slag smelted for week 115 tons, producing 65 tons of pig lead.

WEST CARSIZE.—The engine-shaft is now 4 ft. below the 40 fm. level; the lode is 4 ft. wide, the largest yet seen in the mine; it produees a little tin, with every promise of further improvement. In the old Carsize part the adit is being driven on a lode about 6 ft. wide, the north part of whieh is set on tribute, and the men are getting good wages.

WEST CARZISE.—The lode in the engine shaft is reported to be 3½ ft. wide, tinny, and of a very promising character for the production of tin.

WEST WHEAL GRENVILLE (14th May).—During the past week the shaftmen have been engaged in breaking up the 20-fm. drop-lift, fixing standing drawing lift at the 90-fms. level, which is working satisfaetory, and bringing down skip-road, &c. At Harvey's shaft the skip-road is completed 8 fms. below the 50. We have been obliged to cut ground in this lift during the week, the shaft being so small as not to take the skip-road in its proper position.—T. HODGE, J. SKEAT, N. TENBY.

WEST WHEAL GRENVILLE (21st May).—In the engine shaft the men have this week been sending down main rod, plates, &c., aud eonneeting the same, also fixing skip-road, which is now completed to within a short distance of the 70-fm. level; prepariug forking lift for further working, and have dropped the same to 2 fms. under the 90. At Harvey's shaft, old timber and attle have been cleared from the 60 to 70; ground cut to admit of fixing skip-road, and the same eompleted to within 2½ fms. of the 70-fm. level.—T. HODGE, J. SKEAT, N. TEMBY.

WHEAL GRENVILLE (15th May).—The 205 east end is worth 10*l.* per fm. The 178 east end is worth 20*l.* per fm. These meu are put to rise in the baek of said level in a lode worth 16*l.* per fm. We have started a winze in the bottom of the 165 east going down on said rise in a lode worth 15*l.* per fm. The 165 east end is improved, worth 20*l.* per fm. No other chauge.—T. HODGE.

WHEAL GRENVILLE (22nd May).—Goold's shaft is 14 fms. below the 205-fm. level. We have about 2 fms. more to sink; this done we shall start a 220-fm. level at once. The 205 east end is looking more encouraging; worth 10*l.* per fm. The other places are without any change to notice.—T. HODGE.

WHEAL METAL AND FLOW.—During the month the 35-fm. level has been driven 2 fms., and below the level they have sunk 1 fm., and have opened also a little in the back of the level. All these points show the lode to be fair "tinny" work. The level will now be extended both east and west with a view of thoroughly proving the lode.

WHEAL METAL AND FLOW.—Some little alterations are being made in the pitwork preparatory to sinking below the 35-fm. level on the eourse of the lode, which it has been deeided to do. The lode in the back of the level is looking very promising. The expectation is strong that further development on this lode will result in an early and valuable bunch of ore.

WHEAL UNY.—Good progress is being made in sinking Hind's engine shaft, 9 ft. having been aecomplished duriug the month. A large and valuable piece of tin ground is being laid open above the 195-fm. level, whieh is improving as they advanee westward. In the 193-fm. level east the lode is reported to be of a beautiful character, and the level is now approaching ground that was very productive in the 180-fm. level. The prospects of the mine are certainly most encouraging, and with the additional stamping machinery now being erected, and inereasing productiveness of the tin ground which is being laid open, the uine may soon be expected to show a balance on the right side of the the profit and loss aceount.

FOREIGN MINING INTELLIGENCE.

ALMADA AND TIRITO (27th April).—Have sunk the Balvanera shaft 5 ft. I.10. ground being somewhat harder than last week. Have driven 50-fm. level north 16 ft. 9.10; four men and machine drill; drivage in lode matter, but showing very little mineral. Have driven 12-fm. level north 4 ft. 9.10; breast showing more or less metal in drivage. As per your instruction (Mr. Sauchez's), eommenced exploration work level 31 from winze No. 7, north San José: Have driven 4 ft. 9.10 with four men; front showing 5 ft. of mineral, being the body of ore discovered by you in winze No. 7 some time ago. At present it seems to be a very strong ore body, with indications of widening to the east. The timbermen have re-timbered San Juan winze (ventilatiou), securing assured ventilation; main shaft and ladder ways in good order. Have replaced the large hoist bucket with one of smaller size, which relieves the hoist engine very much.—H. C. CLOUD.

ASIA MINOR.—62 men driviug; aggregate value of ends, 5 tons 10 ewt. per fm.; 186 men stoping; aggregate value of stopes 13 tons 12 ewt. per fm. Four men sinking, eight men rising, four men cross-cutting, 152 labourers, &c. Production to 10th May is 3,545 tons crushed; yielded 456¾ tons rich silver lead ore. Correspondiug period last year, 3,615 tons crushed; yielded 433¼ tons.

BRATSBERG (13th May).—Report for week ending 11th May:—Hoffnung Mine: There is no alteration to notice at either of the points of operation at No. 2 adit level. No. 3 adit level is worth 1 ton per fm. No. 4 adit level is carrying a large lode, but does not now yield more than ¾ ton per fm. No. 5 level east has not beeu advaneed anything since last report owing to the irregularity of the men engaged here. Other men will be put on here as soon as possible. The mid level at Murchison's is producing about 1 ton per fm., and the level at the shallow workings is yieldiug about ¾ tou per fm. Johannes Mine: About 2½ metres have been driven here on Howard lode during the past week, and we are pleased to see the regularity of the ore in the lode, although it is thiuly disseminated throughout the width of the end about 4 ft. wide, worth about 1 ton per fm. Næsmark Mine: 2½ metres have been driven here also in the north level during the week. At present we are meeting with some small transverse veins containing a little ore to save but not enough to value. Surface work and remarks: Nothing new to report under this head more than that we hope to be ready for and able to secure a vessel for a cargo at the end of this month.—J. D. HOLMAN.

CALLAO BIS (18th April).—Mine: In supplementing the mine

foreman's report. I am very pleased to state having met with the small branch of quartz in the south-east cross-cut, small as it is, which I consider a favourable indication of finding something further ahead. This is the first sign of mineral in the drivage since we started from the shaft. I hope I shall be able to report something still more favourable next mail. In the cross-cut north-west I see no change whatever, and is much the same class of rock as found in the cross-cut at the 300-ft. level. Soso-y-Mendez: In the shaft mentioned in my last we have sunk 20 ft. more, making its depth 40 ft. Through the whole sinking the lode is very much broken, solid quartz being only met with at intervals of a few feet, which lasts for 2 or 3 ft., and is then mixed with country rock or cascajo. No regular hanging or foot walls are apparent, but the dip of this mixed material is plainly seen to be southward.—G. W. Eustice.

— (18th April).—Under shaft: In the past fortnight the cross-cut at the 350-ft. level driving south-east of shaft has been driven 10 ft., making total distance 62 ft. In the breast of the end we have struck a small vein of quartz about 3 ins. thick, laying on a layer of slate which carries sulphurets. This may be considered a sign of the ground being mineralized, and we are pushing on this cross-cut with the hope of cutting something later. The cross-cut north-west has been driven 7 ft., making 52 ft. from shaft; no change in the ground. Soso-y-Mendez: The sinking of the shaft on this lode has been continued to 40 ft.; but the lode is very much broken still, and probably will have to be sunk some few feet further before the solid lode is met with. We have stopped this work for a short time. The mine machinery is working well and in good order.—J. Williams.

CONSOLIDATED ESMERALDA.—The superintendent, under date April 30th, reports that the last run at the mill realised bullion to the extent of 4,600*l.* from 736 tons of ore. The clean-up was better than expected; the yield was increased by some very rich ore, shewing free gold. This body of ore now in sight in the lowest level is 2½ ft. thick. The south drift on the 375 level continues to carry some fair quality of ore. The ledge is 2½ ft. wide, and looks well generally. The north drift is in broken ground, but it is hoped to get a change during the week. Mr. Colcord, the superintendent, starts on the 30th of this month for London for the purpose of being present at the annual meeting.

CORTEZ (May 4th).—Work done at mines for week ending this date has been as follows:—Boss tunnel: Advanced 24 ft. Development tunnel: Advanced 25 ft. Main tunnel: East drift advanced 5 ft.: stoped 1 ton of ore, value 75 ozs. per ton. Middle tunnel: West drift, stoped 18 tons of 60 oz. ore. North-east upraise: Stoped 60 tons of 55 oz. ore. North-west upraise: Stoped 41 tons of 130 oz. ore. East drift advanced 7 ft. Ore hauled to mill, 235 tons. Ore treated at mill, 85 tons, averaging 75 ozs. per ton. The mill was closed down for three days to do some much needed repairs, which accounts for the small amount of ore treated. Bullion shipped April 30th, 16 bars, containing 16,642 52-100th ozs. of fine silver and 11 68-100th ozs. of gold.—Welsh.

DAY DAWN P.C.—Report for the fortnight ending 30th March.—The output of quartz is 2,326 trucks to the Excelsior mill, 831 tons to the Defiance mill, 98 dray loads. I have opened out No. 11 level east side on about 4 ft. 6 ins. of stone of fair quality. West side: Still timbering up the drive. No. 10 level has been extended a further distance of 10 ft., making a total distance of 231 ft. from the underlie; there are 8 ft. of stone in the face, of good quality. All the stopes above this level are looking well; average width of stone 5 ft., of good quality. No. 1 winze on this level has been sunk a further depth of 10 ft., making a total depth of 61 ft. The stone in this winze is all underfoot, the winze being sunk in a horse of mullock on the hanging-wall. No. 9 level has been extended a further distance of 12 ft., making a total distance of 321 ft. from the underlie; there are 6 ft. of stone in the face, of good quality. The leading stope over this level is carrying 8 ft. of stone, of good quality. All the rest of the stopes are looking well. No. 2 winze on this level has been sunk by the contractors a further depth of 11 ft. 3 ins., and holed through to No. 10 level; total depth, 109 ft. 3 ins. I have started to stope at the bottom of this winze on 8 ft. of stone of good quality. No. 8 level has been driven 8 ft. for the fortnight, making a total distance of 578 ft. from the underlie. The reef is making again in the face; we have now 2 ft. of rubbly stone, of fair quality. The stone in all the stopes above this level is rather small at present, averaging only 1 ft. 6 ins. of medium quality. No. 7 level: Very little doing over the back of this level this fortnight; being in want of mullock to fill up the stopes, it is our intention to drive the cross-cut on No. 6 level for mullock to fill up these stopes with. No. 6 level: The stopes over this level are now filled up with mullock, and we have started to rise for stopes again on about 8 ft. of stone, of good quality. No. 6 winze on this level has been sunk a further depth of 12 ft., making a total depth of 62 ft.; there is a little stone showing over the back of this winze; this winze is being sunk on the footwall. The number of trucks hauled from each level is as follows:—No. 11 level, 170 trucks; No. 10 level, 890 trucks; No. 9 level, 605 trucks; No. 8 level, 390 trucks; Nos. 6 and 7 levels, 271 trucks; total, 2,326 trucks. We have finished the timbering of No. 2 underlie shaft, and started to sink again; everything in good order.—T. Lester.

DEVALA MOYAR (29th April.)—The winze below the deep tunnel is down 49 ft.; the lode is wider than the winze, is very hard, and composed principally of quartz, and will yield 7 per cent. of pyrites. The end in the deep tunnel east has been extended 4 ft., it will yield 4 per cent. of pyrites, and is not looking so well as last week. The tunnel west of cross-cut has been extended 13 ft.; the lode is poor, and I am consequently removing the machine, and employing it to sink a winze in the bottom of the deep tunnel 53 ft. west of pyrites winze, with the object of opening up the block of ground for stoping. The winze below the 48 is down 21½ ft.; percentage of pyrites in lode, 20. Assays: West of cross-cut, 21 grs.; pyrites winze, 1 dwt. 17 grs.; deep tunnel east, 2 dwts. 14 grs.; stopes bottom of deep tunnel, 6 dwts. 23 grs.; winze below 48 level, 17 dwts. 10 grs. Crushing 300 tons of quartz, separated from the pyritous portion of lode, have yielded 15 ozs. free gold.—J. Williams.

EAST AREVALO (MEXICAN) (30th April).—Since my last report we have driven the No. 3 level on the lode 2 ft. 3 ins., the ore is about the same width, but not nearly so rich for silver. In the early part of the week the richest pieces assayed 50 marks per monstone. I hope for an improvement in a few days. The north cross-cut third level has been extended across the lode 2 ft. 2 ins., but has not as yet reached the footwall; the lode is producing ore, but scarcely enough to be of any value. The No. 4 level has been driven north across the lode 3 ft. 6 ins., it is showing specks of metal of as yet of no value; the lode at this point is 30 ft. thick, and I hope to cut metal before cutting through. I expect next week to send you plan and sections of this mine.—H. Prideaux.

ETHERIDGE UNITED.—Mining manager reports, under date 27th March.—*Re* Canadian West Mine: During the last fortnight the work has been confined to driving west, and at the 139-ft. level stopes have been taken out 30 ft. long 6 ft. high by 6 ft. wide. The western drive is very good-looking stone 4 ft. in thickness. All the stopes, Nos. 1, 2, 3 and 4, are carrying from 2 ft. 6 ins. to 3 ft. of good-looking mundic stone, which I am saving for the next crushing. Other parts of the reef not so good. On visiting the mine underground to-day I picked out some stone which I should like to get assayed, so will forward it you as soon as possible along with some tailings which have been through the usual course here, so I can then find out how much gold is lost in the treatment. The stone now going through, and which I shall clean up on the 4th of April, is from between the walls 6 ft. wide. The result I will let you know in my next report. If I can get stone to go 1 oz. to the ton it will give you a good percentage. On sinking 300 ft. or 400 ft. I am almost certain to do so. *Re* Lord Nelson: The above mine is looking very well. I regret to say that the water will not hold out more than a month longer. If it had I have no doubt that you would have got a return this year. For a fortnight's crushing up till March 20th at the two mills I have got 247½ ozs. retorted gold.

GARFIELD.—The directors have received a report from Mr. Hooper, the superintendent at the mines, under date of May 4th, which concludes by saying the mill has been working regularly with five stamps.

GOLDFIELDS OF MYSORE (30th April).—Fortnightly report.—The west cross-cut at 165 ft. in bridge shaft has been advanced 5½ ft.; total distance from shaft, 30¾ ft.; a lode of quartz 15 ins. wide has been intersected, and it is worth by panning 1½ dwts. The south level at 105 ft. has been driven 5½ ft.; total distance, 75¼ ft.; there are 3 ft. of low grade quartz in the end. The north level at 105 ft. has been driven 3½ ft.; total length, 83 ft.; the end is in country. Middle shaft has been sunk 5 ft.; total depth, 198½ ft.; there are 2 ft. of lode in the bottom, which pans 3 dwts. The north level at 175 ft. has been advanced 4¾ ft.; total distance, 92¼ ft.; the lode is the whole width of the end, and worth 2½ dwts. by panning. Driving the south level at 175 ft., an advance of 5½ ft. has been made; total distance, 88½ ft.; there is a lode 1½ ft. wide in the end of low grade. The west cross-cut from this level has been advanced 4¾ ft.; total, 19½ ft.; the end is in country. The north level at 108 ft. has been driven 6 ft.; total, 154½ ft.; there are 2 ft. of low grade ore in the end. The sinking of the winze in the south level at 108 ft. has been resumed, and an advance of 4½ ft. has been made; total depth, 15½ ft.; There is about 1 ft. of lode in the bottom worth by panning 9 dwts. per ton. The new shaft, south of middle shaft, has been sunk 4½ ft.; total depth, 113½ ft.; the bottom is in country. The east cross-cut from the new shaft, south of bridge shaft, at 75 ft., has been advanced 5¼ ft.; total length, 11½ ft.; the end has passed through 3 ft. of old workings, and is now in the footwall. Champion lode: Coromandel shaft has been sunk 4¾ ft.; total depth, 187½ ft.; the bottom is in country. Driving north from the west cross-cut at 150 ft., an advance of 18 ft. has been made; total length, 69½ ft.; there are two small stringers of quartz in the end, worth 1 dwt. by panning. Prospect shaft has been sunk 5½ ft.; total depth, 216¾ ft.; the bottom is in country. The north level at 200 ft. has been advanced 4½ ft.; total, 20¼ ft. There is a stringer of quartz in the end 2 ins. wide, and worth by panning 10 dwts. In the prospecting shaft near Balaghat the west cross-cut at 49 ft. has been driven 16½ ft.; total length, 64 ft.; the end is in country. —J. Samborne.

INDIAN (29th April).—Crushing operations: Nearly 5 ins. of rain has fallen during the week, and the mill has run with slight interruption for the whole of that time. All appliances are behaving well. In the past month 178 tons of quartz have been crushed, the mill running 17 days only at low speed. From this 30 ozs. of gold were obtained, with plates and tables only, leaving the richer concentrates for future treatment. Health of English staff good; much fever amongst the coolies.—Phillips.

JOSEPHINE.—Extract from superintendent's report for week ending 27th April.—The 300-ft. winze No. 2 has been sunk 12 ft., and shows about 2½ ft. of quartz of good grade. Drift east from No. 1 winze (intermediate drift) has been run 16 ft. in same ore body. The stopes above 300 east are declining in value as we work up to the edge of the ore shoot. The 300 west stopes show considerable quartz, but of lower grade than week previous. The 400-ft. level has been cleaned up (east) and extended 12 ft.; this will now be pushed ahead with all speed. The 400 west stopes show no change.

— The following cablegram has been received from the superintendent:—"Yield of free gold for fortnight, $3,000; estimated value of sulphurets for fortnight, $1,000; tons milled for fortnight, 500.

MESQUITAL DEL ORO.—Mine captain's report, dated 19th April. Work done in the mine during the week was as follows:—Acerada, east of Saus: Four men, driven 5 ft.; total, 176 ft. Reef 4 ft. thick, but rather low-grade ore during week. Acerada winze A: Sinking with four men. Sunk 4 ft.; total, 19 ft. Reef 4 ft. 6 ins. thick, of a very fair average milling ore. The 85 level east: Four men, driven 2 ft.; total, 611 ft. 6 ins. Reef 3 ft. 6 ins. thick, of low-grade ore at present, but look for an early improvement. The 137 east level: Four men, driven 2 ft.; total, 592 ft. Reef 5 ft. thick, of good milling ore, and shows a little free gold. The 190 level east: Four men, driven 1 ft. 6 ins.; total, 403 ft. 6 ins. Reef 3 ft. thick, of a very fair average ore. The 190 east winze B: Four men, sunk 1 ft. 6 ins.; total, 46 ft. 6 ins. Reef 4 ft. 6 ins. thick, of a rather low-grade ore, but looks like an early improvement. The 190 level west (south part): Four men, driven 3 ft.; total, 331 ft. Reef 6 ft. thick, of rather low-grade ore, but looks very promising. The 256 level east: Four men, driven 2 ft.; total, 225 ft. Reef, 4 ft. 6 ins. thick; no alteration in quality since my last report. The 256 level west: Four men, driven 3 ft.; total, 234 ft. Reef, 4 ft. 6 ins. wide, and still more standing to the south. San Miguel tunnel: 14 men, driven 5 ft.; total, 1,807 ft. The 137 east, stopes 1 and 2: Reef, 6 ft. thick, of good milling ore; a little improvement during the week. The 190 west, stope 20: Reef, 7 ft. thick, of a fair average ore. The 190 west, stopes 21 and 22: Reef, 4 ft. 6 ins. thick, of an average ore. The 85 east, stope 4: Reef, 6 ft. thick, of good milling ore. The 85 east, stopes 11 and 12: Reef, 3 ft. 6 ins. thick, of rather low-grade ore.

I am sorry to say that our progress during the week has been very slow, owing to the Easter holidays, and men would not work.

MONTE CHRISTO.—The manager reports under date 25th March: The following work was done during the fortnight: Main shaft has been sunk 6 ft., making the total depth 288 ft. East drive has been driven 7 ft., making 209 ft. from shaft. North shaft has been sunk 7 ft.; total depth, 44 ft. No improvement in any of them. Endeavour shaft has been sunk 10 ft.; total depth, 124 ft. We find that the lode has not been worked from the present main shaft. The chute which was taken out having been wrought from the old shaft. The stone is increasing in size rapidly, in about 6 ft. it increased from 7 ins. to 20 ins., but of poor quality, probably only 7 or 8 dwts. per ton. I shall sink a few feet further, and then cut the lode again. I am not quite satisfied we are on the main lode, but a few feet further sinking will decide the point.

MONTE DEL ORO (14th May).—Fortnightly report—Taylor's engine shaft: Good progress has been made in the 186-ft. level south of the cast cross-cut; since, 26½ ft. have been driven during the fortnight, making the total extent of the level 274 ft. The lode in this end has become very small, the branch of quartz it now carries being 3 or 4 ins. wide. In the early part of the month the lode in the 186-ft. level north of the west cross-cut split into two branches when driving was proceeded with on the eastern or largest branch. This, however, proved to be the wrong one as the quartz cut clean out; consequently, operations in that direction were suspended, and the men set to drive on the western part of the lode, which at present carries a vein of quartz averaging from 4 to 6 ins. in width. Shaft No. 6: The total length of the 186-ft. level north of the shaft is now 208½ ft., of which 26 ft. were extended during the past fortnight, the ground proving very favourable for driving; the lode continues very small, carries a soft flookan about 2 ins. wide, but contains no quartz. This shaft is now being cleaned out preparatory to sinking on the course of the lode below the 186-ft. level, and I hope we shall be quite ready to commence this work immediately the patent automatic pump arrives on the mines. Shaft No. 5: Since last reported on, old workings have again been broken into north of the shaft, but I am inclined to think the men have almost spilled through them, because there are now signs of firm ground ahead, however, by the time I again write to you I shall be able to say something more definite in regard to this point. Shaft No. 2: The intermediate level has been extended 19½ ft. north of winze No. 1, the amount driven for the fortnight being 19½ ft. During the greater part of this drivage the lode has remained small, being composed principally of a soft flookan with a little fine quartz intermixed, but there are now appearances of its opening out since the present end contains small branches of quartz.—J. ROBERTS.

MOUNT MORGAN EXTENDED.—The directors have just received a report from their local committee (per Mr. R. Ballard, M.I.C.E.), dated Rockhampton, April 2nd, which states that the Melbourne machinery has arrived, the contractors will forthwith vigorously proceed with its erection; the machine buildings, engine shed, and amalgamating platform are practically completed, the incline road finished, and the contractors now erecting winch and drum for hauling gear. Substantial progress has been made with the well, now down 68 ft., with a yield of 150 gals. per hour. We are fairly between the walls of the Immanuel vein, and sinking on the underlay; the vein is about 4 ft. thick, underlying very rapidly at an angle of nearly 1 to 1 (assays of ore from Immanuel vein at this point were telegraphed at 1 oz. 15 dwts. 5 grs. gold per ton. This well has been a tremendous expense, and is costing a lot of money, the redeeming point is the vein; we have been fortunate enough to strike in it. If it holds and carries gold regularly it will be the saving of the mine, for the water question is vitally serious. Should the vein hold and carry gold then the question is solved, because in working out the vein we constantly shall increase our underground drainage, and consequently our underground supply of water; here is the rock of our safety, the rock which will go hard towards splitting us up just as this Immanuel vein turns out. The leaching platform shaft is now down 28 ft. I am waiting assays of samples. I have stopped this shaft for want of further money to carry on exploring. I bitterly regret being so short of money, and do my best, I shall be short. Classon's drive: All this month we have been cutting across a fine thick hematite reef; assays not yet to hand, but I do not think there is much in it, by the look of the stone it is too compact to carry gold, and I should not expect to cut gold in it till I got through it, and come to the footwall part; here I am stopped, too, for financial reasons.

MYSORE (30th April).—Mining operations: I am not able to send you the monthly report to-day. The bargains will be measured to-morrow, and particulars will be sent you next week. There is little or no change since my last report. The mine is in a satisfactory condition.—B. D. PLUMMER.

MYSORE WEST.—The mining manager reports for the fortnight ended 30th April.—The 159-ft. level north of Walker's shaft has been advanced by hand labour 14 ft.; total from shaft, 451 ft. The lode continues about 3 ft. wide, of clean blue quartz, but is of no value. The 225 north of Walker's has been advanced by a party of coolies 6 ft.; total from shaft, 151 ft. 8 ins. The lode here is still large, about 6 ft. wide, but the quartz is of no value; we have now put a party of Moplahs to drive this end, and I hope they will make a little better progress. The 225 south on east reef has been advanced by hand labour 4 ft. 3 ins.; total distance from cross-cut, 127 ft. 9 ins. The lode continues here without change; no assay has been made from it this week. We have changed the coolies in this end in hope of making better progress; but the lode is close and hard here, and I do not expect very much improvement so long as it remains as it is. The 300-ft. level cross-cut west has been advanced by hand labour 5 ft. 6 ins.; total distance from shaft, 27 ft. The end is in hard rock. I shall probably stop this during the coming week, and put the men to open a trial pit on surface. The 300-ft. level north has been advanced 18 ft.; total distance from shaft, 81 ft. 6 ins. The cross-cut east has been advanced 7 ft. 6 ins.; total distance from shaft, 29 ft. 8 ins.; both these ends are being driven by machines and by the same contractor. We have no quartz in this north end as yet, but we shall probably meet with it shortly: the lode was barren for some distance in each level, and we are not yet through it in this level. The cross-cut east is in hard ground, but there is a considerable stream of water issuing from it, and I think it will be advisable to continue it for some distance yet. I am making a series of costean pits on surface in a run of ground east of Walker's shaft, but have obtained no definite result yet. All the machinery is working very satisfactorily.

NEW EBERHARDT.—The mine manager reports under date May 5th, as follows:—Mine: Number of tons of ore assorted and put on the ore dump for the week, 22 tons; assay value of same, $56 per ton. I am pleased to be able to state that the favourable prospects in our south workings still continue, and I am hopeful that our output for the coming week will be again increased from that of last week. Our present prospects are very favourable for the finding of more ore, and the extent of new ground unexplored in the direction we are following our ore is sufficient to contain ore bodies, large enough to reimburse the company for all past outlays. Ore at the mill: We now have on our mill dump 360 tons of ore. Bullion shipment: On the 29th April I shipped two bars bullion; total, 3,282.15 ozs.; assay value, $1,589.15. Please find shipping receipt herewith.

NEW HOOVER HILL (11th May).—Briol's shaft: Driving north at the 230 the streak of ore is small, occasionally showing gold in the rock. In the winze below this level there is a good deal of quartz, which pans about $3 per ton. Driving north at the 170 the streak of ore is small and low grade. Sinking on the ore below No. 1 winze it is looking better, and showing a little gold in the rock. The drift going south at the 130 is looking well; we have cut into a good deal of quartz, but it is low grade ore, and pans about $1 per ton. The stope from No. 2 winze is turning out fair ore. In the stope below the 77 the ore pans about $5 per ton. The mill and machinery are working well.

NEW LIVINGSTONE (23rd March).—Fortnightly report:—The underlay shaft has been sunk 9 ft. during the past fortnight, making the total depth 169 ft. from No. 2 platt. The reef is 8 ins. thick of white stone, and the country is very favourable for sinking. I think the contractors will finish their contract in a fortnight from date. I started the battery engine on Tuesday, and fitted the tanks and boilers. Everything is in good order.—N. MAYNE.

NEW RUSSELL.—The following report has been received from the mines, under date 30th April:—Riggon Hill lode: As I informed you in my letter of the 16th inst. work is being continued in the stope below No. 2 level south, with a veia to take up the water draining in from Soliague lead in a winze, and so prevent the constant influx in the shaft. This has been completed satisfactorily, and has already proved of great advantage to us, as we can do without pumping at night while this winze is filling up, and can consequently run the hoist day and night. Laurel Hill, No. 2 level south: As will be seen from the weekly sheet the driving of this level has been completed, and the rise to meet the winze from No. 1 level south has been commenced. The work this week has again been unproductive of milling ore, and, under the circumstances, I would suggest that for the present at any rate no No. 2 north level be driven. I pointed out to you in the scheme I submitted for developments, that the Riggon Hill and Big lodes, and now I think I may also add the new lode, give indications that more amply justify further work in the bottom, and I would therefore submit it would be better to concentrate the development work on those three lodes, and to allow Laurel Hill for the time to remain quiescent. Big lode: Preparations for the erection of the old boiler at the Big lode shaft have been carried on steadily during the week. The repairing was completed on Friday, and the boiler was put into position on Saturday. The mason is now at work walling it in, and if no accident or delays occur we hope to be able to make steam connections this week. New lode: Sinking has been continued in the new lode I referred to in my last, a total depth of 23 ft. having been reached in our Prospect shaft. Although the depth is not great enough for us to expect any settled course of the ore the indications are good, and at the time of writing we have in the bottom a strong vein of 4 ft. in width, and as yet no footwall reached. As is usually the case in workings so near the surface, the ore has veered about considerably both in position and value, but I am glad to report that, in my opinion, and in that of your mining captain, the present showing is amply sufficient to warrant further investigation.

— Mill returns for week ending 27th April: The mill has run with more than ordinary steadiness this week, but our ore that has not shown up quite as well as usual. As will be seen from the sheet a small quantity (35.25) tons of the new lode ore has been milled, but owing to our inability to keep a battery going thereon our only chance was to mix it with the Riggon Hill ore. If the ore gains in hardness, with ordinary rapidity in sinking I hope to be able to make a run on this ore alone during May, but in its present soft state it passes the batteries too rapidly to allow of such a test.

NINE REEFS (29th April).—Mining operations. Malleson lode: Morrison shaft: Sinking under the 185-ft. level has advanced 3 ft. 10 ins.; total depth, 63 ft. 10 ins. The part of the vein carried is 5 ft. wide; the assay, 3 dwts. 6 grs. gold per ton. Baynard shaft: The 310-ft. level north driven 5 ft. 3 ins., a total distance from shaft of 81 ft. 6 ins. The vein in the drift is small and disordered: the assay is 4 dwts. 13 grs. gold per ton. The above drivage has been on the western branch of the vein. Stopes.—No. 1 stope in the back of the 185-ft. level north of main shaft: Vein 6 ft. wide; assay, 5 ozs. 17 dwts. 14 grs. gold per ton. No. 3 stope in the bottom of the 185-ft. level south of Baynard shaft: Vein 4 ft. wide; assay, 2 dwts. 14 grs. gold per ton. No. 4 stope in the bottom of the 185-ft. level south of main shaft: Vein 4 ft. 6 ins. wide: assay, 1 oz. 2 dwts. 20 grs. gold per ton. No. 5 stope in the bottom of the 185-ft. level north of main shaft: Vein 6 ft. wide: assay, 3 dwts. 6 grs. gold per ton. No. 6 stope (1st part) in the back of the 310-ft. level north of main shaft: Vein 6 ft. wide; assay, 14 ozs. 14 dwts. gold per ton. No. 6 stope (2nd part) in the back of the 310 ft. level north of main shaft: Vein 5 ft. wide; assay, 1 oz. 8 dwts. 2 grs. gold per ton. Champion lode: Vyvyan shaft: Winze sinking under the bottom of the 145-ft. level south of Vyvyan shaft, advanced 2 ft. 6 ins.; total, 4 ft. 6 ins. This winze is being sunk under the vein. Stopes: North end of stope in back of the 145-ft. level south of Vyvyan shaft: Vein 1 ft. 8 ins. wide; assay 2 dwts. 14 grs. gold per ton. South end of stope in back of the 145-ft. level south of Vyvyan shaft: Vein 1 ft. 8 ins. wide: assay, 2 dwts. 14 grs. gold per ton. North stope in back of the 115-ft. level north of Vyvyan shaft: Vein 1 ft. 6 ins. wide; assay, 4 dwts. 13 grs. gold per ton. New shaft, sinking from surface. During the week the men have been engaged in cutting through the vein, which is about 2 ft. 6 ins. wide, the quartz portion varying from 8 ins. to 18 ins. wide; the assay is 1 oz. 3 dwts. 12 grs. gold per ton. Hodgson's shaft, 417 ft. south of Baynard shaft, has been

secured by timbers to a depth of about 30 ft., and we have commenced to clean up the remainder of this shaft. Milling: The stamps are running well. You will, doubtless, be pleased at the improvement of the assays, especially so with the assay from the new shaft (Champion lode). I am glad to say this part of the mine looks very promising. I have also great confidence in the future working of the veins at Hodgson's shaft (Malleson lode). Our returns from mill are also better; as we are cleaning up now it makes a difference of some five or six days in our milling month, but this will be rectified by May working.—Capt. BENNETTS.

NO. 2 QUEEN (28th March).—Fortnightly report.—No. 1 shaft: The company have ceased operations in No. 5 level south, owing to the reef getting so much smaller that quantity could not be got to make the stope payable. No. 1 level south: The tributers still continue working No. 2 block south from the straight shaft. The formation is very large, with bunches of reef running through it, varying from 3 ins. to 6 ins. in thickness of poor quality, to judge from appearance. The estimated quantity of stone broken by them is about 16 tons. No. 2 shaft; The contractors have sunk a further depth of 27 ft., making a total from surface of 602 ft., and completed 113 ft. of timbering. Mill: We have finished a crushing of 164 tons 3 cwt. 3 qrs. for the Hidden Treasure Company, and the Identity Company cleaned up yesterday (the 27th inst.) a crushing of 273 tons 10 cwt. we have put through for them. The battery is now engaged on the St. George Gold Mining Company, and we shall start on the Black Jack P. C. Company's stone in a few days.—A. G. CHARLETON.

NORTH MEXICAN (3rd May).—I started sinking again on Monday. So far it has gone along all well. I am having the tanks inside the mill filled with water, and some repaired by the carpenters. I expect in a few days all will be in good shape.—R. S. CARLISLE.

NUNDYDROOG (30th April).—Mining operations: Webb's shaft is down 416 ft. 6 ins.; there is no alteration in the rock, it continues to be hard and barren. Taylor's shaft is down 371 ft. 8 ins., it continues hard and poor. The 370-ft. level north of Webb's shaft, cross-cut in the western side was driven last week 6 ft. 10 ins.; total, 48 ft. 4 ins.; the end is in hard barren rock. The 370-ft. level north of Webb's shaft was driven 3 ft. 10 ins.; there is a lode of quartz 2 ft. wide, assaying 2 dwts. 6 grs. The intermediate level was driven south of Webb's shaft 3 ft.; total, 71 ft. 10 ins.; the lode is 1 ft. wide, assaying 2 ozs. 1 dwt. 6 grs. The stope in the back of the 370 ft. south of Webb's shaft continues to look very well, but it is near the boundary, and we shall not be able to take away a great deal more; the lode is 3 ft. wide, assaying 2 ozs. 9 dwts. The stope in the bottom of the 230, the lode in the middle level, the rise in the back of the 230 north of Webb's shaft, and the stope in the bottom of the 166-ft. level south of Webb's shaft, each contain a lode 1 ft. 8 ins. wide, of an average value of 1 oz. 8 dwts. 10 grs. The new shaft near the north boundary, was sunk 4 ft.; total, 47 ft. There is such a copious stream of water here that the men are scarcely able to deal with it by hand and continue the sinking at the same time. I have, therefore, decided to erect a small steam engine for the purpose of draining this ground. Foundations were commenced to-day, and the erection will be pushed on as fast as possible. Assay of weekly samples from the mill:—Rough quartz, 2 ozs. 4 dwts. 12 grs.; smalls, 1 oz. 12 dwts. 12 grs.—B. D. PLUMMER.

OOREGUM (30th April).—Fortnightly report.—Main shaft: The 250-ft. level driving south on course of lode, 14 ft. 4 ins. have been done, or 262 ft. 3 ins. from cross-cut west; the lode is 2 ft. 9 ins. wide, and gives an assay of 4 ozs. 15 dwts. 16 grs. of gold per ton of quartz. The 250-ft. level driving north, 7 ft. 6 ins. have been done, or 178 ft. 2 ins. from cross-cut west; the lode here has improved, now 4 ins. wide, a sample from it gives an assay of 1 oz. 17 grs. of gold per ton of quartz. Driving on the No. 1 branch intersected in the cross-cut west from shaft, 1 ft. 6 ins. have been done; the branch is 2 ins. wide, and gives an assay of 4 dwts. of gold per ton of quartz. The stope in back of the 250-ft. level south of cross-cut west, 173 superficial feet have been cut; the lode is 2 ft. 6 ins. wide, and gives an assay of 5 ozs. 8 dwts. 21 grs. of gold per ton of quartz. Low's shaft: The 200-ft. level driving north from shaft, 4 ft. 8 ins. have been cut, or 306 ft. 7 ins. from shaft. The small branch of quartz has improved in size and yield, now 4 ins. wide in the bottom of level, a sample taken from it gives an assay of 19 dwts. 15 grs. of gold per ton of quartz. The 200 winze north of shaft, 4 ft. 3 ins. have been sunk, or 61 ft. 10 ins. below the level. Owing to an accident to the old pumping engine here on Saturday last, this winze is now full of water and is suspended for the time. The 200-ft. level driving south, south of shaft, 8 ft. 3 ins. have been driven, or 186 ft. 1 in. from cross-cut west; the lode is at present split, each part being 10 ins. wide, which gives an average assay of 4 dwts. 4 grs. of gold per ton of quartz. The No. 2 winze in bottom of the 200-ft. level south, south of shaft, 5 ft. 6 ins. have been sunk, or 10 ft. 6 ins. below the level; the lode is 1 ft. 6 ins. wide, and gives an assay of 1 oz. 17 grs. of gold per ton of quartz. The stope in bottom of the 200-ft. level south of shaft, the lode is 2 ft. wide and gives an assay of 8 dwts. 17 grs. of gold per ton of quartz. The stope in back of the 200-ft. level south of shaft, the lode is 4 ft. wide and gives an assay of 9 dwts. 19 grs. of gold per ton of quartz. Last Thursday this stope was communicated with the old workings in bottom of the 100-ft. level at old battery workings. Probyn's shaft: This shaft has been sunk 1 ft. 9 ins., is now 38 ft. below the 300-ft. level; the lode is 4 ft. 6 ins. wide, and gives an assay of 4 ozs. 1 dwt. 15 grs. of gold per ton of quartz. The cutting of plat at the 300-ft. level is completed; they are to-day putting sollar in same, also the necessary timber for tram-road across the shaft; when this is done our sinking operations will be increased. The 300-ft. level driving south, 4 ft. 3 ins. have been done, or 32 ft. 4 ins. from shaft; the lode is 4 ft. 6 ins. wide, and gives an assay of 5 ozs. 13 dwts. 5 grs. of gold per ton of quartz. The 300-ft. level driving north, 3 ft. 4 ins. have been done, or 29 ft. 4 ins. from shaft; the lode is 4 ft. 6 ins. wide, and gives an assay of 2 ozs. 5 dwts 17 grs. of gold per ton of quartz. The 230-ft. level driving south, 3 ft. 6 ins. have been cut, or 107 ft. 1 in. from shaft; the lode is 2 ft. wide, which gives an assay of 1 oz. 13 dwts. 18 grs. of gold per ton of quartz. The winze in bottom of the 230-ft. level, north of shaft, 3 ft. 5 ins. have been sunk, or 57 ft. 10 ins. below the level; the lode is 2 ft. 3 ins. wide, and yields 2 ozs. 10 dwts. 2 grs. of gold per ton of quartz. The winze sinking in bottom of the 230-ft. level south of shaft is 37 ft. below the level; the lode is 4 ft. wide, and gives an assay of 2 ozs. 3 dwts. 13 grs. of gold per ton of quartz. The 166-ft. level driving south from shaft, 7 ft. have been driven, or 229 ft. 3 ins. from shaft; the lode is 4 ft. 6 ins. wide, and gives an assay of 8 ozs. 8 dwts. 17 grs. of gold per ton of quartz. The No. 2 winze sinking in bottom of the 166-ft. level south of shaft, 5 ft. have been sunk, or 38 ft. 4 ins. below the level; the lode is 4 ft. wide, and yields, as per assay, 1 oz. 17 grs. of gold per ton of quartz. The No. 2 rise in back of the 166-ft. level south of shaft is now 10 ft. 4 ins. above the level; the lode is 2 ft. wide, and gives an assay of 7 dwts. 15 grs. of gold per ton of quartz. The stope in bottom of the 166-ft. level north of shaft, 148 superficial feet have been stoped; the lode is 2 ft. wide, and gives an assay of 3 ozs. 8 dwts. 14 grs. of gold per ton of quartz. The stope in back of the 166-ft. level south of shaft, the lode is 1 ft. 6 ins. wide, and gives an assay of 19 dwts. 15 grs. of gold per ton of quartz. Stamps: These are working well. To-morrow is our clean-up for end of month; the result we hope will be good, which we estimate at 1,250 ozs. (troy) of gold. All the machinery and pitwork is now working well.—W. MARTIN.

OSCAR (16th May).—No. 3 lode: Fair progress is being made, but the quartz has somewhat fallen off; the assays show no alteration in value. Daw's lode: Shaft, no alteration; we are pushing it down with all speed. The 420-ft. level south shows an increase of quartz, mixed with chloritic slate and iron pyrites. The 370-ft. levels north and south also show more quartz; the same remark applies to 230-ft. level north. There is no alteration to note in the stopes in back of 370-ft. level, but an improvement, we think, is taking place in those in back of 170-ft. level north.—J. DAW, jun.

OURO PRETO (19th April).—Passagem Mine: Incline shaft No. 2 was sunk 5 70 metres through hard quartzite, with small veins of quartz. During past week there has been a great change; quartz came in from south-west side, and the breast of incline is now nearly all in ore. This has more the appearance of regular lode than what has hitherto been found in this shaft. 365 level: Owing to pressure of other work little driving was done in this level during the past month. The north-east end was advanced 1.60 metres, and south-west end 1.70 metres. In each end there is a branch of good ore, about 1 metre thick, against hanging-wall. 315 level north-east was advanced full size in quartz of good quality for 5.55 metres; the lode at present carries bars of schist and quartzite, but these will very likely soon cut out again. 315 level south-west was driven 2.50 metres. A vein of ore about 30 centimetres wide is holding against roof, but lower part of level is in schist. Rise 19 over 315 north-east: Progress made, 3.90 metres. Breast of rise is full size in quartz, which carries branches of fine tourmaline ore. Level cutting in bottom of rise was carried forward 2 metres further, but footwall has not yet been found. 265 level south-west was advanced 2.20 metres. This end is still in unproductive ground. Rise 18 over 265 south-west was put up 3.50 metres, in massive quartz, carrying fine patches of pyrites. A level cutting under floor of rise disclosed, first a thick floor of quartzite, and below that a fine branch of solid pyrites. Rise 20 from 265 cross-cut: Progress made, 4.20 metres, chiefly through close schist. Since measuring, the rise has communicated to the north-east stopes at 235, but only met with quartz 1 metre before holing. Rise 19 over 175 south-west: Lode is very flat, but is continuing regularly, and now carries a good deal of pyrites. A general sample all over face of rise gave 23 grms. per ton; rise was advanced 1.30 metres. 120 level north-east was driven 2.00 metres. Strings of quartz have been making for some time in the schist, and these now appear to be uniting into one compact branch. More force has been put on, and I hope to see this end in good lode before long. Stoping: The lode in the 265 stopes has been holding forward very regularly, and has during past month shown generally more pyrites than formerly. The main lode here is about 3 metres thick, and nearly one-third of the ore milled was broken in the line of stopes above this level. In the new stopes at the 315, the lode has a very good appearance, though at times it is somewhat broken by bars of schist and quartzite. A good quantity of rich ore was broken from the lower branches under the 215 level, and also under floor of old stopes at 190. At the latter place there is a very fine branch of solid pyritous and tourmaline ore over a metre thick. In the 235 north-east stopes, about 150 tons of quartz were quarried, mostly towards 265 level, to hasten communication. Construction: A good force has been kept on the watercourse, and most of the necessary work for considerably increasing our water supply has been completed. Strakes and concentrating apparatus are being laid down for preparing concentrates for pans.

RUBY AND DUNDERBERG CONSOLIDATED.—Report upon the mines for the week ending 28th April.—Dunderberg: Amount of ore shipped during the week by tributers, 90 tons. There has been no change in the appearance of the mine, what ore we have being still in very small pipes. Eagle's drift: We have advanced 9 ft. in the upraise during the week, making a total of 203 ft. raised. We have six contractors and 19 tributers at work in the mine. Lord Byron: We have shipped 11 tons during the week; we have 12 tributers at work here. Bullwhacker: We have shipped 15 tons during the week; we have three tributers at work here.

— Telegram received to-day (21st May) from Eureka:—"59 tons tribute ore shipped; 13 tons tribute ore sold for smelting; producing to company $76."

SOUTH-EAST MYSORE.—Capt. Bennetts of the Nine Reefs, who has, by the permission of his board, undertaken the temporary supervision of the mining operations, writes as follows:—As advised by last mail, I have been making an examination of the property with the following result, viz., I find that to the south, and in close proximity to Lavelle's shaft, there are some very extensive old workings, the full extent of which is not as yet known. The northern extremity of these old workings is found in Lavelle's shaft, where it extends to a depth of about 240 ft. to 260 ft.; but as the workings lie chiefly to the south of Lavelle's, and the dip of the strike of the gold-bearing rock has proved in this district to be northward, it would appear advisable to go below the present 260 ft. level at this shaft, in order to meet with the shoots of gold-bearing quartz that in great probability exist south of Lavelle's shaft, and have not as yet, on account of their distance from this shaft, come so far north as to be met with at the present depth; or, in other words, these shoots are deeper than the present bottom of Lavelle's shaft. The prospect of meeting with good gold-bearing quartz, judging from what can be seen at the surface, is most hopeful. We have for the past week confined ourselves to the following mining work, viz.:—Stoping the back of the 260-ft. level north of Lavelle's shaft by 30 men. The vein in this stope averages about 2½ ft. wide; the average of four assays being 8 dwts. 7 grs. gold per ton. Rogers's shaft has been cleaned up, and the sinking resumed, the shaft having been sunk 9 ins.

during the past week ; 15 men have been engaged at this work ; vein, 3 ft. wide. Realising the importance of getting down to a sufficient depth to strike the shoots of gold that may come into this property from the southward, we shall make every effort to press forward the sinking with all despatch. The engineer, lately arrived on the mine. has reported to Mr. Hodgson at length regarding considerable alterations and repairs of machinery which he considers necessary, and Mr. Hodgson writes that while these are being completed it is not possible to keep the mill running full time. He adds : I have every confidence that our mill returns will improve as soon as we are able to break and hoist sufficient ore to keep the stamps regularly supplied ; and in reply to a telegram, has just wired :— "The mine is looking well. When the necessary work for developing the mine has beeu completed production will increase. It will not take long."

AFRICA.

LATEST FROM THE GOLD AND DIAMOND MINES.

VIRGINIA (TRANSVAAL).—The directors have received information that the transfer of this property has been completed.

MOODIE'S.—The transfer books will be closed during the month of June, in compliance with the requirements of the Natal law.

SHEBA.—The company has received a shipment for February and March of 3,403 ozs. of gold, realising 13,787*l*. 5s. 10d.

GREAT SHE.—The directors have sold, through Messrs. Pixley and Abell, the 93 ozs. of gold, &c., from quartz crushed in the months of July, August, and September last, which realised 293*l*. 19s. 5d.

ESSAMAN.—The company have received the following telegram of April crushing :—" Have rea ly for shipmeut, waitiug steamer, 200 ozs. of gold. Good supply of quartz."

GORDON DIAMOND.—Return of work done at mine for the fortnight ending 18th May :—Loads blue hauled 13,600 ; loads blue washed 10,900. Value of diamonds produced 3,200*l*.

KLERKSDORP.—Extract from letter of Mr. Ogden, mine mauager, just received by the directors from Klerksdorp :—" Whittaker's reef : This reef is without doubt one of the first in South Africa and second to none in this district."

READ'S DRIFT LAND.—Mr. George Brown, secretary, writes from 19, Finsbury Circus :—"I beg to hand you trauscript of a telegraun received May 23rd from this company's agent in South Africa : "I have found gold, Mazelfontein.' "

WASSAU (GOLD COAST).—The remittances of gold for the month of March last were 113¼ ozs., of the net value of 426*l*. 10s. 1d. During this month the mill was at work 22 days and 2 hours, and crushed 273½ tons of ore, the yield per ton being 0.42 oz. By the latest advices, dated 10th April, the manager reports that rain had then fallen, and that the mill was well supplied with water.

WITWATERSRANDT VENTURE SYNDICATE.—The company have just received advices from the managiug director at the mine, dated 26th April, of which the closing sentence reads :—" My firm opinion is that we have got a very good property, and when we get to work on a proper basis I think I shall be able to prove something in about a mouth's time."

SOUTH AFRICAN.—The following particulars of work relate to the week ending April 13th :—Blue ground hauled, 6,010 loads ; blue ground washed, 4,734 loads ; diamonds obtained, 1,447 carats ; estimated value, 1,750*l*. The following particulars of work relate to the week ending April 20th :—Blue ground hauled, 5,700 loads ; blue ground washed, 4,915 loads ; diamonds obtaiued, 1,559 carats ; estimated value, 1,800*l*.

NOOITGEDACHT ESTATE.—The following advices have been received from the mine since the last monthly report :—The 180 ft. level on Button's reef much improved, and now showing 7 ft. of ore, worth 15 dwts. per ton. On Davidson's reef the 80-ft. level east from No. 3 main level has greatly improved, being now 2 ft. wide, and worth 3 ozs. per ton. There is no change to note in other points of the mine. The dam, water-race, and mill are nearly completed.

HENDERSON AND FORBES.—I have the pleasure to inform you that a cablegram has been received by the compauy's solicitors from their agents at Barberton, stating that the property has been duly transferred to the company, and registered in their name. The certificates of shares will be ready on and after the 3rd June, to be exchanged for the allotment letters and bankers' receipts for 10s. per share paid.

TAQUAH AND ABOSSO.—In a circular the directors say that all difficulties being at last oyercome, and the requirements of the French and English laws duly complied with. the directors were enabled to allot to the shareholders of the Société Fermière 64,000 shares of 1*l*. each, fully paid, in exchange for the 3,200 shares of 500 francs (20*l*.), forming the capital of the Socéité Fermière of Paris, and of the new issue of 16,000 shares, with a preferential dividend of 20 per cent.—15,829 were applied for and allotted, leaving only 171 in the hands of the company undisposed of.

BIRD'S SWAZIELAND CONCESSION.—The company's agent, under date April 13th, reports that his representative went to Swazieland and took formal possession in the name of the company, and that the deeds had been received, endorsed as follows : " Registered in the books of the king and committee, and transfer fecs paid." The agent also states that he had received information that gold had been found on the property comprised in the concession, and reefs are known to exist there. The superintendent (Mr. J. H. Hampton) arrived at Durban on April 13th, and proceeded immediately for Swazieland.

HILL'S WATERFALL ESTATE.—The directors have reeeived a letter from their manager (Capt. Pascoe). dated 26th April last, announcing his arrival at the mines on the 23rd. Capt. Pascoe reports :—I at once commenced to put up buildings for the natives, so that I may induce them to remain during the winter. I have also to put up carpenters' and smiths' shops, store-house, office, &c. These will be built to a great extent with stone, having plenty at hand, being more durable aud cheaper than galvanised iron as sold in this eountry. I have had two days with Mr. Thomas on the property showing me the different workings, and it will take me another week at least to inspect the remaining portion of the farm. I like the look of the Irene quartz, but it has to be opened up before any great quantity of stuff can be sent to the stamps.

TRANSVAAL GOLD EXPLORATION AND LAND.—The following particulars are from manager's advices of April 22nd. Bullion : A shipment of six bars, melted gold, weighing 506 ozs. 17 dwts., valuc 1,925*l*., was forwarded through the Standard Bank on April 21st. Mines—Theta vein : Ore extracted for week, 70 tons ; assay value, 3 ozs. 17 dwts. gold per ton. Beta vein : Ore extracted, 10 tons, assaying 1 oz. 12 dwts. gold per ton. Columbian Hill : The vein, which is being proved in various drives, has not yet been found to carry gold in payable quantity, although occasional good prospects are got. Brown's Hill mill—Battery : Time at work, 105 hours ; ore crushed, 68 tons from Beta vein, assaying 1 oz. 18 dwts. per ton, and 41 tons from Theta vein, assaying 3 ozs. 9 dwts. per ton. After crushing of Beta ore was finished a clean-up was made, 123½ ozs. of amalgam being obtained from plates, and 48 ozs. from mortar boxes. Usual clean up of plates at eud of week yielded 122 ozs. of amalgam from Theta ore crushed. Pans : Time at work, 58 hours ; Theta slimes treated, 21 tons ; assay value, 2 ozs. 2 dwts. per ton.

ESSAMAN.—The directors lay before the shareholders a balance-sheet for the year ending 30th June, 1888. The gold obtained in driving the levels, enables the company to show a small profit after paying all home charges and writing off half the preliminary expenses. A small amount only is credited from the tributers' quartz obtained at Broomassie, it having been found necessary to put a stop to the system. On dispensing with the services of the late manager, Mr. Harvey decided to appoint in his place Mr. Macduff, who went out to take charge of the reduction department, although an experieneed Australian miner, and the directors have much pleasure in stating that the energy and ability he has shown have given them great satisfaction. Mr. Macduff promptly decided to work the stamp mill as he found it, rather than lose time by its re-erection. and small defects having been remedied, it has been working steadily since October, on the stone which could be supplied from the levels and two small stopes. From that time the following shipments have been made :—1888 : October crushing, 147½ ozs. ; November, 186 ozs. ; December, 135½ ozs. 1889 : January, 111½ ; February, 176 ozs. ; March, 132 ozs. ; April (by telegram), 200 ozs. ; total, 1,088½ ozs. ; the value of which is about 4,225*l*. The second 12 heads of stamps were in course of erection at the date of last advices. The character of the reef being now thoroughly ascertained, the directors can safely congratulate the shareholders on possessing a most valuable property. They have about 3 miles in length, of a reef running from 5 ft. to 14 ft. wide, about 4 ft. of the centre portion of which produces a minimum of 1 oz. to 1¼ ozs. of gold per ton. but the remainder of the reef will pay well for crushing, although it of eourse reduces the average. At short intervals richer shoots come in, and from one of these at Broomassie, as much as 3½ ozs. per ton have been obtained, while from a shaft recently eut off in the native concession at Prestea, a much higher return is reported, and every effort is being made to get down on this shoot. Mr. Macduff concludes his last letter as follows :—" The shareholders of this mine have nothing to fear as regards the value of their venture. It is only a matter of time to push down a shaft which will give them 'backs' to work, and place the Essaman Company in the front rank as a dividend-paying mine." The directors feel that the period has now arrived when a definite plan for working this valuable property should be decided on, and the course they recommend to the shareholders is to look upon the Essaman Company as a parent company, and to complete the balance of capital at once to 50,000*l*. The sum required will be ample for the development of the Prestea Mine, which is now virtually paying expenses with only partial working. Meantime, the shaft will be pushed on with as rapidly as possible, winding gear for the purpose beiug now in course of construction. Then, as the subscribed capital will be insufficient for working Broomassie, it is proposed to dispose of this concession to a separate compauy on such terms as will give the parent shareholders at least 50 per ceut. in cash and shares as profit. The value of the reef having been ascertained, and a good deal of work done in preparation, amply justifies such a price. How far the Broomassie Company can be worked in counection with the Essaman Company must be left an open question. The position of the property will admit of its being worked independently, or jointly with the Essaman Company, aud the latter will have another mine in the Treasury Hill, capable of beiug worked by the Prestea Mill, with an additional battery when necessary. The value of the Treasury Mine is matter of history among the natives, and the large extent of their old shafts is shown like a railway cuttiug along the line of reef. From the experience gained at Prestea. it will be desirable to sink a shaft to cut the reef at a depth of 60 ft. to 80 ft. below any probable native workings, in order to lose no time in opening up ground for stoping ; and for the development of this mine it is proposed to increase the capital of the Essaman Company eventually to 75,000*l*.

PANULCILLO COPPER.

17th May.—These accounts show a profit of 11,297*l*. 17s., after providing for interest on debentures and all London charges to 31st March last, and after adding (acecording to the 23rd article of association) 1,408*l*. 19s. 11d. to reserve fund, thus raising it to 7,667*l*. 13s. 8d. Interest for the half-year ending 30th June has already been paid at rate of 5 per cent., absorbing 5,625*l*., thus leaviug a balance of 5,672*l*. 17s., which it is proposed to carry forward. The wholly unexpected and most unsatisfactory result of last year's working was due, the manager writes, to a variety of eauses ; the two ehief being the want and utter disorganisation of labour throughout the province, owing to the very sudden and very large rise in copper, as well as to a demand for hands from the nitrate fields and elsewhere, while it was impossible to obtain for the company's regulus a priee at all corresponding with that for bars. Facts have, unfortuuately, shown that a high and sudden increase in the value for copper is not favourable to the company, for whereas a figure like 78*l*. for bars increased outside competition to such an extent as to give only nominal profits, a price very much less yields really large returns, as was proved in 1882, when, with an average price of 67*l*. for bars, the year's net profits reached 36,353*l*. ; and in 1883, with an average of 51*l*., the net profit was 25,662*l*. With eopper prices to-day lower than ever recorded, every effort will be made to reduce expenses, aud to do this effeetually the board have authorised the manager to stop smelting for a time, so as to bring faets in Chili as much as possible into harmony with the position existing here.—A. G. PYE, Secretary.

The letters of allotment and regret to applicants for shares in Tamplin and Son's Brewery. Brighton, have been posted.

THOMAS THOMPSON,

STOCK AND SHARE DEALER,

8½, ANGEL COURT, LONDON, E.C.

Telegraphic Address:—"NOSMOTH," LONDON.

Telephone No. 509.

Bankers:—THE CITY BANK, LIMITED, and THE ROYAL EXCHANGE BANK, LIMITED.

Mr. THOMPSON transacts business in all classes of Securities, Bonds (Foreign and Colonial), Banks, Railways, Insurance, Telegraph, Tramway, Gas, Water, Mining, and all Miscellaneous Shares. Shares sold at special prices for Forward Delivery (One, Two, or Three Months) on Deposit of 20 per cent.

Orders by Letter or Telegram promptly attended to.

Subscriptions will also be received at the same addresses.

NOTICE TO READERS.

Replies to Annual Subscribers will be sent by wire or letter, as may be necessary.

Non-Subscribers must send fee of 5s. 0d., in order to have their enquiries answered in "Mining World," or by wire or letter, as requested.

L. A.—Give them a trial.
Timid (P. P.)—We will inspect papers sent, and reply in our next issue.
W. H. R.—Sell. It is always well to take a profit. 5s. a share is not to be despised.
Banker (S. A. T.)—We think you will get a much higher price for your shares.
A. Lane (Yorks.)—Buy a few more and average.
J. J. Leman.—Gympie Great Fasterns are worth buying.
M. H.—It is not always the broker's fault. We advise you to write to the secretary.
G. W. D.—New Emmas.
Fourteen Years' Reader (A. B.)—A rise is expected immediately. They have fallen in sympathy with others.
Inspector (B. C.)—Cannot insert the matter as it is out of our line.
G. H. B.—There is bad blood between the directors.
August M.—See the full report in this issue, when, no doubt, you will alter your mind.
T. Parsons.—You have been badly advised. Under the circumstances, hold on.
Lady Reader.—You are not a subscriber, according to our books. See notice above.
Burma (U. V. W.)—It is a very good profit, and we advise you to take it.
Investigator.—We have repeatedly told our readers to sell them. The price is, even now, too high.
Regular Reader.—We think well of the breweries mentioned. Sell the Africans.
Uncertain (Wilts.)—Have nothing to do with the company. If you do your money will be lost.
Victor (P. L.)—The shares are cheap, and in our opinion should be bought.
Ignoramus.—Sell all four stocks mentioned.
Inquirer.—The MINING WORLD is nearly 20 years old.

The Mining World.

LONDON: SATURDAY, 25TH MAY, 1889.

The "MINING WORLD" is not the property of a Mining Speculator nor under the control of any clique.

THE POSITION OF COPPER.

DURING the past few days the air has been thick with rumours and positive statements with regard to the progress of the negotiations set on foot some time since, having for their object the rehabilitation of copper. Some of these statements probably have a substratum of fact; but it is impossible to say at present what the negotiations may lead to in reference to stocks and prices. One of the latest announcements is that made by the Paris *Temps* on Thursday evening, to the effect that the American mines, with the exception of the Tamarack, on Wednesday "ratified the provisional arrangement recently concluded by the British and American mining companies with M Morean, the liquidator of the Comptoir d'Escompte." So far as we have been able to ascertain, the statement that the British mines have made any such arrangement as that referred to is a pure fiction. Indeed, the *Temps* contradicts itself, for it adds that it only now remains to arrange matters with the British mining companies who were awaiting the reply of the American mines. The further statement that the Rio Tinto Company has intimated their adhesion to the agreement is not, we believe, founded on fact. We should, therefore, advise our readers to pay no heed to the rumours which are being constantly set afloat. It will be quite time enough to consider the effects likely to be produced by any future combination when it is actually formed. Meanwhile the copper market is firmer in tone than it has been since the speculation broke up. Dealings took place yesterday at about 40*l.* a ton, and a very brisk home business is doing. The new stocks are readily absorbed as they come forward, and it is estimated that the visible supply of the metal is being reduced at the rate of from 4,000 to 5,000 tons a month. The large stocks accumulated by the syndicate are being held back until it is seen what results the *pour-parlers* now going on between the liquidator of the Comptoir d'Escompte and the producing companies are likely to have. Of course, even at the present increased rate of consumption it would take a long while to reduce stocks to their normal level; but it is at all events an encouraging feature that the trade demand of this country, though still carried on from hand to mouth, is almost unprecedentedly large. We do not anticipate any material advance in the price of the metal at present, but the balance of probabilities is certainly in favour of the maintenance of present quotations, with, perhaps a slight further rise. Copper shares have generally improved, Cape Copper and Rio Tinto in particular comparing very favourably with the quotations of a few weeks ago, so that altogether the markets for copper and copper shares are in a more cheerful condition than they have been recently.

SOUTH AFRICANS.

A REFERENCE to our usual weekly tables, giving the variations in the prices of South African gold shares, will show that the upward movement which set in a few days ago has been more or less generally continued throughout the past week, the most marked rise having taken place in Robinsons, Salisburys, Durbau-Roodepoorts and Jumpers. The advance is to some extent due to renewed purchases here and on the Continent; but there is a disposition among London operators to take profits as they accrue, and in doing so we think those operators show that they are wise in their generation. Here and there no doubt quotations seem tempting; but the market is in anything but a healthy state, and there is no telling when the pendulum may swing back again. The truth is that the rapid decline in values between the early part of March and the middle of last week has given outside speculators a shock from which they will not easily recover. In that short period the decrease in the aggregate market value of the Witwatersrandt group of mines could not have been less than from 12 to 15 millions sterling. In Robinson, for instance, the difference between the highest price touched, and the quotation early last week was about 1,850,000*l.*, and in other cases the fall was proportionately almost as great. It is clear, therefore, that even at the much lower level of prices which now exists, the greatest caution is necessary in taking up stocks. We are far from suggesting that many of the mines have not been proved to possess intrinsic value of a quite unusual character. In some of them, indeed, the quartz treated in bulk has turned out exceedingly well. But the market is swayed by the manipulations of the big operators to a far larger extent than by any considerations as to the intrinsic merits of the properties. One never knows whether an upward or a downward movement may best suit the Hattou Gardeners and their allies on the other side, and it is, therefore, very dangerous for outsiders to dabble in the business at all. There can be little doubt that the recent heavy tumble in prices was largely engineered by the same group of operators who netted such vast sums by the rise in the early months of the current year. Having

succeeded in planting large blocks of shares on a too-confiding public, they seem to have deliberately set to work to break the market, so as to be enabled to get back what they had sold to such advantage to themselves, at much lesser figures, and, as we have seen, their efforts in that direction also have resulted favourably to themselves. And now the experiment is being repeated, it will be equally successful if the public forget the severe lesson they have lately received. The Randfontein Company is a case in point. The promoters of that concern placed the capital at the modest sum of 2,000,000*l.*, in 1*l.* shares, aud the shares were run up to over 2*l.*; but when the settlement had been got over those who had made such a big haul left the market to take care of itself, with the result that the shares have fallen to about par—which is probably quite up to their value. Sonebody has had to suffer, but the somebody does not appear to have been in the original swim. Experience of this kind is not easily forgotten, and we should certainly be surprised if, in view of what has beeu going on lately, there were any general disposition here to take up Randt shares. It is much to be regretted that what promises to become an excedingly important industry should have been initiated amidst an amount of sharp practice and rascality almost without a parallel in recent times.

BALAGHAT MEETING—A STRANGE RESULT.

THE issue of Wednesday's proceedings at the meeting of the Balaghat-Mysore Company is much to be regretted. The shareholders on reflection will probably admit that they met in an angry mood, or at least scarcely in a frame of mind to permit them to look at matters with a judicial eye, or to give mature consideration to the consequences of the decisions at which they arrived. At the same time we are free to admit that they had much offered them in the way of provocation. In the first place, the chairman delivered a speech appropriate to the occasion and full of information, but in a manner that made it totally inaudible beyond the reporters' table. He was followed by his colleague, Mr. Wright, a gentleman well acquainted with mining details, but he might have spoken from the North Pole with as much effect as he did from the comfortable and commodious room which the secretary had secured for the meeting. The result was that the report was moved and seconded in dumb show, and this, naturally, did not improve the temper of the shareholders, already irritated by delays, not in working the mine, but in obtaining substantial results of a dividend kind, for which neither the chairman nor Mr. Wright, nor indeed anyone connected with the management, could be held responsible by reasonable men. A further provocation (and perhaps this was the most keenly felt of all) was the practice which seems to have prevailed at this board of dividing the fees of directors absent from the meetings amongst their colleagues actually in attendance. In justice to the directors, we are bound to say that this practice prevails in some other companies of which we have heard, but "it is a custom more honoured in the breach than in the observance." It roused, and we think naturally, the ire of Mr. Henry Staples, a gentleman well-known and highly respected in mining circles, who could not understand the directors of a mining company taking, not only the full fees to which they were entitled, but dividing the fees of their absent colleagues amongst themselves, instead of placing them to the credit of the company. Neither could he understand the extra payment made to directors acting as a "committee" for the ordinary work of passing transfers. To this extent we are in perfect harmony with the shareholders.

But were the shareholders reasonable in their criticism of the mining operations? In the first place we must remind them that their consulting engineer is Mr. John Darlington, who, in connection with the Montana Company, the Scottish Australian Mining Company, and a large number of other successful enterprises, has won a name for ability in this department not surpassed by any of his contemporaries in London or out of it. Under his direction, and in conjunction with Mr. Oakley and Mr. Pryor, the miue is being developed with prudent and watchful care, and already, although simply professing to be in the process of development, it has recovered 2,780 ozs. of gold, yielding 10,238*l.* The average yield of the ore has been the singularly high one of 2¼ ozs. per ton; and if the veins were wide instead of being narrow Balaghat would be the gem of the Colar field. As it is the directors, under the advice of the gentlemen we have named are sinking their shafts deeper, particularly one of them, because it is common knowledge that in India, as elsewhere, veins widen as they go down and have also a tendency to become richer. In spite of the altogether reasonable explanations of Mr. Darlington, coupled with those of the board, the shareholders found considerable fault with what had been doue; but the diversity of their criticism would have been amusing if it had not its serious side. Mr. Parry, for example, said he was "a foolish man who thought he could direct a mine from India"; but Genl. Sankey was as ready with an idea for sinking a new shaft as he would be to lead his troops on a forlorn hope. The errors which Genl. Sankey attributed to the non-sinking of a shaft were with, like assurance, attributed by Col. Walker to the defective state of the machinery. But the wind was a good deal taken out of the sails of the General when Mr. Darlington said that the present shaft was sunk iu a most suitable position. and out of those o the Colonel, by the statement that Mr. Oakley had received all the machinery he required, and that only so late as last year, when in this country, on being specifically asked by the chairman whether he wanted more, he replied, "No, I do not." The shareholders differed among themselves on every point of their criticism. For example, one of them thought immediate ruin stared them in the face; a second was of opinion that they could go on for 13 months, and a third spoke of 18 months. In the result the shareholders landed the company in a *cul de sac*. They refused to adopt the report, to elect the directors, or to re-appoint the auditors. In all this there was a good deal of madness, but very little method. It is perfectly true that the shareholders were disgusted at the couduct of the directors in the matter of their fees, particularly when they contrasted it with that of directors of other companies in a similar position. A deputation of the shareholders is to wait upon the board, and we trust that the issue will be the calling of a fresh meeting to transact the business left unfinished on Wednesday, the strengthening of the directorate, and the allowing of the company to pursue its course without those internal dissensions which are never fruitful in anything but disaster. Shareholders should remember the Balaghat Mine is in quite as good a position as most of its older contemporaries when in the same stage of development. If, for example, the Mysore shareholders at a critical time had acted as Balaghat shareholders did last Wednesday, the brilliant future now opening out for Indian mining might have been relegated to the Greek Kalends.

THE NEW MINING EXCHANGE.

SUCCESSFUL OPENING CEREMONY.

MR. THOMAS THOMPSON, on Thursday last, formally declared the New Mining Exchange opeu for the transaction of business. Before such a declaration could be effectively made, a good deal had to be done. In the first place, the idea had not so much to be conceived as to be brought to maturity, and to this latter end there were two indispensable requisites—a good deal of hard work and some financial backbone. In neither were Mr. Thompson nor the associates he called to his counsels deficient. Mr. Thompson, on casting about for allies, was fortunate in securing the co-operation of Mr. William Henry Bumpus, Mr. James Henry Crofts, Mr. Samuel James, and Mr. Peter Watson—names which, like his own, will give confidence to the mining market and to the public. These gentlemen soon found the force of circumstances press them into the service as a committee, and they at once set about their self-imposed task with a vigour that necessity justified, and that success has amply rewarded. Premises had to be secured, and these were found at No. 9, Old Broad Street, exactly opposite what is known as "The Mining Door" of the Stock Exchange. Though having but slender support at the outset, Mr. Thompson and his colleagues were so confident of ultimate success that they lost no time in commencing work in every department in which it was needed. Whilst the builders were at work in transforming the premises to their new vocation, and the decorators were engaged in imparting to them all the elegance of which they can now boast, the committee laboured in season and out of season iu framing the "rules and bye-laws," to which we made special reference in an article we published in the MINING WORLD of last week. They also canvassed among the better class of the mining fraternity for members, with this happy result, that instead of starting upon a basis of 30 adherents, which was all they dared hope for as a commencement, there are now 51, excluding, of course, authorised and unauthorised clerks of members, whose fees will be paid by their employers, and thus form an important source of revenue to the Exchange. The Exchange itself, we may remark, belongs to the members, who each hold 50 shares in a limited company, and after paying all expenses to date on the amount called up there is a cash balance, forming the nucleus of a reserve fund, of about 3,000*l.* It is expected that the payments by members will quite cover all the ordinary expenses of the Exchange. It will thus be seen that both financially, and from the point of view of membership, the Mining Exchange is strong, and enters upon what we believe will be its useful career with every token of prosperity.

About 12 o'clock on Thursday the guests began to arrive, and were received, in the first instance, in the corridor by Mr. Thomas Thompson and the members of the committee, with the solitary exception of Mr. Samuel James, who is very popular with all those who have the pleasure of his acquaintance, and whose absence was much regretted. Mr. Thompson, followed by the other members of the committee and guests, proceeded past the liveried attendants to the closed doors, to the lock of which he applied a golden key, made expressly for the opening ceremony. When the company entered they found themselves in a well-lighted and ventilated basement of considerable dimensions. A first glance made it obvious that if the Exchange is to grow, as Mr. Thompson foreshadowed in his speech, larger premises will have to be secured at an earlier period than is dreamt of in the philosophy of its projectors. The floor is kamptuliconed, and there are desks both for reading and writing. To the left is a room for the courteous secretary, Mr. Thomas William Martin, and at the further end are special boxes for the members who choose to hire them. These are fitted with

telephones, and all the appurtenances which iugenuity and the rapid commercial life of the present day have called into being. As we said last week, all things must have a beginning, and it was the general opinion of the visitors that the Mining Exchange had begun extremely well, though it was judged to be but the starting on a road that would widen out to much greater prosperity in the by no means dim and distant future. Mr. Thomas Thompson ascended an improvised platform, and then there was a short pause, which enabled us to see amongst his supporters the following well-known gentlemen connected with the mining market and the financial Press :—The members of the committee ; Mr. H. S. Marks and Mr. Arthur Cohen, of the *Financial News* ; Mr. H. J. Bagnall ; Mr. G. Bedford ; Mr. W. H. Bumpus ; Mr. J. H. Crofts ; Mr. J. A. Dobson ; Mr. T. W. Ferres ; Mr. Greenip, of the firm of Suell, Son and Greenip ; Mr. J. Hook ; Mr. William James ; Mr. L. S. Lupton, of J. V. Turner and Co.; Mr. G. Mitton ; Mr. J. H. Nicholls ; Mr. A. Nicholls ; Mr. Allan Nicolson ; Mr. J. Quartermaine ; Mr. J. Rudkin ; Mr. H. Samuels ; Mr. W. Sharman ; Mr. J. H. A. Smith ; Mr. E. H. South ; Mr. H. J. Tallentire ; Mr. Alfred Thomas ; Mr. T. Thompson ; Mr. H. E. Vickers ; Mr. P. Watson ; &c., &c.

Short speeches were then delivered. That of Mr. Thompson fully explained the hopes and aspirations of the projectors of the Mining Exchange, and also the measure of success which has already been attained. The speech, which was eloquently delivered, carried the conviction to the minds of those present that these were the incipient stages of a movement which is destined to have an important influence upon mining as an industry, both from its commercial and its speculative side.

A GREAT SUCCESS.

The Chairman (Mr. Thomas Thompson) : I now declare this Mining Exchange to be opened for the transactiou of business. (Loud cheers.) As we all hope to meet this evening, it will be unnecessary for me to make to you any set speech. I think there are, however, one or two points in connection with this Mining Exchange which may even at this early hour of the day prove not altogether uninteresting if I briefly set them forth. (Hear, hear.) I will begin by telling you that this Exchange is already a greater success than ever we expected. (Cheers.) When the formation of this Exchange was first contemplated we thought that with great difficulty we might possibly get together 30 members, and also that our subscriptions would probably amount to close upon 30 guineas each per annum, but, gentlemen, I have the great satisfaction of telling you now that the number of our members duly elected is 51. (Cheers.) I have also the pleasure of telling you that judging from the number of applications we have received for our rules, and for the particulars of the Exchange, our numbers will be very considerably augmented within the next few weeks, quite apart from those members who will pay subscriptions for their authorised and unauthorised clerks. Of these last we have already over a dozen.

HEALTHY FINANCIAL POSITION.

With regard to the subscriptions, I may tell you that we have seen our way to reduce our contemplated fee of 30 guineas per member to 12 guineas per member per annum, and with this latter sum we think we see our way, without any difficulty whatever, to pay all our annual expenses. (Cheers.) Under these circumstances the whole of our capital which now stands at 3,300*l*. may be regarded, with the exception of about 10 per cent., spent upon the preparation of these rooms, as a reserve fund. (Loud cheers.) Gentlemen, I need hardly point out to you the importance of that statement. That reserve fund gives to our institution a very largo amount of stability, and it also places your committee in such a position that they can enforce that regard for all the rules which must be considered absolutely necessary for the future success of our Exchange. The committee have also been placed in this position that they are now beginning to feel very fastidious indeed with regard to the gentlemen they elect as members, and I might go so far as to say this, they have entirely rejected two applicants for admission, and that they have under serious consideration the cases of two others. We feel that in the course of a very short time we shall be able to make the terms of admission for new members very much more onerous than they are at present ; and I can assure you that your committee will exercise all their rights in that direction, having of course a due regard to the desirability of increasing our numerical strength as much as possible, and of making our Exchange as regards respectability second to none other of a similar character in the whole world. (Loud cheers.)

A THREEFOLD APPEAL FOR AID.

Gentlemen, I have very little more to say, but I would ask you all for your assistance in making this Exchange a success. I say "you all" for this reason—that the committee have a right to ask for all reasonable consideration of the members ; but I see here—and am glad to do so—secretaries of several mining companies, and from those gentlemen we also bespeak cordial assistance and co-operation. We ask them to give us all the information that lies in their power at the very earliest opportunity, so that we may at the same time be of assistance to the public, the companies, and ourselves. (Cheers.) I also see here a number of gentlemen representing the financial press, and I likewise ask them for their assistance. (Hear, hear.)

PUBLICITY COURTED.

They will find that in our rules there is a clause which invites the representatives of the financial Press to come down here as often as they please within certain hours, the object of that being that we may show to the public our desire that all our transactions shall be fair and above-board, and that they may have all the guarantees to that end that are in our power to give. Conscious, as I may say we are of our own rectitude, and the honesty of our conduct, I think that such a guard as that (I am sure this is the opinion of us all) is entirely unnecessary ; but we are all men of the world and men of experience, and our experience tells us that no man does his work better than he who knows there is a greater power over him that is able to criticise and properly to estimate what he is doing. Gentlemen, I have now only to thank you for having listened so kindly to my remarks to-day. I thank all our members very much, and in the names of these and the committee thank also

THE MEMBERS OF THE PRESS

who have come down here to-day. As I have told you, we look for very great assistance from those gentlemen, but in the exercise of that assistance we ask them frequently to visit us, and we think that if we do our part, and if the secretaries of the companies do their part that the visits of the representatives of the financial Press will be rewarded by a *quid pro quo* in the shape of the large amount of information we shall be able to place at their disposal. I thank you very much for your attendance, and once more I declare, as I did at the beginning, that this Exchange is now open for the transaction of business. (Loud cheers.)

THANKS WHERE THANKS ARE DUE.

Mr. Peter Watson : I think we all owe a debt of gratitude to Mr. Thomas Thompson for taking the chair to-day. I am sorry Mr. Samuel James is not present as one of the committee, but all the other members are here. As one of their number, and being in the midst of the hundred or so gentlemen assembled here I desire to say a few words. I occupied the same position 35 years ago that the chairman does to day in starting the first Mining Exchange that the City of London ever saw.

A REMINISCENCE.

That Exchange was started somewhat exclusively, and in some measure it fell to the ground. It was reorganised in 1855 when again we had a large attendance of members, and if it had not been for the conduct of some half a dozen members, there might have been no necessity for the present effort. It, however, brought about the failure to a certain extent of the Mining Exchange, as I pointed out at the time. It had the effect of sending a large number of the members from the Mining Exchange into the Stock Exchange. Had the members pulled together at that time I do not hesitate to say, with the growth of mining during the last 30 years, instead of having this, comparatively speaking, small room, we should have had by now 400 or 500 members. (Laughter.) That was in 1855—nearly 34 years ago. If we look back it is not so long ago since the Stock Exchange was started—about 117 years ago, if my memory serves me right ; in the year 1772. If we see the growth of that institution you can well imagine what the growth of the Mining Exchange would have been if it had been kept up in a proper way.

SOME ADVANTAGES TO MEMBERS AND THE PUBLIC.

We now start with a good admiral to conduct our ship, and as regards the New Exchange you may rest assured of this—that the committee, constituted as it is, will see full justice done as between members and members, and likewise as between members and the public, should any disputes arise between them. (Hear, hear.) On behalf of the members of this institution we tender to Mr. Thompson our sincere thanks for having presided to-day. I hope we shall all work harmoniously, and for the benefit of those who trust us, as well as for ourselves. I will conclude by proposing three cheers for the Mining Exchange.

The three cheers were heartily given, whereupon

CAREFUL CONSIDERATION OF THE RULES.

Mr. Thompson rose to respond. He said : Gentleman, I thank you very much indeed for your cordial support, but I should greatly have preferred that this vote of thanks had been tendered to the committee as well as to me, because I cannot flatter myself that I have any exclusive right to it. I cannot hide from myself the fact that whilst possibly during the present year I have raised the idea of this Mining Exchange, it is more to my colleagues the credit is due of having carried it out and brought it to the success it has already attained. Whilst thanking you, as I do most cordially, I will point out one very important fact which is this, that the committee have exercised great consideration in the formation of the Exchange, and in the laying down of the rules, and I think that they may claim a fair amount of success. You will probably think it egotistical on my part, or on the part of the committee in making such a remark, but I may tell you this that these rules have been sent round to the Press and to all our members.

THE RULES MEET WITH UNANIMOUS ACCEPTANCE.

From the Press they have met with the most unqualified praise, and as regards our members we have not met with a single word of complaint. (Cheers.) Those are two important points. With regard to the Press I am not at all surprised, because during the long period I have been in business, I have invariably noticed that the Press is always willing to give credit to the will as also to the power to do right, and I am sure that credit will be given to us for the views that have been expressed to-day. As regards our members, I may say their support is most gratifying, for our rules include all sorts of restrictions, and it was hardly to be expected that such would meet with unanimous praise. I will now conclude with an expression of some confidence that if we will only move along the lines we have laid down for ourselves we shall meet with all the success the most sanguine amongst us can anticipate. Gentlemen, I again thank you very much. (Loud cheers.)

On the spot, and without an instant's delay, Mr. South, authorised clerk to Mr. Thomas Thompson, bought 100 Balkis shares, and, turning to his *confrères*, triumphantly exclaimed "That is the first transaction that has been done in the New Mining Exchange." The announcement was received with cheers.

The members at their leisure then inspected the premises as described above.

In the evening Mr. Thompson presided at a banquet, held at the Café Royal, for the purpose of commemorating the opening of the Exchange. We noticed that all the more important of the financial Press were

represented, including the *Financial News*, *Money Market Review*, *Financier*, *Bullionist*, *Rialto*, *St. Stephen's Review*, the *Mining Manual*, the *Mining Journal*, and the MINING WORLD. The specches were, of course, of a landatory character, and some very humorous. Each toast was followed by some very good music, and, altogether, the company present spent a very pleasant evening.

THE TRANSVAAL GOLDFIELDS.

(FROM OUR CORRESPONDENT.)

THE COLLAPSE.

I CAN only add to the intelligence of the terrible collapse of the share market, which you must have received by cable, that the consequences are being felt all over South Africa. Nor do I see that there is any necessity to accentuate the fact. Speculation during the months of November, December, January, and February was allowed to run mad. Companies were being formed at the rate of one a day, and capital was recklessly withdrawn from good concerns to be invested in properties that can never pay for many months to come, and perhaps never will pay. At last the banks became frightened. Time bargains, which had been encouraged, were suddenly frowned upon, and now rumonrs of impending insolvencies on a gigantic scale are thick in the air. Whether all this will have the effect of scaring away English capital is a question which people all over South Africa are asking with bated breath.

MINES AND COMPANIES.

Meantime, work is going on all over the Witwatersrandt, and those who have invested for investing purposes are laughing at those who invested for speculating purposes only. From some reports which have been published lately, not from officials connected with the companies, but from au independent source, I cull the following which will give your readers a fair idea of what is really being done :—"The Robinson is looked upon as the premier company on the fields. They have opened up five distinct reefs, namely, the South Reef, Robinson Leader, Main Reef Leader, Maiu Reef, and North Reef. The two South Reefs, which average 5 ft. 1 in., carry 4 ozs. at the very least. They have crushed an average of 6. The deep works show the reefs richer than they are in the upper. The mill is ready. The mine is already lit with electricity, and a heavy production is certain. At to-day's quotations (55*l.*) they would pay a heavy dividend. For instance, the profits made with their rotten 10-stamps amount to close on 67,000*l.* Everything in the mine being paid for out of profits, show positively that the profits, with 100 stamps, will, in the course of a year, run into seven figures. Kaun, a Parisian, who came out with Porges, holds an enormous number of shares, and he was awfully pleased when he saw the mine. The idea that this company's returns would fall off when they started crushing with a large mill is quite exploded." With respect to the Langlaagte Company, he remarks that "the return of this company has been anticipated with considerable interest, and, whilst the retort was going on, it was known within 500 ozs. whether it would exceed 5,000 ozs., or be less. When it was made known that it was 4,800 ozs. some of the most sanguine seemed disappointed. It is utterly impossible to get at a return within some hundred ounces, and for the first month's crushing with a new battery (especially under peculiar local circumstances), and the mine is not nearly in a perfect state of order, such a return as the Langlaagte has just given must be accepted as highly satisfactory. It must be borue in mind that the mill is only a 60-stamp, and can be increased at any time to 100, with which number of stamps an addition could be made to the return of 3,000 ozs. at least, and as the crushing of this month (March) has been less than the average crushing, the return could, at its very lowest, be extended to 8,000 ozs. per month, at which rate the directors could easily pay dividends of 5 per cent. per month, and have sufficient over to keep on improving their mine." Then, with regard to the Salisbury Company, he writes :—"The return of 1,469 ozs. for February has tended to restore a great deal of the shaken confidence in this concern, and were there any tendency of advancement in this market, these shares would, no doubt, see a considerable advance. The declaration of 15 per cent. dividend has also tended to do good, and its future crushings will no doubt be on an iucrease, and their dividends may be expected to become larger and larger, especially when their additional stamps are erected." On the subject of "production," the same writer observes :—"There is no fear of the returns falling off. At the present the following mills are not at work, and will shortly be added to the list of those that are :—Ferreira, 20 ; Wolsingham, additional, 20 ; Robinson, additional, 40 ; Jumpers, 97 ; Langlaagte Central. 30 ; Lauglaagte B, 60 ; Moss Rose, new mill, 50 ; Primrose, new mill, 50 ; Simmer and Jack, 50 ; Aurora, west, 50 ; Glencairu, 50 ; and a lot more. I have given figures at a guess, but I am nearly correct, and as soon as these alone are at work it will add at least 40,000 ozs. per month on the present production. In addition to this we have a number of new concerns, such as the Chimes, Gardener, and many others, which are proving very rich, the former returning 900 ozs. per month. Speaking within bounds, the production will, within a reasonable time, reach 100,000 ozs. per month, and more from Witwatersrandt, and be maintained, if not increased. This estimate does not include Heidelburg and Potchefstroom districts, which, in course of time, will have a production of their own. There is really no disappointment felt here at the depressed state of the market ; on the contrary, there is a great feeling of confidence, and an intense desire to secure stocks at low rates. Investors feeling that the market has not touched "bottom" are waiting for every event that may send stock still lower, so that instead of going into the market with orders they may have stocks offered them, which they may accept. That the market cannot continue long in its present state is a fact that is proved by the iucreased output which is expected for April, and which will again be considerably enhanced by the addition of further stamps in May.

THE KLERKSDORP FIELDS.

In previous letters I have directed attention to the increased confidence in these comparatively new fields, and I confidently assert that in the immediate future there will be a great "boom" on in this direction. For the information of your readers I append the following as the most complete list of these properties which has ever yet been published :—

The town is supposed to be encircled by two reefs—on the one side by the Johannesburg Main Reef, and on the other by the Black Reef. The former has been traced to within 10 miles of the town, and the latter has been proved to exist by experienced experts.

Main Reef.—The principal gold mining companies on the supposed Main Reef are the Riet Kuil Kopje, the Haartbees Union, the Hugenot, the Worcester Hope, the Elandslaagte, the Wolverand Klerksdorp, and Dominion No. 1.

Black Reef.—On the Black Reef, the Nooitgedacht Gold Mining Company, the Ariston, the Wilkinson, the Nooitgedacht Extension, and the Nooitgedacht Victoria, and on the commonage, between these two lines of reef, the following well-known companies have their ground : The Klerksdorp Gold Miniug Company and the Klerksdorp Commonage Gold Estates.

Riet Kuil Kopje. Capital, 200,000*l.*, in 1*l.* shares. Property, 89 claims on Riet Kuil. Reserve 30,000*l.* Battery 10 stamps.

Haartbees Union. Capital, 150,000*l.* in 1*l.* shares, fully paid up. Working capital, 30,000*l.* Reserve, 10,000*l.* Property about 199 (including owners) claims, at Riet Kuil. Several water rights. Battery 30 stamps.

Note.—A new and experienced manager has just been appointed to this company, aud great results are expected shortly, especially as a new reef and leader have recently been struck on the property.

Hugenot, Limited. Capital, 56,000*l.* iu 1*l.* shares, payable 2s. 6d. on applicatiou, 2s. 6d. on 15th February, 5s. on 15th April, and balance in calls of 5s. at 30 days' notice. Reserve, 10,000*l.* Working capital, 15,000*l.* Property, 52 claims on Riet Kuil. Head office, Capetown.

Worcester Hope. Capital, 25,000*l.*, in fully-paid up 1*l.* shares. Property claims on Riet Kuil. Battery, 20 stamps.

Elandslaagte. Capital, 250,000*l.*, in fully-paid up 1*l.* shares. Reserve, 30,000*l.* Working capital, 30,000*l.* Property, Mynpacht of 100 morgen, and water-right on farm Elandslaagte. The proposed battery will be 40 stamps.

Wolverand Klerksdorp. Capital, 250,000*l.* Property (Mynpacht) on farm Wolverand.

Dominion. Capital, 120,000*l.* Working capital, 120,000*l.* Property about 250 acres, comprising about 54 claims, 15 miles from Klerksdorp. Battery, 20 stamps.

Note.—This property has recently been purchased by Messrs. Barnato Bros.

Nooitgedacht. Capital, 100,000*l.*, fully-paid up 1*l.* shares. Reserve, 10,000*l.* Property, a half of the Mynpacht of 435 morgen, on the farm Nooitgedacht, 3 miles from Klerksdorp. Battery, 20 stamps.

Ariston. Capital, 80,000*l.*, in 1*l.* shares, 10s. paid up, 5s. due in three months. and 5s. in six months. Reserve, 10,000*l.* Working capital, 20,000*l.* Property, 24 claims, Nooitgedacht.

Wilkinson, Limited. Capital, 70,000*l.*, fully-paid up. Working capital, 10,000*l.* Reserve, 10,000*l.* Battery, five stamps. Property, 38 claims ou Nooitgedacht. A further 10-stamp battery is about to be erected.

Nooitgedacht Extension. Capital, 100,000*l.* Working capital, 15,000*l.* Reserve, 5,000*l.* Property, 55 claims on Nooitgedacht.

Nooitgedacht Victoria. Capital, 15,000*l.* Reserve, 10,000*l.* Property, 47 claims adjoining Nooitgedacht Mynpacht, and two water-rights.

Klerksdorp. Capital, 125,000*l.*, fully-paid up. Working capital, 20,000*l.* Reserve, 15,000*l.* Property, 78 claims adjoiuing the Nooitgedacht Mynpacht. Battery, 10 stamps.

Klerksdorp Commonage Gold Estates, Limited. Capital, 150,000*l.* Working capital, 30,000*l.* Property, two Mynpachts on the Klerksdorp Commonage, equal to 1,975 English acres. Machinery now *en route*.

Syndicates.—Amy Rose. Capital, 2,000*l.*, iu 25*l.* shares, 10s. paid-up. Property, 60 claims, dip of Bosch Randt Reef.

Berzl Esine. Capital, 1,340*l.*, in 10s. paid-up. Four blocks of claims on commonage, of 44, 32, 19 and 39 claims respectively.

THE DELAGOA BAY RAILWAY.

On several occasions you will remember that I have called attention to the fact that Paul Kruger, the President of the Transvaal, has over and over again obstinately declared that he will not allow a line of railway to enter his territory, either from this colony or Natal, until the Delagoa Bay line has been extended from its present terminus, near the Komati River, to his capital, Pretoria ; and I have also asserted that we are in this country making history so fast as to brinq about a series of circumstances which will completely upset this blundering obstinacy on the part of the President. Already it has been strongly

represented to him by men of light and leadiug, not only in this colony and Natal, but in the Transvaal also, that commercial considerations must in the end overcome his absurd fad. I have also hinted that there are political considerations which have to be taken into account. As yet there is only a rumour in the air, but it is a rumour which it is more than probable will shortly develop into an actual reality. It is currently reported that the English Government is considering the question of acquiring from Portugal the territory south of the Zambezi, which is at present claimed by that Power. Something in the shape of an exchange is talked about, and it is quite possible that by means of a little gentle pressure it can be accomplished. If it is, I need hardly add that it is not so much for the purpose of obtaiuing access to the Transvaal Goldfields from the east coast, as it is to obtain a complete British ascendancy over the whole of the native territories south of the Zambezi, and thus put a stop to auy further Boer encroachments. Of course, such an arrangement will temporally add to present political complications. The extreme Africander party are naturally furious at such an arrangement, and you may therefore expect to hear very shortly of political difficulties being emphasised.

WEST ARGENTINE GOLD CO.

THE improved prospects of this company since the meeting of shareholders will not have escaped the notice of those of our readers who have watched its progress for some time past. That improvement is now before them in practical form in the matter we publish in another part of this issue. The directors have done well to hold back their original scheme in favour of that now submitted for the sanction of the shareholders at the meeting called for Friday next. At first sight it may appear an additional burden on the shareholders, but in reality it is the payment of a bonus—a fairly-earned dividend hitherto locked up in the shares of subsidiary companies. Three new shares are to be issued for two of the present shares, but each share carries a liability of 4s. 6d., or in all 13s. 6d. for three shares, whilst the amount credited is 46s. 6d. against value paid at par 40s., or a bonus of 3s. 3d. per share. The necessity of providing additional capital to work the Seventh Department miucs is thus provided on a most easy and reasonable plan, and we have no doubt that now the corner has been fairly turned, the company will quickly resume its former place in public favour and appreciation, as when its shares were readily saleable at 45s., instead of as now 4s. to 5s., with undiminished prospects. Now that once more the reef has proved good in depth, and fresh openings have proved valuable, there is no reason why shares should not soon recover their premium. The new company will distribute the shares it holds in subsidiary companies.

DEVON CONSOLS AND DEVON UNITED—IMPROVED PROSPECTS.

A MINE that has raised 714,487 tons of ore, realising 3,436,954*l*. ; that has paid 1,854,546*l*. in dividends, whose 1*l*. shares advanced to 800*l*. a share, and whose capital, even at the present time, is only 20,000*l*., is not one that will lightly be abandoned, particularly when such men as Mr. Peter Watson and Mr. Moses Bawden have it in hand. At the present time the chief revenue of the company is derived from arsenic, the price of which has greatly advanced, and has kept, and is keeping Devon Consols on its financial legs. We dread almost to approach the ominous word "copper," but still there is a future for this metal, as Mr. Peter Watson clearly pointed out. He referred to 120,000 tons as the probable stocks on hand, but it must be remembered that this is only about six months' consumption, so that the stocks, though larger than we should like to see them, are not so excessive as some persons imperfectly acquainted with the subject seem to imagiue. Moreover, we must remember the state of trade is extremely brisk, and we should not be surprised to see copper reach from 50*l*. to 60*l*. per ton before the close of the present year. The bearing of all this upon Devon Consols is the great improvement which has taken place, particularly in Watson and Wheal Maria portions of the mine.

Tin, so far as Devon Consols is concerned, seems to be a failure, but a fresh discovery of copper would cheer the hearts of the shareholders, and, as the Cornish captains say in their reports, "reward them for their patience and outlay." It is highly probable that this discovery has now been made, and we shall watch further developments with great interest. A very important discovery has been made in Devon United, the sister mine. We have seen to-day a stouc of ore from the bottom of this company's shaft, received since the meeting, of a value which certainly augurs well for the future of this enterprise. It has also a very small capital, and it is managed on sound economic principles. It would seem that in this miue, as in Devon Consols, buyers of shares are wiser than sellers.

Reverting to Devon Consols, the shareholders should remember that there are between 200,000 and 300,000 tons of halvans on the ground of which Mr. Oxlaud proposes to give a good account. Who is Mr. Oxland? Well, the Mr. Oxland who spoke at Wednesday's meeting is the worthy son of a worthy father, whose important discovery in connection with arsenic has certainly kept Devon Consols alive during the tempestuous times through which it has passed. But for arsenic it had fared ill with Devon Consols. Without this string to its bow Mr. Peter Watson and Mr. Bawden might together have sung its *requiem* long ere this, instead of, as they most certainly did at Wednesday's meeting, holding out promises of better times to the shareholders, based upon facts indisputable, and on discoveries the importance of which will strike the imagination of the shareholders and the public before very long. We agree with Mr. Watson that the prospects of Devon Consols and Devon United, withiu recent years, were never so bright as they are at the present time.

RAVENSWOOD GOLD CO.

THE accouut of their stewardship which the directors of this company were able to render at the meeting on Weduesday, though of a somewhat disappointing character, showed nevertheless that they have not been allowing the grass to grow under their feet. They have had to battle—and they have done it manfully—with those initial difficulties which in a greater or lesser degree beset every company in its infancy. There is an abundance of good stone in the mine, but the chlorination process of treating the ores has not given satisfaction ; and this, notwithstanding the fact that the services of a gentleman who had worked it successfully at Mount Morgan and other mines were obtained to superintend it. Experiments are, however, being made with other processes, and it is hoped that ere long the company will be able economically to extract all the gold from its ores.

EBERHARDT PROSPECTS.

THE reports from the Eberhardt mine have during the preseut year been so extremely favourable that we think it right to call attention to their more salient features. In the report dated December 29th last, it is stated :—"Output of ore from south drift for week, 5 tons ; assay value, $50.28. February 16th : Output of ore from south drift for week, 7 tons ; assay value, $52. March 23rd : Output of ore from south drift for week, 10 tons ; assay value, $50. April 15th : Output from south drift for week, 11 tons ; assay value, $58. Small seams found ranging from $47 to $70 per ton. April 22nd : Output from south drift for week, 13 tons ; assay value, $56. Some bunches found assaying from $70 to $150 per ton. April 27th : Last week's report Output from south drift, 15 tons ; assay value, $56.14, and 4 tons ; assay value, $37. Ore on dump : 305 tons high-grade ore, of an average assay value of over $50 per ton. The mill running well." This is the favourable season for working American mines. The shares seem ridiculously low in price, having regard to the foregoing facts.

LONDON AND SOUTH AFRICAN EXPLORATION CO.

THE record of progress, which Mr. Chas. J. Posno was able to announce at the meeting of this company on Tuesday, must have been highly gratifying to the shareholders. The total income of the company for the 12 months has been 85,326*l*., irrespective of 6,700*l*. derived from the settlement of the Orange River property ; and since the accounts were made up some claim ground has been dealt with, which will add about 4,000*l*. per annum to the company's income. This satisfactory state of affairs is of course attributable to the continued activity iu mining matters in South Africa, which has characterised the past year. Reef work has recently exposed upwards of a million loads of rich blue at the back of blocks in operation. Altogether the outlook is very cheering. This compauy occupies the pretty safe vantage ground that a landlord does with his tenants.

BALTIMORE BREWERIES CO, LIMITED.

THE conversion of brewery undertakings into joint-stock enterprises has in many instances been attended with eminent success ; but it behoves investors to be exceedingly careful in discriminating between the good, bad, and indifferent concerns that are offered to the public. Above all things, they should select only such undertakings as can show satisfactory profits upon recent business. The Baltimore Breweries Company, whose prospectus lies before us, will, we have little doubt, receive that attention on the part of investors which it appears to merit. For the two years ended March last the net profit averaged over 19,500*l*. per annum. The sales since 1880 have increased steadily to the extent of several thousand barrels in each year. The actual sales for 1887 were 39,634 barrels, and for 1888, 43,732 barrels. This rapid growth of business has necessitated the erection of a new brew-house, with a capacity of about 125,000 barrels per annum, which will have the effect of increasing the present capacity more than three-fold. The share capital consists of 7,000 cumulative eight per cent. preference shares of 10*l*. each ; 7,000 ordinary shares of 10*l*. each, and 50,000*l*. six per cent. debentures. The whole of the debentures the vendors will take, as well as 25,000*l*. of the preference shares, 15,000*l*. of the ordinary shares, and 90,000*l*. in cash. No working capital is necessary, as the company takes over all book debts, stock, &c. Taking only the actual average net profit made for the two years ending March, 1889, viz. : 19,500*l*. per annum, the followiug would be the result :—Profit, 19,500*l*. ; debenture iuterest at 6 per cent. on 50,000*l*., 3,000*l*. ; dividend on preference shares at 8 per cent. on 70,000*l*. 5,600*l*. or a total of 10,900*l*., equal to a dividend of over 13 per cent. on the ordinary shares, after providing a yearly sum of 1,800*l*. for the estimated expenses of management. The subscription lists open on Monday, and close on or before the following day.

THE SANTA FE AND CORDOVA GREAT SOUTHERN RAILWAY CONSTRUCTION CO., LIMITED.

SUBSCRIPTION is invited for 650,000*l*. Five per Cent. Perpetual Debenture stock in this company. The company was formed in May of last year to purchase a concession granted by the Argentine National

Government for a broad gauge railway, and about the beginning of next year the working of about 75 miles of the liue will be commenced. It is stated that, wheu the railway is constructed and cheap transport provided, it will be mainly converted to agricultural purposes, the grouud being very favourable for vegetation. There has been a land company formed in order to promote immigration to the vicinity of the railway. The list will open on Monday 27th, aud close on or before Tuesday 28th inst.

THE MONEY MARKET.

CITY, FRIDAY EVENING.

THE Money Market this week has been extremely easy both for discounts and loans, although the money borrowed last week of the Bank has been nearly all paid back as proved by the return. The reason of this is the supply let out by the Bank in respect of Consols redeemed, but delayed in actual payment by various circumstances and formalities now overcome. This has helped the market to repay the loans, and leave a balance for the present, so that money at call has beeu ¾, 1 per cent., and for longer dates 1¼ per cent. Discouut has declined to 1⅜, ½ per ccnt. or quite 1 per cent. under the Bank's minimum. Yet, although it was expected in some quarters, and the return proved so strong, the directors did not alter the rate. In this policy the directors look further ahead than the present, and it would not be like them to reduce it one week and have to retrace the steps a week or two after. The prospects and coutingencies of the future favour harder money as the season advances, as the absorption of capital on all sides is great, and must becoure morc pressing. In fact. every recurring settlement makes it plaiu that the supply is none too great to meet anything more than the ordinary daily demand. The return, with an influx of nearly 300,000*l.* from abroad, shows au increase in the reserve of 600,000*l.*, making it 15,030,000*l.*, or 42 per cent. of the liabilities. The private securities have run off three and a-half millions, and the private deposits three millions through the return of loaus.

Money was strikingly quiet to-day, and very easy, both for bills and loans, and while discount for three months has closed at 1⅜ per cent., accommodation was offered at ¾ for the night, and 1 to 1¼ per cent. for a week or 10 days. An early announcement is expected regarding those Exchequer Bills maturing in June.

The Bank bought 12,000*l.* in bar gold. The Silver market was quiet, but firm.

Business at the Stock Exchange during the past week has been a little more active, but the tendency has still been irregular, so that the alterations for the week are very slight, the rise of one day being counteracted by the fall of the next, or *vice versâ*. In bnsiness circles the most important event has been the issue of the prospectus of the Dublin Distillers' Company, with a capital of one million sterling. In political circles the visit of the King of Italy to the Emperor of Germany has been the most important eveut. The Shah's visit to the Czar is also attracting attention. At length there seems some prospect of the termination of the "Parnell Commission." The Funds have been good, and have risen on the week. Colonial Inscribed Stocks have also come in for a share of attention, with other sound investment securities. Foreign Government Bonds have sympathised with the fluctuations on the Continental Bourses, and as speculators in those centres were morc anxious to realise their present profits than to enter into fresh engagements, prices here have given way. The decline on the week has not been at all serious. Greek Five per Cent. were in good demand, and rose ¾. This is an age of conversions, for now the Greek Government have made an issue of a 4 per cent Conversion Loan and as soon as the consent of the Great Powers has been obtained the Egyptian Government will do the same with regard to its Preferential Debt. Home Railway Securities have been quite active, but attention has mainly centred in the Southern Deferred Stocks. It was rumoured on Wednesday that Mr. Oakley had published his award with regard to the traffic dispute between these two companies, and Brighton A rapidly rose to nearly 137½, and South-Eastern A 116¾, but reacted as the rumours proved to be premature, and nothing definite has yet transpired with reference to it. The Scotch and Underground Lines were dull, but most of the Trade Lines were firm. A better tendency has prevailed in the American Railroad Market, but here again a few special descriptions have engrossed attention. Mexican Central Bonds and Northern Pacific issues have risen 2½ to 3, Milwaukee 2, and the rest ½ to 1. Grand Trunk Stocks improved on the traffic return being better than had been expected, but Mexican eased off, and became dull. Miscellaneous Securities were firm, but without much business.

Although the Stock markets were quiet to-day the toue was almost buoyant in some departments, this feeling beiug particularly noticeable in American Railroad Securities. Foreign Government Bonds being about the only prominent exception. The Funds were steady, and the same may be said for Indian Government, Colonial, Inscribed and Home Corporation Securities. In the Foreign Government section, owing to the weakness reported on the Paris and Berlin Bourses, prices here gave way to an extent of ¼ to ½ per ceut. South American Currency Loans, together with Colombian, Costa Rica, Guatemala, and Venezuela Bonds, however, were in request, and closed at enhanced values. The fine weather influenced buying in the Home Railway market, the passenger lines deriviug the greatest benefit from the movement. South-Eastern and Brighton "A" were exceptionally 1 up, and North-Eastern were inquired for, and rose fully ½ per cent. Taff Vale Stock rose 3, to 263 to 266. In other cases the alteration was limited to ¼, and confined to the most speculative descriptions. Dealers in American Railway Securities were quite excited, and after some hesitation in the afternoon prices closed firm, at an average gain of ½ to 1 all round, with an exceptional rise of over 3½ in Milwaukee and 1½ in Lake Shore and Union Pacific Shares. Grand Trunk Stocks were buoyant, the First Preference rising 1¾, and the other issues in proportion. Mexican Railways were unchanged, and in the miscellaneous department a few fractional improvements were recorded. The directors of the Great Western Railway Company have declined to advise the proprietors to divide the stock.

Annexed are the final quotations to-day :—Consols Account, 99⅛, 99¼ ; Egyptian Preference, 103⅜, 103⅞ ; Egyptian Unified, 92⅛, 92⅜ ; French Four-and-a-Half per Cents., 104¼, 104⅜ ; Hungarian, 87¾, 88 ; Italian, 97, 97¼ ; Mexican Scrip, 96½, 97 ; Peru Five per Cents., 15⅝, 15⅞ ; Peru Six per Cents., 17½, 17¾ ; Russian, 1873, 102⅞, 103⅛ ; Portuguese, 68, 68¼ ; Spanish, 76 1/16, 76 3/16 ; Turkish, 1871, 94⅛, 94⅜ ; Turkish Defence, 101, 101½ ; Caledonian, 119, 119¼ ; Great Eastern, 77⅛, 77⅜ ; Great Western, 159¾, 160 ; Brighton "A," 156½, 156¾ ; North-Western, 184⅛, 184⅜ ; Metropolitan, 88½, 89 ; Metropolitan District, 35½, 36 ; Midland, 144½, 144¾ ; North British, 55⅜, 55⅝ ; North-Eastern, 175⅜, 175⅝ ; South-Eastern "A," 116¼, 116½ ; Taff Vale, 263, 266 ; Grand Trunk, 10⅜, 10⅝ ; Ditto First Preference, 69⅜, 69⅝ ; Ditto Second, 48⅛, 48⅞ ; Ditto Third, 26½, 26¾ ; Canadian Pacific, 57⅛, 57⅜ ; Mexican Ordinary, 52¼, 52½ : Denver, 17⅛, 17⅜ ; Erie, 29⅞, 30⅛ ; Milwaukee, 74½, 75 ; Lake Shore, 107¾, 108 ; Louisville, 70⅛, 70⅜ ; Atlantic First, 32½, 32¾ ; Ontario, 17½ 17¾ ; Ohio, 23, 23½ ; Norfolk and Western, 53¾, 54 ; Northern Pacific, 65½, 65¾ ; Reading, 24, 24¼ ; Reading Bonds, 84¼, 84⅜ ; Union Pacific, 63½, 63¾ ; Wabash Preference, 29½, 30 ; Ottoman Bank, 11 13/16, 11 15/16 : Anglo-Telegraph, 52¼, 52⅜; United Telephone, 15⅞, 16⅛ ; Hudson's Bay, 21⅜, 21⅝ ; Suez Canal, 93, 93½ ; Guinness, 31⅛, 31⅜ ; Allsopp's, 8⅝, 9⅛ ; Bryaut and May, 13⅜, 13⅝ ; Nitrate Railways, 23, 23¼ ; Salt Union, 13½, 14 ; Dublin Distilleries, 1¾ prem. : and Water Gas, 9½, 10 pm.

CORRESPONDENCE.

[*We do not hold ourselves responsible for the Opinions or Statements of our Correspondents.*]

THE "MARYLAND MINE," GRASS VALLEY, CALIFORNIA.

To the Editor of the MINING WORLD AND ENGINEERING RECORD.

SIR,—I read with pleasure, from the *Mining and Scientific Press* of the 6th inst., that an English syndicate is about to be formed to purchase and develop the above mine. This minc, to my personal knowledge, will prove, by proper development and economical management, to be one of the best mines in the State of California, and I congratulate this syndicate (unknown to me) in being enabled to secnre such a desirable property.

The reason for writing this is—our English companies, as a rule, have becn most unfortunate in their ventures in California, and one experiences a sense of relief and pleasnre to find there is every prospect of this, to some extent. being a recompense for the past.

The first mine opened on this vein was the "Eureka," which yielded a large amount of money to its owners ; then the "Idaho Company" was formed by Colman Bros. and Co., which has produced over $11,000,000, consequently this being a continuation of the same ledge, the dip of which enters the Maryland concession, gives a promise of a grand future.

As far as I could ascertain, when on the spot somc time ago, there are backs already 600 ft. in good paying rock, but to work this minc in a systematic and miner-like manner a shaft will have to be sunk entirely in new grounnd, which probably will take about two years crc the necessary development and satisfactory returns can be made.

As far as I could judge, the facilities for working this property is all one could desire, viz., water power, cheap labour, climate, &c.—I am, &c.,

JOSEPH JEWELL, M.M.S., M.G.S.P.,
Civil and Mining Engineer.

Sonora, Mexico, April 21st, 1889.

LA TRINIDAD MINING CO.

SIR,—Hearing that Mr. Harvey has returned from our mines in Mexico, and some ugly reports are about, will he kindly state emphatically if workmen are employed by this company and cannot receive any settlement in the shape of money for their labour? This London secretary, who, unfortunately, I think. for us sharcholders, has been acting as general manager. and left, I hear, with the bullion troop, and that the employés are naturally anxious to find out what has become of all the money from this and other shipments, as but little has been brought back by conductors, debts have been incurred to an enormous extent, with, seemingly, without any calculation as to result.

Now, the question arises—If the white labour have not had a settlement for some months past, what has become of the money?

Has Madame Alsua been paid? If so, how much? Is it true a quantity of merchandise, much of which is undesirable, has been purchased, and time drafts given to 31st Decemher next? What about the various caves which have taken place so often in the mine through incompetency? Is it true the tailings in the assays will give a better percentage of silver than the ore coming from the miue. and how much does it cost to get $1 worth of silver? Will Mr. Harvey kindly answer the above questions for the benefit of anxious shareholders? If he does so fully, and in accordance with known facts, it will prove how easily the property, which for years we have been led to believe was a very rich one, can be damaged by mismanagement.—I am, &c.,

SHAREHOLDER.

MR. REYNOLDS' "IMPLICIT CONFIDENCE."—Trevannance and Polberro mine meetings will be held next week in Cornwall. Mr. J. B. Reynolds has the "most implicit confidence" in these mines. So have we, but our "implicit confidence" is that calls will be made. Trevannance and Polberro will be faithful to very old tradition, but what about Wheal Coates and West Polbreen?

HOLLOWAY'S PILLS.—Indigestion.—How much thought has been bestowed, and what voluminous treatises have been written upon this universal and distressing disease, which is with certainty and safety dispelled without fear of relapse by a course of this purifying, soothing and tonic medicine! It acts directly on the stomach. liver and bowels—then indirectly, though no less effectively, on the brain, nerves, vessels, and glands, introducing such order throughout the entire system that harmony dwells between each organ and its functions. Dyspepsia need no longer be the bugbear of the public, since Holloway's Pills are fully competent to subdue the most chronic and distressing cases of impaired digestion, and to restore the miserable sufferer to health, strength, and cheerfulness.

REPORTS OF MEETINGS.

ALMADA AND TIRITO CO., LIMITED.

ARTICLES AMENDED TO SUIT THE REQUIREMENTS OF THE STOCK EXCHANGE—AN OFFICIAL QUOTATION EXPECTED—MINE LOOKS WELL—DIRECTORS PURSUE A PRUDENT POLICY.

AN extraordinary general meeting of the shareholders of the Almada and Tirito Company, Limited, was held at the Offices of the company, 47, Finsbury Circus, E.C., on Wednesday, under the presidency of William Martinean, Esq., for the following purposes :—

(1.) "To consider, and if thought fit, adopt with or without modifications, in lieu of the regulations contained in the existing articles of association of the company, new or amended regulations to be submitted to the meeting." (2.) "To fix the remuneration of the directors."

Mr. J. A. MORGAN, F.G.S. (secretary), read the notice calling the meeting.

OBJECTS OF THE MEETING.

The CHAIRMAN : Gentlemen, we had better, I think, proceed with the business of the extraordinary meeting, and after that I shall be very glad to answer any questions, and give you all the information that we possess as to the mine and what is being done. The necessity for the alteration of the articles of association is imposed upon us by the Stock Exchange. We, from motives of economy and simplicity, adopted a considerable portion of table A in the articles that we registered. The Stock Exchange Committee now decline to give quotations to any company that adopts table A, and insists upon having new articles that they will approve of being registered. Therefore that is the object primarily with which this meeting is called. I will ask the solicitor to be good enough to explain to you the leading points in the articles, and where they differ from those already registered.

The SOLICITOR read the proposed alterations, explaining that with a few slight modifications the articles were the same as those which existed at the present time.

The CHAIRMAN then moved the following resolution :—"Resolved, that in lieu of the regulations contained in the existing articles of association, those contained in the printed document, or articles of association, now submitted to the meeting, and signed for the purpose of identification by the chairman, be, and the same are hereby, approved and adopted as the future regulations of the company."

Mr. S. J. WILDE seconded the motion, which was carried unanimously.

LATEST FROM THE MINE.

The CHAIRMAN : Our manager writes under date April 30th :—31-fm. level drift north of No. 7 winze (42 ft. below the 24) San José : This work was begun last week, 4.9 ft. were driven at $10 per ft. by four drillers. A good deal of ore is being carried here. We estimate the yield at eight to 10 tons of mineral per lineal fm. ; the average ley is calculated to be about 30 ozs. per ton." He goes on to say :—"From the 'Ore product account' enclosed in my letter of April 9th, you will have observed that we obtained in March 3¼ tons cleaned ore from the 50-fm. level, containing 175 ozs. silver, which gives an average ley of 54 ozs. per ton of 2,000 lbs.

Mr. WHEELER : Has that been sold ?

The CHAIRMAN : No ; it will be reduced as soon as we get our

REDUCTION WORKS

in operation.

Mr. WHEELER : When will that be ?

The CHAIRMAN : I hope very shortly. A good deal of correspondence has taken place with regard to the question of running the smelting works now. Mr. Sanchez wrote on the 12th March :—"My estimates of the nett values of the argentiferous stocks in hand are based upon the supposition that they are realised at the rate of 200 tons weekly, *i.e.*, that they are passed through the reduction works in the midst of a regular run, and along with new ores and products forthcoming from the mine.

A SHAREHOLDER : I understood that you had 4,000 tons of ore on the bank.

Mr. MORGAN : No, not 4,000 tons. It was reckoned that the stocks in hand would realise 5,000*l.* after paying all expenses. A good deal of the stuff is in the condition of pig-lead, which is very rich in silver.

Mr. SMITH : What has become of the very rich ore that was spoken of, I think, 12 months ago ? You had telegrams saying that you had struck ore assaying 1,200 ozs. per ton.

Mr. WILDE : It is in the mine still ; we have not stoped it.

INSTRUCTIONS TO THE MANAGER.

The CHAIRMAN : This is what was written to the manager on the 9th May :—"The board met yesterday and considered your recent letters. They wish me to ask you what amount of ore you consider you ought to have in sight before re-commencing reduction, and also, when you think the necessary quantity will probably be in reserve ? What amount of money will be required ? They would also be obliged by your stating what amount of money will be required for putting the reduction works, stamps, &c., in order before re-commencing reduction—of course, it would be highly desirable to alter the stamps to dry stamps, but time and money, I fear, would not allow this. What would this last alteration cost, and how long would it take to convert them ?

A REMINDER.

Several shareholders having spoken urging an immediate commencement of smelting operations,

Mr. WILDE bade them remember what happened in the case of the Mysore Company. The shareholders were impatient to have immediate returns, and they set to work and got a certain amount of stuff out of the mine, but it fell off because the mine had not been opened out sufficiently. That policy had, however, been reversed, and now the shareholders were reaping the benefit of the extensive development work they had carried on. It was, he thought, very foolish to make undue haste. At the same time the directors were as anxious to obtain returns as any of the shareholders, for their interests were identical. They wished to go to work prudently, so that when once stoping and reducing operations were commenced they would be able to continue them.

A SHAREHOLDER : If you exhaust all your available capital before you do anything in that direction, it is not very likely that the shareholders will agree to a third re-construction.

Mr. WILDE : Of course not, but we are watching that matter very closely indeed. I feel assured that we have

ENOUGH CAPITAL IN HAND TO TEST THE PROPERTY.

Mr. WHEELER : It seems very hard that you should have 5,000*l.* worth of ore on the bank, and yet you cannot commence to reduce until you have got 20,000*l.* worth of ore on the top of it.

The CHAIRMAN : In order to work economically, our reduction works require to be fed with 200 tons of ore a month.

Mr. WHEELER said that the moment reduction operations would commence people would see that it was a *bonâ fide* affair, and thus they would create a market for the shares. He pressed upon the directors to reduce some of the stuff on hand at once.

Mr. WILDE remarked that that was precisely what the old company did, and the money was wasted.

Mr. J. MILTON SMITH asked if the reports were less favourable now than formerly. The manager, he said, always seemed to write in a depressed spirit.

The CHAIRMAN : I do not think there was anything particularly unfavourable in what I read.

MR. WILDE'S OPINION OF THE MINE.

Mr. WILDE : I have had a good deal of experience in mining companies, and I consider the mine is in a far better and healthier position than it has been in for years, and far better than it was before the reconstruction, prior to this one, took place.

Mr. WHEELER asked how, then, did they account for it that the shares were at such a price as 6d. to 9d.

Mr. WILDE replied that the want of a Stock Exchange quotation was one reason the shares not being easily dealt in. Another reason was the fact that a number of the shareholders had not come forward, and paid what they had undertaken to pay ; therefore, there was a feeling prevalent that there might at any moment be a large batch of shares thrown on the market. He was alluding now to the old shareholders—the holders of 22,000 shares not having come into the new scheme. Directly an official quotation was obtained, if those shareholders did not "cash up," a circular would be sent out informing them that the shares would be sold.

A SUGGESTION.

Mr. WHEELER thought that half a shipload of ore sent to Swansea for reduction would have the effect of bringing those shareholders who were now holding aloof down to the office in a cab to see if it were all right, and to claim their shares. (Laughter.)

Mr. WILDE : You must send a considerable quantity to do anything ; half a shipload is no good.

The CHAIRMAN : The expense of transit would be very great—8*l.* or 9*l.* a ton ; but no doubt ore worth 100 ozs. to the ton would pay very well to send to England.

Mr. SIMPSON urged that the board should do nothing of the sort. The weather was against them just now, this being the rainy season out there. They should open up the mine now, and doubtless they would be able to start reduction work in the autumn.

Another SHAREHOLDER protested against undue haste. If a sample were sent to England people would say it was picked, and he, personally, would be less inclined to believe in the mine then than he was now.

Mr. WILDE said they were now

IN VIRGIN GROUND.

The old mine was practically worked out ; and it was a new mine they were working below the adit level.

Mr. WHEELER said that he was convinced that the fact of 22,000 shares not having been taken had more to do with the present low quotation than anything else, and he desired to withdraw his request that the reduction work should be commenced immediately.

A SHAREHOLDER : They are extending the railway communication very largely in Mexico, are they not ?

The CHAIRMAN : Yes, but that does not touch us.

Mr. MORGAN : I have seen a map where a line is actually marked out from Guyamas to Mazakan passing through Alamos, 8 miles from our mines. It is projected, and some day we may have it.

DIRECTORS' REMUNERATION.

Mr. B. D. KERSHAW proposed, "That the directors shall be paid out of the funds of the company, by way of remuneration, the sum of 350*l.* per annum, as from the date of the registration of the company, which sum shall be divided among them in such proportion and manner as the directors may from time to time determine." The fees, he said, used to be double that amount, but he had no doubt that when the directors declared a dividend the shareholders would vote them a little more. (Hear, hear.) At present it was exceedingly little considering the trouble they had had, and would probably have, before they placed the company on a dividend-paying basis.

Mr. SAYRE seconded the motion, which was carried unanimously, and

On the motion of Mr. WHEELER, seconded by Mr. KERSHAW, a vote of thanks was accorded to the chairman and directors.

The proceedings then terminated.

THE ANGLO-MEXICAN MINING CO., LIMITED.

ALTERATION IN THE ARTICLES OF ASSOCIATION.

AN extraordinary general meeting of this company was held at Cannon Street Hotel, on Wednesday, 22nd May, for the purpose of confirming the resolution passed on the 1st May, modifying the articles of association, to meet the requirements of the committee of the Stock Exchange, to enable the company to get a Stock Exchange quotation.—Mr. Geo. Hopkins presided.

Mr. JAMES FORD (secretary) read the notice convening the meeting.

The CHAIRMAN : Our business to-day is to confirm, if you think fit, the resolution passed at the extraordinary general meeting of the shareholders held on the 1st inst. At that meeting I explained to the shareholders present the nature of the alterations proposed in the articles of association. They are mostly verbal, and are made to

meet the requirements of the Stock Exchange in view of the company applying to them for a quotation. The alterations have all been submitted to the secretary of the Stock Exchange—in fact, most of them were suggested by him, and therefore I shall not go through the details again to-day. I shall merely propose, "That the resolution passed at the extraordinary general meeting of the shareholders held on the 1st May, modifying the articles of association, be, and the same is hereby confirmed as a special resolution."

Mr. BROUGHTON (director) seconded the motion, which was carried, and the meeting then terminated.

LATEST REPORTS.

The superintendent at the mine, writing on April 14th, says :—San Gerardo winze has been sunk 6 ft. during the week, making a total of 102 ft. below 572-ft. level. The bottom is in 3 ft. of ore, of which 1 ft. is very good. The drift east of San Antonio winze 648-ft. level has been advanced 6 ft. There is 2 ft. of good ore on the footwall. The drift west from San Antonio has advanced 6 ft. The ore streak here is only 1 ft. thick, and the distance between the foot and hanging wall is about 9 ft. Ultimo winze has been sunk 2 ft.; total, 89 ft. At this point a drift has been started west to connect with the east drift from San Antonio winze; the face shows about 2 ft. of good ore. The intermediate drift east (above 506) has advanced 3 ft.; total, 51 ft. The face shows 2 ft. of good ore.

CARN BREA MINE.

DIVIDEND OF 7s. 6D. PER SHARE.

MR. F. HARVEY presided at the 16 weeks' meeting of Carn Brea shareholders, held immediately after the Tincroft account.

The statement showed: Labour costs, 9,053*l.* 14s. 9d.; merchants' bills, 4,851*l.* 8s. 5d.; dues, 230*l.* 4s. 1d.; doctor's pence, 116*l.* 9s. 9d.; total debits, 14,281*l.* 14s. 5d. Tin sold amounted to 323 tons 7 cwt. for 17,603*l.* 6s. 10d.; copper, 17*l.* 19s.; total credits, 17,629*l.* 14s. 10d. There was thus a profit on the 16 weeks of 3,348*l.* 0s. 5d., and a balance in favour of the adventurers of 4,185*l.* 10s.

A dividend of 7s. 6d. a share was declared.

TINCROFT MINE.

DIVIDEND OF 5s. PER SHARE.

A FOUR-MONTHLY meeting of adventurers in Tincroft was held on the mine on Monday. Mr. T. R. Bolitho presided.

The accounts showed labour costs for the 16 weeks to have been 6,326*l.* 8s. 3d.; merchants' bills, 3,622*l.* 18s. 2d.; dues, 303*l.* 3s.; other items bringing the total debits up to 10,382*l.* 12s. 10d. Copper sold 319 tons 11 cwt., for 1,106*l.* 15s. 7d.; tin, 194 tons 7 cwt., at an average price of 53*l.* 4s. 6d., for 10,345*l.* 1s. 9d.; arsenic, 61 tons 14 cwt., for 408*l.* 10s. 10d.; discounts, 75*l.* 19s. 1d. Total credits, 11,950*l.* 10s. 8d., leaving a profit on the 16 weeks' working of 1,567*l.* 17s. 10d., and a balance in favour of the mine of 3,322*l.* 11s. 2d.

AGENTS' REPORT.—HIGHBURROW LODE.

The 282-fm. level, east of Martin's east shaft, is driven within a short distance of the boundary; the lode is worth for tin 50*l.* per fm. We have communicated the winze from the 270 to the 282-fm. level, east of Martin's east shaft, during the last few days; the average value of the lode was from 50*l.* to 60*l.* per fm. for 9 ft. long. We are now making the necessary arrangements for sinking Martin's east shaft below the 282-fm. level. In the old sump shaft, which is sunk 37 fms. below the 258-fm. level, the lode has been more settled during the last 7 fms. sinking, and producing saving work for tin. We have commenced to drive the 300-fm. level, by boring machinery, east of downright shaft; the lode at present is poor.

NORTH TINCROFT.

In the 154-fm. level west of Tyrie's engine shaft the lode is large and full of mineral, being worth for tin 12*l.* per fm. We have started a rise in the back of this level, and expect to hole to the 140 during the coming week. In the winze sinking below the 140-fm. level, west of Tyrie's engine shaft, the lode is worth for tin and copper 10*l.* per fm. In the 140-fm. level, driving east of cross-cut, west of Tyrie's engine shaft, the lode is worth for tin, copper, and mundic, 15*l.* per fm. This end is driven east of cross-cut about 30 fms. in quite new ground; we consider this a very important feature for us. In the eastern boundary winze, sinking below the 140-fm. level, the lode at present is poor. In the 130-fm. level, driving west of boundary winze, east of Willoughby's shaft, the lode is worth for tin 11*l.* per fm. In the 130-fm. level, driving east of Willoughby's shaft, the lode is worth for tin 10*l.* 10s. per fm. We have made the necessary arrangements for sinking Old Tincroft shaft below the 50-fm. level, in order to deal with the lode referred to above in the western part of the mine.—W. TEAGUE, J. HAMMILL, G. NANCARROW.

A dividend of 5s. per share was declared,

MINING CORPORATION, LIMITED.

SHAREHOLDERS WISH TO WIND-UP THE COMPANY ON THE GROUND OF INSUFFICIENT CAPITAL.

A MEETING of this company was held at the Cannon Street Hotel yesterday—Dr. Clarke, M.P., in the chair.

The SECRETARY read the notice convening the meeting.

DIRECTORS OPPOSE WINDING-UP THE COMPANY.

The CHAIRMAN: Gentlemen, I heard of the last meeting which was held here when several gentlemen were desirous of winding-up the company. I heard of the events which occurred with very considerable astonishment, and since that meeting of shareholders the directors have met, and they have unanimously agreed to oppose any resolution for winding-up the company to-day. But, perhaps, if any good reason can be shown by those who are anxious to liquidate, the directors may change their minds, and I for one might be converted to that view of the case. Since I heard of the meeting I have had time to consider on what possible grounds anyone could ask to wind-up this company. The company is not six months' old yet, and it cannot be as far as anything is concerned in the history of the promotion, because the promoters have only got their out of pocket expenses for advertising and promoting it, and they are taking their profits in the shares of the company. As far as the directors are concerned they are not guinea-pig directors. Every director has applied for and paid for all the shares he holds. No company in existence has got a cleaner history than the Mining Corporation. It cannot be because the directors have been throwing away your money, because out of the 2,500*l.* subscribed 1,500*l.* has been paid for promotion, and we have got about 750*l.* to the good. During the three or four months we have been in existence we have spent under 300*l.* of your money, so that you cannot say we have been extravagant. It cannot be because we have been premium-hunting and got into liabilities, because we have set our faces against that, although we had considerable inducement, and we have been determined only to do business upon *bona-fide* bedrock proposals. So that I cannot understand, as a business man, on what grounds this can be brought forward. During the three or four months we have been in existence there have been 26 meetings of the directors. They have considered about 50 proposals of business brought before them, and they have got some of these proposals in a very advanced state. We have been carrying on the work since the company started, and have done everything that could be done for it. We have in South Africa two able gentlemen representing us. Mr. Charles Anderson, Q.C., M.P., is one, from whom we have letters of importance. We are simply hindered by the action of a small section of the shareholders.

PROPERTY DESCRIBED.

We have in the eastern district Capt. Wetherly as a local director, one of the pioneers of the Transvaal goldfields. He went out in March to take charge of that district for us, and an abler and smarter man could not be found on that field. We have got a very able man representing us in the States, and we have got from all of them properties which, if carried out, will pay a very handsome dividend to the shareholders. We have four, which we have determined upon carrying out. One of these is one of the best Transvaal properties—a property unequalled, because it has a special concession from the Transvaal Government, and will be free from restrictions and costs. We have got a valuable coal property, which would have been carried through had it not been for the attacks made upon our credit. We have got 36 gold claims, in one of which there were 9 tons taken out of the mine, which gave 15 ozs. from the 9 tons, and 1½ ozs. from the battery. We have get a number of things we could have carried through, but lately our company has been retarded, and I want to know on what grounds the attacks have been made against us. There is no shareholder who can come here and tell us we have not done our duty as far as we can. I am told the objection by some is we have

TOO SMALL CAPITAL.

Corporations of this kind do not want big capital. Will any business man come here and tell me a thing like this should be wound up. What would winding-up mean? We have got your 2,500*l.* There is another 2,500*l.* due now. We have spent 1,950*l.* in promotion, and we have incurred liabilities. If you wind up, there will be the winding-up cost. Winding-up would mean you would lose every penny you have subscribed, and be well out of it if you only spent as much again.

THE CHAIRMAN WANTS TO HEAR ALL ABOUT IT.

But there may be something behind this, and I want to hear all about it. There may be some genuine facts, and if there is I shall be very glad to aid the gentlemen who desire winding-up. I will now ask any gentleman who is of that opinion to propose a motion for the winding-up, and tell us why he does so.

Rev. Mr. MAIL: At the last meeting I took a prominent part, and it was my motion that this company should be wound up. I came here expecting to hear a very rosy account of our prospects, but

I AM NOT OPEN TO THE CONVICTION THAT WE SHALL MEET WITH SUCCESS.

I do not think you are treating us fairly. You called us to a meeting on the 9th May, and we responded to your invitation, and it was competent for every shareholder and every director to attend that meeting. At that meeting we passed a resolution by a very large majority—almost unanimously, I believe—that this company should be wound-up, and it was not fair for the directors to issue a circular to the absent shareholders on that occasion to come here to-day. I do not like people going back, and if we pass a resolution that resolution ought to be carried out. (Hear, hear.)

WHY THE COMPANY SHOULD BE WOUND-UP.

I object to the company going on for two special reasons. First, the smallness of the capital—we have only 20,000*l.* subscribed out of 200,000*l.*; and secondly, because there are two hostile camps—the directors on the one side and a large number of the shareholders on the other. We all know that

A HOUSE DIVIDED AGAINST ITSELF CANNOT STAND.

For these two reasons I object most strongly to the continuance of the company. I know very well the directors have access to a great number of votes, and any attempt on our part would be in vain. The chairman spoke about the small amount of money that had been expended, but what about the salaries of the officials. I am told that the directors are to draw 1,200*l.* a year, and so we can easily imagine why they are anxious the corporation should continue. But we are not interested in that way, and I do not believe we shall see any return for the money we pay. I propose "that this company shall be wound up as soon as possible." It is better to lose a little money than pay up more and lose more money.

The CHAIRMAN asked, after waiting some time for a seconder, if any gentleman present intended to second the motion of the rev. gentleman.

Mr. GLOVER said that he would second the motion. In the course of his remarks, the chairman said he would like to know the person who had destroyed their credit. Certainly, the shareholders have not.

A SHAREHOLDER: You and Mr. Mahew have done all you can.

Mr. GLOVER continued to say that the directors had paid 1,500*l.* for promotion costs, and asked if they had not also given some shares away.

The CHAIRMAN: Certainly not.

A CAUSE FOR SURPRISE.

Mr. GLOVER: Then in respect to the directors' fees. It had been said that they received 1,200*l*., but he made it 1,450*l*., and there were other expenses that would make 1,000*l*. more a year. He was astonished that any body of honourable men should have gone to allotmeut on 20,000*l*. subscribed, when such a gigantic capital was asked for in the prospectus. He had a hundred letters from shareholders, who said that they would not have applied if they had known that the directors were going to allotment on a subscription of 20,000*l*. He believed that 12,000*l*. was promised to one financial agency, and 8,000*l*. to another. What was the meaning of that?

The CHAIRMAN: I never heard of anything of the kind. The whole thiug must be purely imaginary on your part. You might as well say we promised you 100,000*l*.

Mr. GLOVER: Have you not given any shares away to finaucial agencies?

The CHAIRMAN: Certainly not. The whole thing is absurd.

NO WINDING UP.

Mr. PIXLEY opposed the motion for winding-up, and spoke in the most complimentary terms of the way in which the directors had worked for them. He never knew a body of men that had worked so hard. They had 150 shareholders, and with such a number it would be a serious matter to wind-up the company. He was sure that if they could get a poll they would reverse the vote of the last meeting.

Mr. HAWKINS spoke in deprecatory terms of the motion, and of the motive that had actuated the rev. gentleman and his solitary supporter in bringing the resolution forward. He feared that their action had adversely affected the interests of the company. (Hear, hear.)

After a further brief discussion the motion for winding-up was withdrawn, and a vote of thanks to the chairman for presidiug closed the meeting.

WHEAL AGAR.

LOSS FOR THE 12 WEEKS, £3,455—A CALL OF £1 PER SHARE.

A MEETING of this company was held yesterday at the Offices of Mr. Edward Ashmead, 2, Drapers' Gardens, E.C.—Mr. John Darlington in the chair.

Mr. CORNELIUS BAWDEN (purser), read the notice conveuing the meeting, and the accounts were taken as read.

AGENT'S REPORT.

In presenting you with the following report I said that in consequence of the water being in the main part of the mine during the whole of the past quarter, the differeut points of operation valued in the report that was presented to the East Pool meeting stands about the same for this meeting, and the valuations were therefore as follows:—Waddington lode: The 255 east on south part of the lode worth 25*l*. per fm. Rise in back ditto worth 20*l*. per fm. The 255 west on south part worth 9*l*. per fm. The 255 east on south part worth 7*l*. per fm. Winze sinking below 235 east of cross-course worth 27*l*. per fm. Five stopes worth on an average 10*l*. per fm. The south lode: The lode in 235 end east worth 11*l*. per fm.; ditto in west worth 8*l*. per fm.: stope in bottom 225 east 10*l*. per fm. North or South Crofty lode: The lode in 225 eud west worth 10*l*. per fm. The work duriug the past 12 weeks has been cutting the balance bob-pit at the 120-fm. level, which is completed, and the bob fixed therein is working very satisfactorily. The ground excavated for this was 12,960 cubic ft., making about 925 tons of stuff, the whole of which has been drawn to the surface. We have also taken abroad and drawn to the surface 150 fms. of pit work from the old eugine shaft. Finding our water did not rise above the 140-fm. level whilst the eugine was idle, we began to clear this level and to divide it east (which is driven 93 fms. east of old engine shaft). The lode iu the end looks very kindly, aud proves good stones of tin, copper and mundic. We had assayed a sample from the leader part of the lode in the back of this level, and it made a produce of over 1 cwt. to the ton. We are now driving a cross-cut south at this level for the purpose of cutting the south lodes coming in from the neighbouring mine. We consider this a good point. Since we commenced to fork the water, we have cleared the 150-fm. level, and are now driving the end east. The lode is worth 10*l*. per fm. The driving of this end should open good stoping ground. Fortune shaft: We have cleared up this shaft with timber 5 fms. deep, and made it secure and partly fixed a ladderway therein to the water-level. Levels are extended east aud west of shaft on a lode underlying north 18 ins. in a fm. We think this is the same lode as worked at the 48-fm. level iu the western part of the mine. The opening of the shaft will, we think, be of importance to future working of the mine. In extending our operatious eastwards we find Winstane's shaft is sunk on the course of the lode. The ground appears te be exteusively worked, but the lode averages from 4 to 6 ft. in width. Independent of the work done underground since the last meeting, we have rebuilt 637 ft. of the arsenic flue at an average height of 9 ft., all of which has been arched in with brick, and is working satisfactorily. We have thoroughly gone through the boilers and flues and outside work of the stamps, and also torn up and refixed the well-work of the air compressors and given it a thorough overhauling inside, so that when the mine is again in fork (which, with good speed, we think, will be in about four weeks' time) the workings will, we trust, be carried on with satisfaction.

Capt. WHITE: I have just received a telegram from the agent at mine, stating that the water this (Friday) morniugis 6 fms. below the 195-ft. level.

Mr. THOMAS HAMILTON proposed "that the accounts be passed, and copies, together with the ageut's report, be sent to the shareholders."

Mr. THOMAS seconded the motion, which was carried unanimously.

THE BALANCE TO BE WIPED OFF.

The CHAIRMAN: We shall have to make a call, necessarily, and a heavy one; the balance against us for the 12 weeks is 3,455*l*., which makes the net balance against us 5,456*l*. In order to wipe off that balance the call ought to be 1*l*. a share. The time of payment must be considered, and I shall be glad to hear any expression of opinion upon the matter.

After some discussion,

Mr. MITCHELL proposed "That a call of 1*l*. per share be made, and that a discount of 5 per cent. be allowed if paid on or before 1st July."

Mr. LENNOX seconded the motion, which was carried.

Mr. HAMILTON: There has been a great deal said in London about the dilatoriness with which ends are driven in Cornwall. We find out in India. where they employ Indians and Chiuese, that they can drive about double the quantity of ground that our men can do in Cornwall. Can you explain how it is?

CAPT. WHITE: No, I cannot explain it; but a great deal depends upon the quality of the ground you have to work. We drove in the 245-fm. level 11 fms. a months. We have had difficulties to coutend with in sinking the shafts, and one thing and another; but I quite agree with you that the best that can be done should be done.

AN IMPORTANT QUESTION.

Dr. FELCE: I should like to ask the position of the East Pool: whether any equitable arraugement has been come to with regard to the pumping?

The CHAIRMAN: The only arrangement that has been come to is that each party has agreed to leave it to arbitration. We want to be on good terms with our neighbours, and I hope the arbitration will be satisfactory to both parties.

A SHAREHOLDER asked whether the mine had suffered from the water that was in it.

Capt. WHITE: I do not see that there is any reason to think that the mine has suffered in any way. As far as we have gone everything is perfect.

THE ENGINE.

A SHAREHOLDER: Is the engine all right now?

Capt. WHITE: The cugine is working very satisfactorily now.

Mr. MITCHELL proposed "That the next meeting of Wheal Agar be held this day 16 weeks on the mine," which was carried.

Mr. MITCHELL proposed a vote of confidence in Mr. White and Mr. Bawden, which was carried.

Capt. WHITE: I am extremely obliged to you. Wheal Agar has caused me great uneasiness. I have almost dreaded to meet the shareholders, but I am very pleased you have confidence iu me for the future as in the past.

A vote of thanks to the chairman closed the proceedings.

THE UNITED STATES GOLD PLACERS (NEW COMPANY), LIMITED.

1st May.—In placing before you my report for the month of April, I take great pleasure in stating that since my last report I have been more than successful in getting the important work then in hand, pushed forward with great rapidity, aud in a substantial manner. We have completed our rock-cut, and have it now ready for sluice boxes, which we will put in right away. We have finished the fitting of sides, &c., on the whole length of the ditch flume, and will have all the new work completed in the ditch by the 10th of this month. This new work consists of 350 boxes of 12 ft. long, 8 ft. wide, and 4 ft. high, containing 535 ft. of lumber each, or a total of 187,250 ft. To complete all the work mentioned above will have (of necessity) cost a considerable sum for labour, tools, supplies, and freight, most of which appears in statement herewith for April. I will say in this connection that for the money expended so far this season, we have had much better returns in the way of labour and otherwise, than for any similar amount spent since I was here.—W. J. MADDEN, Manager and Superintendeut.

P.S.—It might be of some interest to you to know of what our ranche consists, as I have already alluded to it. I have about 16 acres of oats sowed and 3 acres of potatoes; I have cultivated, in addition, about 3 acres for vegetables of various kinds. I have seeded about 6 acres with alfalfa and timothy seed. This I have sown with the oats, which will contiuue after this year to give a crop without cultivation.

ALEXANDRA PALACE.—At this popular place of resort, from July 15th to August 17th, there will be an exhibition of the various appliances counected with the excavation and subsequent treatment of ores of various descriptions, which will afford some of our miues an opportunity of making an interesting display. Should power be required, this will be supplied gratuitously, and we are authorised to state that space will be charged for at a merely nominal rate. Exhibits should arrive at the latest by July 8th. It is earnestly to be hoped that our home mines, especially, will co-operate in making this display worthy of the great interest represented. Sir Hercules Robinson, G.C.M.G. (Governor Cape Colouy), and Sir Charles Mills, K.C.M.G. (Agent-General Cape Colony), have consented to be patrous. Mr. G. Leighton Hare is the secretary.

TIN FROM PAHANG.—Mr. H. Teague writes:—Having recently returned from the Malay Peninsula, where I have been employed to iuspect and prospect the miuing properties of the Pahang Corporation, Limited, I naturally read with interest some of the observations made by Mr. Strauss yesterday at the Carn Brea Mine meeting of shareholders in reference to the "tin prospects," which appeared in your issue of to-day. I have always had the highest respect for Mr. Strauss, who doubtless is a very great authority on all matters in connection will our metal markets, and many of his past predictions have been realised. But if Mr. Strauss thinks that "it would take years and years to bring the Pahang tin to the market," I must say that he is labouriug uuder a very great misapprehension indeed. I am sure that if Mr. Strauss had himself favoured Pahang with a visit, or had beeu informed by any competent person who had actually inspected the extensive tiu mining region, that he would then have known that Pahang has withiu it the greatest number of large and rich tin lodes that has ever been laid open in any tiu mining district of the world, which can be most expeditiously and cheaply worked; and wheu sufficient stamp mills are erected the metal can be brought "to the market" for less than half the cost of tiu raised in the Cornish mines. The Kuantan River and its tributaries have their general directions at right angles to, and iutersects most of, the lodes; hence the advantage of full and free access to the lodes without finding the "great jungle" such a serious inconvenience. The "great jungle" consists of an abundant supply of all kinds of useful wood for buildings and mining purposes, as well as wood for the production of charcoal for tin smelting, fuel for steam engines, &c.—*The Western Morning News*, May 22nd, 1889.

NEW EMMA SILVER MINING CO., 1886, LIMITED.

4th May.—I have to report work carried on at the mine for the week ending to-day, as under:—Level No. 1, south-easterly, advanced 6 ft.; total, 273 ft. The rock is hard, though seamy, and very much mineral stained, and seams filled with oxidised iron; worked one man full time, and one man three and a-half days for the week in this level. Raise from No. 1 extended 4 ft.; total, 58 ft.; shows a little improvement; galena seam continues, besides three small stringers of ore crossing the face at right angles from seam of galena, which gives great encouragement; one man worked full time. Level No. 1, north-westerly: We are still raising and drifting from this level through the old workings, opening up and taking out ore for the mill; worked six men full time. Level No. 3, south-easterly, advanced 10 ft.: total, 457 ft. Nothing new to report from this level. Rock continues seamy, and very much mineral stained; is looking very encouraging; worked three men full time. Level No. 4, north-westerly, advanced 12 ft.; total, 77 ft.; not any change to report; seam continues about 20 ins. wide, filled with iron, clay, and soft limestone, and showing ore occasionally; besides, the surrounding rock is very much stained with oxidised iron. The outlook in this level is very hopeful; three men worked full time. Most of the time during the week has been consumed in getting mill ready to start concentrating. Men from the mine were taken to do this work, which will explain why no greater progress was made in the levels in the mine. We started concentrating mill this morning, and so far it is working quite satisfactorily.—H. C. WALLACE.

The following cablegram has been received from the superintendent at the mine:—"Palmer completed survey; mill running; shipping ore and concentrates."

THE WATERBERG PROSPECTING SYNDICATE, LIMITED.

ISSUE OF £10,000 CAPITAL IN £1 SHARES.

A most remunerative investment in First-class South African Gold Mines.

MESSRS. EDWIN FOX and BOUSFIELD will PLACE by AUCTION, at the Mart, on FRIDAY, May 31st, at Two, in Lots to suit large and small capitalists, 10,000 £1 SHARES in the WATERBERG PROSPECTING SYNDICATE, LIMITED, being further capital in addition to the existing amount of £10,000. The Syndicate has acquired the mining rights in respect of 163 claims equal to 255 acres in the Klerksdorp District of the Transvaal, which, in the opinion of experienced mining experts, is considered to be one of the richest goldfields in South Africa. Careful inspection and assays demonstrate the production of reefs already opened to be in some instances up to 4.75 oz. to the ton. It is intended to form a company with a capital of £200,000 to acquire 115 claims, all the shares in which, after transferring one-fifth due to the South African claim-holders, will become the property of the Waterberg Prospecting Syndicate, the cash for purchase and working capital being provided by the Syndicate. The option on the remaining 48 claims will be retained by the Syndicate to be dealt with hereafter. The new capital is necessary to meet the above and other requirements. The recent report of the directors to the shareholders, and further particulars, may be obtained of Frederick Romer, Esq., solicitor, 4, Copthall Chambers, E.C.; of F. W. Sellick, Esq., secretary, at the office of the Company, 26, Austinfriars, E.C.; and of Messrs. Edwin Fox and Bousfield, 99, Gresham Street, Bank, E.C.

Preliminary Notice.

TOLGULLOW UNITED MINES.

Near Scorrier, Cornwall.

MR. W. T. DAVEY, Auctioneer, Redruth, has been favoured with instructions to SELL by PUBLIC AUCTION, on MONDAY and TUESDAY, the 17th and 18th day of June, 1889, at the above Mines, the whole of the MACHINERY and MATERIALS, consisting of, viz., 1 high-class 70-in. cylinder pumping engine (stroke 10 ft. by 9), with first piece of main rod and caps; 3 excellent 12-ton boilers with fittings complete, iron balance bob complete, 1 60-ft. shears with shieves and brasses, excellent donkey engine; 1 pair 14-in. cylinder, 2 ft. 6 in. stroke horizontal slide-valve high-pressure coupled engines, No. 1103, date 1886, by Sandycroft Foundry Co.; 1 pair 14-in. air compressors, 2 ft. 6 in. stroke, attached to back of steam cylinders complete with air receiver; 1 20-in. cylinder double-acting winding engine, 6 ft. stroke, with 2 fly-wheels and cage, 1 good 11-ton boiler with fittings complete, steam capstan, about 300 fms. nearly new steel wire rope; 1 34-in. cylinder stamping engine with 2 large fly-wheels and shafting; 2 first-class 11-ton boilers with fittings complete, 5 good stamps axles with 60 heads and frames complete, 2 stamps axles for 16 heads each, about 25 fms. 20-in. pitwork, 35 fms. 18-in. ditto, 40 fms. 12-in. ditto, and 53 fms. 10-in. ditto, 6 15-in. pitch pine rods, 3 11-in. ditto, and 2 12-in. ditto. 1 10-in. balance rod complete. Several pairs faggotted strapping plates, 5 shaft tackles with shieves, 4 climax patent rock drills with fittings complete, 1 4-in. 9-ft. drop screw, 1 3½-in. 6-ft. ditto, and 1 2-in. 3-ft. ditto. Dry tube—about 200 fms., iron stave ladders, wheel and hand barrows, launders. A large quantity of very useful timber. About 15 tons tram-road iron, tram wagons, shaft rolls, old cast and wrought iron, smiths' and miners' tools in variety, 2 nearly new 42-in. smiths' bellows. A good double-power winch, 3 single ditto, lifting jack, &c. Also a large quantity of other articles in general use on mines. The pumping engine is considered by competent judges to be one of the finest and best finished engines in Cornwall, and the whole of the other machinery and materials will be found in perfect order, and of the best possible description.

For further particulars apply to the liquidators, Messrs. John Garland and Wm. Michell, 6, Queen St. Place, London; Capt. John Gilbert, of Mellanear Mine, Hayle; or to the Auctioneer.

Dated, The Auction Offices,
Station Hill, Redruth, May 20th, 1889.

RIO TINTO COMPANY, LIMITED.

NOTICE IS HEREBY GIVEN, that an EXTRAORDINARY GENERAL MEETING of the Company will be held at the Offices of the Company, 30, St. Swithin's Lane, London, E.C., on THURSDAY, the 30th May, 1889, at half-past Two o'clock precisely, for the purpose of confirming as a Special Resolution the following Resolution which was passed at the Extraordinary General Meeting of the Company held on the 13th May, 1889, namely:—

SPECIAL RESOLUTIONS.

That the articles of association be altered in manner following:—

(*a*) The following article shall be substituted for article 133.

"133. The Company shall not, notwithstanding any notice or knowledge they may receive or have, be bound to recognise any legal or equitable right, title, or interest whatever, to, in, or in respect of, any shares or stock represented by a share warrant, except the following rights:—

(A) "An absolute right in the bearer for the time being of any coupon so advertised as aforesaid for payment, to such amount of dividend or interest on the share warrant whereto the same coupon shall belong, as shall have been as aforesaid declared payable upon presentation and delivery up of that coupon.

(B) "An absolute right in the bearer for the time being of the share warrant, and the unadvertised coupons to the shares or stock included in the same share warrant, and all benefits thereof other than the dividends or interest, which shall have been as aforesaid declared payable on the same shares or stock."

(*b*) The words "but they shall under no circumstances issue any new share warrant for any shares or stock for which a share warrant shall have been previously issued, unless and until the share warrant so previously issued shall have been first delivered up to them to be cancelled" in article 140 shall be omitted from article 140.

(*c*) The following article shall be inserted after article 140, namely:—

"140A. If any share warrant or coupon has been or shall be lost or destroyed, the board, if such loss or destruction be proved to their satisfaction, and if in their absolute discretion they think fit, may in the case of any such coupon which shall have been advertised for payment as aforesaid, pay the dividend payable in respect of such coupon to such person as may in their opinion be entitled thereto, or may issue a new share warrant or coupon in lieu of the warrant or coupon so lost or destroyed, but every person to whom any such payment or issue shall be made shall previously pay to the Company all expenses connected with such issue, or with the investigation of the evidence of such loss or destruction, and shall also previously give to the Company such an indemnity as shall be satisfactory to the Board."

(*d*) There shall be added on to article 154 the following words, namely:—

"All dividends unclaimed after having been declared may be invested or otherwise made use of by the board for the benefit of the Company until claimed."

Holders of share warrants to bearer will receive a ticket of admission on depositing their warrants in accordance with the articles of association three days prior to the meeting, either at the Company's Offices in London, or at the Société Générale, Rue de Provence, 56, Paris, or at the Deutsche National Bank in Bremen.

By order, of the Board,
R. J. FENNESSY,
Secretary.

KENDAL.

WATER-GAS PROVED A COMMERCIAL SUCCESS. A SAVING OF £10,000 PER ANNUM IN ONE WORKS ALONE.

THE BRITISH WATER-GAS SYNDICATE, LIMITED.

WATER-GAS.

The following extract from the *Times*, of January 2nd, 1889, relative to the manufacture and application of Water-gas, is reprinted for general information.

WATER-GAS.

"For many years past attempts have been made at intervals to produce what is known as water-gas—that is, gas resulting from the decomposition of water. Experimentally there have been several successes, but practically and commercially up to the present time, as far as we are aware, these have been only failures. These failures have mainly arisen from the difficulty experienced in separating the water-gas from the other products. This difficulty has now been overcome, not by one invention, but by the combination of the best features of several inventions having for their object the manufacture of water-gas. What is more, the patented inventions which have been combined in the new process are not those of one inventor or of one country, but represent several inventors and several nationalities—namely, England, Germany, America, and Sweden. The amalgamation of these various patents and the beneficial results which have accrued therefrom came about by reason of the exigencies of manufacture of corrugated boiler flues and press-flanged steel frame plates for railway rolling stock at the Leeds Forge Company's Works, Leeds. The metallurgical operations carried out there demanded fuel of a higher calorific intensity than could be obtained from either the generator gas of the Siemens' producer, or ordinary coal gas. Mr. Samson Fox, the managing director, therefore turned his attention to water-gas, and, having carefully considered the whole question, decided upon putting down a water-gas plant at the Leeds Forge. The works were begun on September 29th, 1887, and on March 29th, 1888, plant capable of producing 40,000 cubic ft. of water-gas per hour was started, and has since been in constant operation with perfect success, and without interruption. The gas produced gives every satisfaction, not only for metallurgical, but also for lighting purposes, the whole of the works being supplied with it.

"Water-gas is the result of a chemical re-action which takes place in passing steam through incandescent carbonaceous matter, and may be considered as the practical result on a wholesale scale of the ordinary laboratory experiment of decomposing water by passing steam through a highly-heated iron tube. In the water-gas apparatus the fuel, which at Leeds Forge is coke, is raised to a high temperature in a generator by the aid of an air blast. The blowing is continued for about 10 minutes, by which time the fuel has reached a dull red heat. During this period what is known as producer-gas is given off, and this is led away to a range of Lancashire boilers, where it is utilised in raising steam for the engines in the works. At the end of 10 minutes the valves are reversed, the air-blast being stopped, and the further exit of producer-gas to the boilers prevented. Steam is then admitted at the top of the generator for four minutes, and, passing down through the incandescent fuel, becomes decomposed, and a fixed gas results. This gas as formed passes away to a scrubber, where it is treated much in the same way as ordinary coal-gas. From the scrubber it passes to the gas-holder, where it is stored for use for metallurgical purposes in the works, such as heating and welding. For indoor illuminating purposes a portion of the gas is conducted from the gas-holder to the purifiers, where its purification is effected by means of oxide of iron. It will thus be seen that the process consists of alternately blowing the generator hot and making gas, and that a run of gas is made every 15 minutes, during which time the yield from each generator is about 17,500 cubic feet of producer-gas and 5,000 cubic feet of pure water-gas for heating and lighting purposes. The gas is also used most successfully for driving gas engines.

"The metallurgical purposes to which the water-gas is applied at the Leeds Forge are various. In the first place, it is used in the heating furnaces in the plate mill, where the steel ingots are rolled into plates for the manufacture of Fox's corrugated boiler flues. It is also used in welding these tubes and heating the plates for Mr. Fox's flanged frame-plates for railway rolling stock, and for his flanged boiler-fronts, besides which it is utilised in various other similar operations throughout the works. In the application of water-gas to the manufacture of Siemens' steel there is a marked improvement in the quality as well as the quantity of the product. With this gas 30 charges of steel per furnace per week can be turned out, as against 11 charges per furnace per week from furnaces of equal capacity using gas from Siemens' producers. Besides being used for metallurgical purposes, the offices and various parts of the works are lighted with water-gas, the burners employed being arranged on the Fahnejelm system. Burnt in the ordinary way, the water-gas gives a blue flame, but by suspending a comb composed of thin magnesia rods in the flame the filaments are quickly heated to a white heat, producing a bright glow light of high illuminating power, but which is neither unpleasant to the eye nor prejudicial to the sight. The heating power of water-gas was very great, as was demonstrated upon our recent visit to the Leeds Forge Works, where we inspected the method of its manufacture as well as that of its use in the various departments. To give one instance only, a piece of copper wire placed in an ordinary coal-gas flame was only made red hot. A similar piece of wire placed in a water-gas flame issuing from a similar burner was quickly and perfectly fused.

"An important consideration in the adoption of any new system is, of course, its cost; and in this respect water-gas comes out well. Its production per ton of fuel is about 30,000 cubic ft., and with fuel at 8s. per ton, labour at 3s. 6d. per man per day, and the production going on continuously, it is found that the gas costs slightly less than 4d. per 1,000 cubic ft. The experience of nine months' working at the Leeds Forge has led to the conclusion, based on carefully-ascertained data, that the saving effected on the whole works is about £10,000 per annum. Looking at the advantages of water-gas for illuminating purposes, it is to be observed that, besides giving an agreeable light, it does not develop any noxious fumes, nor does it produce smoke; health and cleanliness being thereby preserved, and paintings, furniture, and decorations remaining uninjured. For lighting mansions this would prove a boon, while the producer-gas can be utilised for heating purposes. Similarly, a mill-owner laying down a water-gas plant for lighting his factory will obtain gaseous fuel for steam-raising purposes practically for nothing. For small towns also the lighting could be carried out with water-gas, the producer-gas being used for steam-raising and manufacturing purposes generally. Although the installation of this water-gas plant at the Leeds Forge is the first in England, the system is being largely adopted in America and on the Continent, both at steel works and for illuminating purposes."

In addition to the above extract, the following papers have recently commented favourably on water-gas.

ARGENTINE REPUBLIC.

THE SANTA FE & CORDOVA GREAT SOUTHERN RAILWAY CONSTRUCTION COMPANY, LIMITED.

(INCORPORATED UNDER THE COMPANIES ACTS, 1862 TO 1886.)

CAPITAL, £500,000, divided into 5,000 Shares of £100 each,

The whole of which has been Subscribed, and £185,365 paid up thereon in cash.

ISSUE OF £660,000 Five per cent. PERPETUAL DEBENTURE STOCK.

Secured by a Deed of Trust dated the 23rd day of May, 1889, in favour of the undermentioned Trustees for Debenture-holders as a first charge on the undertaking and property of the Company, consisting of the Railway constructed and to be constructed between Villa Constitucion and La Carlota, of about 187 miles in length, and its equipment. Payable as follows :—On Application. 5 per cent. ; on Allotment, 5 per cent. ; on the 30th September, 1889, 20 per cent. ; on the 31st December, 1889, 20 per cent. ; on the 30th April, 1890, 25 per cent. ; on the 31st August, 1890, 25 per cent. ; total, £100.

Applicants can pay for the Debenture Stock in full on Allotment. Interest at the rate of 3 per cent. per annum will be allowed on such pre-payments. The Company Covenants to pay interest on the 1st January and the 1st July in each year, and such interest will run on the instal-ments from the dates fixed for payment of the same respectively. The first payment will be made on the 1st January, 1890. A form of application for Debenture Stock accompanies the prospectus, and may be filled up for any amount being a multiple of £10. The Stock will be registered in the names of Subscribers free of expense, and the Bankers' receipts will be exchangeable in due course for the Stock Certifi-cates of the Company. The proceeds of this issue will be held by the Trustees to be applied in accordance with the provisions of the Trust Deed and on Engineer's Certificates.

PROSPECTUS.

THE Santa Fé and Cordova Great Southern Railway Construction Company, Limited, was formed on 29th May, 1888, to purchase from Mr. C. Frederic Woodgate a concession granted by the Argentine National Government for a broad gauge railway (5 ft. 6 ins.)

The line starts from the town and port of Villa Constitucion, on the River Paraná, 30 miles below Rosario.

The first section extends from Villa Constitucion to the town and colony of Melincué, and from thence to the town of Venado Tuerto, a distance of 103 miles.

The second section terminates at the town and colony of La Carlota, a distance of 84 miles. The entire length of railway is therefore about 187 miles.

The following materials have been shipped :—18,000 tons of rails and sleepers, 10 locomotive engines, 100 wagons, besides bridge work, material for station buildings and sheds, and the requisite plant. The road bed has been prepared for a distance of 40 miles, and about four miles of track has been laid.

The whole of the 21,000 tons of steel rails and 20,000 tons of steel sleepers, which are in course of shipment, have been ordered from Messrs. Camnell & Company, and the Moss Bay Company. The earthworks platelaying, culverts and stations have been contracted for with Messrs. Teltey & Gardom and Nichols & Donne, local contractors of good standing, and the total cost of the line, well built and equipped, together with an ample working capital, will, it is estimated, be well within the capital and debenture issue.

About the beginning of next year the working of the line to Melin-cué (about 75 miles) will be commenced.

The country which the railway route traverses is at present heavily stocked with sheep and cattle in enclosed estancias, and partly under cultivation. As the land is a black loam, which can compare favour-ably with the best in South America, there is no reason to doubt that when the railway is opened and cheap transport for cereals provided, it will mainly be converted to agricultural purposes for at least 10 miles on either side of the line.

These lands are principally populated by emigrants from Italy. The number of immigrants of all nationalities who entered the Republic last year being, as stated by the official report, 155,000.

At the Port of Villa Constitucion ocean steamers can load and dis-charge at all seasons of the year.

By the terms of the concession, the real and personal property of the Company necessary for working and traffic are exempt from national taxes, and the materials for construction and working from import dues.

The Company are allowed by the Argentine Government a period of three years ending on the 22nd June, 1891, to finish the line, which is more than sufficient for the purpose.

The Company have purchased from Mr. Woodgate the concession, and he has also agreed to supply all the lands required for the rail-way and stations according to the plans approved of by the Argentine Government, besides an area of 123½ acres at the Port of Villa Con-stitucion for workshops, terminus, &c.

In order to direct the stream of immigration to the lands in the vicinity of the railway, a land company was formed under the name of the Santa Fé and Cordova Great Southern Land Com-pany, Limited, at the same time with the railway company, which will, it is expected, by settling up the lands bordering on the line, greatly increase the amount of traffic on the railway.

The shares of this land Company, which were issued to the public on 29th May, 1888, are now quoted on the Stock Exchange at about 50 per cent. premium.

The nature of the traffic to be carried will be similar to that of the Buenos Ayres Great Southern, Buenos Ayres and Rosario, and Central Argentine Railways.

The receipts of the above named lines, from the last returns given in Herepath's Journal, up to the 11th May, are :—

£30 gross per mile per week Buenos Ayres and Rosario.
£33 „ „ „ Buenos Ayres Great Southern.
£62 „ „ „ Central Argentine,

with about 44 to 50 per cent. for working expenses.

The estimated receipts of the Santa Fé and Cordova Great Southern Railway have been taken at £20 only per mile per week, and 55 per cent. has been deducted for working expenses, making the estimated traffic when the line is completely opened :—

£20 gross per mile per week on 187 miles.

Earnings gross ...	...	£194,480
Deduct 55 per cent. ...	...	106,964
		£87,516 Net Income.

showing, even at this comparatively moderate estimate, a large mar-gin beyond the £33,000 per annum required to pay 5 per cent. on the present issue of the £660,000 debenture stock.

A Stock Exchange quotation for the debenture stock now offered for subscription will be immediately applied for.

Where no allotment is made the deposit will be returned. If the amount allotted is less than that which was applied for, the balance of the deposit, so far as requisite, will be credited towards the pay-ment due on allotment.

If any instalment is not duly paid, the amount previously paid will be liable to forfeiture.

Prospectuses may be obtained from the brokers, the bankers, and at the offices of the Company, where a copy of the debenture trust deed can be inspected.

Application for debenture stock must be made on the accompanying form, and forwarded, together with the required deposit, to Messrs. Glyn, Mills, Currie and Co., 67, Lombard Street, London, E.C.

23rd May, 1889.

London : Printed for the Proprietors by Straker Brothers & Co., and Published at the Offices, 234, 5, & 6, Gresham House, Old Broad St., E.C., Saturday, May 25, 1889

SUPPLEMENT.

The Mining World AND ENGINEERING RECORD.

ESTABLISHED 1871.] SATURDAY, MAY 25, 1889. [ESTABLISHED 1871.

REPORTS OF MEETINGS.

BALAGHAT-MYSORE GOLD MINING CO., LIMITED.

SHAREHOLDERS ARE ANGRY AND REFUSE TO PASS THE REPORT AND ACCOUNTS—THEY ALSO REFUSE TO RE-ELECT RETIRING DIRECTORS AND AUDITORS—THE MAIN CAUSE OF THEIR ANGER IS THE DISTRIBUTION OF DIRECTORS' FEES—THE CONSULTING ENGINEER GIVES SATISFACTORY EXPLANATIONS OF MINE WORKINGS—2¼-oz. ROCK.

A MEETING of this company was held on Wednesday at Winchester House, to receive the report of the directors, and to transact the necessary business—David F. Carmichael, Esq., chairman of the company, presided.

The notice calling the meeting was read by the SECRETARY (Mr. E. O'Dwyer), and the report of the directors was taken as read.

RETROSPECT.

The CHAIRMAN: Gentlemen, this is our third annual meeting, and we may take a brief retrospect. We bought this property early in 1886, and got to work there in May of that year. Some very favourable crushings had occurred under the previous company's own vendors. In one case 42 tons produced 5 ozs. per ton; in another, 200 tons yielded over 1¾ ozs. per ton; and from further crushings, 400 ozs. of gold had been obtained. The mine had not been extensively developed in depth, yet its underground workings were not unimportant. All the shafts you see on the plan—except that to which our esteemed consulting engineer stands godfather—were started by the old company—one here to a depth of 250 ft., and levels had been run at depths of 100 and 200 ft. respectively. Our people, however, on arriving on the field, reported that there was hardly a trace of gold in the workings, and no reliable indication of any good body of quartz in sight. They elected to proceed into the levels north and south of the north engine shaft, especially as the very rich quartz extracted by the old company had been found at a short distance from the shaft on the south. After some months' working the shoot forming a continuation of that quartz was found. The ore was rich, but there was comparatively little of it, and it extended about 50 ft. only in depth, in for about the same distance in length, just below the 270 south level. After that they lost it, but it may re-appear, we hope, in some of the lower workings. Meanwhile the shaft was being slowly sunk in levels driven north of it to prove the ground in that direction, where old workings were indicated. Ultimately, in November, 1887, a shoot of good quartz was entered in the 165 north level.

ENERGETIC DEVELOPMENTS.

Three levels below this, the 205, 270, and 330 north, were energetically pushed forward, and they have all entered the same shoot. It is stated by Mr. Bosworth Smith, the mineralogist of the Madras Government, that the auriferous quartz veins on the Colar goldfield are not so much continuous veins as they are series of parallel shoots—dipping at a low angle in a direction somewhere between north-west and north. In our 330 level, however, the shoot was so obliging as to take a considerable dip to the south, so that we entered it quite 100 ft. earlier than was expected; and from a telegram just received from Mr. Oakley, he expects soon to be in quartz at the 410 level, where we have tunnelled at present under 100 ft. only, so that there is a further dip south of this same shoot, probably. When the levels north of the north engine shaft were thus proved to be paying ground, we resolved to work them energetically, postponing further explorations in the levels south of the same shaft, where we had discovered nothing worth much, any more than in the levels cut north and south of the south engine shaft. But even when we met with pay quartz, the comparative narrowness of the quartz has made it impossible for us to extract enough to keep our 10-stamp mill in full work, and the returns have therefore not come up to the expectations which were put forward at the last annual meeting at which Mr. Oakley was present.

SMALL CRUSHINGS, BUT BIG YIELD OF GOLD PER TON.

Mr. Oakley's estimate, you remember, was that we might hope to crush 300 tons a month, yielding 2 to 2½ ozs. per ton, which would give us 2,000*l*. a month. The result for 1888 falls short of that figure considerably, though we hope you will concur with the paragraph in the directors' report, that a yield for the year of 2,780¼ ozs., realising 10,238*l*., may be considered large, or at all events promising, for so young a mine. It is fair to Mr. Oakley to remind you of one point in which he was not over sanguine—the gold per ton crushed has averaged 2 ozs. 3 dwts. continuously. Our expenses, I may point out, are 2,500*l*. under last year's. I estimated them at 1,500*l*. a month, or 18,000*l*. a year, in England and India together. They have reached a slightly higher figure than that—19,500*l*., or 1,625*l*. a month. Now, as to our prospects for the future. Mr. Oakley, who we may well suppose is not likely to make another over-estimate, in a memorandum which accompanied the plan of the mine just sent home by him, reckons the reserves, *i.e.* the quartz in sight in the ground, we have opened out in the north of the north-engine shaft, at about 2,000 tons, of about the same value as that already milled. Accepting this, I think we shall not be foolish in looking for a decided improvement as we get further down, both in the thickness of the quartz and the length of the shoot—not to mention the probable contingency of our meeting with another body of pay quartz.

A PRIZE OBTAINED.

We intend at the same time to resume explorations in the southern part. Extensive old workings, judging from surface indications, were carried on there, below which we hope to find untouched quartz. There is still another quarter in which we place some hope. We began the Darlington shaft on a large and apparently rich lode, but found no quartz to speak of. There is little doubt, however, that it must contain shoots of paying quartz. Now we are making cross-cuts east and west from the 270 level north, the east cross-cut should strike the lode in Darlington shaft, and we may find a good shoot of quartz; if we do, it may be advisable to resume the sinking of the shaft. In the report, from which I have already quoted, Mr. Bosworth Smith, who classes the Balaghat Mine as one of those lying in the "Champion run" of old workings—to which the term "Champion lode" has been given—speaks very highly of the quartz found in this lode, and one specimen shown to him from the Balaghat Mine he pronounces to be "by far the richest specimen I have seen from the Colar goldfields." Soon afterwards we learnt that at the Exhibition of Agricultural and Industrial Arts, lately held at Mysore, Balaghat won the prize for the best quartz—the beautiful silver medal I now hold in my hands. The prize specimens have been sent to the board by Mr. Oakley, and are now on the table. Only let us find more of this kind of quartz and we shall do very well. I will now, gentlemen, move "That the report and accounts for the year 1888 be adopted."

FURTHER EXPLANATIONS.

Mr. WRIGHT (director): The statement made in the directors' report, and the statement also made by our chairman, goes so fully into all the details relating to the company that I think I may venture to pass it over without any further remarks beyond this—that the expenditure on machinery and appliances has been upon a scale the like of which we do not anticipate again for a long time to come—at least until we find some very favourable result. With regard to our not supplying the mill so fully as was expected, I should say that the mill we have there was on the mine when we took over the property. It appears to have been erected in rather a makeshift sort of way, and when it had to stand continual working it was not equal to the strain put upon it, and needed considerable repairs, including new foundations. That delayed us in milling during March and April. In April the mill only worked 10 days instead of 25, but I hope there is a good store of ore on the ground for the mill to proceed with now that we have a new boiler fixed and the machinery repaired.

THE STAFF IN INDIA.

I think everything now upon the mine will be in a very good condition for future working. I ought to say, in justice to our staff there, that we have found our returns and accounts are kept in such a careful manner, and come to us so punctually, and that the reports are so clear and explicit, that we cannot do otherwise than feel that we have faithful servants, and so we place full reliance on their integrity and watchfulness of our interests. For the first time

WE HAVE OPENED A REVENUE ACCOUNT.

We had receipts amounting to 10,000*l*., and thought the time had come when we ought to open that revenue account, even if it showed a loss. It does, as might be expected, in the first year of our milling operations, but whether we shall be able to recoup that in the year that is before us it is impossible to say, and I should not like to prophesy, but if we have such good ground in the 410 as what the 330 and the 270 lead us to expect, we shall certainly find that the yield will be larger than it has been last year. (Hear, hear.)

STATE OF THE MACHINERY.

Col. CAMPBELL WALKER: With reference to the remarks of the last director—before the report is adopted, may I, without any breach of confidence, mention that Mr. Oakley stated two years ago, when I was on the mine, that the machinery was certainly not in an efficient condition, and that it was not fit to do the work required of it. He could not also guarantee the results until it was altogether improved. May I ask for some information as to why it has taken two years to put that machinery into thorough order and equip the mine in a proper manner. I say that

until quite recently matters have been going wrong, and it has been a constant question of repairs for the last two years. Surely, with the ability of our board and with our mining engineer as our adviser, it is possible to put Mr. Oakley and Mr. Pryor, in whose good faith and efforts I certainly rely, and fully endorse what has been said by Mr. Wright—surely, it is only proper to put them in a position to do justice to the board, to the shareholders, and to the mine. I regret to say that, in my opinion, the management out there has not until quite recently been placed in such a condition. I need only say further that, before passing the accounts I should like to know if the directors have taken the full amount of their fees, which, of course, they are entitled to claim, but I presume, as in other mining companies, they will consider the position of the shareholders, and abstain from doing so until they have something more satisfactory to tell than they have been able to relate to-day.

MR. WEST'S IDEA OF WHAT DIRECTORS AND SECRETARY HAVE TO DO.

Mr. WEST: In reference to the expenditure, I think we must bear in mind that the real business of this company is carried on in India, and that, therefore, it only requires a very slight supervision on the part of the directors here. (Laughter.) I should say that half an hour a week would be amply sufficient to deal with the business of this company in England. (Laughter.) Yet we find the directors are receiving a very large sum, but I hope it will turn out, as the last speaker foreshadowed, that the directors are not drawing the full amount of their fees, but have merely put them down as a matter of account. I also find that the consulting engineer alone draws 200 guineas, though I do not know under what circumstances this payment is made. What a consulting engineer can do in England with regard to a mine in India, that can entitle him to earn 200 guineas, I do not know, and the item requires an explanation from the directors before the accounts are passed. Then we come to the office expenses and salaries, which I think are excessive, for the duties cannot be heavy, and cannot demand more than two or three hours time a day. (Laughter.) With regard to the state of the expenditure in India, it is, of course, very difficult to analyse it or to form a correct idea as to whether it is reasonable, or extravagant. I am of opinion that the failure to pay dividends is not due to the want of productiveness in the mine, but to the extravagance of the management. If the mine had been economically managed the loss might have been converted into a profit. I think the directors should give explanations why we are charged with these heavy sums upon a mine that is not earning a dividend.

FINANCIAL POSITION FROM A SHAREHOLDER'S POINT OF VIEW.

Genl. SANKEY: I understand that this is the first year in which a capital and revenue account has been opened, but the effect of it is that rather a false idea is conveyed as to the position of the company. It shows that the yield of last year has also only fallen short of the expenditure by 2,288*l*. If that be the case we have about 3,000*l*. or 4,000*l*. in hand, plus 10,000*l*. to call up, or 13,000*l*. or 14,000*l*., which, divided by 2,288*l*., would leave about four years' working, whereas, according to my reckoning, we have not more than 13 or 14 months' cash in hand. In the first instance, the real expenditure in India and England is nearly 20,000*l*. a year, so that I think my estimate is correct. It is right to begin a capital and revenue account, but I think the way it is done here leaves rather a false impression that we have a longer life in our mine than is really the case. I think we ought to look matters fairly in the face, because the disagreeable alternative will soon face us of having to raise further capital. I see from the general statement that this is in a great measure attributable to the fact that there has been a falling off in both the quantity and quality of the ore.

2¼-OZ. ORE.

The quality, however, I maintain, has been unexceptionally good—averaging 2¼ ozs. to the ton. In any other mine that would be looked upon as very good, and as far as the shoots are concerned it is the richest mine in the field, but why is it that the quantity has not also been forthcoming? It seems attributable to want of energy. In the first instance the north engine shaft was pushed down to 270 ft., and in that distance levels have gone further and further away, and it is taking a direction to the north in a very rapid way. In the four levels about 1,000 ft. have been driven almost in barren rock. It is acknowledged we did not expect to touch the lode in the 330 level at less than 370 ft. from the shaft, but by good fortune we have got it 130 ft. sooner than we expected. It was expected that the level would not have reached the ore under 370 ft. or under 450 ft. in the 410, so that it seems to me there has been an amount of unfruitful work that is incredible. When it was found the shoot was going in one direction, the shaft should not have been worked from that position, or if it were, it should have had the further *raison d'être* of working from both sides.

CAPT. PRYOR'S REPORT.

I have had the pleasure of seeing Mr. Pryor, who seems to be a very energetic sort of man, but he says, in a very unmistakable way, that the operations at the south shaft have remained in abeyance, as per instructions. At page 12 he says: "The 165 level south has been extended 37 ft. 8 ins., or 282 ft. 2 ins. from the shaft. The lode is poor. This drive was suspended, as per instructions March 30th, 1888. The south shaft has only been sunk 10 ft. 6 ins. below the 220 level. The lode is poor. Operations suspended here February, 1888." In his concluding remarks he says: "I think the development of the southern ground should be prosecuted, as in my opinion the indications of old workings at surface south of the shaft, and the rich, although small, shoot of quartz passed through south of the north engine shaft, fully warrant the opening out of this part of the mine. I should, therefore, strongly recommend the driving of at least one level in this direction." Mr. Oakley speaks in the same way:—"Our prospects of finding something of value at the southern end of the property are, I think, also decidedly encouraging." The encouragement these men have had south was the encouragement they had a year or more ago. There has not been a single new fact developed, and yet we find that the levels were stopped at the southern end. It requires explanation as to why that was not done. Why was not the mine worked in the southern direction? It is now discovered that it should have been so worked. Surely the facts were quite known. Of course, there may have been a sufficient explanation, but without that it is very unsatisfactory the way the mine has been worked. In last year's report attention was called to the rich shoot of quartz on the 200-ft. level south, to which I think Capt. Bray also called attention, and with all these evidences I am at a loss to understand the conduct of the directors in the development of this mine.

DIRECTORS' FEES.

With regard to directors' fees—I have a good deal to do with Irish railways, and I know one of them that has been managed for 10 years without one farthing of remuneration being drawn by the directors. Several of the Colar mines are at the present time managed by directors, who have taken a certain proportion of their fees, but not the whole.

Mr. STAPLES: In the accounts we are debited with 892*l*. for directors' fees, but by article 75, the total amount that they are entitled to take is 850*l*., and in the previous year it was 900*l*. That calls for an explanation.

VIEWS OF A PRACTICAL MAN.

Mr. JOHN DARLINGTON (consulting engineer): I think that the work we have done in this mine will compare very favourably with the work done in the Mysore district. We have had the benefit of rock-drills, and have gone a greater length with them than any other mine in that locality. With regard to the amount of quartz that exists in the mine, it is very clear that we could not take out more than we found. We have taken out that quantity, and unfortunately for us, instead of it being 2 ft., as Mr. Oakley expected, it narrowed to 10 ins. wide. Our object was to find some payable ground, and that payable ground showed itself to some extent to the north of the shaft. The next point was to determine the dip of that ground, and in the 205-ft. level it appeared to dip off north from the shaft, though there was still a tendency showing that it might be south. We found in the 330 that it dipped towards the shaft, and we are hoping in the 410 that it will come still nearer to us. Our expectations are founded upon the approach of the quartz to the shaft, and the widening of the quartz at that time, if it followed the same lines as in the 270, would give us a length of 380 ft., as against 200 ft. 380 ft. of quartz, by means of winzes, and methods of working that can be adopted, would enable us to increase our returns rapidly.

THE REAL EXPLANATION OF A DIFFICULTY.

With reference to the ground south of the shaft, we have been for a long time embarrassed with a boundary question. As we go south the lode runs nearer to the boundary, and as the lodes in India are cut off by side lines it is clear that the side line in this case would soon cut out the lode as far as we were concerned. Our efforts have therefore been directed to get settled the question of the boundary, and we have succeeded. (Cheers.) Until we did so we were not justified in pushing forward the 270 level to develop other people's ground, nor to ascertain what was likely to be found under the old workings. The question of sinking a new shaft is a more important one than the speaker who suggested it seemed to realise. Darlington shaft was discontinued on account of the water, and could not be re-commenced without the re-erection of new pumping machinery, and as the quartz was not then so well proved as now, that shaft was kept idle. Whether we shall sink it to connect with the lode will depend upon circumstances.

AN EXPLANATION QUITE UNDERSTANDABLE.

Genl. SANKEY: You have not explained why the advice of Mr. Pryor and Mr. Oakley has not been followed.

Mr. DARLINGTON: My explanation was the boundary question, of the existence of which they were aware.

Genl. SANKEY: Why have you altered your views?

Mr. DARLINGTON: My views are not altered, but the lode, without the extension of boundary, would have passed into the adjoining property. (Cheers.) The boundary is now further shifted away, and we have more ground in length and depth.

Genl. SANKEY: In pushing that level south would you have crossed the boundary with the dip the lode was taking? There has been no mention made of Darlington shaft. (Yes.) The shaft I foreshadowed was one 400 ft. to the north of the engine shaft, and about 100 ft. to the west, which would have taken you down through the whole of the pay-shoot.

Mr. DARLINGTON: We are all wise after the event. (Laughter.) If the dip should continue as it is at present, the existing shaft is in the very best place. (Cheers.)

A SHAREHOLDER GIVES REASONS FOR HIS HOPE AND CONFIDENCE.

Mr. CRANE: I think that one or two of the speakers have taken too gloomy a view of the situation, and have not been quite just to the directors, whom they have accused of a want of knowledge. Let me point out one or two more cheering facts. One gentleman noticed that we have made a loss of 2,288*l*. this year, and then he calculated what our remaining sources were, and concluded that we had only enough to carry us on for 13 months. I should like to point out a more cheerful side to that position. I see that in December, 1887, there was a balance of expenditure over receipts of 33,000*l*. odd. In December, 1888, there was only a balance of 2,288*l*. If we were to go on with the development of our mine and increase our output at the same rate, in December, 1889, we should have a balance to the good. This is a progressive undertaking. If anybody compares our progress with that of the Mysore or Nundydroog they will consider it very good in every respect. While our veins continue so narrow it is quite unreasonable to expect the output to be increased.

NARROW *v.* WIDE VEINS.

If we had veins of the same width as the Mysore we should now be able to crush 400 or 500 tons a month. A gentleman asked, "Why did you drive the 330 level such an enormous distance when you knew you could not reach the ore ground till at least the same point it had been met with in the 270?" And then almost in the same breath he asked, "Why did you not drive south of the shaft?" I presume the simple reason was because it was unproductive. It is not quite consistent to blame directors for driving in one direction where they have reason to believe they will meet with a good ore shoot and then ask them why they did not drive in another direction where they had no such good reason. I think there is every cause to have hope in the future, and I trust that by this time next year the directors will declare a dividend. (Cheers.)

Mr. JOHN OGLE: There is no explanation as yet as to the change of front in giving orders now to do what your men out there thought was necessary two years ago. We are now getting nearer to the end of our tether, but instead of 13 months I make the duration of our funds 18 months. Still, if we go on as we are at present at the end of 12 months we shall have before us a scheme of re-construction or of issuing debentures. (No, no.) It would not be safe for directors to call the shareholders together without laying before them some plan to raise fresh capital. It is necessary to push on work energetically, because the stauding expenses amount to the same on both the larger or smaller percentage of ore treated. This percentage will be reduced, the more quartz you have and the more you treat. I must say that the explanations given so far have not been satisfactory.

Col. WALKER: Mr. Oakley is a personal friend of mine, and I have great confidence in his personal skill. I state, without any fear of committing a breach of confidence, that when I was there two years ago he complained bitterly that he could not do what he hoped to, because his machincry was not in a fit state. I am very sorry to have to express that opiniou to day. I ask now—is the mill in the state it ought to be, and do the directors feel justified in takiug their fees until the mine is brought into a more satisfactory condition?

A REPLY TO COL. WALKER.

Mr. DARLINGTON: Mr. Oakley has had all the machinery he has asked for. (Hear, hear.) The old machinery has been materially supplemented by pumping apparatus. The mill was erected before the company took possession, and the wooden foundations were found to be defective and had to be replaced. One of the plates of the boilers showed signs of weakness, and it had to be replaced, but the miue is absolutely found in machinery, and with the rock-drills we have driven over 100 ft. a month in one level, which is very good progress. (Hear, hear.)

Col. WALKER: Mr. Oakley did not complain about the directors.

A CRUCIAL QUESTION.

Mr. WRIGHT (director): Did he say "I have asked for better machinery and cannot get it?"

Col. WALKER: No, he did not. (Laughter.) Two ycars have elapsed since then.

THE REAL FACT AS REGARDS MR. OAKLEY.

The CHAIRMAN: Mr. Oakley has had everything he has asked for. Even last year when he was here, and when he supposed that we were going to crush 300 tons a month, I said to him: "Do you want any more stamp-heads or rock-drills?" and he said, "No, I think we have all we want at present. If I want more I will telegraph, or write"—and he has not done so. As to the directors working without fees, I am not prepared to do so. We attend to our important duties constantly, and why you should wish us to serve without fees I do not know. We have had a turn of bad luck, aud not been successful as soon as we expected.

A SHAREHOLDER: It is not suggested that you should do more than go without part of them.

The CHAIRMAN: Travelling expenses used to be allowed to two of the directors, but the Stock Exchange disallowed them.

STRANGE DIVISION OF DIRECTORS' FEES.

Mr. STAPLES: The fees are 850*l*. in the articles, and you have taken 892*l*.

The CHAIRMAN: Two of the directors who live iu the City are usually employed in getting through the transfers, and for that they receive payment of one guinea each on every occasion they meet. (Laughter.)

Mr. STAPLES: Do I understand that the amount in the articles, presuming the whole of the board do not meet, is divided amongst those who remain and carry on the work for that particular time?

The CHAIRMAN: That has been the practice.

Mr. STAPLES: I fail to see the legality of that. (Cheers.) You have uot only taken the amount authorised by the articles, but you have taken more than you have been entitled to.

The CHAIRMAN: One gentleman was away ill for some months. He did not get his fees, and they were divided amongst the rest.

Mr. STAPLES: I must protest against such conduct. I must also protest against such accounts as these being signed by the auditors. It does not seem to me that Messrs. James and Edwards have followed out their duties in allowing this payment to be made.

The CHAIRMAN: I do not understand you.

Mr. STAPLES: In the articles the legal maximum that the directors can take is 150*l*. each per annum—the chairmau being allowed an additional 100*l*. I understand you to say that supposing two or three directors are away their fees do not go to the credit of the company, but are actually divided amongst those who are present. I eontend that that is distinctly illegal. (Cheers.) What confideuce can shareholders have in you when you make this omission?

Mr. PARRY: The Scripture says, "They of the household divided the spoil," and that is what the directors, wise in their generation, have done. I suppose some of you employ a large body of men. One man is absent, who gets 30s.; the foreman says to the others, "You take a pound betweeu you and give me the odd 10s., but do not say anything about it to the governor." There is the whole logic of the directors' proceedings. I know what would be thought of such conduct at the Mansion House. We have been three years in labour and have brought forth a mouse. There is no question about the goodnes of this mine if properly handled. It is acknowledged to be one of the best pieces of mining ground on the field. If you have good men as directors you are bound to succeed. I deprecate interfering with officials in India. The directors should allow them fairly to carry out their views, for it is uonsense for any man of common sense to think he can direct a mine in India from London. Unless some radical change must be made, ruin stares us in the face, or else re-construction.

MORE ABOUT THE DIRECTORIAL EMOLUMENTS.

Mr. STAPLES: You mentioned that the directors received extra remuneration for attending to the transfers, but I am of opinion that that is utterly and entirely illegal. It must of necessity be one of the ordinary duties of the directors to see that the transfers are in order, and pass them.

Mr. GAUSSEN complained that although only a week behind paying his call, owing to travelling engagements, he had been charged interest, so that he concluded the directors looked after themselves better than they did the shareholders.

A SHAREHOLDER ATTACKS THE BOARD AND RETIRES.

Mr. WRIGHT: Geul. Saukey has gone without waiting for a reply to the points he raised, but as he will see the report of these proceedings, I am anxious that both he and you should have a few words from me. He stated that we did not show a proper appreciation of our duty, or a proper kuowledge of mining, because we did not sink a new shaft. If we had sunk a new shaft we should have done so at random, aud that would have been most foolish. Our anxiety was first to discover indications of richness, and these were found in the 270-ft. level. Our position then was that we could attack that ground from the old shaft, and it would have been absurd to place another one almost beside it, besides which it would have exhausted your capital, and brought you very soon to that position of impecuniosity to which some shareholders have (without any justification in the present circumstances) referred. These things have all been before us as directors, and they have also been most carefully gone into by Mr. Oakley, Mr. Prior, and Mr. Darlington. Moreover, we are sufficiently experts in mining matters ourselves to know what we are doing. I have been connected with mining for something like 50 years, and wheu I get a miniug report I understand perfectly what it tells me and what it means to convey. I can judge of the recommendatiou made and the opinions expressed, and throughout our proceedings we have worked with the greatest freedom and the greatest cordiality, and at any given moment we have always been in accord as to what should be done. Mr. Darliugton checks the whole of the reports with a practical eye. We do it ourselves and we consider periodically in what direction it is most desirable to expend the remainder of our capital. We have exercised a wise discretion in not sinking the shaft recommended. All experieuce of uining shows that you may expect greater riches in depth, and, therefore, when you have got deeper you may anticipate better results.

RICHER IN DEPTH.

To get deeper has been our aim. We have at the 270 to the 330 driveu levels, and in the latter we have fouud the ground surprisingly better than above. We are now dowu to the 410, and I look forward to something better still in that level than has been found in the 330, and if we do find that then I say we shall have a mine which offers the greatest eucouragement in the future. There seems to be a disposition to take au unfavourable view of our position, which I think is wholly unwarranted. Our mine is a great deal better than many others iu the same field that have been at work longer. Our predecessors got upon tribute 3,000*l*. worth of gold, and we were led to expect that that shoot would go down.

A SHAREHOLDER: I remember the first commencement of the Balaghat Mine, and I assure you that that is not so.

Mr. WRIGHT: I venture most confidently to say that so it was represented to us when we first became directors, and in fact the prospectus justifies my remarks. (Hear, hear.) We have had two years fight over the boundary question, and by a compromise we have arrived at a settlement giving us a greater dip and length of the lodes. Working southwards we were near our boundary, and

SURELY NO GENTLEMAN HERE WOULD SUGGEST

that we should go on improving other people's properties until we had settled the question in our own interest. I must say that every point of our mine offers us encouragement—(cheers)—but it is not a quarry. We must, however, persevere, aud the policy we are pursuing, I maintain, to be the true one in the interests of us all.

Col. BYRDE welcomed the criticism of the shareholders, but claimed their confideuce. This was not a factory, but a mining speculation. He did not think any possible objection could be to take to the course they were pursuing.

IS THERE A DIFFERENCE OF OPINION.

Mr. OGLE said they were not attacking the directors, but the management, which ought to have produced better results. He suggested that it would be wise to call in on behalf of the shareholders some competent engineer to confer with the directors as to the present method of working the mine, for there seemed to be some conflict of opinon.

Mr. WRIGHT: I can assure there has been nothing of the kind.

Mr. OGLE said he must differ from Mr. Wright. It was obvious, from the course the discussion had taken, that the shareholders were not satisfied.

Mr. WRIGHT pointed out that to have an expert would involve a heavy expense, without being of much practical utility. (Hear, hear.)

A DIRECT NEGATIVE.

Mr. STAPLES: I beg to move that the report be not received or adopted.

Mr. PARRY seconded the amendment.

The CHAIRMAN, ou a show of hauds, declared it carried.

DIRECTORS NOT RE-ELECTED.

The CHAIRMAN then moved the re-election of the retiring director, Mr. Grant.

Mr. WRIGHT seconded the motion.

A SHAREHOLDER: How many shares do the retiring directors hold?

Mr. O'DWYER: Mr. Grant 800, and Mr. Hastings 300.

The SHAREHOLDER: That is satisfactory.

Mr. WEST: I propose that the number of directors be reduced to three, and that it is not desirable to fill up the vacancies.

The SOLICITOR (Mr. Hilliard) said it would be necessary to call a meeting to alter the constitution of the board before this could be done.

Mr. STAPLES: I propose that Mr. Grant be not re-elected.

Mr. OGLE seconded the motion, which was declared carried on a show of hands.

MR. STAPLES EXPLAINS HIS POSITION.

The CHAIRMAN proposed, and Mr. WRIGHT seconded, the re-election of Mr. Hastings.

Mr. STAPLES: I have been one of the mainstays of Indian gold mining. (Hear, hear.) My opinion of its possibilities was largely derived from the fortnightly letters I had with regard to Balaghat in its babyhood. Those letters fixed in my miud the enormous industry

that might be created in India, and I have been justified, but not by the history of this company. These directors have had the control of our funds, and they have not used them well. As part of the programme of a better state of things, I object to the re-election of these two directors who are before us to-day, and I should have, on the same grounds, objected to the re-election of any other two had they been before us. I now oppose the re-election of Mr. Hastings.

Mr. WEST seconded the amendment, which was carried.

THE AUDITORS NOT RE-ELECTED.

Mr. STAPLES: How is it that the auditors have not taken exception to the amount given to the directors in fees and to the payments made to them on the score of transfer work? Can there be a right to claim more pay than the articles allow? You, the directors, have divided the fees of your absent colleagues amongst you. You have charged in the accounts 892*l.*, and you are only allowed 850*l.* Is the extra amount given to the directors for passing transfers?

The CHAIRMAN: Yes.

Mr. STAPLES: Then it is utterly wrong. I say in every sense it is a wrong to us. When I came into this room I had unabated confidence in the directors. I had not thought of casting the slightest aspersion upon the board, but when I find they have taken absolutely more than they are entitled to, I am sorry to say my opinion of them is entirely changed. (Cheers.) It is most disgraceful.

The CHAIRMAN here read one of the articles which entitles to directors to vote remuneration to their number for special service.

A SHAREHOLDER: On this point our directors should read the manly views expressed by Mr. Malcolm Low at the Indian Consolidated meeting, where he at once, on behalf of his board, agreed to take less fees while the company was not paying dividends.

The REPRESENTATIVE of the firm of Messrs. James and Edwards said his principal, after waiting in the meeting for an hour, had been obliged to leave, but in his absence he could not allow to pass unanswered the attack which Mr. Staples had made on his firm. The money was paid under the authority of the article referred to, and as a payment they had to put it in the accounts.

Mr. STAPLES: We complain that the directors have taken more fees than they are entitled to.

The REPRESENTATIVE of Messrs. James and Edwards said he was not defending the directors, but his firm. The explanation should be asked for from the solicitor, but being a payment the auditors were bound to enter it in the accounts. It was not bottled up in some other item, but clearly put under its right heading. If the auditors had allowed the amount to appear where it could not be discovered, then they would be to blame; but it was put where it ought to be put. (Hear, hear.) What more the auditors could do he was at a loss to know. They had certified the accounts, and that was all they were called upon to do. It was not part of their duty to traverse the acts of the directors.

The CHAIRMAN proposed the re-election of the auditors.

Mr. WRIGHT seconded the motion.

An amendment was proposed and carried. The auditors were, therefore, not re-elected.

A cross-table conversation took place, and when the meeting broke up it was understood that within a month's time there will be another meeting held, after a committee of shareholders have had a conference with the board.

CAPT. PRYOR'S REPORT FOR FORTNIGHT ENDING APRIL 30TH.

North engine shaft: The progress in sinking this shaft below the 410-ft. level during the last fortnight has been very limited, owing to a scarcity of Moplahs. I have, however, just arranged with a new party, and trust shall be able to report better speed in my next. The 410-ft. level north has been driven 14 ft., or 74 ft. 6 ins. from the shaft; the lode is at present poor, and the ground hard for driving, but I hope we shall soon get an improvement at this level. The 330-ft. level north has been advanced 19 ft., or 155 ft. 6 ins. from the shaft; the quartz is about 1 ft. wide, and assays 18 dwts. of gold per ton. The No. 1 winze in the bottom of this level has been sunk 4 ft. 5 ins., or 31 ft. 8 ins. below the level; the quartz is about 1 ft. wide, and assays 2 ozs. 18 dwts. 9 grs. of gold per ton. The stopes in the bottom of this level yield quartz of about 14 ins. wide, and assay 1 oz. 3 dwts. 5 grs. of gold per ton. The stopes in the back of this level produce quartz of an average width of about 14 ins., and assay 1 oz. 18 dwts. 7 grs. of gold per ton. The drive south from the bottom of the No. 3 winze, at the 270-ft. level north, has been extended 9 ft. 8 ins.; the quartz is about 8 ins. wide, and assays 6 dwts. 12 grs. of gold per ton. The No. 2 cross-cut west, at the 270-ft. level north, is now 76 ft. 3 ins. from the level. The No. 2 east cross-cut has been extended 1 ft. 2 ins., or 41 ft. 6 ins. from the level. Nothing of importance has yet been met with in either of these cross-cuts. The stopes in the back of this level yield quartz of about 1 ft. wide, assaying 2 ozs. 4 dwts. of gold per ton. The 270-ft. level south has been driven 11 ft. 9 ins., or 195 ft. 6 ins. from the shaft; the lode is of a kindly appearance. The 165-ft. level north has been advanced 3 ft. 9 ins., or 482 ft. 9 ins. from the shaft; the quartz is about 2½ ft. wide, but this week it only shows a trace of gold. The stopes in the bottom of this level yield quartz of about 1 ft. wide, and assay 3 ozs. 2 dwts. 18 grs. of gold per ton. Surface: I am pleased to say the repairs to the mill boiler have been completed, and crushing was again resumed on the 22nd inst. All other surface work is progressing satisfactorily.

REPORT OF THE DIRECTORS.

14th May.—The directors beg to submit their report on the progress and prospects of the mine, together with the reports of Mr. Oakley, the resident agent, and Capt. Pryor, the mine superintendent. They also present the revenue account and balance-sheet for the year. A plan and section, showing the workings up to 15th March, 1889, will also be found enclosed. Although the yield of gold during the year has not been so large as was expected, the amount obtained, combined with the important discovery made in the 330-ft. level, justifies the opinion that the operations of the year have greatly enhanced the prospects and value of the mine. The good ore descending from the 270-ft. level, which commenced at about 310 ft. from the shaft, was not expected to be struck in the 330 level until 370 ft. from the shaft had been driven; but, as a matter of fact, rich ore was entered at this level at a distance of only 240 ft. from the shaft, and it is continuing good as far as it has been driven. It was 436 ft. 6 ins. from the shaft on the 16th April. We may, therefore, anticipate that in this level we shall have a run in rich quartz of about 130 ft. more than in the 270-ft. level. Detailed particulars of the operations on the mine will be found in the reports of Messrs. Oakley and Pryor. In these it will be seen that the north engine shaft has been sunk so as to enable a 410-ft. level to be commenced. This is being pushed forward, and it is hoped that in this level, as in the 330 ft., the good ore will be found nearer to the shaft than in the levels above it. A change in the dip of the lode occurs at about the 270-ft. level, extending downwards through to the 410-ft. level, which being 10 degs. nearer to perpendicular, will give a great increase in the depth of the lode before the western boundary of the property can be reached. The further sinking of the north engine shaft below the 410-ft. level and some exploratory operations between this shaft and the south engine shaft are progressing. A deeper level is looked forward to with much interest as being likely to develop ore ground even more favourable than that proved in the upper levels. The machinery and appliances suffice for the present requirements. Some of the English miners, whose term of engagement had expired, returned home. The superintendent has not found it necessary to replace them, and some economy has resulted. The health of the *employés* at the mine has been good. The establishment of a hospital and staff at the joint expense of the local mining companies has proved beneficial to all concerned. The old stamps were imperfectly fixed, and this has caused some hindrance to continuous crushing. They have been repaired and are now working satisfactorily. Notwithstanding this hindrance, and a falling off in the quality of some of the ore, the crushing, as will be seen in Mr. Oakley's report, has been large for so young a mine, the yield for the year having been 2,780¼ ozs., which realised 10,238*l.* This yield, however, did not meet the cost by 2,288*l.* 2s. 8d., as appears in the revenue account. The current year, so far, shows an increase in the monthly average, and a much better return is confidently expected. A call of 2s. 6d. per share became necessary in October last. This produced 10,000*l.*, of which a considerable amount is unused. 10,000*l.* of capital remains uncalled, on which no immediate demand is contemplated. The directors are pleased to report their unabated confidence in the good management of Messrs. Oakley and Pryor.—E. O'DWYER, Secretary.

DEVON GREAT CONSOLS CO., LIMITED.

A MINE WITH A BRILLIANT PAST AND A SMALL CAPITAL—714,487 TONS RAISED—£3,436,954 REALISED—£1,851,516 PAID IN DIVIDENDS—A MINE WITH A FUTURE ALSO.

THE ordinary general half-yearly meeting was held at the Offices, No. 18, Austin Friars, London, E.C., on Wednesday—Peter Watson, Esq., chairman and managing director, presided.

Mr. W. H. ALLEN (secretary) read the notice calling the meeting, and the report of the directors was taken as read.

BETTER PRICE FOR ARSENIC.

The CHAIRMAN: Gentlemen, the report will have told you that, for the half-year ending April 30th, the sales of copper ore were 2,040 tons, realising 3,462*l.*, being an average price of 1*l.* 13s. 4d., or about 6s. per ton less than that obtained for the same period 12 months ago, and in money value about 600*l.* The receipts for arsenic have been satisfactory, amounting to 9,725*l.* There is an advance on the contract price on the previous sale, which comes at a very opportune time, owing to the great fall in the price of copper that has taken place even since that contract was entered into. Although we have 600*l.* less in copper ore value, at the same time we have made reductions in various ways, and so have saved that amount and more. (Hear, hear.) You will remember that about the time of the last meeting we had entered into a contract for the purchase of a new Marsden crusher, or stone-breaker. That has since gone to work, and I am happy to say is working very well.

200,000 OR 300,000 TONS OF MINERAL HALVANS.

It will be chiefly used to work over the large quantity of halvans which have been accumulating for a period of something like 45 years, and amounting, it may be, to between 200,000 and 300,000 tons. These halvans will be a great acquisition to the company when they can be made marketable. The cost of that crusher has been 600*l.*, and the amount has been paid during the last six months. The shareholders who were present at our meeting some two years ago will recollect what I stated with regard to the low price of copper then ruling—it was then 38*l.* to 40*l.* a ton. They will also remember that a very few weeks afterwards I had predicted it would go up to about 60*l.*—it went up to about 100*l.* That was unfortunate, because that price was unjustifiable in every sense. It disorganised trade completely, and has ended, as we have seen, in knocking down the price to 35*l.*, which is lower than we have ever seen it before. When that state of things came to pass the directors took into consideration the undesirability of selling any more copper at such a price, and I am pleased to say that quotations to-day are nearer 40*l.*

ONLY A MINOR PROPHET.

I cannot predict the future of copper. No one should prophesy unless he knows. You always try, however, to extract some sort of opinion from me—(laughter)—and I always speak candidly and fearlessly my convictions. (Hear, hear.) My own impression is that we have seen the lowest price for copper that we shall see for many years to come. We see that some arrangement has been come to between the big companies working abroad to lessen the output on the one hand, and very considerably to increase the demand on the other, and we may see a big advance in copper during the next 12 months on 40*l.* a ton.

EFFECTS OF THE COPPER SMASH.

We know that when the price fell to 38*l.*, before the big rise, the trade

of this and other countries was very flat indeed, whereas at the present time trade is reviving all over the world, and necessarily there must be a greater consumption of copper; and after all, when we come to consider that when the syndicate failed in France copper went down for a short time to 35*l.* a ton, it was then stated that the stocks of copper were something like 160,000 tons, which was considered alarming. We have this fact before us, that during the last few days the stocks of copper have been reduced to 120,000 tons. There is also a decrease in the output, and many copper mines are stopping in all parts of the world. They cannot produce the metal at the ruinous prices that prevail, and consequently we may have a great demand set in on the one hand, and a lessening of the output upon the other. I believe that Mason and Barry, Rio Tinto, and these other concerns may again go on producing their late low quantities, and that there may be a still further advance in the metal. I hope I make myself clearly understood on that point, because it is one of vital importance to the copper mines of this country. I see distinctly a great demand all over the world at the present moment at these prices. and my own impression is that whoever buys copper and holds it at present prices will do well. (Hear, hear.)

TIN A FAILURE.

I now come to our underground operations and commence with the Wheal Emma portion of the sett. We tried to see whether there was any tin there, and sank from the 120 to the 160 in something like six months—a distance that has never before been accomplished in the same time in Devon or Cornwall. (Cheers.) We encountered many branches, which, although producing small quantities of tin were not so promising as to warrant our going on sinking any deeper at that point. We, therefore, thought it would be better to go on prosecuting other parts of the mine, and to abandon that one. Capt. Richards will be able to explain his policy with regard to that, but that is the desire of the directors as well as of Capt. Thomas, whose report you have read. Coming to the more favourable side of our affairs, you will remember that about 10 years ago I stated that we ought to try other portions of the mine, and I said that Watson's portion showed promising indications from the old reports which I read, and inasmuch as we could work that portion by water power, we thought we would try it again.

WATSON'S PORTION OF THE MINE.

The indications at first were very promising indeed, and ever since then we have gone on with the hope of ultimately meeting with some discovery, and expected that long ere this we should have been able to report to you the finding of courses of ore. We have told you from time to time that it was always looking promising, though, in the absence of copper to any large amount, shareholders have sometimes said, "What is the use of going on?" We sank from the 70 to the 100, and there we had good stones of ore. We sank to the 112 and had a little more. We still persevered and got to the 124, where we found still more ore. Then we came to the 136-fm. level, and have driven in the 136 something like 35 fms. west in a lode varying from 1 to 5 tons to the fm. Going east we have driven also something like 35 fms. in orey ground in various parts worth 1 to 5 tons to the fm., so that the 136, both ways, we have driven an aggregate of 70 fms. At the 148, the next level, so far we have driven 18½ fms., of which 8 fms. have been of the value of 5 tons of ore to the fm., and the remaining 10½ have been worth 2½ tons, whilst the present value is about 2 tons, and improving. We sank to the 160, and six months ago, as you will find by the report, we drove a cross-cut where we hoped to have something good to report to the shareholders to-day, according to the indications seen at the 136 and the 148. Just before Capt. Richards wrote his report he valued the lode at 4 tons of ore per fm. and 3 ft. wide. He then cut into it 4½ ft. wide, and now it is 7 ft. wide, being the largest and widest portion of the lode that we have seen. (Cheers.) This is

THE FINEST DISCOVERY WE HAVE MADE IN DEVON CONSOLS FOR THE LAST 10 OR 15 YEARS.

(Cheers.) So far as seen it is worth 8 tons of good ore per fm., and in addition there is the mundic. Capt. Richards brought up certain specimens for me, not for you to see, but as I have them here, I lay them on the table to show you the nature of the ore we are now passing through. (The specimens were here exhibited, and to any practical man must be regarded as extremely good.) I wanted to see the general character of the lode, and also the nature of the country rock. These are very fair samples of the lode as it exists at the present time. I think I am entitled to congratulate you on having made such an important discovery as this. (Cheers.) The only hope we have is that it will last as long as it did at the 126. If it does it will put quite a new feature on our old mine. The report and accounts really do not require any remarks from me. No doubt a good many of the shareholders have been throwing away their shares lately at an absurd figure, because if the whole affair were sold off to-morrow it would bring 3*l.* or 4*l.* a share. As long as shareholders know everything that we know, I think

THE DIRECTORS ARE QUITE JUSTIFIED IN BUYING SHARES

if they wish to do so. Immediately after the publication of the last news I went into the market and bought some shares, and so did my co-directors. I repeat we have a perfect right to buy provided we give the shareholders the same information that we ourselves possess. A great many shareholders are alarmed at the present price of copper, but they should remember that we sell about three times the amount of arsenic to what we do of copper, and therefore this is a great deal more an arsenic than it is a copper mine. I think it my duty to point that out specifically. One of the auditors mentioned to me something about the capital and liabilities on the one side, and the property and assets on the other. He said the accounts did not show what we paid for the mine. He expected, I suppose, to see 150,000*l.* or 300,000*l.* down for the mine, but Devon Consols has not cost the shareholders anything whatever. All the capital called up was 10,000*l.*, or 1*l.* per share originally. There was a renewal of a lease for the railway, etc., for 20,000*l.*, but that was all paid out of profits, so that there is nothing paid up for the mine. Mr. Freese is the auditor, and desires me to point this out. On the other hand we have property and assets from which we take off regularly about 10 per cent. We add to the value every year of these things, but we take off 10 per cent. Take that for the period of the last 10 or 12 years and you will see that at present for steam engines, water-wheels, &c., the sum stands at 26,673*l.* If you look back about 10 years ago it was 40,000*l.* to 50,000*l.*

Mr. GRIFFIN: In 1888 it was 29,000*l.* odd.

The CHAIRMAN: All your machinery is in working order, and if you go on for another three years in the same way you will wipe it all off, and you will have all your machinery intact and in good working order. We are bound to keep it so, because you will understand that this is not an ordinary mine,

IT IS A SERIES OF MINES.

The gentlemen who have been there know this, and although we have made one discovery at Watson's part of the mine, there is also another portion which we have started—the Wheal Maria. It was near there that the original discovery occurred, which sent the shares from 1*l.* a share to 800*l.* a share. I am not going to say that that will be repeated, but we are close to the neighbourhood of where the great riches occurred at that time.

SWEET MEMORIES.

This mine was abandoned at one time, but since it was re-started, in 1845, we have raised 714,487 tons, and realised 3,436,954*l.*, and we have paid in royalties 260,968*l.* We have sold in arsenic 346,562*l.*, and paid dues on that commodity to the extent of 14,893*l.*, and the mines' costs, in merchants' bills and labour at Tavistock, have been about 1,854,546*l.* Now comes the item of machinery. Out of profits there has been paid for steam engines, water-wheels, railway, reduction work, &c., upwards of 546,985*l.* You know that recently we have had to make a call of 1*l.* to put up extra works, but the total amount of capital is only 20,480*l.* During this time 1,211,904*l.* has been paid in dividends—154 dividends in all, realising 118*l.* 7*s.* per share on every 2*l.* share. The shafts since the commencement have been sunk 2,862 fms., winzes and rises 6,335 fms., and cross-cuts driven 29,803 fms., or equal to 45 miles of shafts, levels, and winzes, or in other words, 39,000 fms. All that has been done out of profits, and you can readily imagine that such a big concern as this demands a very great deal of attention to keep everything in good order, and to work the mine efficiently and economically I believe we shall yet surmount all our difficulties and again come into smooth water. I thank you for allowing me to make this statement, and I beg to move the reception and adoption of the report and accounts. (Cheers.)

3,000*l.* CASH IN HAND.

Mr. HENRY CATTLEY STEWART (director): I think that the speech we have had from the chairman, with his complete exposition of all the circumstances, must be very satisfactory indeed. You will observe that we have upwards of 3,000*l.* in cash at the present moment, and very few mines can say that. I will also advert to the discovery, because I think it must be manifest to us all that, should we be fortunate enough to have one or two others like that it would have at once placed us in a very good position. I do not think that the prospects of Devon Consols have looked so good for many years as they do at this moment, and I do sincerely believe that after a time our drooping fortunes will be revived.

A SHAREHOLDER: Are not the reserves of ore less than usual?

The CHAIRMAN: I think they are about the same—rather more at Watson's. I may tell you that the reserves now would be materially altered with this discovery, which is not taken into this account at all.

DIRECTORS BLAMED.

Mr. GROVER said he could not think that the present was a satisfactory state of things. They had been nine years without receiving a dividend. For one month or more the price of copper had been high, and yet it seemed to make no difference to the position of the company. He contended that if there had been the disposition on the part of the board they might have given a small amount of dividend. Last year there was a balance of 3,926*l.*, out of which the directors might have paid 2*s.* per share. When the chairman was speaking of the promising character of the lode at a former meeting, he asked if there was any prospect of a dividend, and the answer was that 4,146*l.* worth of copper had been sold, but the chairman could not have answered him more contemptuously if no copper had been raised at all. He did not think there was any disposition on the part of the board to pay dividends.

Mr. HORNCASTLE: So far as my memory goes no profit has been earned, and I cannot see what advantage it would be to pay a dividend in that case. It would be one of the worst things we could possibly do. (Hear, hear.)

Mr. COLE: Will the halvans prove profitable?

The CHAIRMAN: Oh, yes, they will pay costs.

Mr. HORNCASTLE asked for an explanation about the writing off from the machinery of 10 per cent., and in the valuation of the property and assets. He quite approved of this, but wanted to understand how it was arrived at. He thought that this company, as compared with others with which he was connected, was in a pre-eminently good position. Instead of charging everything to capital, they had developed the mine out of profits—a position which, when a turn of prosperity came, would be enormously in favour of the company.

THE HALVANS.

Mr. OXLAND: If Mr. Grover had examined our accounts, he would find that we had just been fairly meeting costs out of revenue. In regard to the halvans, it is incumbent on me to make a declaration to the shareholders regarding the investigations that I have undertaken, on the part of my father and myself, respecting them. These investigations have not been any less satisfactory than when I last reported, but I stated that I hoped to be able to make reports to the directors previous to the meeting, but the fall in the price of copper quite altered our calculations. Consequently, I can tell you that the reports we shall have will be almost a complete turnover, but, fortunately, it will be a turnover to our advantage.

A SHAREHOLDER: When may we expect that report?

Mr. OXLAND: Within the next few weeks—say, within three weeks. Taking the price of copper at the present time, everybody can see immediately what the trouble has been in delaying our reports, but many others may have said—why could it not immediately have been presented?" You cannot deal with a report in that way. I must call attention to the way in which the mine has been carried on.

A VALUABLE INVENTION.

It is really due to an invention of my father's that arsenic has been

produeed at so low a priee, without whieh this eompany would have been elosed long ago. It is mainly on your arsenie that you have lived, and, fortunately, we have the improvement in the produetion of copper, and again a slight showing of tin whieh I have deteeted myself. Upon these matters the shareholders may eongratulate themselves, but we must not make too mueh of them. All mining companies are going through the fire at present, but I agree pretty well with the ehairman in his foreeast of the markets.

Mr. Griffin was pleased to see there had been a saving of 500*l.* or 600*l.*, but the expenses were 2 per eent. upon the capital. As times were bad, eould not the directors make a little reduction?

CHAIRMAN'S REPLY.

The Chairman: Mr. Grover, with 10 shares, has a perfeet right to eritieise the aeeounts, but wheu he says that I answered hiu last time eontemptuously I must appeal to the shareholders whether that is so. (Cries of "No, no.") I uever answered hiu eontemptuously, but told him fairly and plainly the state of the mines. I have uever promised anything—I only report for the time what we may hope aeeording to these indieations. My eolleagues and I have kept this mine afloat during the last few years when 95 per eent. of the eopper mines in this eountry are stopped, and when, I suppose, 90 per eent. of the eopper mines abroad are stopped also, therefore I think we deserve some eredit for having kept the ship afloat. Meanwhile we have aetively developed the mine, and have at last eome upon a good diseovery, but what benefit it will be to us I cannot tell. If it eontinues for 70 fms. as it is uow at the 136 level, it will be a grand thing. We have to pay all expenses out of revenue. It would be easy to give you a dividend if we went on ealling up eapital, but what would be the use of doing that with the one hand and paying you dividends with the other? This is the biggest uudertaking of its kind in this eountry. Mr. Oxland is by far the largest shareholder, and is still investigatiug the matter of the halvans, but we must give him further time. At the last meeting the shareholders were unanimous that the direetors should have a further inerease of fees, but I said, "No; let us wait another six months." We had 500*l.* a year, and we reduced it to 300*l.* I ehalleuge any man to produce a mine managed more eheaply than this. When you eome to eonsider that the priee of arsenie has beeu raised from 6*l.* to 10*l.* per ton, and that it has saved the eompany many thousands of pounds, it is paltry to speak about the direetors' fees. (Hear, hear.)

Mr. Griffin said he was perfeetly satisfied with the explanation, aud must eongratulate the direetors on having eondueted the affairs of the mine so satisfaetorily. (Cheers.)

Mr. Freese (auditor) said that the positiou of Devon Consols with regard to its eapital was quite unique. They only took eredit for that which was overground—and not for anythiug underground—in faet, he never kuew sueh a mine. Virtually all the great expensc had been defrayed out of revenue. Even this depreeiation of 10 per eent. had been written off profits. When a thing was bought they wrote it off revenue and not eapital.

The report was then unanimously adopted.

NO TIN WORTH FOLLOWING.

Capt. Richards: Your chairman has alluded to almost every point of the mine; but I will refer to Wheal Emma, whieh we proseeuted for tin, and whieh has been a failure. We are unanimous in our opinion that it will not be wise to proseeute it any further, and I am sorry to say so. We had very good indieations at the 120, whieh justified us in going on, but it has been a failure.

AT WATSON'S WE HAVE A DECIDED IMPROVEMENT.

From the 100 to the 148 we had a good lode during six months, and at the 160 we had a better lode still. I have every reason to believe that we shall have a better lode at another level than we had there. At Wheal Maria we are also looking promising for eopper ore and arsenie. I believe at the 100 we shall have a good lode. The ground alongside the lode is all we ean desire, and the speeimens we have in the bottom are also very good. I think altogether we have reason to eongratulate the shareholders generally upon the improved prospects of the mine.

A Shareholder: What is the value of the lode in the 160?

Capt. Richards: About 12*l.*

The Chairman: That is, with present price of eopper.

Mr. Oxland proposed that the remuneration to the direetors should be 300*l.*

Mr. Horncastle seeonded this and it was earried unanimously.

Mr. Cole proposed the re-eleetion of the retiring directors, and said they eould not be in better hands. In his opinion if they looked further they would fare worse.

Mr. Roberts seeonded the motion, whieh was carried.

Mr. Horncastle proposed the re-eleetion of Mr. G. T. Rait aud Mr. Freese as auditors, at a remuneratiou of 40 guineas for the year. He said that very few eompanies had their aeeounts shown in so elear and proper a manner.

Mr. Oxland seeonded the motion, which was earried.

On the motion of the Chairman, 30 guiueas was appropriated for the promotiou of education of the children of the miners employed by the eompany.

VIEWS OF MR. BAWDEN.

Mr. Bawden: Duriug the last year we have placed our sehool under the Government, and have earned the grant on 96 per eeut. of our ehildren—a thing almost unparalleled. We have 53 seholars —all the ehildren of the miners. I am eontinally reeeiving letters from the managiug direetor, urging the reduetion of eosts, and the inerease of returns. When our managing direetor took offiee we were working at a eost of from 4,000*l.* to 4,200*l.* per month, but we have reduced that eost to about 2,600*l.* a month, and during the last six months we have made a reduetion of uearly 700*l.* We are watehing the thing as elosely as possible. The ehairman omitted to say, in eonnection with Watson's, that we have had to drive eross-euts to interseet the lodes, and at no eross-eut have we found the lode of a less value than 2 tons a fm., until in the 160 we have had 8 tons, and a lode 7 ft. wide, as against 3 ft. wide at the 70. (Cheers.)

The Chairman expressed his intention to do his utmost to bring this mine to the front, though he would not for a very large sum indeed undergo again the great anxiety he had experieneed during the last 10 years.

Mr. Oxland proposed a vote of thanks to the ehairman.

Mr. J. Nicol Roberts, in seeonding the motion, said: I ean bear my testimony to the faet that his exertions on behalf of the shareholders are unremitting. Mr. Watson has not only the eonfidence and esteem of the shareholders of this eompany, but he has recently been eleeted by the largest majority of any eaudidate County Counceillor for Middlesex. (Hear, hear.)

The motion was carried unanimously.

The Chairman, in returning thanks, meutioned eulogistieally the serviees rendered by Capt. Riehards, the other agents, Mr. Bawden, and Mr. Allen, the secretary.

The proeeedings then elosed.

THE DEVON UNITED CO., LIMITED.

GREAT IMPROVEMENT—THE LODE STRUCK AND THE VALUE OF THE MINE ALLEGED TO BE PROVED.

The seeond ordinary geueral meeting was held at the Registered Offiees of the company, No. 18, Austin Friars, ou Wednesday, to reeeive the direetors' report and statement of aeeounts made up to the 30th April, 1889, and on the general business of the eompany, in eonformity with the artieles of assoeiation—Charles Oxland, Esq., ehairman of the eompany, presided.

Mr. W. H. Allen (seeretary) read the notiee ealling the meeting.

LATEST ABOUT THE DISCOVERY.

The Chairman: The improvements that have taken plaee in Devon United sinee our last meeting are sueh as we may well congratulate ourselves upon. I will refer partieularly to the improvements that have oeeurred in eouneetion with the 120 and the 132 levels. At the end of the 120 a winze was eommeueed, whieh is to eonneet with the 132. That winze is intended to open a section of good stoping ground. At the bottom of the 132 we found very good ore, which has inereased in value at the winze, and I will read a letter from Capt. Clemo, just reeeived, whieh is to the followiug effeet:—

"I am glad to say there is a great improvement in the winze. The lode is standing south. We have eut into it 20 ins., and so far it is a very fine lode, worth 3 tons of ore per fm. I have sent some fine stones to my father, and he is eoming dowu underground with me to-morrow morniug. The water is drained from the upper part of the winze. There is no alteration in the ends of the 132."

This morning we have a telegram saying, "Very fine lode standing; eut into 2 ft., and no south wall Devon United."

This is an eneouraging feature whieh you must not forget when you eome to conneet it with all that has been said by Capt. Riehards, as regards the Wheal Maria part of Devon Consols. Many will know that that portion has eome ou our Capel Tor lode in Devou United. That is only at 86 fms. in depth, and we are at the 132 in Devon United. Consequently, it is a matter of great eongratulation for us to find that we have sueh good indieations on both our eastern and western sides. It is a matter of joint eongratulation between the two eompanies. Our expenses have been small. We only have had a small air engine put near the winze for facilitating pumping and raising the ore in that part of the mine, whieh eosts 85*l.* The shareholders will agree that the expenses have been kept well within bounds. We have eopper in reserve, and we have to eongratulate ourselves, taking into eonsideration the small time we have been working, as to our results. It seems to betokeu that our future, with eare and with eeonomy as heretofore, will bring about a profitable issue. I beg to move the adoption of the report and aeeounts.

AN INTERESTING AND HOPEFUL POSITION.

Mr. Peter Watson seeonded the motion, and said: At the last meeting, in November, we had stones of ore in the shaft, and the position was hopeful. From that time we have gone on until we have got down to the 132, and the lode has varied in value up to 9 tons of ore per fm. for the length of the shaft. Although the end is not looking so well at the present time we believe we are not on the main part of the lode. We have in the winze a lode worth 3 tons of ore, and we are not yet through it. Capt. Clemo eonfirms by telegram the information he has sent by letter. It is just possible that this diseovery at Devon United may prove of eonsiderable value to Devon Consols, a diseovery sueh as Capt. Riehards mentions we might have, during the next six or eight months, at Devou Consols, and that also would throw great light on Devon United. Looking to the faet that these workings are in the neighbourhood of where the rieh diseovery took plaee in Devon Consols, the position is both interesting and hopeful. Mr. Oxland is the largest shareholder, and I am the seeoud. We have faith that in the near future we shall have something good to state. There is a fine lode at the bottom of the shaft, and we shall shortly eommence to sink again in the ore ground. How deep it will go it is impossible to say, but our prospeets are most eneouraging. (Hear, hear.)

The Chairman, in reply to a question, said that the outstanding ealls would soon be eolleeted.

The report was unanimously adopted.

The Chairman proposed, and Mr. Stewart seeonded, the re-eleetion of Mr. Peter Watsou as a direetor.

This was earried, aud the gentleman iu questiou returned thanks.

A PET SCHEME OF MR. BAWDEN'S.

Mr. Bawden: This has beeu a pet seheme of mine for many years. I told Mr. Peter Watson that I eonsidered 2,000*l.* would tell us whether we should spend more money on this mine or not. We have speut about 3,000*l.*, and we have made a diseovery almost quieker than we expeeted. I think our prospeets exeeedingly good—in fact, I have never seen a mine opening up as this one has been doing.

Capt. Richards: Our prospeets exeeed my most sanguine expectatious. We have a very good lode in the shaft. I do not think I should have been as satisfied as I am if we had uot met with ore before we got to the 130, beeause I quite expeeted it. If the ore eontinues we shall soon put the company in a very favourable position. (Hear, hear.)

The meeting then closed with votes of thanks to the chairmau, directors and officers.

LATEST REPORT.

Since the general meeting held on Wednesday last the improvement in the winze in bottom of 120 west of Willesford's shaft, then reported, has gone on steadily iucreasing in value, and the lode will now produce from 4 to 5 tons of rich yellow ore per fm. Some specimens of the ore just received at the London office will yield over 20 per cent. of fine copper.

UPPER ROODEPORT GOLD MINING CO.

STATUTORY MEETING—AN EXPERT REPORTS UPON THE PROPERTY —1 OZ. 4½ DWTS. TO THE TON.

THE statutory general meeting of this company was held at Winchester House on Tuesday, under the presidency of Mr. J. Shaw Kennedy, J.P., D.L.

Mr. JAMES J. NOLAN (secretary) read the notice convening the meeting.

PRELIMINARIES.

The CHAIRMAN: Gentlemen, I will just trace the history of the company from its formation to the present time. The company was registered on the 22nd January, the prospectus issued the same evening, and on the bankers opening their lists the next morning the shares were over and over again subscribed for. The allotment letters went out on the 30th March. You will remember that certain statements were made in the prospectus that were verified by a statutory declaratiou of Mr. Wood's. Although the directors had no reason to doubt that those statements were perfectly correct, they did not consider themselves justified in taking them alone without getting au expert to go to the property, and confirm those statutory declarations. Accordingly, we selected a gentlemau of long experience and great skill—Mr. W. F. Crawford—who started on the 3rd February for the mines, but was delayed in getting up to them until the 10th Mareh. In his pocket he carried from the directors full instructions as to how to act, and by the same mail that he went out in we sent instructions to Messrs, Knight and Herle, your solicitors and attorneys in Johannesburg, to assist him in these negotiations, and, in faet, to aet in concert with him. These instructions I will uow, with your permission, ask the secretary to read.

Mr. NOLAN here read the correspondence referred to; also Mr. Crawford's report, and numerous telegrams principally relating to the acquisition of the water rights mentioned in the prospectus.

IMPORTANT TELEGRAMS.

The CHAIRMAN: On receiving that last report and assay from Mr. Crawford, we telegraphed out to him for an explanation of his assay, as follows:—"Knights and Herle. Retain Villiers shares until further instruetions; Spencer's assays unsatisfactory; instruct Crawford make personal assays forthwith eaeh reef mentioned Wood's declaration, especially three ounce one; wire result before 12th; acquaint Wood," as we could not understand it, and I am happy to say that within the last hour or two we have received the following telegram:—"Crawford's assays: Lode, block A—highest, 7 ozs. 18 dwts. per ton; lowest, 10 dwts. Villiers—highest, 8½ dwts. per ton; lowest, 3½ dwts. per ton. New reef, 12½ dwts. per tou. Kent, of Hull, assays: Lode, block A, 9 dwts. per ton: Villiers, 5 dwts.; New reef, 1 oz. 10 dwts. per tou. Expert assisted; find Villiers reef at the lowest level very good.—Knights and Herle." (Hear, hear.) Well, gentlemen, beyond that we have another telegraun to hand to-day:—"Struck rich body of ore, milling 1 oz. 4½ dwts. per ton." (Cheers.) I think you will consider that very satisfactory. We have had a great deal of anxiety and trouble with regard to the water rights, but our minds are relieved by this last telegram.

Mr. WOODMAN asked which was the more reliable test. panning or assaying?

The CHAIRMAN: I believe that panning is miniature crushing, and it is a far better test thau assaying.

ONE WHO KNOWS THE PROPERTY.

Mr. JAMES OLLERENSHAW (director): I was until recently the manager of the Durban-Roodeport Gold Mining Company. I went out some 18 months ago to take over the management of their property, and, through ill-health, was obliged to resign. I have spent about 30 years of my life gold mining—16 years in South Africa, principally in the Transvaal. I know this property very well. It lies within 200 yds. of where I was living on the property of the Durban-Roodeport. I know the property, but I have never assayed any of the stuff. I have known Mr. Woods for many years, and I have not the least doubt but that what he declared was his opinion at the time. Of course mines vary in richness, but taking it altogether, my opinion is that we have got a very good property. (Cheers.)

13 ADDITIONAL CLAIMS.

The CHAIRMAN: I may add that we have acquired 13 additional claims, for which we merely pay the license of 1*l.* a month; so that we have in reality 35 claims instead of 22.

A SHAREHOLDER asked how soon crushings might be expected.

The CHAIRMAN said the machinery would be ready very shortly; but as this was the winter time in the Transvaal, the carriage up country would be exceedingly expensive. They must, therefore, leave to the discretion of the directors when to send out the machinery.

Mr. OLLERENSHAW thought it undesirable to send the machinery out at present. Of course development was going on at the mine, and they were, so to speak, getting grain for the mill. Many of the mining companies had rushed up their mills, and they lacked the stuff with which to feed them. Everything was being got ready, and they expected to have a considerable quantity of ore at grass by the time the mill was ereeted. The mill was ordered from

THE SANDYCROFT COMPANY,

who were about the best mining machinery manufacturers in the country. Three-fourths of the machiuery in the Transvaal came from the Sandyeroft Company.

The CHAIRMAN: Although our property is not on the main reef, the richness of the Witwatersrandt properties is not on the main reef itself, but upon the leaders and veins that issue from it.

A vote of thanks to the chairman and directors terminated the proceedings.

THE NEW VANCOUVER COAL MINING AND LAND CO., LIMITED.

POSITION TOTALLY CHANGED FOR THE BETTER—DIVIDENDS INSTEAD OF LOSSES—POSITION OF THE UNDERGROUND WORKINGS, AND OF THE MESSRS. ROSENFELD—AVAILABLE BALANCE OF £30,373.

THE first ordinary general meeting of the shareholders in the new company was held at the Offices of the compauy, 12, Old Jewry Chambers, on Tuesday—John Galsworthy, Esq. (chairman of the company), presided.

Mr. JOSEPH RAMSDEN (secretary) read the notice calling the meeting.

ACTUAL POSITION.

The CHAIRMAN: Gentlemen, this is, as you are aware, the ordinary statutory meeting, and of course at it we have no accounts to produce or resolutions to come to: but it affords one the opportunity of placing before the shareholders the position of the company, aud for that purpose it is certainly a very useful provision that there should be a meeting of every company within four months from the time of its incorporation. I shall proceed, therefore, to tell you exactly how we stand. The new company was incorporated on the 30th January, 1889, and thereupon we took the opportunity of laying the ghost of the discount shares by acquiring all of them, and we did so by giving 10 1*l.* shares for each 10*l.* share which was held by shareholders who took the shares at a discount. By that proceeding I think we have now effectually disposed of the matter, and as it is extremely satisfactory to the directors, no doubt it will also be so to the shareholders—at all events, to those who held those discount shares. On the 28th February we confirmed the re-construction resolutions, and from that date all the property of the old company passed to the new—all the property undisposed of by the old company, and all the profits of the old company undisposed of by that company up to the 28th of February. Then I may tell you that we applied for a quotation on the Stock Exchange a week since, up to whieh time

181,470 SHARES IN THE NEW COMPANY WERE APPLIED FOR

and allotted, leaving but very few outstanding, and those only because there was a difficulty in finding the people to whom they belonged. They have gone away and left no address—rather less than 1,830 shares, so that practically the thing has been carried through without a hitch—I may say

THE OPERATION HAS BEEN CARRIED THROUGH UNANIMOUSLY.

Nobody has objected to the re-construction, aud the whole thing has been done in a way that has made it perfectly free from cavil. You will remember that the old company declared a dividend before it. so to speak, went out of office, which was payable on the 30th of April. They also made a call payable on that date, aud the effect was to make all the shares of one denomination in the company and fully-paid, so that from that point we start quite fairly. The effect of re-construction also has been to get rid not only of the discount shares, but to give us larger powers in every respect, and, therefore, it is important with regard to the proposed sale (supposing the Messrs. Rosenfeld exercise the option), because now we are quite in a position to dispose of the undertaking to them in case they elect to buy without any question arising as to our powers. You will recollect that at one of the meetings that question was raised as to whether we had the power to do this, but now it is set at rest. All the agreements have been filed at the registration office, in order to make the issue of shares fully legal, as required by the Act of Parliament, and as I said we have applied for a quotation.

A DIVIDEND.

The directors have to-day, out of an amount of profit which I will refer to presently, which comes from the old company to the new, declared a dividend of 2½ per cent., payable ou the 24th of June, which, as you will observe, is an addition to the dividend already paid of 20s. per share since last December. That is all the information with regard to the new company it is necessary I should give you; but now I will refer to the proceedings of the old company up to December. You have had the report of the directors and the balance-sheet, with the notice calling this meeting, for these documents have been sent to each shareholder. From them you will have observed that the result up to last December for the half year was a gross profit of 71,675*l.* 9s. 10d. That gross profit was, of course, subject to the ordinary depreciation, and the usual amounts carried to reserve funds, aud that depreciation and the amount appropriated towards the discount shares of 12,500*l.*, with the other items writteu off, left

A BALANCE AVAILABLE FOR DIVIDEND OF 30,373*l.* 9s. 9d.,

out of which I told you a dividend of 20s. a share was declared, whieh absorbed 18,500*l.*, and left a balance of 11,873*l.*, which goes to the new company, and out of which we have now declared a dividend of 2½ per cent. Before the old company be wound up we must go to the 28th of February, and, therefore, there will be more profit which will be added to the sum carried forward. We shall have made a profit for these two months, no doubt, but that will come into the half-year's account of the new company when we meet you in October. You will see then what has been done with the two months from December to February, also the four months from February to June, which really belong to the operations of the new company. You will observe from the profit and loss account that we are now in altogether a much better situation than we have been for many years, because we have taken advantage of the profit we made last year to eliminate an item, which was very objectionable, on the asset side of 26,781*l.*, in respect to the Fitzwilliam Mine, whieh, for the

moment, is abandoued, and, therefore, could be hardly called an asset of the company, at all events.

Mr. ROBERTS: The full amouut has beeu written off, has it not?

The CHAIRMAN: Yes, the full amount. It does not say that the Fitzwilliam is no longer a mine; it is a mine, but not being profitable we have written off all that attaches to it.

Mr. ROBERTS: I do not know whether it is necessary to write off the full amount.

The CHAIRMAN: We have had no profit from it for years, and we thought the proper course was to write it out of the assets. It gets rid of the difficulty we have had before, namely, with regard to our capacity of paying dividends in the face of a balance-sheet having an item of that questionable character in it.

Mr. ROBERTS: I thought some of the items were of greater value.

The CHAIRMAN: The whole of that will be involved in the carrying over from the old company to the new at a price which will appear in the balance-sheet, and those items which are on the one side to the credit of the account will be written off by so much less as the reserve funds on the other side make. Therefore you will find that the property and assets on the balance-sheet of the new company, when we come to bring it before you, will be assessed on the whole at less than now by the amount of those reserves. It is true that the one item of Nanaimo and Harewood Estate may be considered of more value, but there are other items which follow which may be considered of much less value, but we will show you, when we come to make out the balance-sheets, what we consider the fair amount on the credit side, and we shall write off the reserve funds on the other side in aid of that reduction on the credit side. What I mean to assert is that the balance-sheet will be in a much healthier condition than it has been for many years past, and it would relieve us of any difficulty in the future with regard to the payment of dividends.

STATE OF THE MINE.

The report tells you that the output for the half-year was 144,949 tons—in fact the sales for the year 1888 were altogether 232,328 tons—a very considerably larger quantity than in any preceding year. You will find that the report also alludes to the state of the mine thus:—

"At the East Field Mine, after passing through several faults, good coal has been met with in the No. 1 north level, but in the No. 3 north level the faults continue. The prospectiug bore at the foot of the No. 2 shaft has been continued to over 790 ft. below the bottom of the shaft, or 1,400 ft. from the surface. The measures appear favourable for finding what is known as the Wellingtou seam, but boring operations have been delayed by the breaking of the rods. The No. 2 South Field Miue has been conuected with the old No. 1 South Field Mine. Some pillar coal has been taken out of the latter mine, but the great bulk of the output has come from the No. 2. The coal keeps fairly good, although some of it is not very thick. The No. 3 South Field Mine, which was opened in 1887, is situate near the mouth of the Chase River, about 2½ miles south of Nanaimo. The coal in this mine has been of very good quality. The new No. 4 slope at South Field is situate about half a mile in a southerly direction from the No. 3 South Field Mine. This slope is now down over 340 yds., with a counter slope as a return airway. The coal has been very thin for most of the distance, and in some places quite cut out, so that the prospects here are not eucouraging. A new bore has recently beeu put down at South Field, where, at a depth of 450 ft. from the surface, a 12 ft. seam of average coal has been struck. The sinking of the shaft at North Field (Wellington district) has been let to a contractor, who commenced operations on the 2nd January, 1889, and who hopes to be able to reach the coal by the eud of June next. The conditional agreement (as modified), giving Messrs. John Roseufeld's sons the option of purchasing the company's property at Nanaimo, within two years from the 31st December, 1888, was submitted to and adopted by the extraordinary general meeting of shareholders, held on the 4th December last."

That report was sent out with this notice, and gave the shareholders the position to the 31st of December, and when we have a meeting which will involve this present half-year, it will show you what has been done since that time up to the time of taking over the property, and also afterwards up to the 30th of June. I think that that is all the information I can give you, but I will be happy to answer any questions shareholders may be willing to put.

VIEWS OF SHAREHOLDERS.

Mr. ROBERTS: I think, considering the amouut carried forward, it might have been possible to pay rather a larger dividend at this time than the 2½ per cent. You carry forward 11,000*l.*

The CHAIRMAN: You must recollect the bonus, which was rather a large item. We well considered the matter, for there are financial considerations which come iuto these matters, and having now made the call, and really called up all the capital available, we must be careful uot to spend all our money, or let it go from us, because if we want it we may have a difficulty in getting it. With regard to the finances, we were bound not to divide all the money we possibly could, but to maintain the company in a strong position.

Mr. FREDERICK TENDRON (director): We had a very heavy indebteduess when the year began, which we not only had to discharge, but to put ourselves in a position to supply working capital, and besides that the expenditure on the year for new work has been 33,000*l.* What the expenditure for the new year will be for new works we have little means of kuowing, and, therefore, it would never do to run short of cash. When the shareholders had their shares fully paid-up by the operation of last year it meant 1*l.* share in cash to the fully-paid shares, and they are now receiving a dividend at the rate of 5 per cent. per annum, so that I think the change is so very great, as compared with what it was two years ago, that we must be satisfied if we continue to prosper in like manuer.

Mr. ROBERTS: I am quite satisfied with the explauation.

WHAT ARE THE RESERVE FUNDS?

The CHAIRMAN: I think there is one other matter I ought to refer to. The old company had a lands sales reserve fund 12,746*l.* That was created because of a provision in the debentures that we should set aside a portion of the profits of the land sold to meet the debentures, and now what we have done is this: we have appropriated 12,000*l.* of that in the purchase of the Harewood estate, which adds to the security of the debenture-holders, and is a proper and legitimate application of 12,000*l.* of that fund for the additional security of the debeuture-holders. I thiuk it requisite I should state this, because it has been done, and the debenture-holders will be perfectly satisfied that that is a legitimate application of our funds. Of course, in future in the new company we shall still go on to create that fund until the debenture-holders are satisfied.

GRATIFYING DEVELOPMENTS.

Mr. SIMPSON: Are there any indications of a geological character in connection with the new borings which would enable one to judge whether they are likely to turn out successfully?

The CHAIRMAN: In the North Field, if we get what we hope, we expect to strike the Wellington seam, which would add wonderfully to the value of the property.

Mr. SIMPSON: Is the history of the borings so far satisfactory?

Mr. TENDRON: We have actually got the coal by the boring, but whether it will turn out to be the Wellington seam or not we cannot say.

The SECRETARY: I think I understand the nature of your question. We some time back put down the bore, and proved the coal to be at 445 ft., and we are putting down a shaft first to prove and then to work it.

Mr. SIMPSON: I was not aware that you had satisfied yourselves of the existence of the coal.

The CHAIRMAN: Yes, and we hope it is the Wellington seam. If it should turn out to be so it would make a great difference to the property.

PROBABLE ACTION OF THE MESSRS. ROSENFELD.

Mr. SIMPSON: I suppose it would determine the question of the sale?

The CHAIRMAN: I should say it would immediately.

Mr. SIMPSON: Can you tell if the Messrs. Rosenfeld are likely to buy?

The CHAIRMAN: I hear that they are frequently there, and it looks as if they did intend to buy. My information is that they not only intend to buy this property, but to make a big affair of it.

Mr. ROBERTS: At the present prices of coal is there a satisfactory profit?

The CHAIRMAN: We have some contracts still to carry out, and they ought to leave a profit.

Mr. SIMPSON: To me the state of things is most satisfactory.

Mr. ROBERTS: I beg to propose a vote of thanks to the chairman and directors.

Mr. SIMPSON: I beg to secoud the motiou.

Carried unauimously.

The CHAIRMAN: We are very much obliged to you for your kindness.

The proceedings then closed.

LONDON AND SOUTH AFRICAN EXPLORATION CO., LIMITED.

A COMPANY THAT PAYS 150 PER CENT., AND WITH GREAT POSSIBILITIES—KIMBERLEY AS A HEALTH RESORT—GROWTH AND PROGRESS OF THE PLACE.

THE aunual geueral meeting of shareholders was held on Tuesday at the Cannon Street Hotel, Caunon Street, E.C., to receive the report of the directors, the accouuts and balance-sheet, and for other business. —Charles J. Posno, Esq. (chairman of the company), presided.

Mr. GEO. BROWN (secretary), read the notice calling the meeting.

The CHAIRMAN, who was heartily received, said: I declare the meeting duly constituted. Shall we take the report as read, or will you have it read?

Several VOICES: Take it as read.

The CHAIRMAN: Before we proceed to the business of the meeting, I have to apologise for the absence of Mr. Ochs. As you are aware, Mr. Ochs was one of the original directors. Owing to illness he was unable to attend to-day, but I have a letter from him in which he says that the doctors give him hope that with the return of fine weather he will be able to resume his duties.

GRATIFYING RECORD OF PROGRESS.

It is my pleasing task to move the adoption of a report and of accounts that exhibit further progress after another period of 12 months. The receipts from dwelling sites were 25,384*l.* 6s. 5d.; comparing with for 1887, 24,414*l.* 10s. 10d.; comparing with for 1886, 21,284*l.*; and the total under the headings of general and sundry, receipts for 1888 were 45,125*l.* 10s. 9d.; against receipts for 1887, 44,220*l.* 17s. 2d.; leaseholds bought, 1,297*l.* 13s. 9d.; against for 1887, 987*l.* 3s. 6d.; rent from claim-leases, 38,145*l.* 16s.; against for 1887, 37,750*l.* 4s.; against for 1886, 37,250*l.* There is, therefore, an increase of 1,610*l.* 15s. 10d. over 1887, whereof 1,215*l.* 3s. 1d. is an increase in the surface rentals, and when it is borne in mind that our increases in 1887 were greater than they had been for many years, and that the attraction of the goldfields has exercised a powerful influence, causing a considerable migration, then it will be seen that we may well be pleased with the development that has taken place.

THE TOTAL INCOME WAS 85,326*l.* 5s. 2d.,

irrespective of 6,700*l.* derived from the settlement of the Orange River property. The total building sites let at the end of 1887 stood at 2,646, at the end of the year under review it stands at 2,830, irrespective of 35 grants to religious and charitable institutions. We have introduced into our accounts surface rents outstanding, and written off there against the balance of mineral property suspense account; the 11,937*l.* 14s. 9d. written off was a doubtful asset, the 14,676*l.* 12s. 6d. introduced is a good asset; we have not taken the difference of 2,738*l.* 17s. 9d. as a profit, but put it to reserve. We have written off 2,500*l.*, an estimated loss on tenauts' rates. It certainly is a hardship that tenants' rates can be claimed from us when, as is shown here, we cannot always recover the amount from the tenant. This matter has our most serious attention. We have also written off 500*l.* for brick-making machine. Our towns,

Newton and Beaconsfield, as the figures have shown, may be said to have done very well, aud tree planting has also been very successful, and it would seem that what was not long ago a barren country, is not unlikely to become an attractive health resort, as well as a trade gate to the interior. We have, during the year, commenced the erection of a manager's residence, the want of which had for some time been felt. The spot selected is just outside Newton, close to Belgravia, and the beauty of the garden is so vividly described by Mr. Currey that I do not think I can do better than give you his own words :—

VIEWS OF THE MANAGER.

"Manager's residence: The contract has been taken for this at 3,560*l*., with power to increase the accommodation by building the west wing at an increased cost of 340*l*. It will be an unpretentious family residence, with four sitting-rooms, and six or eight bed-rooms, with the necessary offices, all on the ground floor, after the fashion of the Indian bungalow. The ground enclosed round it is betweeu 5 and 6 acres, a large portion of which has been formed into a plantatiou, in which the young trees are doing well. Of English varieties we have pines, poplars, planes, white acacias, and spreading cypresses, and oak, elm and beech will also be tried. Of foreign kinds, we have several varieties of the eucalyptus, the grevilla robusta, a flowering tree, called here (I believe incorrectly) syringa, and many sorts of Australian willows or wattles, one of which—the glaucophylla—has been sown round the enclosure to make a feuce. An orchard has been planted with peach, apricot, nectarine, apple, and pear trees, all of which are thriving. A space has been reserved for a nursery garden; tennis and croquet grounds occupy the remainder. Though the main object has been to provide for the company's representative a residencc in some way adequate to the position of the company, I have been greatly influenced in pressing this matter on the directors by the consideratiou that an example in the way of assimilating homes here to those in other parts of the world could hardly fail to improve the company's property by encouraging others to follow it. With better houses, Kimberley, with its dry climate, its unique and interesting industry, its share market, its club, aud its varied population, would offer no small attraction to invalids and travellers, hundreds of whom even now make the journey only to be driven away by the absolute impossibility of getting decent accommodation."

An important decision has been rendered in our favour. The Mining Boards had set up a pretension to which we could not assent. They claimed (they the members of the Mining Board in their individual capacity being tenants) that they could acquire from a tenant who had failed to renew his lease, not only the tenant's rights which he had forfeited, but the landlord's rights which he had never possessed.

THE COMPANY VICTORIOUS AT LAW.

This may seem strange to you—a novel mode of conveyancing—but it is as true as it is strange, and what is stranger still is that a first decision was at Kimberley rendered in their favour. This decision was overruled by the Supreme Court at Cape Town. An appeal to the Privy Council was then lodged against this Supreme Court decision by the Bulfontein Mining Board, but this appeal was last week withdrawn, and the Supreme Court judgment in our favour stands thus unchallenged and acknowledged. Since these accounts were balanced some claim ground has been dealt with this year, adding about 4,000*l*. per annum to our income, and reef work aud reef falls have recently exposed upwards of a million loads of rich blue at the back of blocks in operation, and I should not be surprised if there are millions more at the back of that. If I have not touched on all points of interest, I shall be happy to answer questions. (Cheers.)

RETIRING DIRECTORS AND AUDITORS RE-ELECTED.

Sir GEORGE R. PRESCOTT seconded the motion, which was carried without discussion.

The CHAIRMAN: It is next my duty and my pleasure to move the re-election of Sir George Prescott.

Mr. GEORGE MOSENTHAL seconded the motion.

The CHAIRMAN: It requires but very few words from me to make it known to you, as it is known to us, how efficient a director and how charming an associate we have found in Sir George Prescott. I have great pleasure in putting that motion to the meeting—it is carried unanimously.

Sir GEORGE PRESCOTT: Gentlemen, I beg to return you my sincere thanks for re-electing me a member of your board, and to assure you that my best endeavours will be used to making this concern an even greater success than it has already become. I have the strongest possible belief in the future of the company, and am sure it is impossible at present to state what it may become. I propose the re-election of Mr. Henry Barlow Webb as a director of the company. He is one of the oldest of our board, and I am sure must retain the confidence of you all.

Mr. J. C. MARTIN seconded the motion, which was carried, and Mr. WEBB briefly returned thanks.

Mr. DENTON: I have great pleasure in proposing the re-election of the auditors, Messrs. Mardon, Mosley and Co.

Col. CRAGG seconded the motion, which was agreed to.

THANKS ALL ROUND.

The CHAIRMAN: I have a pleasant task to discharge before you, and that is to bear testimony to the efficiency of our staff, and in doing so I would prominently mention the name of Mr. Currey, our manager in South Africa, Mr. Jones, who has been associated with us for a number of years, and, last but not least, our London secretary, Mr. George Brown. (Cheers.) It only remains now that I should thank you for your attendance here to-day.

A SHAREHOLDER: I think I am only giving expression to the opinion of the meeting when I propose a cordial vote of thanks to the chairman and directors for the very able way in which they have managed the affairs of the company.

Mr. DENTON: I have very great pleasure in supporting the resolution.

The motion was carried unanimously.

The CHAIRMAN: On behalf of my colleagues and myself, we beg to return you our heartiest thanks.

RAVENSWOOD GOLD CO., LIMITED.

INITIAL OPERATIONS — ABUNDANCE OF GOOD STONE — DIFFICULTIES WITH THE CHLORINATION PROCESS.

THE ordinary general meeting of this company was held at the City Terminus Hotel, on Wednesday, under the presidency of George Brooke Mee, Esq. (chairman of the company).

Mr. THOMAS WINDER (secretary) read the notice convening the meeting, and the report was taken as read.

DISAPPOINTING FINANCIAL RESULT EXPLAINED.

The CHAIRMAN: Gentlemen, in moving the adoption of the report—this being the first opportunity that the directors have had of meeting their fellow-shareholders in this company since operations were commenced—I propose briefly to deal with the subjects upon which I have to speak in the order in which they appear in the report. You will have seen that the anticipations which were held out when we started have not been realised, aud I think that I shall interest you most by speaking on those points where differences have occurred. First, with regard to the property purchased. You will remember that there were three reefs—the Black Jack, the Grant and the Sunset. The operations of the company have so far been confined to the first two, because it was found that the ores of the Sunset were of a more complicated character, and not so easily worked. Therefore all the crushings that have taken place so far have been from ores taken out of the Black Jack and Grant Mines. It was estimated that these ores would yield gold in excess of the quantity which has been obtained by the company up to the present time, but the falling off to some extent is due to the process that we have been working under—chlorination—from which we have experienced some trouble, more especially with regard to the roasting of the ore which has been found exceedingly difficult. The ores which have been roasted by the company from these two reefs—Black Jack and Grant—it was supposed would yield about 1 oz. 18 dwts. of pure gold, whereas the assays of this ore before treatment have only shown about 1 oz. 10 dwts. The quantity thatwe had hoped to raise from the mines has not been reached. We have been raising and treating about 400 tons a month, but that is as much as we have been able to deal with up to the present time. The value of the ore which we have raised has also been rather less than we had hoped; for although it assayed 1 oz. 10 dwts., we have lost by our method of treatment between 7 dwts. and 8 dwts. of gold. Therefore, instead of getting 38 dwts. of pure gold, as we expected, we have obtained only about 1 oz. 1 dwt., and that gold has not been pure. It has been found to be mixed with silver, zinc and other metals, and the result has been that in the sale of this ore, instead of realising four guineas an oz. we have only realised 3*l*. 2*s*. 9*d*. That is a matter, of course, which has been beyond the control of the directors on this side, and so far as we know the result has been all that the chlorination process could do for us. You will naturally understand that in conducting a new process, at starting there may be slight defects which can be remedied by experience, and that has been the case with us. Our manager out there, who is a thoroughly reliable and able man, has been effecting some small economies, but not to any very appreciable extent. For instance, in roasting the ore—it has to be roasted before it is chlorinated—he found the number of hours during which the ore was roasted did not enable him to produce all the gold; therefore he tried more roasting, and doubled the time from 20 to 40 hours, but without improving the result. If we had succeeded in getting a fair price for this gold, and had been able to get it at a moderate figure, the financial position would have been very different. We have

PLENTY OF GOLD IN THE ORE;

the difficulty has been how to get it all out, and do so economically. These are the questions that have puzzled our manager. It is well for me to put you in possession of all the facts, because in the future you will not be disappointed, and will understand exactly the position of affairs. The expense of mining and crushing was estimated originally at 50*s*. a ton; of roasting and treatment at 40*s*.; or a total of 90*s*. We have treated 1,457 tons, the cost of which has been 66*s*., and milling 14*s*. 4*d*., or a total of 80*s*.; so that you will see where the difference arises. The cost of chlorinating work, estimated at 40*s*., has been 30*s*.; but that is irrespective of the expenses of management in London and at Ravenswood. The total cost of extracting our gold has been 6*l*. 3*s*., against an estimate of 4*l*. 10*s*., which is a considerable difference, and that, taken with the difference between the estimated value of the ore and its actual value, accounts for the result being a loss instead of a profit. With regard to the treatment of the ore—as I have told you, the chlorinating process is the one that we have been working; but I do not propose to deal with that question fully, because my friend, Mr. Ross Robinson, who joined the board upon the retirement of Mr. Mills on his leaving for Australia, has recently returned from Ravenswood. He was present at the mines when the chlorination process was started there, and he knows a great deal about the property, having lived there for many years, and is, therefore, in a position to tell you much more than I can with regard to it.

THE FUTURE.

As to the future—the only thing I can tell you is that Mr. Mills left England to a large extent with the object of going to Ravenswood to give the managers there the benefit of his knowledge and experience of mining, and of the property generally, so that some scheme for developing this mine to greater advantage may be arrived at. He is there now, and with the aid of the local directors we hope that Mr. Mills will be able to suggest some *modus operandi*. Being at a great distance from the property we are largely dependent upon the advice which we may get from the other side as to future work. We selected the most able men we could get on the spot, and we obtained the services of a gentleman who had been working the chlorination process successfully at Mount Morgan and other mines in Australia, and he has been the adviser of our manager, Mr. Barton. You will see, therefore, that every step possible has been taken to work this property to the best advantage, and the failure that has so far been met with has arisen not from the management, but from difficulties with the treatment of the ore which we are trying to overcome.

FINANCIAL POSITION.

With regard to the financial position—when this company was

formed and the property taken over, it was mortgaged to an Australian bank for 25,000*l*., and the machinery on the mine, which we acquired, was valued at what was considered a very low valuation—12,200*l*. That is our principal asset at the present time, and upon that we look to be able to raise sufficient money to carry the operations of the company, as we hope, to a successful issue. The chairman concluded by moving the adoption of the report and accounts.

VIEW OF AN EXPERIENCED MINER.

Mr. ROSS ROBINSON seconded the motion, and said that, although the result hitherto had been disappointing, he was hopeful of the future. He was well acquainted with the mine, and had made a thorough inspection of it in November last. It was very true that the stone raised had not been so good as it was before this company worked it, but that was no fault of the management. If the gold were not in the stone, it was impossible for the management to put it there. But stone of a much better class had been raised before, and he was sanguine that before very long it would improve in quality. He was also hopeful that they would be able to extract a larger quantity of gold from the stone at a much less cost than they were doing at present. They were already in negotiation with the Corsel's Company, who have treated two half tons of stone in what the manager considered a fairly satisfactory manner. But the board were not altogether satisfied with that, and they were in treaty with the company at Glasgow for treating 5 tons of ore which he himself intended to superintend. As an old and experienced miner, in spite of the unsatisfactory state of the accounts, he was very hopeful indeed of the property. Mr. Mills had arrived at Charters Towers, and no doubt before now he was at Ravenswood. Mr. Tozer was also there, and doubtless between them they would be able to overcome the difficulties. The coarser the ore the more difficult it was of treatment by the chlorination process. Something had been said about the quantity of stone not being equal to that anticipated by the promoters. The quantity of ore raised could be quadrupled at any time, but the manager very properly declined to work at great expense, and preferred to wait until he could obtain the gold with much more satisfaction than at present. He (the speaker) went through the property, and

THE STONE WAS UNLIMITED.

He might mention that the Corsel's Company had agreed to treat 100 tons at Ravenswood.

The motion was carried unanimously.

The directors, all of whom retired in accordance with the articles of association, were re-appointed, as was also the auditor, and the proceedings terminated with a vote of thanks to the chairman and his colleagues.

ST. AUGUSTINE DIAMOND CO.

THE DEATH OF COL. McMURDO—MORE ADVANTAGEOUS ARRANGEMENTS FOR FINANCING THE CO.—MR. FINLAYSON, THE RESIDENT DIRECTOR, ADDRESSES THE SHAREHOLDERS.

AN extraordinary general meeting of this company was held at Cannon Street Hotel on Thursday—Col. Malleson presiding.

Mr. NEWMAN (secretary) read the notice convening the meeting.

OBJECTS OF THE MEETING.

The CHAIRMAN: Ladies and gentlemen, I little thought when I had the pleasure of addressing you at the end of March that I should so soon convene you again to talk upon the affairs of the company. If you recollect, the meeting at the end of March was a very large one, and it was an absolutely unanimous meeting. As far as I could gather the feelings in the minds of the shareholders, it was that the mine was in a very prosperous condition, and the arrangements which we had made for financing it, although they deprived the shareholders of any chance of immediate profits, were very good for the shares as an investment. I told you then of the arrangement which had been come to between the company and Col. McMurdo, by virtue of which Col. McMurdo found the capital for carrying on the works at the mine on condition that 75 per cent. of the diamonds which accrued from those workings should become his property, and it appeared to be the feeling of the meeting that that arrangement was not at all a bad one for the company. I told you at the time that there was this advantage—I might call it a prospective advantage—that whereas Col. McMurdo had found the capital for the working of the company, and proposed to carry on the workings of the mine until it should be in a paying condition, yet that the agreement which we had with him was terminable at one week's notice on either side. Now, two events have happened, which determined your directors to summon you once more in order that we might consult together regarding the affairs of the mine. The first of these events was the arrival in England of the resident director, Mr. Finlayson. (Cheers.) For the last four years Mr. Finlayson has had the management of the mine on the spot. He has sunk every shaft in the mine himself, and he will be better able to tell you than anyone else the exact position and the prospective value of your mine.

FEARS CALMED.

Under any circumstances then I should have called you together to hear the report of Mr. Finlayson, but an unfortunate circumstance has occurred, which rendered it absolutely necessary, in order to calm the minds of the shareholders, and to re-assure them as to their position, that I should ask you to meet me to-day. I need not tell you that I allude to the death of Col. McMurdo. It must have occurred to some of you that as Col. McMurdo was the gentleman who had the contract for financing the company, there was some danger lest in consequence of his death no one would be at hand to supply his place. It was quite possible—it seemed indeed to a great many even probable that Col. McMurdo's executrix, or the gentleman whom she had charged to attend to his affairs, might determine to give us the seven days' notice which would close our source of supply. Now, on that point I am able to give you very re-assuring information. (Cheers.) There is not the smallest chance that the supplies needed for the mine will be cut off, and not only that but the information which I shall give you this morning is of a nature to show you that the giving of seven days' notice to close the contract would be a politic thing for your board to do, because you must be aware from what I have already told you that by virtue of that contract, if the mine were to prove to be the richest mine in the world you would draw no immediate profit as 25 per cent. goes to the holders of the Royal certificates, and the balance of 75 per cent. would go into the pockets of Col. McMurdo's executors. Now it is obviously to

THE ADVANTAGE OF THE SHAREHOLDERS,

if we could find a group of gentlemen who would advance the money on far less onerous terms—not asking payment by 75 per cent of the diamonds. I believe—indeed, I may say as an absolute fact—that such a combination can be arranged—(cheers)—and, when it is arranged, your board will give the seven days' notice required for the rescinding of that agreement, and from that date forth every diamond which may be found in the washing of the blue, which you will hear from Mr. Finlayson has already accumulated, will go into the pockets of the shareholders, (Cheers.) I hope, then, that your minds will be quite reassured on that point. Lamentable, and much to be regretted, as is the death of Col. McMurdo, as far as the St. Augustine mine is concerned, it will be in an improved position, and the interests of the shareholders will naturally be improved also. These were the points upon which I wished to dwell, and for the purpose of dwelling on which I asked you to come here this morning. Mr. Finlayson is here, and will give you the fullest information in his power regarding the history of the mine, and his idea of its future prospects. The chairman concluded by offering to answer any questions that might be addressed to him.

EXPRESSIONS FROM SHAREHOLDERS.

Mr. BLUMENTHAL corroborated the statement of the chairman with regard to the parties who were prepared to finance the company, and assured his fellow shareholders that they would not be required to put their hands in their pockets for the purpose of developing the mine. He hoped the directors would give the necessary notice to the executors of the late Col. McMurdo.

Mr. WITT asked if there was any prospect of an amalgamation?

Mr. PEASEGOOD said it had been stated that the workings of the Kimberley Company were supposed to be underneath the St. Augustine's—in fact, the St. Augustine's workmen had heard the Kimberley workmen. He wished to know if that were so?

Mr. RHODES hoped that the directors would not treat with his namesake, Mr. Cecil Rhodes, who desired to sink a shaft on the St. Augustine's Mine ostensibly for ventilation, but he believed it was for other purposes.

A SHAREHOLDER asked to whom would the blue belong that was now on the floors.

The CHAIRMAN said that the contract with Col. Mc.Murdo, was that three-fourths of the blue which was obtained in sinking the shaft, should belong to him. As soon as the contract with those who were about to furnish the money for the development of the mine was signed, notice would be given to the executors.

In reply to a further question,

The CHAIRMAN said the board were contemplating submitting at a future period, a proposal by which the royalty certificates, which were now issued, would be exchanged for shares.

VIEWS OF MR. FINLAYSON.

Mr. FINLAYSON, who was received with applause, then addressed the meeting, and prefaced his remarks by saying that his experience of the diamond mines of South Africa extended over 20 years. It was necessary, he said, that he should be somewhat retrospective in his remarks, as he found in this country a very singular ignorance existing with regard to the diamond mine industry of South Africa. There had, it was true, been considerable experience gained with respect to gold, silver, lead and other mines, certain indications having led up to certain facts in connection with the past, which guided us to-day, but there was nothing of the kind with regard to diamond mines—it was a perfectly unique industry. In the early days, when diamonds were found in the Vaal river, it was well understood that they were brought there by water from a remote place. Various theories had been suggested—some celebrated geologists clinging to the wind theory, others to the ostrich theory, &c., but he thought they might now really accept it as a fact that these mine had a volcanic origin. The St. Augustine Mine, as they were perfectly well aware, was the most abused mine in South Africa, and he was the most abused man. (Laughter.) So far as it affected him, personally, however, he did not care one jot; but it affected the property of the shareholders, and their scrip, and it behoved him, therefore, to be very plain in his remarks to-day, and he would have to go through, not only the past history of the mines, but of some of the men who had been connected with it. Twenty years ago, when he went out, the whole of the industry was centred on the Vaal river; but he took up his private position at Dutoitspan, where a few Dutchmen were working down the river. For so doing he was ridiculed, and

PRONOUNCED AN IDIOT.

There were no De Beers or Kimberley in those days, but as soon as a little success was achieved people crowded round about Dutoitspan, and they soon had a population of 15,000 people. He was called upon by them to draw up rules and regulations for the government of the fields. President Bland paid him the honour of appointing him inspector of mines and resident magistrate, and the whole of the political affairs were in his hands. Shortly after the assumption of British rule—which was done in a manner that he heartily disapproved—he received Her Majesty's commission as a justice of the peace, and for the services he rendered the people he received not only their thanks, but the thanks of the Press, the President and Parliament. He thought it desirable that they should know this, in order to be better able to appreciate the value of the attack which had been made upon this property generally, and himself in particular. After the Dutoitspan Mine was worked, the De Beers Mine was found, and the Kimberley Mine was rushed out in July, 1871. To show how small a matter was necessary to create a mighty industry—a Kimberley Mine had been prospected several times and abandoned, but one morning a gentleman, resident in Colsburg, brought to him a small diamond (about 1½ carats) and asked him if he would declare the digging. He (Mr. Finlayson) visited the spot, examined the soil, and found various deposits that he knew to exist in the Dutoitspan and De Beers properties, and declared the mine. He laid out that mine on a different principle to

the others, making roadways throughout the whole of the property, and insisting that the diggers should remove their stuff and treat it outside the mine. For this piece of presumption, as it was called, he had a whole army against him, and was

NEARLY LYNCHED.

It was, however, owing to that circumstance that the Kimberley Mine became so largely developed, and its marvellous riches had surprised the world. In those days there were many people working on the ground. The finding of the diamonds was so complete and so sudden that it drew people away from the other mines, and consequently the lucky holder of a claim in a mine gave it out to be worked in eighths and sixteenths. Every foot of ground was being individually worked, and everybody was astonished at the daily accounts of the marvellous riches. The Dutoitspan and Bultfontein Mines were abandoned, and people flocked to Kimberley. The St. Augustine Mine was given out within a few weeks of the Kimberley Mine, but the nature of the ground at the surface being hard and having to work simply with pick and shovel, no dynamite or gunpowder being available, the diggers soon abandoned the St. Augustine Mine and worked in the Kimberley. Then came the formation of several private companies, and the Kimberley Mine stretched out its workings in every direction, and the St. Augustine, being just within a stone's throw, was taken possession of and used as a depositing floor for the Kimberley Mine, and was soon covered and was soon forgotten. Several years after, however, he met a gentleman who said he was going up to Kimberley to take out a mine which he (Mr. Finlayson) had discovered—referring to the St. Augustine—and in an affidavit which that gentleman handed to him he stated that whilst washing the Kimberley blue they were instructed by the owners of the mine to deepen the well that they found there, and in carrying out that operation they found blue ground, which, when pulverised and washed, yielded a number of diamonds. They at once communicated this find to the owner of the block of ground in the Kimberley Mine, who begged them not to disclose the fact, as it would ruin the Kimberley Mine if another mine were discovered so close to it. He (Mr. Finlayson) was asked to take the matter in hand, which he consented to do, provided that he received confirmation of these statements, and upon being satisfied that they were correct he took steps to acquire the property as a depositing floor—some little

SLEIGHT-OF-HAND

being necessary, as it would never have done to have disclosed his knowledge of the existence of the mine. He obtained from the Governmeut a prospecting license. By this he was enabled to prospect within a certain radius, and no one could come near him until he had reported a find of diamonds. He defined the mine—that was to say, he made a trench following the containing rock of the country, through which the volcano had upheaved this mysterious blue, and then commenced digging operations. Under the ordnance at that time every digger had a right to a claim, on payment of 100*l*., so soon as a find of diamonds was reported. Knowing of the existence in Kimberley of a vast amount of rascality, he and his friends desired to have associated with them in this venture the pick of Kimberley men—men of repute and good position; and by means of a little strategy the men whom they selected were brought up so as to be in readiness to secure a claim in the mine when the find was reported. Among these gentlemen were Mr. Francis Baring-Gould, of Kimberley Central; Mr. Rudolph Heinrichson, chairman of the De Beers; Mr. Thane Allen, managing director of the United Diamond Mining Company; and Mr. Cecil Rhodes, the great amalgamator. The latter gentleman was good enough to do the surveying, but when the claims were given out he was not present, and failed to secure his claim. These gentlemen formed a committee, and instructions were given to deepen the shaft through the blue, raise it and wash it. Tenders were accepted, and under the supervision of the committee the blue was washed, and in one wash-up 118 diamonds were found. (Mr. Finlayson then referred to what he termed a "vile conspiracy," which was got up by certain parties out at the mine.) Continuing, he said he was sent over to England by the claim-holders with the view of floating a company or selling the mine. Sir John Pender was going to take the matter in hand and advance the necessary sum, when whispers were raised by unfortunate investors who had entrusted their money to his (Mr. Finlayson's) predecessors with diamond ventures, some of which were a disgrace to the men who introduced them. Diamond mines were characterised as "swindles." However, after struggling on perseveringly, Sir John Pender and others agreed to go into the matter.

A SIGNIFICANT REMARK.

There was not one single feature in connection with the St. Augustine Mine that did not show itself in the Kimberley and De Beers Mines. They had the same blue—soft blue, hard blue, rock blue, with all the ingredients. They had bad blue at the top and at the west end, but better blue as they went deeper. The De Beers Mine was now in a pretty flourishing state, but when he went over to start working this property, the De Beers Mine was in great trouble, not being able to pay expenses; and many of the properties that are now in the richest ground of the Kimberley Mine were considered utterly worthless. The United Company never paid its way, and the proprietors of that mine went into the market endeavouring to sell what have since proved to be the rich claims in the great De Beers Mine, and they could not find a buyer. A syndicate, however, found money for them, and they went down another 150 ft., and it was proved to be one of the richest mines in the world. At the St. Augustine Mine the shaft at the west end had been worked 160 ft. At 150 ft. he defined the containing rock; he then continued the main shaft to 336 ft., and defined the containing rock again, and the same thing had been done at 450 ft. They had now upon the deposit floor 8,500 loads of blue from this 450-ft. level. That they would find diamonds he had not the least doubt; they had already found

SOMETHING LIKE 1,500 DIAMONDS,

and if they found one only worth 20,000*l*. it would be as naught compared with finding 1,500 small diamonds. The mine was a small one—large at the top, but smaller as they went down, assuming the shape of an hour-glass, which was precisely the same as the Kimberley. On the north side of the mine it was found that the rock cuts out, which was also the case in the Kimberley, but it was perfectly vertical. The theory was that the upheaval was originally a volcanic action, travelling in a lateral direction, and as it found weak vents in the rock, assuming the vertical, and then afterwards, by a geyser movement, this softer mud was brought up. If that were the case, the action coming from north to south, taking in the two mines, Kimberley and St. Augustine, the whole of the intervening ground would be blue ground. This was recognised by the Goverment so far back as 1883, and a clause was inserted in the ordnance providing for any such contingency, and disallowing any one obtaining rights on the surface. If a chamber existed there, this mine would be one of the most wonderful mines in the world. In conclusion, Mr. Finlayson expressed the hope that the shareholders would not base their estimate of the value of their property upon the statements of their enemies whose duty and obligation it was to prevent their existence. At the same time they must not be disappointed in mining if they sunk their money and lost it. All he wished them to believe was this—that having worked in every depth from the surface, he had never had a blank wash-up, and in the Kimberley Mine thousands of loads had been thrown away as not worth washing. He thought there was every reason to justify the presumption that a chamber of blue existed between the two mines, and in his opinion it was worth going for. (Cheers.)

In reply to Mr. BLUMENTHAL,

Mr. FINLAYSON said he was the original promoter, and had something like 100,000*l*. in the concern. He had

NOT PARTED WITH ONE OF HIS SHARES,

and until he had proved his venture a paying one not one of his shares would be put upon the market. (Cheers.)

The Duke of MANCHESTER, in proposing a vote of thanks to Mr. Finlayson, said that that gentleman had impressed him with the greatest confidence in his honour and ability. He hoped for Mr. Finlayson's own credit, as well as for the benefit of the shareholders, he would achieve eminent success in the St. Augustine Mine.

Mr. BLUMENTHAL seconded the motion, which was carried by acclamation, and with a similar compliment paid to the chairman the proceedings terminated.

THE WAIHI GOLD MINING CO., LIMITED.

THE SUCCESSFUL RESULT OF THE NEW TREATMENT OF THE ORE—GOOD RETURNS FROM THE MINE NOW, AND BETTER STILL EXPECTED IN THE NEAR FUTURE.

THE ordinary general meeting of the shareholders was held at Winchester House, Old Broad Street, E.C., on Monday last, to receive the directors' report and statement of accounts, and to transact the general business of the company. And notice was further given that, immediately after the conclusion of such ordinary general meeting an extraordinary general meeting of the company would be held at the same place, at which certain resolutions of the board relating to a new issue of 20,000*l*. debentures will be submitted for approval, and resolutions proposed authorising the directors, if and when requisite, to increase the capital of the company by the issue of ordinary shares, at par, to such an extent (not exceeding 20,000*l*.) as may be sufficient to enable them to carry out the terms of such new debenture issue, and to allot the increased capital, or any existing unissued share capital of the company, in such manner as may be necessary for the purpose of carrying out such terms.—Thomas Russell, Esq., C.M.G., presided.

Mr. CHARLES AKERS (the secretary) read the notice calling the meeting, and the report of the directors was taken as read.

The CHAIRMAN: Gentlemen, it becomes my duty now to say a few words to you in asking you to adopt the report which you have received, and in doing so I may say I think we have given you in the report so much information, and so fully and clearly, as to leave, indeed, very little for me to add to it. The extracts which we have given you, showing the state of the mine and the work done in it, have been taken from the mine manager's reports as sent to us month by month. We have not selected the most sanguine of his statements, the most highly-coloured, but have given you a fair average of the whole.

NOT A TOO ROSEATE VIEW.

Some of his reports have contained stronger statements than we have printed, but we did not think it right to give you too roseate a view lest hereafter it might not be confirmed by actual experience. What is said in the report I think you may take as a very fair account of the mine, and I think you will agree with me that the 12 months' operations in the mine have led to satisfactory conclusions, and that we have a good property, and a property likely to be, as far as we can see from the indications in it, one of permanent value. Another thing about which we are well satisfied is that the process which we have adopted for saving the gold has been found to be successful. If you will remember, gentlemen, at our last meeting we told you of the difficulty which had brought this property into our hands—the difficulty which the original owners had of saving the gold by the old method of water crushing.

DRY CRUSHING.

Well, after a good deal of inquiry and experiment, we adopted the idea of saving the gold by dry crushing and pan amalgamation; but up to that point we only believed we would be successful. Now we are able to tell you that by the actual experiment we have found the gold which is contained in the ore of our property, and which could not be saved by the wet crushing process, we can save by the process of pan amalgamation, and that the question has passed the region of theory into one of actual and satisfactory proof. (Hear, hear.) We tell you in the report that some delays have taken place, and some mistakes have been made, and that a considerable amount of expense has been incurred which we had not anticipated.

NO DESIRE TO APOLOGISE.

We have no desire to apologise for these mistakes, nor do we wish to fix the responsibility on any particular individuals; but, as we have told you in the report, we have taken steps to rectify these blunders, and I am happy to tell you that none of them are of a vital character; they are all in connection with things that can be set right, and none affect the permanent interest of the company. The power of saving the gold is there, but the mistakes have arisen from too sanguine a view entertained by certain persons of the cost of the erection of the works; and in point of time and so on, their estimates have proved to

be uncertain and unreliable. But we have now taken steps to put these matters right, and we believe now we are on the right tack. The original idea, as you know, was to drive the machinery by water power. and we were made to suppose that the introduction of this water power would be very much more expensive than we have subsequently found it to be. We, consequeutly, did not go on with that plan at the outset, but sent out a steam engine, which was very good indeed, but was found in use to be very expensive to drive, because of the cost of the firewood, and it was not adequate to the whole of the work required of it.

WATER POWER.

Now, however, we have accepted contracts for introducing water power to supersede the steam engine. This water power. we are iuformed by competent advisers, will be sufficient to drive the whole of our mill and do all our crushing; and I need not tell you the advantage of water over steam, especially when obtained by the use of firewood. Water power is the cheapest of all powers, and the steadiest of all powers; one which is not dependent on the condition of the roads for obtaining firewood, but one which is at work in all weathers. The delay that has occurred, and the erroneous estimate formed of the cost of the inauguratiou works at the mine, has led to a considerable amount of expenditure more than we had anticipated. We have met that expenditure up to the preseut time by the issue of 10,000*l*. of debentures, which were subscribed for by friends, and we are now proposing to create another 10,000*l*., or to issue 20,000*l*. in debentures to clear off the whole of the obligations, including the 10,000*l*. of debeutures originally issued; to pay the cost of bringing iu the water, and to make a clean start.

AN INDUCEMENT OFFERED.

Now, gentlemen. these debeutures we propose to issue to every shareholder. to give every shareholder the right of taking up the proportion to which he is entitled; or if auy shareholder desires to have more than he is entitled to, his claims to such additioual number will be fairly considered by the directors. And in order to indnce the shareholders to take up these debentures, there are attached to them considerable privileges. They carry interest of 8 per cent. per annum, and will, withiu 12 months, give the holder the right to call for one share and a half at par—that is to say, one share and a half for every £ of debentures subscribed; thus, the holder of debentures for 100*l*. is eutitled to obtaiu 150 shares at 20s. each. I need scarcely point out to you that at the time when this takes place the mere fact of the debenture-holder taking up his shares would liberate 15,000 shares—or the shares that we now have which are unsold, and the condition of the company, which would impel him to take up the shares to which he was entitled under his debentures, would be such, I presume, as to enable us forthwith to pay dividends.

THE YIELD OF GOLD.

Now, with regard to the quantity of gold that has been obtained, as I before informed you, the steam engine has not turned out to be a success, and the comparative failnre of the Globe mills to do the work expected of them has led to the impartial suspeusion of the work of amalgamatiou at the mine. But during the last month we obtained 750*l*. worth of gold, in the month before that 600*l*.; what we shall get this month I do not know. but I have a telegram here of rather an important character. which shows that when this water is obtained, and the mill is in working order, our returns will be as good as ever we expected them to be.

THE LATEST TELEGRAM FROM THE MINE.

The telegram is from one of our local directors who is now in charge of the mine. having complete control over all the company's operations there. and he informs us: "After October next I can turn out a net profit of 2,500*l*. per mouth." I am afraid that is rather a sanguiue view of the case, but if it is very much less than that I think you will find that the property is quite as good as anythiug it was ever described to you. (Cheers.) I now beg to move, gentlemen, the adoption of this report.

VIEWS OF A LOCAL DIRECTOR.

Mr. DAVID HEAN, who was introduced to the meeting by the chairman as one of the local directors who knew something of the mine, and as an inspector of the National Bank of New Zealand, seconded the motion, and said he endorsed all Mr. Russell had said with regard to the mine. Some six months ago he visited the mine, and was really surprised to find the amount of work that had been done in developing the property. There was an immense amount of first-class ore on the surface ready for crushing. He thought it ought to be borne in mind that the present difficulty was not owing to the reef having pinched out or become poor, but was simply due to the machinery not being in working order. He expressed his thorough confidence in the mine, and said he had not sold a share, and was prepared to take up his quota of the debentures.

GOOD DIVIDENDS EXPECTED.

He thought, in fact, they had a splendid property, and would get good dividends in future. (Hear, hear.)

Mr. POWELL asked whether the chairman had any information as to the yield of gold per ton of quartz.

The CHAIRMAN replied that he could not give the desired information as to the yield per ton, but he could tell Mr. Powell that the amount of gold obtained last month was 750*l*., and this would increase month by month till October, when they were promised the

MAXIMUM PROFIT OF 2,500*l*. PER MONTH.

(Cheers.) The manager's latest report was on March 22nd, when he said: "They are now dealing with good ore, saving quite 75 per cent. of the assay value. We reckon now that we are getting 10*l*. worth of bullion from each ton treated." Some ore from the mine had assayed as much as 200*l*. a ton, while some of it was worth only 4*l*. or 5*l*.

NO BARREN ORE.

He believed none of the ore in the mine was barren, and the only question was that of treating it on a large scale to get out a very rich return.

The re-election of the retiring directors, Sir Edward Stafford (who was unfortunately absent in consequence of a domestic affliction), and Mr. Bristow, having been moved by the CHAIRMAN and duly seconded, was unanimously carried.

Mr. MOORE (the auditor) was re-appointed at a remuneration of 20 guineas, the motion being moved by Mr. GOSLETT, and seconded by Mr. THORNBURGH.

The business of the ordinary meeting being thus concluded.

SPECIAL MEETING.

A special meeting was afterwards held for the purpose of considering and approving the resolutions set forth in the notice calling the meeting, and which had already been passed, subject to the shareholders' approval by the board.

The CHAIRMAN formally proposed the approval of the proposed alterations.

Mr. HENRY J. BRISTOW secouded.

The motion was carried unanimously.

THANKS.

Mr. D. HEAN moved, and a SHAREHOLDER seconded, a cordial vote of thanks to the chairman and directors, which was carried *nem. dis.*

The CHAIRMAN appropriately responded.

The meeting then separated.

THE ECTON CO., LIMITED.

RESOLUTIONS CONFIRMED—THE COMPANY TO BE RE-CONSTRUCTED

AN extraordinary general meeting of shareholders of the above company was held at the Great Eastern Hotel, Liverpool Street, on Tuesday, for the purpose of confirming the following resolutions passed at the extraordinary general meeting held on the 3rd inst., and so make the same special resolntions, as provided by the Companies Act, 1862, sec. 51, viz. :—

(1.) "That the company we wound-up voluntarily." (2.) "That the liquidator be authorised to transfer the leasehold interest of the company in the mines held by them, together with the buildings, plant, machinery, stores, utensils, debts, and all their other property and effects of every description, to a new company, with limited liability, under the same or such other name as the liquidator may approve, having a capital of 40,000*l*. in 1*l*. shares." (3.) "The consideration for such transfer to be the payment of the sum of 35,000*l*. by the allotment to the liquidator, or his nominees, of 40,000 shares, credited with 17s. 6d. as paid thereon, leaving a liability of 2s. 6d. only on each share; and the payment of the debts of and claims upon this company, the costs of and incidental to the liquidatiou of this company, and the formation and registration of the new company." (4.) "The whole of the shares forming the purchase-money to be offered in the first instance to the shareholders in this company, and they shall be entitled to one share in the new company for each share held by them in this company. Any shareholder who shall neglect to apply for the shares to which he may be entitled within the time limited by a notice to be sent to him by the liquidator, shall be deemed to have declined to aeeept the same." (5.) "The shares to which any shareholder is entitled, but declines or neglects to accept, to be sold, or otherwise disposed of by the liquidator, as he may think fit, but the net amount realised thereby (if any), after deducting the expenses connected therewith, shall be paid or put to the credit of the shareholder, who, being eutitled thereto, shall have declined or neglected to take such shares."

Mr. W. W. Urwick presided.

Mr. NEWMAN GOLDMAN (secretary) read the notice convening the meeting.

The CHAIRMAN: Gentlemen, this is merely a formal meeting to confirm the resolutions passed on the 3rd May, and which the secretary has read. It is the only course left open to the directors, and, therefore, having been passed at the previous meeting, I hope there will be no hesitation in adopting them to-day. I, therefore, propose that the resolutions be passed.

Mr. KERLY seconded the motion, which was carried unanimously.

APPOINTMENT OF LIQUIDATOR.

The CHAIRMAN: The next thing is to appoint a liquidator, and we think, in the interests of the company, the secretary (Mr. Goldman) should act as liquidator, which will be a considerable saving of expense, because he will be always on the spot to reply to enquiries of the shareholders and directors. I therefore propose "That Mr. Goldman be appointed liquidator of the old company."

Mr. KNOWLES seconded the motion, which was carried.

The CHAIRMAN then moved the following resolution:—"That the liquidator be authorised to enter into a contract (in the form submitted to the meeting), with power to concur in any modifications of the same, which he may consider necessary or expedient for giving effect to the above resolutions."

Mr. KERLY seconded the motiou, and read the draft of the agreement.

The motion was carried unanimously.

The meeting then closed.

SLATE SYNDICATE.—It is rumoured that negotiations for amalgamation of the North Wales slate quarries are still being carried on. A large freehold quarry in the Festiniog district, adjoining the celebrated Palmerston quarries, has been acquired by the New Welsh Slate Company, Limited.

MINING MACHINERY

Of Latest Approved Designs as developed in American Practice.

The ultimate success of the African Goldfields must depend on large economical Mills, crushing the maximum quantity of ore with the minimum outlay for fuel and labour.

As an illustration of what can be done with superior machinery reference is made to the Montana Company's Mill. This consists of three rock-breakers, 60 stamps and 24 Frue Vanner concentrators. It crushes daily 120 tons of hard quartz, burning six cords wood (3 tons coal) per 24 hours, and employs 15 men in the 24 hours. The engine has been run four months at a stretch without once stopping.

The following extract from the "Engineering and Mining Journal" shows the difference between Fraser and Chalmers' Mills, and those of less experienced firms :—

"STAMPS AND STAMPS.—The El Callao Company has two mills of 60 stamps each; the new one supplied by Fraser and Chalmers representing the best modern designs and workmanship. Both mills are run under one management, and the old mill has been much improved on its original condition.

"Old Mill crushed 31,770 tons in 48½ weeks, cost 24.60 fcs. per ton.
"New Mill crushed 29,000 ,, 25 ,, ,, 8.60 fcs. per ton.

"New Mill will probably crush 60,000 tons in 51 weeks. The rock is a very hard quartz."

The cost of freight and erection is nearly as high for a poor mill as a good mill. The difference in first cost between ordinary mills and the best mills can be made up in the extra saving on a month's run. The large masses of low-grade ore in Africa cannot be worked to a profit with expensive fuel and labour except by improved mills. The days of small mills and rich rock are numbered, as proved by experience in all other goldfields.

THE ORDINARY SHARES OF THE BRITISH WATER-GAS SYNDICATE, LIMITED, ARE AT A HIGH PREMIUM.

The Chairman of that Company (Capital £300,000) stated at the Statutory Meeting that the Capital was applied for 8 times over. That the Yorkshire Water-Gas Company (Capital £150,100) was applied for 6 times over. That the Nottingham and Derby Water-Gas Company (Capital £150,100) was applied for 8 times over. That the North British Water-Gas Company (Capital £300,100) was applied for 10 times over.

SPECIAL FEATURE CLAIMED FOR NICHOLSON'S PATENTS.

Cost of 1,000 tons of Coke at 8s. a ton for making Water-Gas at the Leeds Forge by the British Water-Gas Syndicate Patents and Plant is stated to be £400. It is claimed that the same number of tons of Coke for making Water-Gas by the Mercantile Gas and Coke Producers (Nicholson's Patents) can be produced not only free of cost, but at a profit of £700, on the following basis of calculation :—

COST.

2,000 tons of Coking Slack, at 6s. per ton	£600	
Extra labour, say at 1s. per ton	£100	
	——	£700

(Two tons of Coking Slack should produce one ton of Coke)

PRODUCTION.

Estimated value of Coal-Gas made in producing the Coke	£600	
Estimated Bye-products (Tar, Ammoniacal Liquor and Benzol) at 4s. per ton of Slack	£400	
Sale value of Coke at 8s. per ton	£400	
	——	£1,400
Profit		£700

SIR DOUGLAS FOX, C.E., has reported on the process of Water-gas as carried on at the works of the Leeds Forge as follows :—"I have, from the experiments made on my behalf, come to the conclusion that Water-gas has a great future for manufacturing, heating, and lighting purposes, and that it can be produced at a cost, at present prices, of about 4d. per 1,000 cubic feet. It must, under many conditions, prove a formidable rival to ordinary coal-gas."

The experience of nine months' working at the Leeds Forge with the British Water-Gas Patents and Plant has led to the conclusion, based on carefully ascertained data, that the saving effected on the whole works is about £10,000 per annum.

THE SUBSCRIPTION LIST OF

STAFFORDSHIRE WATER-GAS COMPANY, LIMITED.

NICHOLSON'S PATENTS.

WILL OPEN ON 31ST MAY, 1889, AT 10 A.M., AND DUE NOTICE OF CLOSING WILL BE GIVEN IN THE DAILY PRESS.

Registered under the Companies Acts, 1862 to 1888.

CAPITAL, £120,000, IN 24,000 SHARES OF £5 EACH,

Of which 100 are Founders' Shares, entitled to receive one-half of all Profits in any year after 15 per cent. has been paid on the Ordinary Shares. The Ordinary Shares are now Offered for Subscription. Payable—10s. on Application ; £2 10s. on Allotment ; £1 One Month after Allotment ; £1 Two Months after Allotment. When fully-paid no further liability.

PROSPECTUS.

THE object of this Company is to secure an exclusive license to work in Staffordshire the English pateuts numbered 5,727 of 1886, and 9,239 (provisional) of 1888, granted to Thomas Nicholson, and by which patents it is claimed that both water-gas and coal-gas can be produced by a simple and economical process. This county offers an extensive field for the introduction and use of these patents, including as it does the following important towns : Stafford, Wolverhampton, Stoke-upon-Trent, West Bromwich, Walsall, Wednesbury, Bilston, Burton-upon-Trent, part of Tamworth, Lichfield, Uttoxeter, Cheadle, Hanley, Burslem, Longton, Newcastle-under-Lyme, Leek, and Tunstall. The ironworks in the county of Stafford are among the most important in the United Kingdom, added to which there are extensive manufactories.

Over a very large area the operations in the ironworks and manufactories are and must of necessity be at work day and night, and it is believed that this county provides one of the best fields in the United Kingdom for the introduction of water-gas. Water-gas has proved so extraordinarily efficient, cleanly, and economical, that it is likely, in the course of a few years, to be adopted at all works where there is room for the plant. The Leeds Forge Company, Limited, state that they obtain nearly three times the produce from the same furnaces, and save £10,000 a year, by using water-gas, the gas costing 4d. per 1,000 cubic feet.

Mr. Townsend, of Dewsbury, is reported in *Gas and Water*, June, 1885, as vouching that water-gas at even 6d. per 1,000 ft. is more economical than coal for steam engines.

The advantages claimed for Nicholson's patents are :—

1st. Fuel for the water-gas not only frec of cost, but producing a large profit.

2nd. Coal-gas, tar, and other bye-products which more than repay the cost of the coal and labour used in production of the coke.

3rd. Water-gas made in the same structure as the coke, saving the labour of removing the fuel from coke works to water-gas producers.

STAFFORDSHIRE WATER-GAS COMPANY, LIMITED.—*Continued from previous page.*

It is claimed, therefore, that water-gas can be produced by this process practically free of cost, consequently if sold at only 2d. per 1,000 ft., very large profits must result.

Mr. George William Parker, the manager of the coke ovens at the Spring Vale Furnaces, near Wolverhampton, certifies as follows :—

"19th April, 1889.

"I worked Mr. Nicholson's gas and coke producers for more than 12 months, and can testify that they will make good hard coke, together with coal and water-gas and other bye-products.

GEORGE WILLIAM PARKER."

In addition to its value for manufacturing purposes, water-gas can be used with great economy for house fires.

Apart from the question of water-gas, there are large profits to be made from the production of the coke.

The Company has power to grant sub-licenses to, and receive royalties from the Corporations of towns and owners of manufactories, and a very large return may be expected from this source.

It will be seen by the foregoing that this Company has before it a very productive field of operations.

The following contracts have been entered into, viz. :—An agreement, dated the 16th day of May, 1889, between "The Mercantile and Domestic Gas Company, Limited," of the first part, Thomas Nicholson, of the second part, and Joseph Burrows of the third part ; and another agreement dated the 20th day of May, 1889, between the said Joseph Burrows of the one part, and A. R. Johnson, as trustee, for and on behalf of the Company, of the other part.

The vendor, who is the promoter of the Company, has fixed the purchase-money at £80,000, payable as to £500 in 100 fully paid-up founders' shares of £5 each, as to £20,000 in cash, and as to the balance, either in cash or shares, at the option of the directors. This leaves, it is considered, an ample margin for working capital. The vendor will pay all the expenses connected with the formation of the Company, other than legal expenses and brokerage on shares, up to the first allotment. In relation to these expenses and to a subscription of a portion of the capital, certain arrangements with various persons have been entered into which may technically constitute contracts within the meaning of the 38th section of the Companies' Act, 1867. Applicants for shares must be deemed to have had notice of and to waive the specification of dates and names of the parties to any such contracts, and to accept the above statement as sufficient compliance with that section.

The memorandum and articles of association and the two agreements specified above can be seen at the offices of the Company's solicitors.

If no allotment is made the deposit will be returned in full.

Prints of prospectus and forms of application for shares can be obtained at the bankers and at the Company's solicitors, and the offices of the Company.

Applications for shares by letter to the secretary will be received.

London, May, 1889.

This Sheet to be filled up and remitted entire to the Company's Bankers, LONDON & SOUTH WESTERN BANK, Limited, 168, 169 & 170, Fenchurch Street, London, E.C., or to the Secretary, A. R. JOHNSON, at the Offices of the Company, 10, Moorgate Street, E.C., with the sum payable on Application.

PROSPECTUS.

Objects of Company.—This Company is formed for the purpose of purchasing and taking over 70 old-established bakers' businesses, carried on for many years past in main thoroughfares of various densely populated parts of London, where bread forms the staple article of food, and also an extensive and valuable freehold bakery and steam flour mill, with a capacity sufficient to supply the whole of the shops, thus forming a "tied" trade, in the same manner as licensed houses are tied to a brewery.

Profitable Nature of Business.—The business of bakers, even as at present conducted, is very profitable, as will be seen by the accountants' certificate herein, but on the large scale upon which the business of this Company will be conducted, important economies will result; besides which, the Company having its own flour mill, will retain the profits now made by millers on the flour used by the shops, and the result cannot fail to be highly satisfactory to the Company.

Flour Mills.—The steam flour mills acquired by the Company are situated at Wharfdale Road, King's Cross, on the basin of the Regent's Canal, thus having the advantage of water carriage, and are known as Steel's Mills. They are of substantial construction, and are equipped with both stone and roller plant, in excellent condition and thorough working order.

Present Net Profits.—The bakers' shops have been carefully selected, and have leases averaging 20 years, many of which can be still further renewed, and as the trade is entirely a cash one, all risk of bad debts is eliminated. The books and accounts of these shops have been examined by Messrs. Herbert Watkins and Co., chartered accountants (who are well acquainted with the trade), and they report that the average consumption of flour was 1,237 sacks per week, and the net profit, after paying all usual expenses of the shops, was £19,703 per annum. They have also examined the books of the flour mill, and find that this weekly output of 1,237 sacks, delivered to the Company's own shops at present prices, represents a further net profit of £4,020 per annum. The total profits, therefore, from these two sources amount to £23,723 per annum, which is over 18 per cent. on the entire capital of the Company.

Profit should Increase.—The Freehold Bakery is an extensive building, situate in Waterloo Road, London, S.E. (close to the terminus of the London and South-Western Railway), occupying an area of over 12,000 superficial feet. It is equipped with large steam ovens, and, with a trifling outlay, can be adapted to supply the whole of the Company's shops. From the estimates which have been prepared on the basis of the Company's consumption of 1,237 sacks per week, this should approximate to a saving of £6,000 per annum in making the bread.

It will be seen, therefore, that the profits from these various sources should result in dividends of from 20 to 30 per cent. on the capital of the Company.

Profitable Nature of Bread Companies.—As showing the remunerative character of bread companies, reference is made to the following:—

The Aerated Bread Company's £1 shares are now quoted on the London Stock Exchange at £5 to £5 5s. per share, or 400 per cent. premium—the last dividend paid by the Company being 25 per cent. per annum.

The Bristol Bread Company pay dividends of 35 per cent. per annum.

Boland's, Limited (capital £280,000), a Bread Company started in Dublin in May last, declared an *interim* dividend in November last of 10 per cent.

The Press and Joint-Stock Bakeries.—The *Financial News* of Wednesday, January 9th, 1889, in a leading article on "Joint-Stock Bakeries," says:—

Joint-Stock Bakeries.

Every year has its boom. What will be the boom of 1889? There is one form of industry which is likely to have a boom of more or less importance, and that industry is bread-making. Some time ago the *Financial News* took occasion to point out that the manufacture of bread is not less profitable than the manufacture of beer and other commodities too numerous to mention.

The Aerated Bread Company, after passing through broken seas, has undoubtedly sailed into smooth and pleasant waters. A shareholder who is not satisfied with a dividend of 25 per cent.—exclusive of the share bonus allocated by this Company in October last—(of 5s. per £1 share) must, indeed, be difficult to please. It is obvious that what has been done in London may very well be done in the large towns in all parts of the country.

Nor is it in the least degree surprising; for bread, like water, no household can do without. The demand is universal. It is true that the supply is forthcoming, but it is not the best that can be reasonably expected for the price paid. Large Bakeries in populous towns invariably return excellent profits to their proprietors. It is when the trade requires upwards of 50 sacks of flour that the advantage of machinery is at once experienced. From that level a Bread Company may enlarge its business step by step, with first class results to its shareholders. The use of modern machinery and the most improved patent ovens will give such an undertaking an immense advantage over competing bakers.

At present, notwithstanding our boasted advance in sanitation and the operation of the Factory Acts, but too much of the staff of life is manufactured under injurious conditions, of which the consumer knows little or nothing. Only in a well-appointed modern factory can immunity be secured from the objectionable influences of smoke and dirt. A company with a relatively moderate capital, and well-officered, which can guarantee such immunity, and supply a superior and uniform loaf at the ordinary price of household bread, must, sooner or later, attain conspicuous success.

Management.—The mills will be managed by Mr. Thomas A. Steel, who is an experienced miller, and who is well-known on the markets. Mr. Philipp König and Mr. Jacob Schwenk, both thoroughly practical men, will manage the bakery, and personally visit each shop every week.

Price to be Paid for Property.—The price fixed by the vendor for the freehold bakery, flour mills, including all machinery and plant, with the fixtures, fittings, leases and goodwill of the 70 shops, has been fixed at £115,606, of which two-thirds will be payable in cash, and one-third in shares or cash, at the option of the directors.

Contracts.—The following are the contracts which have been entered into:—(1) Contract dated May 21st, 1889, between T. A. Steel of the one part, and W. Evans of the other part; (2) Contract dated May 24th, 1889, between W. H. Clark of the one part, and the said W. Evans of the other part; (3) Contract dated May 27th, 1889, between the said W. Evans of the one part, and C. Brown of the other part; contract dated May 28th, 1889, between C. Brown of the one part, and C. W. Bennett, as trustee for the Company, of the other part.

The vendor, Mr. Brown, is the promoter of the Company, and will pay all expenses in connection with the formation and raising the capital of the Company, including printing, advertising, legal charges, &c., up to the first allotment of shares. In relation to these the vendor has entered into certain arrangements which may constitute contracts within the meaning of the 38th Section of the Companies' Act, 1867, and applicants for shares will be required to waive the insertion of the dates and names of the parties to any such contracts as required by such section.

In the event of no allotment being made, the deposit will be returned in full, without deduction. Should a less number of shares be allotted than that applied for, the balance will be applied in reduction of the amount due on allotment.

The above-mentioned contracts, together with the articles of association, and the accountants' certificate and schedule of the businesses to be acquired, can be inspected at the offices of the Company.

Prospectuses and forms of application can be obtained of the bankers and brokers, or of the secretary, at the offices of the Company.

Accountants' Certificate.—The following is the certificate of the accountants before referred to:—

Moira Chambers, Ironmonger Lane,
Cheapside, E.C., May 17th, 1889.

Gentlemen,—We have examined the books and accounts of the various bakers' businesses proposed to be taken over by the Metropolitan District Bread Company, Limited, comprising in all 70 shops, of which a schedule is attached hereto. We find therefrom that the present aggregate consumption of flour at the said shops amounts to 1,237 sacks per week, and that this is bringing in a net profit at the rate of £19,703 per annum.

We understand that your Company have also acquired the steam flour mills known as Steel's Mills, at King's Cross, on the banks of the Regent's Canal Basin. To the profit certified above should, therefore, be added the wholesale profit which should accrue on the business done by the mill in supplying the shops with flour. On an output of 1,237 sacks per week, which trade would be ensured by the demand of your shops, this should approximate to a further sum of £4,020 per annum, or a total of £23,723 per annum.—We are, Gentlemen, yours faithfully,

(Signed) HERBERT WATKINS and CO., Chartered Accountants,
To the Directors of the Metropolitan District Bread Company, Limited.

QUINLAND—LONDON.

THE MINING MARKET.

CITY, FRIDAY EVENING.

MUMMIFIED CONDITION OF THE MARKET — SOUTH AFRICANS CHANGEABLE — INDIANS FEATURELESS — COPPER STRONGER — HOME MINES AND METALS IMPROVING.

The course of the market this week has been somewhat difficult to describe. At times there has been absolute stagnation; then there has been a shaking of the dry bones, and then matters have relapsed into their previous mummified condition. Under these circumstances "Excelsior" has not been the cry. There is a hopeful tone, but at the same time it must not be forgotten that the rush of new issues is absorbing a vast amount of capital which might otherwise be employed in dealings in old companies. It should also be remembered that the shares taken up in new ventures are now making their calls, and that is another reason why money has not been available for ordinary stock-jobbing purposes. At the same time there are certain descriptions which are not without animation.

South Africans have gone up and down in the scale with almost equal regularity, but rather more business has been done than of late. Some good returns are coming to hand, and are expected to stimulate the market. In the Diamond department South African (Pullinger) shares have been in demand, and prices are firmer.

In the Copper market the rise has been decidedly marked, and though prices do not close at highest quotations, yet the tendency has been upwards. Tone is given to this market by the arrangement said to have been come to by the large producing companies, but these rumours are rather losing their effect, seeing that on an average we have about two of them per week.

Indian shares have been stagnant, and Mysores have not improved, even on the pleasantly significant circular which the directors have just issued, calling a meeting to authorise the disposal of a portion of the property.

In Foreign mines there has been some buying of El Callao and Palmarejo. Both are better on the issue of more satisfactory reports than usual. Pressure upon our space prevents us doing justice to the report of El Callao in our current issue, but we hope to revert to it next week. The market for Colombian Hydraulics, Orita, and similar shares has been firmer, and it is thought that Colons and Tetuans should be bought as a speculation or to average.

Home mines have risen considerably, particularly Tincroft, Carn Brea and Cook's Kitchen. The general disposition is to take a hopeful view of matters, which can easily be done with tin at 92*l.* 5s. Copper is 1*l.* firmer than last week, at 41*l.*, and English lead is now quoted up to 12*l.* 15s.

AFRICANS.

A large business has been transacted in these shares, and notwithstanding the failure of a very large operator which has taken place this week, prices remain remarkably steady.

The following are the making up prices of a few of the companies chiefly dealt in :—Bantjes, 1¾; City and Suburban, 8½; Crown Reef, 5¾; De Villiers, 37; Ferreiras, 13; Goldfields of South Africa, 2¾; Heriot, 3¼; Jubilee, 4½; Jumpers, 11½; Langlaagte, 3½; Salisbury, 14; Wemmer, 6½; and Wolhuters, 3¼.

The following have fallen: Johannesburg Waterworks, 1/16; Moodies, fully paid, ¼; Blaubank, 1s.; Central Langlaagtes, ⅛; Crown Reefs, ⅛; Dornkop, 1/16; Goldfields of South Africa, 5/16; Henry Nourse, ⅛; Jubilee, ⅛; Mainreef United Roodeport, ¼; Moss Rose, ¼; Nabob, ⅛; Royals, ½; Salisbnry, ¼; Spes Bona, ⅜, and Stanhope, ⅛. A rise has taken place in Shebas of 1/16; Aurora, ⅛; Bankets, ¼; City and Suburban, 20s.; Johannesburg Pioneer, ½; Jumpers, 20s.; Knights, 3/16; Langlaagtes, 3/16; Modderfontein, 1/16; Simmer and Jack, ¼; Teutonia, ⅛; United Langlaagte, ⅛, and Wemmers, ⅛.

Copper.

A somewhat brisk business has been done in Copper shares, and nearly all have improved since the making-up day (Tuesday). The following are a few of the making-up prices:—Capes, 2 7/8; Masons, 6 1/8; Panulcillo, 11/16; Quebrada, 11/16; Rio Tinto, 10 1/2; and Tharsis, 3 5/8. It will be noticed that there has been a rise of 22s. 6d. in Tintos since Tuesday, but only 1 5/8 on the week. A rise has taken place in Bratsberg of 9d.; Cape, 1/4; Copiapo, 1/4; Libiola, 1/4; Mason and Barry, 1/4; Namaque, 3/8; Panulcillo, 1/8; Quebrada, 1/8; Rio Tinto, 5/16; and Tharsis, 1/8. No other changes to record.

Australians.

There is nothing of a favourable nature to report as regards the Australian properties, and prices have fallen purely from want of support. The following have receded:—Bonnie Dundee, 1s.; Day Dawn, 1s.; Etheridge, 6d.; Mount Britten, 3d.; Mount Morgan, 9d.; No. 2 Queen, 6d. No improvement on the week to note.

Diamonds.

The market for diamond shares has been somewhat neglected, and, in consequence, prices have fallen off somewhat.

A fall is shown in Anglo-African, 1/8; De Beers, 1/16; Griqualand West, 1/8; New Jagersfontein, 1/2; South African (Pullinger), 6d.; and Burma Ruby Mines, 3/16. No rise to note.

Anglo-African	4 3/4 —	5
Bultfontein, New Shares	3 1/2 —	3 3/4
Central Dorsfontein	8 —	10

Read's Drift Land Co.	1 3/4 —	2
Burma Ruby Mines	1 1/8 —	1 1/4 pm

Indians.

There has been a fair amount of business transacted in the above shares, but prices have not improved. We repeat what we have frequently urged—that Mysores should be bought for at least a 10s. rise. It is rumoured that the meeting called for 7th June is to sanction a sale of a small portion of the property. This is, in our opinion, the correct thing to do, it being simply impossible for the present company ever to work the whole of the ground. A rise is shown in Mysore Gold of 1/8, and Nine Reefs, 1s. 6d., whilst a fall is registered in Balaghat of 6d.; Goldfields of Mysore, 1s.; Ooregum Preference, 1/16; and South-East Mysore, 6d.

Foreign Shares.

A somewhat extensive business has been transacted in several of the low-priced shares, and Columbians, New California, Palmarejo, Consolidated Esmeralda, New Organos, Orita, Victory, and Yuruari have been in demand, in some cases at an advance.

An improvement has taken place in Balkis of 1s.; Columbian, 1/8; El Callao, 1/4; New California, 1s. 6d.; Palmarejo, 1/16; and Veuezuelan Austin, 6d. The fall being in Colon of 1s.; Consolidated Esmeralda, 1s. 6d.; Dickens Custer and Elmore, 3d.; Jay Hawk, 2s.; Kapanga, 3d.; New Organos, 3d.; Orita, 3/16; and Victory, 3d.

The following list shows the principal changes which have taken place:—

LATEST FROM THE MINES.

Indian Mines.

Nerbudda.—The sales of coal for the month of April last amount to 1,239 tons.

Colonial Mines.

Cromwell.—Cablegram to-day from the mine:—"40 tons stone crushed, yielding 81 1/2 ozs. of gold."

Day Dawn Block.—The following cablegram, from the general managers at Charters Towers, gives the result of the crushing for the fortnight ending 25th inst.: "Tons crushed, 1,100; yield of gold, 1,074 ozs. Approximate value, 3,700*l.*; fortnight's expenses, 2,140*l.*

Day Dawn P.C.—A telegram from the manager at Charters Towers gives the result of this company's crushing for the fortnight ending May 25th, viz.: "1,000 tons; 1,254 ozs." Estimated value, 4,263*l.*

Midas.—Cable from the mine: "Yield for week, 153 ozs. (612*l.*)"

Mount Morgan.—Messes. Laughland, Mackay and Baker have received the following telegram:—"We pay 100,000*l.* on 1st June, being 2s. per share for the month of May. This makes 575,000*l.* paid in dividends for the half-year ending 31st May."

Mount Leyshon.—Cablegram (May 28th):—"Mills working;" which means that the 20-stamp mill is in work again, after three weeks' stoppage.

New Guston.—Cable: "No. 4 level stope high grade ore, lot 68, over 300 ozs. per ton; lots 69 to 73 average $430; cars 74 to 79 return 120, 130, 160, 170, 300 and 300 ozs. per ton. No. 5 level: good ore is still being found."

Foreign Mines.

Avala Quicksilver.—The second batch of letters of allotment have been posted, including to between 200 and 300 applicants, from Servia, subscribed under the public issue, in addition to the 50,350 shares allotted before the issue of the prospectus to applicants in Belgrade.

Don Pedro.—Telegram, dated Marianna, 29th May:—"Sinking progressing very satisfactorily. Driving 10-fm. cross-cut from Gordon's shaft will be commenced next month (June). Works for produce soon after."

Javali.—The directors are in receipt of letters from the manager, dated April 5th. During the previous month 200 tons of ore were crushed by five stamps, producing 240 ozs. of bullion, valued at 636*l.* The cost at the mine was 296*l.*

Monte Del Oro.—The following are the results received to-day of assays made in London of nine samples taken from different parts of the mine, viz.:—No. 1, sample from 186-ft. level north of No. 6 shaft, assayed 11 dwts. 18 grs. gold per ton. No. 2, sample from 186-ft. level south of cross-cut east, assayed none. No. 3,

sample from 186-ft. level north of cross-cut west, assayed traces of gold per ton. No. 4, sample from bottom No. 6 shaft, assayed 1 oz. 7 dwts. 10 grs. per ton. No. 5, sample from intermediate level, assayed 11 dwts. 18 grs. gold per ton. No. 6, sample from 186-ft. level north of No. 6, assayed traces gold per ton. No. 7, sample from 186-ft. level north cross-cut west, assayed none. No. 8, sample from intermediate level, assayed 3 dwts. 22 grs. gold per ton. No. 9, sample from bottom No. 6 shaft, assayed 1 oz. 6 dwts. 3 grs. gold per ton.

Ouro Preto.—The directors have sold, through Messrs. Johnson Matthey and Co., the gold obtained in the month of March, which realised 4,084*l*. 1s. 3d.

United Mexian.—Telegram :—"San Cayetano property : Gross returns for week ending May 25th, $5,950 ; expenses for week ending May 18th, $6,750 ; loss for week ending May 18th, $150. El Cubo property : Gross expenditure, including capital expenditure for week ending May 18th, $3,970.

Victory.—The directors have received advices that the mill of five stamps would start running on Monday, May 6th, and a further battery of five stamps is now in course of erection.

Yuruari.—Telegram from the mines :—" Lode struck in water shaft is true fissure vein ; droughts over ; crushing re-commenced ; prospects all could desire."

Metals.

Copper has been steady. The consumptive demand continues and the market for warrants has improved from 39*l*. 15s. to 41*l*. 5s. cash, at one moment 42*l*. Cash was paid for 50 tons Chili bars, but price eased soon after, and at the close there are sellers of G.M.B. at 41*l*. 2s. 6d. cash, and buyers, at 41*l*. ; for three months fixed 41*l*. being accepted. Chili bars commanded about 2s. 6d. premium over G.M.B. Liverpool and Swansea stocks decreased 736 tons during the fortnight. Australian still nominal. We quote English tough, 45*l*., to 46*l*. ; best selected, 46*l*. to 48*l*. ; strong sheets, 52*l*. to 53*l*. ; Indian sheets, 48*l*. 10s. to 49*l*. ; yellow metal sheets, 4¾d., 5d. ; ore, regulus, &c., 7s. 6d. to 8s. 6d.

Tin has been quiet, but prices rather firmer. Straits have sold from 92*l*. to 92*l*. 5s. cash, closing buyers at 92*l*. 2s. 6d. Australian done at 92*l*. 5s. ; three months is quoted 93*l*. The arrivals in May were 1,861 tons, and 450 tons in transit to America. Delivery, 2,020 tons, of which 360 tons to America. Stock here 5,856 tons, against 6,011 tons on 1st May. The Dutch market has been steady. Banca, 55½fl. ; Billiton, 55¼fl. ; the banca sale of 24,200 slabs went at an average of 55½fl., or 92*l*. 15s. in Holland, and 1,000 slabs Billiton at 55fl., or 92*l*. ; English ingots, 95*l*.

Tin Plates have been quiet, and ordinary coke quoted at 13s. to 13s. 3d., f.o.b. Liverpool.

Spelter steady, 18*l*. for ordinary brands ex ship here. Specials, 18*l*. 5s. ; Birmingham, 18*l*. 10s.

Lead quiet. Soft Spanish done at 12*l*. 15s., but closing sellers at 12*l*. 13s. 9d. ; buyers, 12*l*. 12s. 6d. ; Soft English, 12*l*. 15s. to 13*l*. ; L. B., 13*l*. ; Sheet Lead, 13*l*. 15s.

Quicksilver.—Rothschild still asks 8*l*. 10s. ; Seconds, 8*l*. 4s. to 8*l*. 5s.

Antimony dearer ; 55*l*. to 56*l*., but smelters ask 60*l*. for June delivery.

London Metal Exchange.

4.25.—Closing official report.—Copper : G.M. Brands, cash, 40⅞, 1¼ ; three months, 40¾, 1⅛ ; best selected, 47, ½ ; strong sheets, 52, 3 ; English tough, 45, 6. Tin : Fine foreign, cash, 92, ½ ; three months, 92¾, 3¼ ; Australian, 92⅛, ⅝ ; English ingots, 95.

AND ALL PARTICULARS OF FOREIGN AND HOME MINES,
SEE PAGES 920 AND 921.

COMMERCIAL NOTES.

Railways.

The traffic receipts of the undermentioned railways for the past week show the following changes when compared with those of the corresponding period of last year : — Increases : — Caledonian, 2,998*l*. ; Great Northern, 2,174*l*. ; Great Western, 2,280*l*. ; Hull and Barnsley, 559*l*. ; London and North-Western, 5,869*l*. ; Manchester and Sheffield, 1,894*l*. ; Midland, 7,370*l*. ; and North British, 2,556*l*. Decreases : — Eastern and Midlands, 22*l*. ; London and South-Western, 7,236*l*. ; London, Chatham, and Dover, 1,407*l*. ; Metropolitan, 534*l*. ; North-Eastern, 8,838*l*. ; and North Staffordshire, 638*l*.

The Brighton Railway traffic return for the week ended May 25th exhibits a decrease of 8,215*l*., and the South-Eastern a decrease of 6,009*l*.

For the past month the Canadian Pacific Railway's gross earnings amounted to $1,137,000, and the expenses to $733,000, leaving a net profit of $404,000. For April, 1888, the receipts were $1,034,000, and the expenditure $785,000, or a net balance of $249,000.

The gross earnings of the Mexican Central Railway Company for the third week in May were $111,792, showing an increase of $22,687 over 1888.

The gross earnings of the New York, Lake Erie, and Western Railroad Company, including the New York, Pennsylvania, and Ohio Railroad Company, for the month of April were $1,953,733 ; the working expenses $1,329,237 ; and the net earnings, $624,496. The net earnings, less proportions due leased lines, are $449,587, showing a decrease as compared with the same period last year of $83,159.

Tramways.

The traffic receipts of the following tramway companies for the past week show the subjoined comparative results :—Decreases :—North Metropolitan, 615*l*. ; London, 634*l*. ; London Street, 363*l*. ; Provincial, 672*l*. ; London Southern, 94*l*. ; Southampton, 104*l*. ; Woolwich and South-East London, 78*l*. ; Bristol, 488*l*. ; Imperial, 137*l*. ; Sunderland, 108*l*. ; Burnley, 84*l*. ; Swansea, 221*l*. ; Hull, 61*l*. ; Bordeaux, 170*l*. ; Hamburg, 11*l*. ; Germany, 774*l*. ; Calais, 31*l*. ; France, 143*l*. ; Gothenburg, 1*l*. ; Calcutta, 53*l*. ; South London, 282*l*. ; Stockton and Darlington, 33*l*. ; North London, 375*l*. ; Southwark and Deptford, 14*l*. ; and West Metropolitan, 323*l*.

Miscellaneous.

Mr Benjamin Whitworth, chairman Tredegar Iron and Coal Co., has joined the board of the Flameless Explosives Co.

It is announced that the shares of the Staffordshire Water-Gas Co. were dealt in to-day at ¼ premium.

We are requested to state that the shares in the Terra Cotta Fire and Sound Proof Brick Co. have been dealt in to-day at ¾ premium.

Letters of allotment to applicants for shares in the Baltimore Breweries Co. have been posted.

Dividends Declared and Announced for Week Ending June 1st.

Carried forward.

Bank of Roumania	—	10s. 6d. per share.
Continental Metropolitan Tramways	337*l*.	1s. 6d. per share.
National (South British and National) Fire and Mariue Insurance	—	10 per cent.
Peninsular and Oriental Steam Navigation	—	5 per cent.
Pennsylvania Railroad	—	5 per cent.

PALMAREJO MINING CO., LIMITED.

Directors' Report.

May 30th.—The directors, in submitting the accompanying balance-sheet for the year 1888, have pleasure in reporting active and satisfactory progress of the company's business. The Mexican Mineral Railway Company is employing a large staff of native and other workmen on the railway and conduit in course of construction, and the works are being carried out in accordance with the terms of the contract between the two companies. The building of the first new 50-stamp mill at Zapoté is in hand, and it is calculated to be ready for running simultaneously with or shortly before completion of the railway and conduit, both of which are being proceeded with as rapidly as possible. In connection with this it may be remembered that Mr. Moreing's figures show that this first mill, treating what may be termed low grade portions of the Palmarejo ores, will yield a net profit of 80,000*l*. per annum, and the reserves of these ores are practically inexhaustible without reckoning the workings below the Socorro level, viz., the Dios Padre tunnel, to which reference is made later in this report. The completion of this tunnel will allow of an eventual output far exceeding the 80 tons per diem, upon which the above estimates are based, and Mr. Moreing also states that a second 50-stamp mill will double these profits. It has been decided to discontinue treating ores at the old mills pending completion of the new works. Every available hand is being employed, either by the railway company or in the works connected with the building of the new mill. The company has, at the present time, cash balances of 22,125*l*. in London, and over 20,000*l*. in Mexico, besides an estimated surplus deposited with the trustees of the Mexican Mineral Railway Company, which will not be released until completion of the railway and conduit. All stores, materials, &c., at Palmarejo and the large reserves of ore extracted from the mines are paid for, and the company is free from debt. The resident staff now at Palmarejo consists only of the following officials : (1) the superintendent, Mr. F. W. Breach, whose knowledge of the Mexican language and laws, and experience in dealing with the Mexican authorities, renders him exceptionally valuable during a period chiefly occupied with construction works ; (2) Mr. Tremellen, bookkeeper and accountant, who was sent from England by your late board to take charge of the office and to check the running and store accounts ; (3) Capt. Clarke, the mining captain, who was selected by Mr. Breach towards the end of last year to take charge of the mine, and who has the very highest character and recommendations ; and (4) Mr. Lohsé, engineer. This gentleman has charge of the erection of the new mill at Zapoté, the terminus of the railway ; he has great experience in this class of work, and is both energetic and painstaking. The directors are availing themselves of the valuable assistance of Capt. F. Drake in furthering the despatch of the mill machinery. Telegraphic communication has been extended to Chinipas, and telegrams between London and Palmarejo can now be exchanged in a few hours. The object of the Dios Padre tunnel is to facilitate the output of the ore bodies above and below the Socorro level. It has been advanced a total length of 816 ft. on the lode. For some distance it has been driven in low grade ore, but at 787 ft. a stringer of ore, assaying 52 ozs. silver and 10 ozs. gold per ton, carrying stones of immense value, was cut through. The ore bodies towards which this tunnel is directed have been measured as being now about 600 ft. ahead, but the present showings indicate earlier results. The directors are particularly anxious not to enter into speculative matter in this report, nor to lead the shareholders to expect greater results in the future than the plain facts warrant. They therefore content themselves with stating that they are perfectly satisfied from the information gained by the chairman on the spot, not only that the whole of the estimates furnished at the outset and confirmed by the independent report made last year are not exaggerated, but also that the value of the company's property, in respect to matters not estimated or previously referred to, is very great, and that these advantages will become apparent when the new mill is set to work. The chairman, who recently spent several weeks at Palmarejo, has returned to England, and will attend the general meeting. Subject to the approval of the shareholders, the directors propose for the future to circulate quarterly reports, and to publish in the financial papers any special news that may arrive from time to time. The board desire to recognise the universal consideration and assistance they have received from all persons connected with the company during the past six months.—R. J. Scriven, Secretary.

BRITISH MINING INTELLIGENCE.

BERTHA CONSOLS (15th May).—The lode in the 40-fm. level west at the junetion continues to produee from 7 to 10 tons of mixed ores per fm., and the stopes over this point, 9 tons per fm. Glasson's new rise in back of 40 east of new engine shaft is going up in a good lode; full size not known. Stopes therefrom in baek of the same level will produee from 8 to 9 tons per fm. Stopes in baek of the 40 east of great eross eourse produee 7 tons of mineral per fm. Cook's late stopes below the 30 east of great eross-eourse produees over 10 tons per fm., together with good tin work.—T. Gregory.

BERTHA CONSOLS (22nd May).—There is no ehange to notice in the 40-fm. level east or west at the junetion. The men at present are engaged on other work. The lode, however, remains produetive as usual. The lode in Glasson's rise in baek of the 40 at new eugine shaft produees ten tons of mundie and eopper per fm. for the width earried. Stopes therefrom produee 10 tons per fm. Stopes in baek of the 40-fm. level east of cross eourse will produee 8 tous per fm. of eopper and mundic. Cook's late stopes will produee 10 tons per fm. All other points show no ehauge of importance.—T. Gregory.

BERTHA CONSOLS (29th May.)—The lode in the stopes in baek of the 40-fm. level east produees 3 tons of eopper, and rieh work for tin per fm.; in faet, a good paying tin lode. In Glasson's rise in baek of the 40 at the new engine shaft the lode produces 8 tons of arsenieal mundie per fm. In the stopes therefrom the lode produces 6 tons of mundie and eopper ore per fm. The lode in the 40 level east and west of junetion is of the same value as last reported. Stopes below the 30 west of junetion are produeing a large quantity of mixed ores. No ehange of importance to notice in any other part of the mine.—T. Gregory.

CARPUAN (13th May),—I am pleased to inform you that we continue to make good progress in sinkiug the shaft on the south lode, whieh I am also pleased to say is all the size of the shaft, slightly disordered by small paths of granite, which I eonsider is owing to the shallow and unsettled nature of the ground. We are now elose upon 8 fms. deep, aud have had a good lode from surfaee throughout; its value to-day is about 12*l.* per fm. I would reeommend sinking the shaft a few fathoms deeper, whieh will be quiekly done, as the ground is very good, and still requires close timbering, after whieh I beg to reeommend your going near the river, whieh forms the western boundary, and take up an adit on the eourse of the lode; you will thus open it out very rapidly, and if it proves anything like the character of the lode in the shaft above referred to, you will shortly be in a splendid position to erect, say 12 heads of stamps, the cost of whieh will not be heavy, as you have ample supply of water, not only for stamping and dressing purposes, but also sufficient for pumping when the time arrives to sink below the adit level. There are another three lodes opened on by costean pits, presenting a very promising appearance, and ought not to be lost sight of, and, moreover, I believe you have a very valuable property indeed.—R. Knott.

D'ERESBY.—The Gors shaft is being pushed down as fast as possible, aud there are strong patehes of lead in the lode, aud likely to improve as the sinking is advaneed. A good lode is reported to be going up in the roof to the north and west of the shaft at No. 9. There is no ehange reported in the stopes.

D'ERESBY.—The sinking of the Gor shaft is proceeding satisfactorily, and the roof in the level on the north of the shaft is improving for lead, which is of importance. The great point will be the dipping of the lead into the Gors shaft, as there is undoubtedly a splendid lode gone down below the present bottom level.

D'ERESBY.—The sinking of the Gors shaft is progressing, although rather impeded by the increase of water. The rise north of the shaft at No. 9 is worth from 2 to 3 tons of lead ore per fm., and the stope south of the shaft about 1 ton per fm. A breakage to the erusher during the week has been repaired, and everything is now working satisfaetorily.

DEVON CONSOLS (16th May).—Wheal Maria, eastern shaft, Capel Tor lode: There is no alteratiou in this part of the mine sinee the date of the six-monthly report on the 2nd inst. At Wheal Emma also there is no alteration. Watson's engine shaft: At the 160 the lode eontinues to present the same very fiue appearanee, and for the short distanee driven east and west of the eross-eut it is worth in eaeh direetion 8 tons of eopper and mundic ores per fm. In the 148 west the lode is 3 ft. wide, aud worth 2 tons of eopper and mundic ores per fm. In the 131 east the lode is 2½ ft. wide, very promising, and yielding saving work of eopper and mundic ores. In the 136 west the lode is 4½ ft. wide, also very promising, and yielding 2 tons of copper and mundie ores.—I. Richards.

DEVON GREAT CONSOLS (30th May).—Wheal Maria, eastern shaft, Capel Tor lode: In the eastern shaft, sinking below the 86-fm. level, the ground continues favourable for exploration and eongenial for the production of mineral. No lode having been taken down, there is no alteration to notice at any of the points of operation in this part of the mines sinee last adviee. Wheal Emma, railway shaft, new south lode: No other portion of lode having been met with in the eross-eut north at the 260-fm. level, and it being improbable that anything of importanee exists in that direetion, driving has been suspended, and the men are now engaged in extending the eross-eut south to prove if auy other portion of the lode may be met with in that direetion. Watson's engine shaft: In the 160-fm. level east the lode, portion earried 5 ft. wide, is of a very promising charaeter, and yields 3 tons of eopper ore per fm. In the 160-fm. level west the lode part earried 5 ft. wide, is also very promising, and yields 6 tons of copper ore per fm. At these two points the falling off in value is considered only temporary, and we hope for a speedy improvement. In the 148-fm. level west the lode is 4 ft. wide, eonsisting of a large portion of eapel aud quartz, with fluor, and 2 tons of eopper and mundic ores per fm. In the 130-fm. level east the lode is 3 ft. wide, very promising, and is yielding 1 tou of copper and mundie ores per fm. In the 136-fm. level west the lode is 5 ft. wide, and yielding saving work of eopper and mundie ores.—Isaac Richards.

DEVON UNITED (16th May).—Willesford's shaft: In the 132 east the lode is 2 ft. wide, composed of a large portion of capel, with quartz, peaeh, and small quantities of copper and munie ores. In the 132 west the lode is 4 ft. wide, eomposed of strong eapel and quartz, with peaeh, a little eopper ore, and 2 tons of mundie per fm., and is promising improvement. In the winze, in the bottom of the 120 west, the lode is 2 ft. wide; also very promising, and yielding a little copper and mundic ores.—I. Richards.

DEVON UNITED (30th May).—Willesford's shaft: In the 132-fm. level east the lode is 2 ft. wide, eomposed of a large proportion of eapel, with quartz, peaeh, and a little eopper and mundie ores. The drivage is temporarily suspended, the men being engaged in eutting top plat at this level. In the 132-fm. level west the lode is 4 ft. wide, very promising, and yielding saving work of copper ores. In the winze in the bottom of the 120-fm. level west the lode is 2½ ft. wide, also very promising, and is yielding 3 tons of good quality copper ore per fm. tor length of winze 9 ft.—I. Richards.

DRAKEWALLS (15th May).—The sinking of the engine shaft and cutting trip-plat, &c., at the 147-fm. level is being pushed on as rapidly as possible. The part of the lode earried is in a fine eourse of mundie, produeing 24 tons per fm. (for the length of the shaft 12 ft.) and rieh stones of eopper ore. The driving of the 147 levels east and west, as stated last week, is suspended for the time to admit of trip-plat being eut, and also for breaking mundie to keep the ealeiners at work; also to make preparations for rising, in order to effeet a communieation with the winze sinking below the 132, whieh is of the greatest importanee, to sceure better ventilation in the bottom part of the mine. During the past month we have broken from the north part of the lode some good speeimens of tin ore. In the 132 west we are putting out a eross-eut north for further proof of the lode, and in whieh we are breaking some very fine speeimens of tin, worth 10*l.* per fm. Judging from appearanees, as the mine beeomes more developed it will prove to be a large tin produeing lode. In the winze sinking below the 132 the eopper ore is suddenly cut off, and we are now down on a floor, or bed of muudie, yielding 10 tons per fm. for the length 9 ft. The stopes in the baek of the 132 are produeing 6 tons of eopper aud mundie ores per fm. The ground in Rule's rise, in the baek of the 117 west, is a little improved, and satisfaetory progress is being made. In the winze sinkiug below the 90-fm. level west the ground is a little easier for exploration. The No. 3 caleiner is made complete, aud the fire lit, and shall eommence burning mundie to-morrow. The eleaning out of the arsenie soot from the chambers of the No. 2 ealeiner will be finished, and the samples taken by the end of the present week.—H. Rodda.

DRAKEWALLS (30th May).—There is nothing new to report in the engine shaft. The men have been engaged during the past week in cutting ground for trip-plat below the 147-fm. level, whieh I hope will be made eomplete in the eourse of another week. The rise and stope in the back of the 147-fm. level will produee 9 tons of mundic per fm., and saving work for tin. The lode in the cross-eut driving north at the 132 west of the engine shaft is showing signs of improvement, and is produeing a little more tin. The lode in the wiuze sinking below the 132 west will yield 9 tons of mundie per fm., and a small proportion of tin. The lode in the stope in the baek of the 132 is produeing 6 tons of eopper and mundie ores per fm. The grouud in Rule's rise in the baek of the 117 west continues favourable for progress. The same remark will apply to the winze sinking below the 90 west of the engine shaft. All other work is beiug pushed on vigorously.—H. Rodda.

DOLCOATH (23rd May).—The engine shaft has not been sunk much sinee the last report, as we have been cutting ground for cistern plat, &e., for fixing a new lift. The eastern shaft is sunk 6 fms. below the 302. Exeellent progress is being made in sinking this shaft, and in driving the 352 east of new east shaft towards it. We have intersected the south lode at the 338-fm. level south of Harriett's shaft, and cut into it 4 ft. It is worth for that width 30*l.* per fm., but we do not yet know the size of the lode. The other parts of the mine are on the whole as last reported.—J. Thomas, J. Johns.

EAST BLUE HILLS.—A large shareholder has recently visited the mine, and reports most hopefully of the prospeets both on the Baldhu and Pink lodes. On the latter particularly expectations are great. The returus are inereasing, and will eontinue to inerease, and with any improvement on the Pink lode, whieh may daily be expeeted, this mine would soon again take a prominent positiou.

EAST BLUE HILLS.—The general meeting will be held on Thursday, wheu a full report of the mine and its prospeets will be presented. The developments of the Baldhu aud Pink lodes are points of great interest, and under the present energetic management there is every expeetatiou that the mine will soon oeeupy a prominent position.

EAST GRASSINGTON (29th May).—Manager's report.—Hammond shaft: In the 47-fm. level west the lode continues large and easy for progress, yielding 12 ewt. of lead ore per fm. A stope in the back of the level yields 8 ewt. of lead ore per fm. In the drivages east and west of No. 2 sump below Amy's workiugs we have a pretty lode in easy ground, and yielding upon an average fully 20 ewt. of blue and grey lead ores per fm. A stope in baek of the 37 yields 10 ewt. of lead ore per fm. We have resumed operations in the eastern part of the mine. In the 47-fm. level east the lode is 2 ft. wide, the filling matter beingtsoft sugary spar and flookau intermixed with solid stones of lead ore; worth 15 ewt. per fm. In the end of the 37-fm. level east we are following the eross vein south to reaeh the main lode on the other side of the level. A stope in back of the level, worked by four men, yields 15 ewt. of lead ore per fm. Harris shaft: We have eompleted the plats at the 47 and 37 fm. levels. The eross-eut north to intersect the lode at the 47 is in 16 ft. The cross-eut north to intersect the 37 is in 16 ft. The country roek in both, though spare for progress, is highly eongenial for the produetions of mineral. On surfaee we have eommeneed harvesting peats for smelting fuel. We have weighed off a parcel of pig lead, and are daily easting ore towards another smelt. Our pumping gear at Hammond's shaft is working with clockwork regularity, and doing excellent duty.

GLYNDWR.—Operations have been eommeneed by the repairing of the engine shaft. A small winding engine has been hired to eomplete the necessary repairs, and to make the shaft ready for the maehinery. An offer of a suitable pumping engine, boiler, and all their belongings, situated within a short distanee of the mine, has been eonditionally aceepted, and no time will be lost in getting the same to work. A steam winding-engine, eapstan, and other requirements will also be ereeted with as little delay as possible, and the mauager hopes to have the workings drained, and to be raising large returns of lead before the winter sets iu.

GREAT FORTUNE.—The water in the engine shaft is now down 5 fms. below the adit level, but as the drainage proeeeds it is evident there is a considerable extent of workings on the various braneh es and lodes to drain, which, with the clearing of the stuff, will take some little time to accomplish. The next sale of tin is expected to be about 3½ tons.

MID-DEVON (25th May).—Surface: The repairs to axle of pumping wheel have apparently secured it for temporary work, and will, in all probability, enable us to cope with underground water throughout the summer. A shaft: The water is drained 42 ft. below the 80; all underground pumping appliances are in good order. C shaft: The 50 east No. 3 stope, worked on by six men, maintains its yield of copper ore 6 tons per cubic fm. The strata possesses all its favourable characteristics, and the deposits of ore are still dipping eastwards, and extending southwards.—J. NIELL.

PHŒNIX UNITED (28th May).—We have at various points throughout the mine nine pitches, at tributes varying from 8s. to 11s. in the £ for tin.—J. WILLIAMS, J. RUNDLE, J. PROUT, W. MANLEY.

PRINCE OF WALES.—The sinking of the engine shaft below the 155-fm. level is progressing satisfactorily, and the lode maintains its value and promising appearance. In the bottom level east the lode is 4 ft. wide, and valued at 12*l*. per fm. In the 135-fm. level east the lode presents a very kindly appearance, worth 9*l*. per fm. for tin and 3 tons of copper ore per fm. The 90-fm. level east is being driven by the side of the lode, which has a very promising appearance for both tin and copper ore.

PRINCE ROYAL.—The general meeting of this mine will also be held on Thursday next, when full details will be given of the arrangements made for the drainage of the workings, by which time it is hoped the bottom of the mine will have been reached.

ROMAN GRAVELS (30th May).—The pumping engine and machinery continue to work very well indeed, and the mine is being drained at a very fair rate. The water at the engine shaft is to-day about 10½ fms. below the 95-fm. level. The rise from the said shaft to the forebreast of the 110 south is about 9 fms., and this level is now dry from the forebreast back for a distance of say 50 fms. By this you will see that we are at present forking the mine not only below the 95 level, but below the 110 also. We hope to be able to connect the bottom bucket lift early next week.—A. WATERS and SON.

SOUTH CONDURROW (29th May).—The lode in the 40 end east of engine shaft is worth 10*l*. per fm. The 50 end east of King's is worth 12*l*. per fm. The 60 end east is worth 10*l*. per fm. The lode in the back of the 70 is worth 18*l*. per fm. The stopes throughout the mine are without alteration to notice.—W. RICH, W. WILLIAMS, H. KING.

SOUTH DARREN (30th May).—The stope in the 142 west, the west of which is being worked, is at present worth 2 tons of silver-lead ore per fm. The ground opened for stoping here is 12 fms. long, the lode being of average width of 12 ft., worth for the width of the lode 1½ tons per fm. The stripping of the lode is being continued east, and maintains much the same in value, viz.: 15 cwt. of silver-lead ore per cubic fm. The stope east of the shaft in this level is worth 15 cwt. of silver-lead ore per fm. The drivage in 130 west is now poor, but we do not think it is yet through the lode. The cross-cut in the 100 has been cut 6 ft. into the lode, and is producing good leady stuff, worth 15 cwt. of silver-lead ore per fm. The ground here looks very promising. There is no change in the other points.—J. MITCHELL.

VAN (30th May).—I am very pleased to report that the 135 south level (which is 78 yds. south of main lode) continues to improve, and is to-day worth fully 60*l*. per cubic fm. No other change. We sold yesterday 100 tons blende, realising 3*l*. 9s. 6d. per ton.—Capt. WILLIAMS.

WEARDALE.—Report on mines for week ending 25th May.—Water getting very scarce for ore dressing. Ore raised for the week, 77 tons; ore dressed for the week, 79 tons; ore fume and slag smelted for the week, 127 tons, producing 65 tons of pig lead.

WHEAL GRENVILLE (29th May).—Goold's shaft is going down as fast as circumstances will admit of. The 205 east end is worth 10*l*. per fm.; ground hard. The rise in the back of the 178 east is worth 16*l*. per fm. The winze below the 165 east, coming down on said rise, we had to suspend for a few days on account of the water being too powerful for manual labour. Last night we tapped a fresh feed of water in the rise which is draining down the winze, so we hope to start the winze again in a day or two. We are only carrying part of the lode here; last valuation 15*l*. per fm. The 165 east end is worth 20*l*. per fm. The 140 winze west of Pease's shaft, and the 150 rise, we expect to communicate in a few days and lay open moderate tribute ground. No other changes in the bargains. All surface work is being pushed on.—T. HODGE.

WHEAL METAL AND FLOW.—The sinking of the sump below the 35-fm. level has been commenced, and the agents will be able to report on it more fully next week. The lode in the 32-fm. level looks very promising. The agents expect to sell about 3½ tons of tin next week.

WEST WHEAL GRENVILLE (29th May).—The mine is now drained to a depth of 4 fms. below the 90-fm. level; we find nearly all the wall plates in the shaft under the said level to be badly bent, and some broken, which necessitates our re-timbering a portion of the shaft, at which the shaftmen have been engaged during the past week, and fixing ladder road, putting bearers to carry drop lift, &c. At Harvey's shaft the men have been securing back of 70 plat, taking out old bed plank, &c., below the 70-fm. level; skip road completed to about 3 fms. below said level.—T. HODGE, J. SKEAT, N. TEMBY.

FOREIGN MINING INTELLIGENCE.

ALMADA AND TIRITO (May 4th).—Have sunk Balvanera shaft 4 ft. 1 in.; ground very hard; total depth from 50-fm. level, 71 ft. 4 in. Have driven 50-fm. level north 13 ft. 5 ins. by four men and machine drill. Have driven 31-fm. level north of No. 7 winze, San José, 4 ft. 1 in. in metal, breast 5 ft. wide, half of which I can safely call clean metal; shows no sign of pinching. Have driven No. 12-fm. level, San José, 4 ft. 4 in.; ground hard, and showing very little metal. A slip occurred in main adit, north of Tirito shaft, but was secured promptly, doing no damage, causing no delay in the mine. Have carried tramway up to works in the 50 and 24-fm. level; raised and levelled 50 ft. of tramway in main adit, Shaft and ladder ways in good order.—H. C. CLOUD.

ASIA MINOR.—Number of men driving, 62; value of ends, 4 tons 15 cwt. per fm.; number of men stoping, 186; value of stopes, 13 tons 10 cwt. per fm.; four men sinking, 10 men rising, four men cross-cutting; 141 trammers, labourers, &c. Production to 17th May is 3,901 tons crushed; yielded 506¾ tons rich silver-lead ore. Corresponding period last year, 3,956 tons crushed; yielded 477¾ tons. Number of men employed at the dressing-floors, 74.

BIRDSEYE CREEK (13th May).—I was not intending to make another clean-up until the final, as since our last clean-up the ditch has run 400 ins. short, but the past two weeks we have had heavy rains, giving us quite a good head of water, which I believe will give us nearly or quite another month's run. Therefore I thought best to clean-up a few of the head boxes, which I did on 14th inst. The amount cleaned-up is $1,500. This is about our average, although I expected more, but with so light a head of water it has been uphill work.—J. S. GOODWIN.

BONNIE DUNDEE.—Mine manager's report for fortnight ending 30th March:—We have had six men in the back stopes from No. 1 south west level on an average of 2 ft. 6 ins. of reef; there is about the same amount of stone in the face at present. Have had two men in the underhand stopes from No. 1 south west level on an average of 2 ft. of reef; there is still a strong reef under foot. In the underhand stopes from No. 6 north east level have had four men on a foot of reef which appears to be making larger as the stope is continued. A crushing of 335 tons. 15 cwt. of quartz from these stopes was completed yesterday for a yield of 128 ozs. 9 dwts. 2 grs. of smelted gold. As this yield will not pay the cost of taking out and crushing it was decided to stop taking any more stone out on wages, and to let the several blocks of ground on tribute. We made arrangements to-day to let four more blocks on tribute in addition to the two blocks already let. This makes six blocks already let to a total of 20 men, with power to add to their number. In the block from a winze from No. 6 footwall level the tributers started work by turning off towards the hanging wall, and broke into a fair-sized reef of good-looking stone which should crush very well. The tributers have stripped the wall right into the end of the level, about 20 ft., with stone more or less all the way. There is about a foot of reef in the end, which has every appearance of improving in size as the block is opened up. The block altogether promises to open up well, and (as the tributers have only got a depth of 34 ft. from the level) will be the means of prospecting a large block of ground for the company. Have raised 100 tons of stone for the fortnight.

BRATSBERG (20th May).—Report for week ending 18th May.—Hoffnung Mine: No. 2 adit level is worth fully ½ ton per fm., and there are good indications of an improvement. The rise in the back of No. 2 is yielding fully 1½ tons per fm. No. 3 adit level has again improved in value, now worth 1½ tons per fm. At No. 4 level the lode is yielding but little ore, being now in a very disturbed state. No. 5 level is worth about ½ ton per fm., very little, however, is being done here. The mid level at Murchison's is worth 1 ton per fm., and the shallow level continues to open very promisingly, producing about ¾ ton per fm. Johannes Mine: About 3 metres have been driven on Howard lode during the past week. The lode here has fallen off in value, now yielding ¼ ton per fm. Næsmark Mine: About 2½ metres advanced in the level north of Barker's shaft during the week; we are pleased to find a little more ore in the lode now than hitherto at this level. We hope it will further continue to improve and be lasting. Surface work and remarks: The state of the roads is now tolerably satisfactory and we can cart a fair load down to Baudksalid. We have experienced a good deal of delay in starting the new machinery, having had to do a good deal of adjustment, which was found necessary on starting the machines, but we hope, nevertheless, to be ready with a cargo at the end of the present month. The weather lately has been very warm, and all of the accumulated stuff is free from frost and available for treatment.—J. D. HOLMAN.

CALLAO BIS (2nd May).—Mine—Unda shaft, 350-ft. level: The cross-cut being driven north-west has been continued forward 6 ft. 6 ins., making its total from shaft 68 ft. 6 ins. The ground is still quite as hard. Frequently small veins of quartz come in with the heads, and containing some iron pyrites. The cross-cut south-west at this level has been driven 7 ft. 6 ins., making its total length from shaft 59 ft. 6 ins.; the ground is somewhat harder than formerly. We are busy making some repairs in the shaft, which I hope to have finished in about a fortnight.—G. W. EUSTICE.

COLAR CENTRAL (7th May).—Low's engine shaft—200 ft. east cross-cut: This has been advanced 14½ ft., making a total of 229 ft. 6 ins. The water here has greatly increased in volume; in fact, as much as the pump can do with steady working to keep it. Though as hard as ever, the ground is somewhat changed in appearance, but the floors are still bad for boring. Driven by one rock-drill. South drive from east cross-cut: 4½ ft. were driven here, making a total length of 51 ft., when I stopped the drive. The quartz we had originally followed had entirely disappeared, and we were in hard and unpromising ground with no favourable indications. Driven by one rock drill. 200 ft. west cross-cut has been driven 16 ft., making a total distance from main shaft of 236 ft.; no change here since last report. Driven by one rock-drill. Underlay shaft: 171-ft. level has been driven 2 ft. by hand labour to end of April, and 8 ft. more by one rock-drill since 2nd May, making a total length of 105½ ft.; no change here as yet. East boundary shaft: west cross-cut has been advanced 15 ft. by hand labour, making a total of 61 ft.; there are no fresh indications. East cross-cut has been driven 21 ft. also by hand labour, making a total of 73½ ft.; water continues the same here. Trial shaft has been sunk 4½ ft.; still on the underlay, and is now down 50 ft. The lode continues to hold about the same; quartz about 2½ ft. thick in the bottom; by hand labour. I have also started two fresh trial pits for further prospecting towards our eastern bonndary.—A. S. B. OAKLEY.

COLON.—The agent writes from the mines, under date April 12th: Water on mine: The ditch when finished will be some 13 miles long. A great deal of it is finished, but it will require some time to get the water on to the Margaritas mine, where I purpose opening No. 1 mine. Afterwards another mine still lower down should be opened, so that one mine can be kept running while the other is cleaning up. By this means no water will be lost. I have already done a great deal of prospecting the run of mines, and have repeatedly directed attention to the great value of the property, and it was at my instance that the long ditch was commenced. Still, as you wish it, and it is the proper course to pursue, further prospecting shall be commenced at once. I have also taken steps to commence building residences for the employes, cottages for workmen, store rooms, &c.

COLORADO.—The following are extracts from the manager's report for fortnight ending 15th inst.:—Terrible lode, 15th level east: Mineral vein, 2 to 3 ins. wide; samples of ore assayed, 129 ozs. silver per ton. 9th level west, vein 1 to 2 ins. wide; the ore milled, 672 ozs.

and 174 ozs. silver per ton, in two elasses. 3rd level west, vein 1 to 2 ins. wide : Ore milled, 168 ozs. silver per ton. 2nd level, vein 1 in. wide ; ore milled, 160 ozs. silver per ton. Coin lode, mineral vein 1 to 2 ins. : Ore milled, 203 ozs. silver per ton. Brown lode, O'Connell's Stope, vein 1 to 2 ins. wide : Ore milled, 1-10 ozs. gold, 144 ozs. silver, 11 per cent. lead per ton ; 1-10 ozs. gold, 117 ozs. silver, 10 per cent. lead per ton ; 75 ozs. silver, in three classes. Weir stope, 4 ins., mineralised quartz, with 1 to 4 ins. mineral : Ore milled, 665 ozs. silver 27 per eent. lead per ton ; 15-100 ozs. gold, 157 ozs. silver, 15 per cent. lead per ton, in two elasses. Drift west from Power's cross-cut, vein 1 to 2 ins. wide : Ore milled, 217 and 77 ozs. silver per ton, in two classes. Winze west of Power's eross-cut, vein in bottom, 1 to 3 ins. wide : Ore milled : 1-10 oz. gold, 217 ozs. silver, 21 per cent. lead per ton, 1-10 gold, 77 ozs. silver per ton, in two classes. Babcock stope is improving. Mineral vein 1 in. to 2 ins. wide. Ore milled, 227 and 153 ozs. silver per ton, in two classes. Genson's stope : Mineral vein, 1 in. to 2 ins. wide. Ore milled : 1-10 oz. gold, 142 ozs. silver, 20 per eent. lead per ton. New drift east to connect silver ore tunnel with Brow's shaft has been driven 40 ft. in past fortnight. The lode is 5 to 6 ft. wide ; vein 1 to 2 ft. wide ; mineralised quartz, assaying 25 ozs. silver per ton. Chelsea Beach lode : Drift east from eross-cut ; vein 1 in. to 2 ins. wide. The ore milled : 227 and 153 ozs. silver per ton, in two classes. Gunboat lode : Mineral vein, 1 to 2 ins. wide ; the ore milled, 112 and 78 ozs. silver per ton, in two classes. Blaine lode : Stope west of West Terrible tunnel ; vein 1 in. wide. Ore milled, 108 ozs. silver per ton. The quantity of ore sent away during April was about 34 tons, ranging in value from 75 ozs. to 672 ozs. silver per ton, showing a great improvement in grade.—D. Norris.

COROMANDEL (18th April).—I beg to hand you the following report for four weeks ending 13th inst. Main shaft : The 280-ft. level north has been advanced 35 ft., intersecting the black reef, by six men ; total distance from cross-cut, 87 ft. We pricked through the black reef and cut into the Green Harp, resulting in a great flow of water from a reef carrying very fair-looking quartz 4 ft. wide. 7 ft. have also been driven westwards on the black reef. I look upon this so-called reef more as a cross-course, although it yields gold at times about the junetion of reefs. Our principal aim is now to reach the cross reef. which has been the richest in the mine. To reaeh it a contract has been let to eight men—230 ft., to cut the cross-reef westwards on blaek reef at 22s. 6d. per ft. No. 1 level, 80 ft. : 21 ft. 6 ins. have been risen in the rise on Venus reef ; total risen, 61 ft. 6 ins. ; during the latter part of the month since we have got the place ventilated six men have been employed here, and will continue until communicated to winze below surface, the reef in rise averaged this past month 12 ins., yielding occasional colours of gold, and saving work for the stamps. I have had to suspend driving north on Macdonald's Reef to push on rising on Venus : driven by two men 12 ft. 3 ins. Lynche's reef 80 ft. level : This level, by two men, have been driven 17 ft. 6 ins. ; we have not met any gold although the country rock is very favourable and highly mineralised. Surface : The battery and boiler to work same is in trim for working, and our surface work generally getting closed up. Machinery, pumping, and winding goes on regularly and well.—F. Hodge.

CORTEZ (11th May).—Work at the mines for past week has been as follows :—The Boss Tunnel : Advanced 31 ft. Development Tunnel : Advanced 37 ft. Main Tunnel east : Advanced 6 ft. Centre stoped one ton of ore, value 70 ozs. silver ore per ton. Middle Tunnel : West drift stoped 22 tons of ore carrying 52 ozs. per ton of silver. North east upraise : Stoped 90 tons of ore, carrying 60 ozs. per ton of silver. North-west upraise : Stoped 51 tons of ore containing 140 ozs. per ton of silver. East drift advanced 6 ft. Ore shipped at mill, 234 tons. Ore treated at mill, 158 tons ; average assay of which shows it to have eontained 76¼ ozs. silver per ton. Bullion shipped : 16 bars containing 15,221 80-100 ozs. silver, and 7 62-100 ozs. gold.—Welsh.

DENVER (11th May).—The discovery of ore in the 200 west drift has opened up into a very promising vein some 2½ ft. wide, of good milling ore. Samples taken from the place a few days ago gave the following results on assay : Average sample milling ore, 44-100 ozs. go'd per ton ; 6 84-100 ozs. silver per ton. Sample seleeted ore, 1 44-100 ozs. gold per ton ; 77 85-100 ozs. silver per ton. Sample across 8 ins. of the better portion of the vein, 1156-100 ozs. gold per ton ; 8 84-100 ozs. silver per ton. These results are encouraging for good mill returns. Since these samples were taken, the lode has widened out, with well-defined walls, and shows a steady improvement. The (1.050 east drift) cross-cut south has reached the length of 59 ft., and this morning shows signs for a change of ground in the appearance of wa'er.—F. Rickard.

DEVALA MOYAR (6th May).—Mine manager's report :—The winze sinking below the 48 is down 26 ft. ; the lode is somewhat irregular, and resembles the stope below in the deep tunnel. The east drive has been carried slightly to the right of the lode, and we have been stripping down the lode further back and following the footwall which carries a small band of pyrites, showing gold in the pan. The west drive which has been suspended lately will be continued by hand labour, in order to aseertain if the lode strikes the deep tunnel or runs parallel with it. The lode in the pyrites winze now carries very little pyrites, and is of low quality, but the footwall continues regular and well-defined ; one drill is employed stoping, and the other in sinking the new winze. The washings give various shows of gold from all the working parts of the mine.

FLAGSTAFF (11th May).—During the past week work has been carried on in the following places :—Level No. 7, cross-cut No. 1 south is in 16 ft. ; bunches of iron appear now and then, and the streak continues, and the rocks around it are very favourable for ore at any moment. Cross-cut No. 2 south in 201 ft., aud there is no change except that the ground is a little better. No. 2 west drift north is in 142 ft. ; good ground continues, which is very hard to work at present. Level No. 8 : The Bonanza drift is up 89 ft. ; the streak continues, and is good-looking as before. The Bonanza winze which I started last Saturday is down 9 ft. ; there is a seam of silver-lead mixed with spare rock, and this kind of rock is coming in more all over. It is my opinion that if the seam continues down, and we get through this rock formation, which has made a kind of break, we shall come to a body of rich ore. The black winze is down 53½ ft., and is about the same. Level No. 9 : North cross-eut is in 363 ft. : there will be no particular ehange here till the eonneetion is made. I will do my best to keep the water out of the mine although it is coming in very fast.—Hagen.

FRYERSCREEK (18th April).—During the past fortnight we have extended the 520-ft. level south a further distance of 22 ft., making 154 ft. from cross-cut. The quartz mentioned in my last report has gone over the back of the drive rising on the point off the slide, showing stone about 2 ft. thick. I shall put up a rise to meet with this stone when we get a little further on with the drive. There is a little water coming from the back of the drive as we go south from the slide, which I think is coming from stone above this level. There is not any stone in the face of the drive just now. The flukau is very small and tight ; mostly slate country, but not bad for driving. We have finished repairing the 420-ft. level ; are up to the face, and put in one set of timber further south. I shall drive the end another 10 ft. About 40 ft. back from the end the flukan and the back of the drive ran up for 10 ft., and discovered quartz, making from the flukan in the hanging-wall, so I have commenced to rise north of No. 4 rise instead of south. We shall be up to the quartz this week. There is every appearance of a large body of stone making over the back of this level. There are three cross-heads in this drive within the distance of 100 ft. from the end. We shall be able to see what it is like this coming fortnight. There is nothing fresh to report from the 260-ft. level ; ground still very hard ; drove 6 ft. for the fortnight ; total, 83 ft. from the winze. The 320-ft. level western line of reef : We are still stoping the back of this level ; quartz about 15 ft. in height from the back of the level, where the stone makes up to a block of sandstone and cuts off. I did not clean up the stuff broken from the rise back of this level mentioned in my report of 21st March, as the lauder had put about 5 tons broken from the stopes with the rise stuff ; so we crushed 60 tons this fortnight from the stopes and the rise, result 9 ozs. retorted gold ; three men working at this level. I shall put on more men to get stone as soon as I can see what the stone is like at the 420-ft. level.

GRAVEL GOLD.—Mr. Griffiths, the engineer in charge constructing the diteh, reports, under dates 2nd and 30th April, that he had commenced work upon the Rica Guali ditch on the 2nd April, and had, up to the 17th April, made 4,553 ft. of the preliminary cutting on grade 3 ft. wide. The above time includes Easter week, when very few men attended. Mr. Griffiths was making houses to establish several camps along the line, so as to be able to employ a large foree of men.

GYMPIE GREAT EASTERN (4th April).—Fortnightly report : During the past fortnight the drive north at the 634-ft. level has been extended 5 ft. ; total, 63 ft. ; there is a large body of crushing stuff showing good gold. The south drive has been extended 9 ft. ; total, 100 ft. ; the reef keeps about the same showing a little gold. The stopes north and south above these levels are about the same as last reported, some of them showing fair gold. The stopes above the 500-ft. level north and south are all showing fair gold, and those above the 364-ft. level on the old eastern reef are all showing a little gold. In the winze at the 580-ft. level to cut 1 South Great Eastern, we have been driving south on the reef ; it still keeps small from 2 to 6 ins. of solid stone, showing a little gold ; there is no improvement in the rise as yet ; the reef formation is laying very flat to the east ; the getting away of the stuff here makes the work very slow. For the four weeks ending 27th Mareh 600 tons of quartz were raised and crushed for a return of 1,019 ozs. 10 dwts. of smelted gold. Everything about the mine is in fair working order ; there are 78 men employed, 68 at the mine and 10 at the battery.—J. James.

INDIAN CONSOLIDATED (6th May).—Colar section : No. 5 shaft : This shaft has been sunk by one drill 6 ft. 2 ins., or 65 ft. 10 ins. below the 360-ft. levels, or 23 ft. 5 ins. for the month ; there is nothing to value in the bottom of the shaft ; shall eommence to drive the 430-ft. level south in a few days. The 360-ft. level driving south of shaft has advanced 1 ft. 6 ins., or 56 ft. 8 ins. from shaft, or 4 ft. 6 ins. for the month ; the ground in this drive is very hard and of no value. The 360-ft. level driving north of shaft has advanced 1 ft. 6 ins., or 63 ft. 10 ins. from shaft, or 2 ft. 6 ins. for the mouth ; the lode is the full size of the drive, but assays only 15 grs. per ton stone. The 300-ft. level driving south of shaft has advanced 1 ft. 6 ins. for the month. In the forebreast there is a vein of quartz 4 ins. wide, which shows a little gold. The 300-ft. level driving north of shaft has advanced 1 ft. ; this drive has just been restarted : nothing to value in the end. The 300 bottom stope south has been cut by coolies 9 fms. 2 ft. ; the lode in this stope continues from 1 ft. to 2 ft. wide, assaying 5 dwts. 5 grs. per ton stone. The 300 bottom stope north has been cut 6 fms. 3 ft. ; lode fully 2 ft. wide, during the month assaying 2 dwts. 14 grs. per ton stone. The stope in the back of 300 south has been cut by drill 7 fms. 2 ft. ; lode very irregular ; averaging 9 ins. wide ; assaying 1 dwt. 22 grs. per ton stone. The 230-ft. level driving south of shaft has advanced 1 ft. 6 ins. ; lode of mixed eharacter, showing only a trace of gold per assay. The 230-ft. level driving north of shaft has advanced 1 ft. 6 ins. ; no quartz in forebreast, and no indieations at present. The stope in the back of the 300 was discontinued at an early part of the month ; cut 16 ft. by coolies ; quartz too poor to work. The stope in the bottom of the 156-ft. north level has been cut 7 fms. 3 ft. ; lode 2 ft. wide ; assaying 6 dwts. 13 grs. per ton stone. Davey shaft : The cross-cut driving east of the 170-ft. level has advanced 5 ft. 6 ins., or 53 ft. 6 ins. from level, or 16 ft. 6 ins. for the month. The ground for the past two weeks has been hard trap ; cut a little water in the forebreast on Saturday, which indicates the approach of the lode. The level driving south on east lode has been extended 18 ft. In the drive we have a lode of quartz 1 ft. wide of promising appearance, but only shows a trace of gold per assay. Total cut for the mouth, north and south, 45 ft. 6 ins. New south shaft : This shaft has been sunk 2 ft., or 146 ft. from surface, or 6 ft. for the month ; no change in the ground. Air shaft : We have cut down and timbered this shaft 70 ft. ; men now engaged cutting below this point : ground harder for cutting, but good progress is being made. Trial shaft : This shaft has been sunk 12 ft., or 142 ft. from surface, or 24 ft. for the month. There is quartz of a mixed character 1 ft. wide, which pans a little gold.—T. R. Davey.

JOSEPHINE.—Extract from superintendent's report for week ending May 4th :—The 300-ft. level east : Winze No. 2 is down 33 ft., and shows a good body of quartz. Intermediate drift is now 63 ft. east of No. 1 winze, all in quartz, which looks well. The stopes above the 300 are nearly exhausted. The 300 west stopes have improved in grade, the vein is very large, nearly 12 ft. wide, and carries about 2½ ft. of quartz ; the hanging-wall being much broken, we have to use great care in timbering. The 400 west stopes show an improvement in size and grade of ore. The 400 east drift has been run 14 ft., carrying about 20 ins. of quartz.

— Extract from superintendent's report for week ending May 11th.

—The 300-ft. level: The drift between the two winzes has been run 29 ft. and connected. The quartz looks well through this drift. Raise No. 5 to the 220-ft. level has gone up 16 ft. The vein in the 300 west stopes still continues very large, and gives us a good deal of trouble in timhering. The 400-ft. level has been driven 18 ft.; total distance east of shaft 315 ft. The 400 stopes show no change. The mill has run steadily during the week, but the batteries do not look very good, and I do not look for very much improvement in them this month, as we shall have very little of the good rock from the 300 east to mill, till the 400 drift gets into it.

KAPANGA (17th April).—I beg to hand you my report for the four weeks ending 13th inst.:—Larnach's shaft: Ten men have sunk this shaft 12 ft. 6 ins.; total depth, 51 ft. 6 ins. We have a portion of Scotty's reef now in the shaft split up and disordered, and of no value; the strata around it is too much broken up and irregular, which accounts for not meeting a well-defined reef. Two men have driven south on Scotty's 420 level 17 ft.; the reef disordered, and of no value. The stope by two men above 420 on Kapanga has yielded about 1 oz. per ton; this is now exhausted, and consequently suspended. Driving north and south of main rise above 420 on Scotty's intermediate by six men. Driven north 20 ft. and south 18 ft., the reef producing stamping work. Two men have risen rise above intermediate south on Scotty's 16 ft. 6 in; the reef is of no value, and now suspended. Driving north of winze (Oshorne's) below 300 by six men has been driven 48 ft. We met a few colours of gold in this drivage; the quartz on the whole averages about ½ oz. per ton. The 300 south on Scotty's was advanced 28 ft. 6 ins., with nothing to value. Two men have completed stoping our new bunch up to the disordered channel caused by a flat head above the 300 south, so in consequence it is abandoned. The drivages north and south of rise above 420 on Scotty's have been disappointing, the rise seems to have carried all the gold, and the drivage under the 300 bunch of gold. North of winze (Oshorne's) the same remark will apply, we may find our gold shooting south of Osborne's winze when we open out in that direction. The 420 must be communicated to Osborne's before that can be done. All this ground under the two 300 bunches south we reckoned on as reserves, but if as we advance southwards under them and find the shoots of gold ouly reach a few feet below the 300 level, I shall be compelled to stop our stamps until fresh discoveries are made. It would seem as if the bunches came in flat just below 225 ft., and go out flat just under 300 ft. We stamped for the month 125 tons of quartz, giving amalgam 231 ozs., retorted gold 114 ozs., and computing costs and returns leaves loss about 500*l*. The machinery all through the mine is working well, and everything proceeding in good order.

— (17th April).—Since writing my report this morning, on stoping a small piece of ground left between rise above 420 and winze below intermediate south, we discovered ore stone of quartz weighing 18 lbs., which I compute value at 80*l*. sterling. In all we got 39 lbs., the remainder (21 lbs.) I compute worth 20*l*. This will give you (a basis) some idea of what our reefs are qualified to yield at any moment, and somewhat substantiate my concluding remarks in my report, dated 19th July, 1888.—F. Hodge.

MOSMAN (6th April). — North Australian Mine—Stoping: The various stopes are about as last reported, the average of the whole is only 6 ins. in thickness, therefore, it is not possible to raise any great quantity of stone. Stone raised: The total amount of quartz now in the paddock is upwards of 100 tons, the quality of which is, I should judge, about 2½ ozs. per ton. Eastward Ho! Mine—Stoping: The stope over the 1,000-ft. back levels carries a reef 2 ft. thick, of poor quality, very white. The underhand stope here carries a reef 2½ ft. thick, of much better looking stone. One stope being worked above 1,000-ft. level—in the old stopes—has a reef 8 ins. thick, of good quality: and one underhand stope, being worked at bottom of 1,000-ft. level from the most southern winze, carries a reef 1 ft. thick, of good quality stone. Columbia Mine: We have got all the air pipes down the shaft to bottom, and connected with the boiler on the surface, by this means all the foul air is drawn out of the mine, and passes through the fire in boiler, thereby enabling the men to work below. Below: Sinking was commenced again at beginning of this week, and 4 ft. added to the depth of underlie, making a total of 339 ft. from the vertical portion.—W. Hollinson.

MOUNT LEYSHON (QUEENSLAND) (6th April).—Herewith I have the pleasure of handing you statements of receipts and expenditure for the past month, together with fortnightly report and copies of report and letter of last fortnight sent you. I am sorry to say, owing to fever, I have as yet been unable to send you the survey promised or the quarterly statement, which shall go without fail this week. I am much pleased at the improved return, which I think would have been better if the water had heen cleaner, and with 20 head continuously for a fortnight on such stone I am certain I could exceed 600 ozs. I beg to acknowledge your favour containing bill of lading for 19 bottles of quicksilver, which have been cleared, and are in Messrs. Burns, Philp and Co.'s hands, your instructions concerning which shall he duly followed.—J. G. West.

MOUNT SHAMROCK (8th April).—We have continued the stopes towards the western side mentioned in my last advice for economical reasons. This stope consists of a horse or splint of ground dividing the most productive portions to the east and footwall to the west, and still maintaining a parallel course to the latter. Veins of mineral interlaces this belt for 9 ft. wide, containing gold, but not equal in value to the average yield of the whole bulk of the reef visible at this point, 40 ft. in width. Samples of stone taken from the west, and assayed by the most efficient assayers in the colonies, gave the result of gold, 25 ozs. 14 dwts.; silver, 9 ozs. 6 dwts. per ton of stone. At the close of my last report we were in the midst of a three weeks cleaning up, owing to a falling off in the water supply; 280 tons of stone had then been reduced, and 4,000 ozs. of gold retorted, completing the crushing 24 hours later, making the total quantity of stone 300 tons, for a return of 665 ozs. of gold. Samples have been taken promiscuously from concentrated tailings. A portion of the above crushed and assayed gave the favourable result of 9 ozs. of gold per ton of concentrates. Provision has been made for increasing the returns by the erection of two new pans. Since the clearing up and the suspension of the mill 112 tons of stone have been lodged in the shoots, ready for next crushing. Our principle attention has been directed to preparatory work of a pressing and urgent character, namely the advancement of the whim for more expeditious winding, and especially work in connection for a water supply. First, by repairing the old dam for the first emergency; and second, the enlargement of the trial shaft for water sunk contiguous to the present creek. This work has been carried out, and a further depth of 10 ft. sunk; the last 7 ft. has been through the bed rock, making the total depth 41 ft. The present influx of water warrants my saying that an ample supply will be met with by driving across underneath the old water channel. We are now preparing to open out for that purpose, but, not having a suitable mining pump to act as an efficient auxiliary, our works are greatly retarded in consequence. We have fixed the boiler and two stationary pumps; unfortunately neither is adjustable to our requirements. Preparations are also being made to wind the *débris* from the water shaft by a whip in order to despatch the driving before the weather breaks up.

MYSORE (7th May).—Monthly report for April.—In most of the places the rock-drills did excellent duty. The 466 north of Taylor's shaft was driven 66 ft.; total, 648 ft. 3 ins.; the lode is 2 ft. 6 ins. wide, assaying 1 oz. 6 dwts. 3 grs. Driving the 296 north of Taylor's shaft, 34 ft. 6 ins.; total, 652 ft. 10 ins.; the last 30 or 40 ft. it is in barren rock. Trials were then made in the western side, where quartz and trap-rock mixed together for a width of 6 ft. were discovered; 10 ft. 9 ins. were driven in this place, making a total driven in the month of 45 ft. 5 ins. This drill is now put to sink in the bottom of the 296, towards the rise in the back of the 400. A communication may be expected in 15 days, when the driving in the western side will be resumed. Driving the 236 level north of Taylor's shaft, it was driven in the early part of the month 19 ft. 8 ins., making a total from the shaft, 526 ft. 7 ins.; 11 ft. 4 ins. were driven from the rise in the back of the 296, where a communication was made. The total length of the rise is 537 ft. 11 ins. Three men are now employed stoping in the back of the 236, where the lode is 3 ft. 6 ins. wide, assaying 2 ozs. 3 dwts. 1 gr. Driving the 236-ft. level south of Plummer's shaft, 8 ft. 7 ins. were cut; total 233 ft. 7 ins. There are small strings of quartz in the forehead which assay 10 dwts. 10 grs. Driving the 296-ft. level north of Plummer's shaft on the west lode, ground cut, 8 ft. 9 ins; total 94 ft. 9 ins. The lode is 4 ft. wide, but no assay was made. No. 4 winze in the bottom of the 173-ft. level north of Taylor's shaft; operations were suspended in this place some two or three years ago. In consequence of bad air and the large influx of water, it was then considered to be an eastery lode, but results from the last few months prove it to be a part of the main lode. At the 236 ft. north of Taylor's shaft, a communication has been made at this winze. It has improved the ventilation, and although the ground around it is not very rich yet I think it will produce some paying quartz. Driving the cross-cut west at the bottom of Taylor's shaft, it is in barren tight rock. 34 ft. 9 ins. were driven in the month there is no sign of a lode. Driving the 173-ft. level south of William's shaft, the rock is a little easier for driving, but it continues to be barren; 14 ft. 4 ins. were cut last month, making a total of 216 ft. 10 ins. The 152 level south of McTaggart's shaft was only worked for a part of the month; 12 ft. 10 ins. were driven; total, 296 ft. 4 ins. The air became poor, and the men are now sinking a shaft at surface for ventilation. The 220 south of Schaw's shaft was driven 7 ft. 4 ins.; total, 70 ft. 10 ins. The lode is 3 ft. 6 ins. wide, assaying 11 dwts. 2 grs. There is nothing new in the cross-cut at the 160 south of Schaw's. It was driven 5 ft. 8 ins.; total, 96 ft. 6 ins. It continues to be hard. At Tennant's shaft the men have been employed fixing a plunger lift in the perpendicular. This is completed, and it works very well, but yet there remains a good deal to do. It is now intended to fix an angle-boh and divide the pumps into lifts below the bottom of the downright; it will take two or three works more, when the sinking will be resumed. The 130-ft. south end was driven 8 ft. 3 ins.; total, 82 ft. The lode is 1 ft. 2 ins. wide, assaying 3 dwts. 6 grs. The 180 north was driven 8 ft.; total, 85 ft. The lode is 1 ft. wide, assaying 4 dwts. 14 grs. Stopes: The stope in the back of the 466 north of Taylor's shaft, two men with one drill cut 19 fms. 5 ft. 2 ins. last month. The lode is 2 ft. 6 ins. wide, assaying 3 ozs. 15 dwts. 3 grs. The 466-ft. level north of Taylor's shaft, south of the cross-cut, the lode is 2 ft. wide, assaying 1 oz. 12 dwts. 6 grs. The stope in the back of the 400 ft. north of Taylor's shaft, two Italians with one drill cut 17 fms. 4 ft. The lode is 4 ft. wide, assaying 1 oz. 15 dwts. 22 grs. The stope below the 296 north of Taylor's shaft, two Italians cut 18 fms. 3 ft. 2 ins. The lode is 2 ft. wide. No assay was made. The stope in the bottom of the 296 south of Plummer's shaft, the lode is 3 ft. wide, worth about 1 oz. to the ton. The stope in the bottom of the 296 north of Plummer's shaft, north of the winze, there is a small lode of good-looking quartz. The stope in the back of the 236 north of Taylor's shaft, two Italians with one rock drill, in addition to driving 19 ft. 8 in. in the end, cut 10 fms. 4 ft. in the stope. The lode is 3 ft. 6 ins. wide, assaying 2 ozs. 3 dwts. 2 grs. Stoping in the back of the 400 south of Taylor's shaft on the west lode; the quartz is about 6 ft. wide, worth about 15 dwts. or 16 dwts. to the ton. Sinking: The incline below the 466 was sunk 26 ft; total, 87 ft. 6 ins.; the lode is 3 ft. 6 ins. wide, assaying 2 ozs. 7 dwts. to the ton. Sinking in the bottom of the 466 ft. north of Taylor's shaft on the west lode the land of quartz is 6 ft. wide, and sinking in the bottom of the 296 ft. south of Plummer's shaft, there is a band of quartz 3 ft. wide, no assay was made from either of these places. Rowse's shaft was sunk in the month 18 ft. 2 ins.; total, 126 ft.; the rock is hard and bad for cutting, but we now regularly work a rock-drill, and I think the speed will be better in May than it was in April. Sinking a winze in the bottom of the 220 south of Schaw's shaft it is down 5 ft. 10 ins.; the lode is 5 ft. wide, assaying 15 dwts. 16 grs. The new shaft near Schaw's has been sunk a total depth of 21 ft. 6 ins. Schaw's shaft sinking below the 220 ft., 17 ft. 10 ins. were done last month, making a total of 42 ft. 4 ins. We intend to make it 100 ft. before we drive levels; the lode is 4 ft. wide, assaying 15 dwts. 16 grs. Sinking Tennant's shaft, 6 ft.; total, 230 ft.; the lode is 1 ft. 8 ins. wide; there was no assay made. Rising over the 400 north of Taylor's shaft to be a continuation of Rowse's shaft, was risen 32 ft. 7 ins.; total, 62 ft. 7 ins.; the lode is 2 ft. wide, assaying 4 ozs. 18 grs. We are now sinking from the 296 towards the rise, there are 95 ft. from one level to another, and we expect to cut the remaining portion in 15 days. All the machinery is working very well, and we have commenced with the work of putting down 4-in. air pipes from Tennant's to the compressor. Assay of samples from the mill:—Old mill, April 23rd, 2 ozs. 3 dwts. 2 grs.; new mill, 23rd April, 2 ozs. 7 dwts.; old mill 29th April, 2 ozs. 8 dwts. 4 grs.; new mill 29th April, 2 ozs. 5 dwts. 17 grs.—B. D. Plummer.

MYSORE REEFS (7th May).—Fortnightly report:—Harvey's shaft: The 320-ft. levels north and south of east cross-cut have been extended by one rock-drill 21 ft. 6 ins.—3 ft. 3 ins. south and 18 ft. 3 ins. north. The last 10 ft. driven in the north end have been

in black trap-rock. I have suspended this and am now driving the south end, which shows in the forebreast small branches and stringers of quartz and arseuical pyrites intermixed with hard black rock, and worth on an average from the several samples taken, from 4 dwts. to 5 dwts. of gold per ton. We shall continue this for a few feet more, and then, if there is no improvement, commence to strip out the side of level in the best part of this bunch of quartz and pyrites and start to sink a winze to prove it below the level. Winze sinking below the 250-ft. north level has been sunk 3 ft. 6 ins., now 16 ft. 3 ins. below the level; there are branches of quartz and arsenical pyrites, with alternate bands of black trap-rock, for the whole width of winze. Several samples have been taken from quartz and pyrites selected. The roughs give from 15 dwts. to 1 oz. of gold per ton, and the smalls from 6 to 7 dwts. of gold per ton. Cross-cut west of plat at the 250-ft. level has been advanced 15 ft., now 213 ft. 9 ins. from plat. The rock is exceedingly hard, but small stringers of quartz are running through it, which show an occasional speck of gold. This cross-cut should be pushed on as fast as possible, as I fully believe when we intersect the western formation we shall have gold. Cross-cut east of 250-ft. level north has been advanced 2 ft., now 177 ft. 6 ins. from level; this is now suspended. Taylor's engine shaft: A full force of men and rock-drills have been employed here; 7 ft. 3 ins. have been sunk, which makes a depth of 167 ft. 3 ins.; we find small branches of quartz in sinking, which give a fair show of gold in the pan. In 8 or 10 ft. we expect to reach the lode. All our machinery is in good working order.—M. SCANTLEBURY.

NEW EBERHARDT.—The mine manager reports under date May 12th, as follows:—Number of tons of high-grade ore assorted and put on the ore dump 21 tons; assay value of same, $62.93 per ton. Number of tons of ore of a lower grade assorted and put on ore dump 5 tons; assay value of same, $37.71 per ton. Total number of tons of ore extracted and assorted for the week, 26 tons, an increase of 4 tons from our output of last week. The geueral prospects of the mine at present are quite encouraging, although we have no large ore body yet. I am pleased to say that we have more ore in sight, and more favourable prospects than we have had in our mine for the past year. I do most certainly feel greatly encouraged, and am quite hopeful of finding more ore than we now have. Bullion shipment: On the 10th of May I shipped 2 bars bullion; total, 2,953.40 ozs.; assay value, $1,359.37. Please find shipment receipt herewith.

NEW LIVINGSTONE (6th April).—Fortnightly report:—During the past fortnight the underlay shaft has been sunk 9 ft., making the total 178 ft. from No. 2 level, and this has finished the contract of 50 ft. At present the reef is broken into small leaders through the formation, which has got much harder since my last report. The footwall is dipping a little sharper than it was, and I hope this change will be the means of making an improvement in the mine. Everything is in good working order.—N. MAYNE.

— The mining agents, Messrs. E. D. Miles and Co., add:—We certainly think the property is well worth a further trial by sinking and opening it out, and it would be a pity to cease operations now after having erected such a valuable plant on the mine, and such very little prospecting done in it so far. Although the stone gone through is poor it may change at any time, and there are plenty of similar patches of poor stone, even in the best mines on this field.

NINE REEFS (6th May).—Milling: As cabled you on the 3rd inst., the work done at the mill was for 16 days in April; 635 tons rock stamped, the yield of gold being 116 ozs. During the past week the assays were: Battery, 5 dwts. 5 grs. gold per ton; tailings, 2 dwt. 14 grs. You will notice with regard to the assays that for the past few weeks there has been a gradual improvement; also that for the 16 days' work in April we had an appreciable increase in the yield of gold. I am doing all I can to expedite the opening up of Hodgson's and the new shaft, trusting to good results from those points. Hodgson's shaft is cleaned up to about 40 ft. in depth; the haft is said to be 70 ft. deep. I attribute some of the increase in gold to the ores that were laying at surface at Hodgson's shaft, and I am sanguine of results to be obtained at this point. The ground is much easier for working, and the two veins, *i.e.*, Malleson vein and the parallel vein, are comparatively intact at this point. The ore that has been obtained from Malleson vein at this shaft has proved to contain an appreciable quantity of gold. At the new shaft the extent of the old workings and the assays from the vein left by the old workers are also very favourable indications of what may be expected from the vein when developed.—Capt. BENNETTS.

NORTH TOLIMA (12th April).—The accounts, including exploratory work, &c., show an expenditure beyond the receipts of 240*l.* 18s. 3d., of which 200*l.* is for materials used. Our returns for the month are the biggest yet made by the present company, but our costs are higher. We are pushing ahead, and have really as much work going on (more underground) than at Frias itself. This is owing to the avantage of not having pumps, and sinking to contend with, facts which I pointed out in my original report.—J. G. GREEN.

NO. 2 QUEEN (10th April.)—No. 1 shaft: The tributers are still stoping over No. 1 level south on a very large formation, with veins of quartz running through it. They have broken about 10 tons. No. 2 shaft: Hill and party (contractors) have sunk a further depth of 16 ft., making a total of 614 from surface. Owing to the excessive strain put on the drum of the small winding engine, with the depth we have sunk it gave way last Saturday. The boss being fractured on both ends, and one sack extending across one of the arms right through to the outside of the flange, obliging us to stop operations for a week. We shall be ready to start again on Monday, however, new flanges having been cast and the drum repaired. Mill: We have had a good fail of rain, which has refilled the reservoir. I have to report the following crushings. Our own stone that was at surface when I closed No. 1 shaft, and a lot from the Sweedeuborg is following this.—A. G. CHARLETON.

NUNDYDROOG (7th May).—Mining operations: We hope there is some little improvement in the 370-ft. north end. I told you a few weeks ago, in addition to the cross-cut we had commenced to drive north on the band of quartz, which yielded some 3 or 4 dwts. to the ton in previous working. It shows quartz 2 ft. wide; it has a very much better appearance, and it assays 7 dwts. 12 grs. of gold to the ton. We are much encouraged, and hope it will be better when I write to you next week. Webb's shaft continues to be in hard, dark colour, barren rock. The 370 cross-cut north of Webb's is got into a lighter coloured rock. There are small faces of quartz; it has now been driven a total distance of 53 ft. Taylor's shaft was sunk 2 ft. 6 ins. last week; total, 374 ft. 2 ins.; there is no improvement, it continues to be very hard and quite barren. The new shaft near the north boundary we have not been able to sink in the past week, nor shall we be able until the small steam engine is erected and the pumps got down; this work is employing the engineer and all his assistants. The stopes are looking much the same as usual. In the back of the 370 south of Webb's shaft the lode is 3 ft. wide, assaying 1 oz. 15 dwts. 18 grs. The intermediate level, the stope in the bottom of the 230, the middle level, the lode in the back of the 230 north of Webb's, and the lode in the stope in the bottom of the 106-ft., all contain quartz 1 ft. 8 ins. wide, assaying respectively 1 oz. 13 dwts. 12 grs., 12 dwts., 1 oz. 14 dwts., 16 dwts. 6 grs., and 2 ozs. 9 dwts. Assay of weekly samples from the mill: Rough quartz, 2 ozs. 1 dwt. 6 grs.; smalls, 1 oz. 11 dwts. 12 grs.—B. D. PLUMMER.

OSCAR (25th May).—No. 3 lode: The quartz has slightly increased, and assays 4 dwts. gold to the ton. Daw's lode: Shaft and bottom level, no alteration to note. The 370-ft. level north shows very little quartz, but in the south end we have a very fine lode about 9 ins. wide, and assaying 7 dwts. The 230-ft. level: The lode in this level improves; the quartz is 8 ins. wide, assaying 3 dwts. to the ton. No alteration to call your attention to in any of the stopes.—J. DAW, jun.

PACHUCA.—Advices have been received from Mr. Bawden, the company's engineer, that he arrived in Pachuca on the 21st of March, and took formal possession of the company's property. The machinery sent from England arrived at Vera Cruz on the 30th of March, and was, at the date of the last dispatch, daily expected at the mines. The shaft is being cleared, and the work generally vigorously proceeded with. As showing the high appreciation in which the property is held in Pachuca, offers to purchase are being freely made there of $10 per 1*l.* share, upon which 10s. has been paid.

POTOSI (2nd May).—New lode: No. 3 tunnel has been extended another 19 ft., which makes the present total length of same 203 ft. There is no change in the size or character of the lode since last reported on. No. 2 new lode: The deep tunnel has advanced since my last 34½ ft. I am pleased to say that the quartz at this point is improving in value, and yesterday, upon taking down some of the lode, we found it looked very well indeed, showing coarse gold. Potosi Viejo—Zeiler's shaft: This, which is down a little over 100 ft. below the bottom level, is suspended for the time, and the men put to drive a level east, with the object of communicating with the winze which is being sunk below the level above. The lode in the shaft continues to be fully 3½ ft. wide, showing free gold throughout, and a more healthy looking lode than is now presented in the bottom of this shaft cannot be desired. Socorro lode: The deep tunnel has been driven south since my last 22 ft., in which the lode has varied in width from 2 ft. to 2½ ft. This lode, I am glad to say, is opening up very satisfactorily, and the indications are that better results will be forthcoming in depth. A winze is being sunk below No. 2 level south of shaft in a lode 2½ ft. wide, with the quartz gold showiug freely.—PRYOR.

RUBY AND DUNDERBERG CONSOLIDATED.—Report upon the mines for the week ending 5th May:—Dunderberg: We have shipped no ore from this mine during the last week, the furnaces having to cease buying for a day or two to make some arrangements for storing, but they have again commenced to buy. We have about 40 tons of ore ready for shipment. There has been no change during the week. Eagle's drift: We have advanced 8 ft. during the past week, making a total of 211 ft. raised. We have 18 tributers and six contractors at work. Lord Byron: This mine is not looking so well above the tunnel level. We have about 65 tons of ore ready for shipment and 12 tributers at work.

— Telegram received to-day (28th May) from Eureka:—"42 tons tribute ore shipped; 99 tons tribute ore sold for smelting, producing to company $295."

RUSSELL UNITED (29th May).—During the past month the 80-fm. level has been driven west 5 fms. 1 ft. 6 ins., on a productive lode, worth from 5*l.* to 10*l.* per fm. In the present end it has been disordered by a small spar crossing, but I believe the lode will make again and, I hope, be found equally productive as before the crossing was met with. The end has been re-set to six men, at 5*l.* 10s. per fm. In the rise about 5 fms. above the back of this level the lode is 4 ft. wide, composed of mundic and peach, and worth 6*l.* per fm. for tin, re-set to six men at 6*l.* per fm. I think by the end of next week the end will have been driven far enough to admit of a cross-cut being commenced towards the south lode. This I shall recommend being done, with the hope we shall find that so improve from where seen in the level over, as the other lode has done. The machinery is all working satisfactorily.—W. GEORGE.

SOUTH-EAST MYSORE.—During the past week the principal underground works at this mine have been as follows, viz:—Rogers' shaft sinking under the 260-ft. level has advanced 4 ft., the total depth now being 286 ft. 9 ins. The vein in this shaft appears to be improving, both in width and general character, the present width being about 3 ft., of which 2 ft. is solid quartz. The assay is 4 dwts. 13 grs. gold per ton. The stoping of the back of the 260-ft. level north of Lavelle's shaft has been continued. The vein varies very much in width, the general average being about 3 ft. The assay of three samples of the quartz yielded 10 dwts. 2 grs. gold per ton. We have also been engaged in cutting ground for an angle-bob to enable us to work a plunger below the 260-ft. level, and in laying a track for the quicker delivery of the quartz from the stope at the 260-ft. level north of Lavelle's shaft. Preparations are being made for the sinking of the winze under the 260-ft. level Lavelle's shaft, and also for the more rapid delivery at surface of the quartz that may be broken in the mine. As soon as the above works are in order more vigorous working will be adopted. The resident engineer also reports that the compressor, pumping and mill engines have been put in order, the boilers thoroughly cleaned out, and the various pumps overhauled; also that the trucks and turn-tables are made, and the rails being laid for the tramway in the 260-ft. level from Rogers' to Lavelle's shaft.—CAPT. BENNETTS.

TETUAN (29th May.)—Annexed I send you copy of the latest report from the manager, which I venture to think you will find very satisfactory. The large amount of water at command ought, when brought into operation by the monitors, to briug exceedingly large results.—J. CARLOS, Secretary.

— (26th April).—Since last advices the amount of ground prepared for the ditch is 1,225 ft.; the average height of the excavations being 15 ft., and the width 12 ft. You will thus see that the works at the mine are being carrried out in a satisfactory manner. The monitors have been on the mine for some time, and as a portion of the iron pipe, &c.,

has now been delivered, washing can be commenced in a comparatively short time. I would point out that the ditch is being constructed to carry 3,000 miner's inches of water, and that, therefore, the works at this mine will be larger than those of any other property in this country, with the exception of the Gold Gravel, where the works are on a grand scale. As you have already been informed, the facilities for working are all we can desire. The gravel overlies the greater portion of the estate; we have a splendid head of water, a magnificent fall for same of about 400 ft., and a dump that can hardly be surpassed. The gravel is rich, producing on the average about 30 cents per cubic yd. We have 10 peons washing gravel with the batea (the native manner), and even in this primitive way the yield equals the above estimate. There is no doubt that when the monitors go to work a very large profit will be made, as the gold obtained is much in excess of that obtained from similar hydraulic mines. The mine is undoubtedly rich; but, of course, there must be some drawback. In this case it is the boulders, of which there are a good many. These, however, can be easier dealt with than was the case with the pipe clay at the Colombian Hydraulic. We will have such a large quantity of water, so that we may, without inconvenience, reserve some of it to drive special machinery, to enable us to effectually deal with the above-mentioned hindrance. In conclusiou, I have only to state that thongh the completion of the works has been much delayed, by reason of the fact that it was determined to carry out the works on a larger scale than was originally intended, I tiust, judging by appearances, the shareholders will be rewarded for their patience.—C. Garcia.

TOLIMA.—The directors have received advices by the mail of 27th May from their mines, of which the following is an abstract:—Frias: March cost, 966*l.* 12s. 3d. Frias: March returns, 675*l.* 12s.; loss for month, 291*l.* 0s. 3d. The underground agent reports 36 fms. 2 ft. 8 ins. of ground expended, of which 15 fms. 1 ft. 7 ins. were productive, leaving 21 fms. 1 ft. 1 in. of unproductive ground. The superintendent explains that the small returns obtained in March, and the loss incurred in that month, were due to the almost uninterrupted drought.

THE YURUARI CO., LIMITED.

The assistant secretary advises receipt, of the following telegram from the manager at the mines:—"Lode struck in Water shaft is true fissure vein. Droughts over. Crushing re-commenced. Prospects all could desire."

By letter dated Chile, 1st May, the manager reports:—"Good progress is being made with developments, and the prospects are most encouraging. The mining work done during April was most satisfactory, considering that the droughts which have prevailed during the present dry season have been of great severity. No. 4 drift east (Water shaft) is still looking very well, and showing visible gold. All possible progress is being made with development operations, and the prospect in this shaft is quite equal to our anticipations. I enclose mine report and usual documents."

MINE REPORT.

30th April.—During the month of April our attention has been entirely engaged in developing the mine, by driving the following drifts and levels:—Water shaft, No. 4 drift east: Ever since I commenced driving this drift, the lode has been very regular, and the walls well defined. The lode varies from 2 ft. to 3 ft. in width, quartz of good quality, showing visible gold; progress 32 ft. No. 5 drift east: I began driving this early in the present month; depth, 85 ft. below No. 4 drift; lode 3 ft. wide; walls well defined, and quartz of good quality. Shaft: Progress made during the month. 14 ft. 6 ins. Besides sinking, I have been engaged in making a plat for No. 5 drift. Sinking operations have been delayed by this work, as also by the Easter holidays. The lode in the bottom of the shaft is now 4 ft. wide, and of fair quality. Cenicero shaft—Drift No. 8 west: Progress, 40 ft.; during this month the drift has been passing through good looking quartz, slightly mixed with bluestone; during the last few days a marked improvement has taken place, and the lode is now 2 ft. 6 ins. wide. Drift No. 10 west: Progress, 40 ft.; this has been driven through a big lode of quartz, varying from 4 ft. to 6 ft. in width, but is now only about 3 ft.; quartz of fair quality. Owing to the dry season the contractors have experienced difficulty in keeping us supplied with timber. This has somewhat delayed operations. I am pushing on vigorously so as to form the connection as early as possible between the Water and Cenicero shafts, and as I have pointed out in previous reports, this will open up a large amount of unexplored ground, which we are aware contains several good shoots of pay-rock.

THE PALMERSTON COPPER MINING CO., LIMITED.

The manager submits his quarterly report on the mines:—Mount Shoobridge Miue: I am pleased to be able to inform you that a very decided improvement has taken place since my last report. I am pushing on these levels as far as air will allow. I shall then sink a winze, which will open up a splendid block for stoping, from which, with ore already at grass, I estimate I shall obtain sufficient ore to keep the machine going for the remainder of the year. Since my last, the winze between Nos. 1 and 2 levels north has been holed through, improving the ventilation and leaving a block of ground ready for stoping. Both these levels are at present poor in tin, but have precisely the same characteristics as the south levels. Machinery: I have at length pleasure in reporting that this is so far complete as to be at work. From trials made, I estimate the plant will treat about 30 tons of stuff per day, which will yield an average of about 2 tons of clean tin, besides the slimes, which, when dressed, will yield ½ ton more. Of course, if the lode continues as rich as at present the yield will be much higher. I am basing my present calculations on what I have tried from the average ore at grass. I find we have to crush to a very fine gauge (16 to the square inch) in order to free all the tin from the waste. I am taking some pains to instruct the Chinese in the working of the machinery, and when I have these trained I shall be able still further to reduce the number of Europeans employed. I am greatly pleased with the present prospects of this mine; they exceed my most sanguine expectations, and the results of the next six months will, I am sure, be most satisfactory.—J. Dunstan, Manager.

Moodie's.—Profit, 3,768*l.*, carried forward; will not pay a dividend.

REVIEWS.

A Dictionary of Explosives, by Major J. P. Cundill, Royal Artillery. Hamilton, Adams and Co., London.

A large amount of information on the subject of explosives is given in this volume, which will prove a great value to the wide circle of persons pecuniarily and commercially interested in them. We have of late devoted a good deal of attention to Roburite, and this is what Major Cundill has to say of that well known and much esteemed explosive:—

"Roburite is an explosive due to Dr. C. Roth, and is now being manufactured on a commercial scale in this country. It has been for some time in use in Germany. It essentially consists of a mixture of nitrate of ammonium with chlorinated di-nitro-benzole, and thus much resembles bellite and securite. It is a brownish yellow powder, with the characteristic smell of nitro-benzole.

In the license it is defined as consisting of a mixture of:—

(a). Nitrate of ammonium with or without an admixture of nitrate of sodium and neutral sulphate of ammonium, or either of them, provided that the amount of nitrate of sodium so added shall in no case exceed 50 per cent. of the total amount of nitrates present; and

(b). Thoroughly purified chlorinated di-nitro-benzole, with or without the addition of thoroughly purified chloro-nitro-naphthalene and chloro-nitro-benzole, provided that such chlorinated di-nitro-benzole shall not contain more than four parts by weight of chlorine to every 100 parts by weight of chlorinated di-nitro-benzole, and that the proportions of chloro-nitro-naphthalene and chloro-nitro-benzole shall not amount to more than 2 per cent. and 5 per cent. respectively of the finished explosive."

This definition succeeded a much simpler one, in which the two main ingredients alone were designated. Roburite volatilises without explosion or ignition when slowly heated, and burns slowly in the open, at all events in small quantities. It requires a powerful detouator to develop its force.

Notes on the Treatment of Gold Ores. By Florence O'Driscoll, Assoc. M. Inst. C.E. Offices of *Engineering*, London; and John Wiley and Sons, New York.

The books on this subject are legion, but, nevertheless, the present one will be welcomed by students, and particularly by non-technical readers. An endeavour has been made to place before the public certain particulars on the subject of gold ores and their treatment, in such a form that a reader who has no knowledge of the subject may be able, after perusal, to have some fairly clear idea of the outlines of the matter written upon. No pretention is made of having treated the subject exhaustively; only the essential details are touched upon; nor is any attempt made to theorise on the formation of veins, or the deposition of gold in them. It has been a very difficult matter to keep the notes within the limits originally laid down—a statement to be readily believed, for the subject is extremely fascinating once it commands the attention of either writer or reader.

Nooitgedacht Estate.—Cablegram from the manager at the mines:—"Have discovered a new reef, yielding 1 oz. per ton.—Sweet."

The committee have made the following addition to the by-laws of the Mining Exchange:—"Persons who have been declared defaulters upon the Stock Exchange are not eligible for election as members of the Mining Exchange."

Thirty-fifth Anniversary of the Opening of the Crystal Palace.—On Whit Monday, June 10th, it will be 35 years since the Crystal Palace was opened. The event will be celebrated in a special manner, and on an imposing scale.

Mount Morgan Extended Gold Mining Co, Limited.—At a meeting of the debenture-holders of the above company, held at their office on 27th inst., after a full statement by the chairman to the financial position and prospects of the company. it was unanimously resolved, "That the proposed scheme for the reconstruction of the company, as explained, be and is hereby approved." The directors further announce their intention to convene the necessary meetings of shareholders at the earliest possible dates.

White Lead Company, Limited.—Applications to work the patent by licence or royalty are pouring in daily from the trade. The directors have received a cash offer of 100,000*l.* for one of the foreign patents. The French, German, and other European patents have also been extensively applied for, the sums offered more than twice covering the capital of the company. The offers emanate from manufacturers of white lead under the old process. This arrangement will ensure the shareholders a return of their money in full almost at once. These shares should have a big rise before them.

THOMAS THOMPSON,

STOCK AND SHARE DEALER,

8½, ANGEL COURT, LONDON, E.C.

Telegraphic Address:—"NOSMOTH," LONDON.

Telephone No. 509.

Bankers:—THE CITY BANK, LIMITED, and THE ROYAL EXCHANGE BANK, LIMITED.

Mr. THOMPSON transacts business in all classes of Securities, Bonds (Foreign and Colonial), Banks, Railways, Insurance, Telegraph, Tramway, Gas, Water, Mining, and all Miscellaneous Shares. Shares sold at special prices for Forward Delivery (One, Two, or Three Months) on Deposit of 20 per cent.

Orders by Letter or Telegram promptly attended to.

Foreign Copper Mines. — Price of Shares.

IMPORTANT TO SHAREHOLDERS.

IN our JANUARY CIRCULAR we stated thus :—"We have thoroughly investigated the present position and prospects of RIO TINTO, CAPE COPPER, THARSIS, MASON AND BARRY, and COPIAPO in connection with the present price and heavy stocks of Copper, and our opinion is that before this year is out we shall have to record great fluctuations in the quotations of shares of all the above-named Companies, and in all probability a heavy fall in prices."

The price of shares at this time was as follows :—

Rio Tinto... ...	£25	...	Present price is	£11⅝
Cape Copper ...	£6	...	,, ,,	£3
Tharsis	£6	...	,, ,,	£3½
Mason and Barry	£10¼	...	,, ,,	£6⅛
Copiapo	£4½	...	,, ,,	£1½

The price of Copper was then (January) £78 per ton. and it is now £41 per ton. We think many of the above mine shares should now be purchased, and we shall be pleased to Buy or Sell Shares therein at the close market prices.

The above is an extract from the *British and Foreign Monthly Mining News*, Nos. 916—917. Published and issued yesterday, and can be obtained of

All ORDERS and TELEGRAPHIC MESSAGES to Buy or Sell Railway, Bank, Mine, and other Shares and Stocks, punctually attended to, at Net Prices for Cash, or for Fortnightly Settlements, with advice as to Purchases or Sales, to be addressed to MESSRS. PETER WATSON AND CO.

FORTY YEARS' EXPERIENCE!

(Two in Cornwall aud Thirty-eight in London.)

BANKERS—THE ALLIANCE BANK. LIMITED.

From the proximity of our Offices to *The Stock Exchange*, and *The Mining Exchange*, we are enabled to act with promptitude on all orders entrusted to us, which at all times are carried out with punctuality.

Being daily asked our opinion of particular Stocks and Shares, as well as to *recommend mines either for investment or speculation*, we beg to state that we give our advice, and recommend mines to the best of our judgment and ability, founded on the best practical information or advice we can obtain.

Every information can be obtained ON PERSONAL APPLICATION OR BY LETTER. as to Purchases and Sales of Stocks and Shares, and the best investment for capital.

N.B.—All matters as to the Management of British and Foreign Mines, &c., and any *Private* communications are to be addressed to Mr. PETER WATSON.

The Mining World.

LONDON : SATURDAY, 1ST JUNE, 1889.

The "MINING WORLD" is not the property of a Mining Speculator nor under the control of any clique.

NOTICE TO READERS.

Replies to Annual Subscribers will be sent by wire or letter, as may be necessary.

Non-Subscribers must send fee of 5s. 0d., in order to have their enquiries answered in "Mining World," or by wire or letter, as requested.

C. L. (Southsea).—Do not apply for any Savoy Hotel shares; you had better keep the others.

T. R. (Leeds).—Metropolitan Bread is a fairly good speculation. So are the Water-Gas shares.

A. L. P. (Willesden).—Sell at once.

J. M. W.—Buy Victory and New Emma.

Timid (T. A.)—Will go better shortly. Hold on.

B. Hammond.—You have not sent your address. Do this, and we will answer by letter.

X. Y. Z. (Bath).—Sell 1, 2, 4, 5 and 6. but hold on to others.

Reader (H. M.)—No market here for the stocks named.

L. B. Scott.—Yearly subscribers to France pay 1*l.* 3s. 6d.

Faithless (Edinburgh).—Under those circumstances, our advice is to keep them.

G. W. S. (Paris).—Very speculative. We advise you to have nothing further to do with them.

J. Goschen.—Buy a few more and take them up next account. Do not carry the others over, but insist upon delivery.

A. B. C. D.—We think you are fortunate to get so much. Be satisfied under the circumstances.

Client (I. J. K.)—We will write you further about the new shares on Tuesday. In the meantime do nothing.

M. J. A. (Exeter).—Hold 2 and 3; sell 1 and 4.

Captain B. A.—You have no alternative. Pay at once to save further expense.

Auction (B. B. B.)—Ten days are allowed for delivery.

DIAMOND AMALGAMATION.

THE negotiations for the amalgamation of the South African diamond mining companies do not seem to have got much "forrarder," since the arrangements between the De Beers and Griqualand West and Consolidated Bultfontein Companies were concluded. The Griqualand West Company is to have a 4 per cent. guarantee on its ordinary capital and 6 per cent. on the debentures; while the Consolidated Bultfontein is to receive a guarantee of 7½ per cent. on its capital, the De Beers Company, of course. being the guarantors in each case. We understand that Mr. Cecil Rhodes, who is here conducting the negotiations on behalf of the De Beers Company, made a pretty good offer to the Anglo-African Company, but that company stood out for better terms. In the meantime the news from the Anglo-African property became less and less satisfactory, and as the claims are said to be almost completely covered with reef-matter, Mr. Rhodes felt himself compelled not only to withdraw his original offer, but to decline to come to any arrangement while the property is in its present state. It is understood, however, that the De Beers Company has secured the practical control of the Anglo-African Company, so that sooner or later the amalgamation is bound to be effected. What benefit the amalgamation, when completed, is to produce, remains to be seen. It will no doubt lead to a saving in the working expenses; but beyond that the gain appears to be entirely problematical.

STOCK WATERING WITH A VENGEANCE.

IT is a curious experience to find the shares in a large profit-yielding mine standing at a discount of over 20 per cent. Yet that is the case with regard to Robinson or De Villiers shares. As everybody knows the original shares of 1*l.* each in this mine were run up to 70*l.* a couple of months ago; but at such a price market transactions were too few to suit the wirepullers on the other side, so they hit upon the idea of splitting the one-pounders into 10 shares of 5*l.* each; thus increasing the nominal capital at a stroke of the pen from 50,000*l.* to 2,500,000*l.*, and no doubt the holders thought they were going to derive very great benefit from the operation. But soon after the stock-splitting arrangement was decided upon, prices began to slide away, until the quotation of 32*l.* 10s. for the original shares was reached. There has since been some recovery, but the highest price for the old shares this week has been about 37*l.*, and the 5*l.* shares are quoted at under 4*l.* But there is an even more extraordinary feature in the business. Some of the new certificates have just arrived here, and upon them the nominal capital of the company is described as 2,750,000*l.* People here are quite in the dark as to what the odd quarter of a million represents. There is a vague impression that additional property has been bought; but there is no sort of information as to the size or position of the property, nor as to its value or cost. The probability is that sombody or other has had a nice picking out of the transaction. It is this sort of stock-watering operation which has done so much to make people on this side chary of taking up Witwatersrandt shares.

SIR JOHN PENDER ON COPPER.

IN another part of our present issue will be found a *verbatim* report of the meeting of the Panulcillo Copper Company, which was held on Tuesday. Owing to the scarcity of labour and sudden advance in the price of copper ores, the Panulcillo Company derived less benefit from the "boom" in the metal market than it would otherwise have done. Still the advance in price enabled the undertaking to free itself from debenture debt, and to re-enter the dividend list. Our objeet in referring to the company, however, is not to show what it has done in the past, for that is clearly set out in the report of the directors, and in our account of the proceedings at the meeting; but to call the attention of our readers to the practical, common-sense views, which Sir John Pender enunciated with regard to the future of copper. Those views, we may say without egotism, are exactly those which we have ourselves consistently expressed, in the face of a pretty general coneensus of opinion that the days of profitable copper mining had gone, perhaps never to return. While fully recognising the seriousness of the position, we have never regarded it as hopeless; and we are glad that our opinion is so fully shared by a man of such wide business experience as Sir John Pender.

It is indisputable that during the period of very inflated prices, every pound of copper, new and old, was scraped together and put on to the market, and as at the same time the high prices checked consumption, stoeks rapidly accumulated. In this particular, however, Sir John Pender might have suggested to Mr. Everett that the estimate of 200,000 tons of copper to be cleared off was an exaggerated one; we should say that 170,000 tons would be nearer the mark, and out of that we should have to deduct about 50,000 tons for the normal stock. As we showed last week, our home consumption is absorbing considerably increased quantities of copper, and in other directions a much greater demand has sprung up. On the other hand, it is unquestionable that the supplies are beginning to decline, and at anything like present prices they are likely to decline still further. Sir John Pender quoted an important extract from a Valparaiso circular just received, which states that:—"In all the copper mining districts the tributers have ceased working on their own account, and most of the mining establishments have dismissed the greater part of the labourers, whilst others have shut down entirely; we calculate from 2,000 to 3,000 miners are out of employ, and wages have fallen 25 per cent. all round. At the present rate offered for low grade ores no mines can be worked to a profit, even with lower wages and the present exchange; we look for a falling off in the production from the month of May of at least 50 per cent." The American mines are also turning out smaller quantities of copper; and as trade in the United States is steadily expanding, it is reasonable to assume that the shipments from that quarter to Europe will, in future, be considerably less than they have lately been.

With an increased demand, therefore, we have to look for a diminished supply, so that the production of an equilibrium between the two factors does not seem to us to be so far off an event as Mr. Everett and other pessimists, who look at the matter simply from the point of view of the consumer, regard as probable. Sir John Pender admirably summed up the position when he said, "What both consumers and producers should desire is that the reaction may not be so long delayed as to cause the rebound to be so large as again to check consumption. A priee of about 50*l*. per ton for Chili bars would seem to be the golden mean, and all that is required to bring it about is the adoption of a prudent and definite policy by the leading mines and the present stoekholders. This course seems so self-evident that I cannot doubt of its aeeomplishment, especially now that we have the most distinct evidenee of a very sound and expanding trade in all directions." This is really the common-sense of the matter, and we have reason to believe that the "prudent and definite policy" referred to will very shortly be adopted by the principal producing companies of Europe and America, and by the holders of the stocks which the French syndicate had taken up before the collapse came.

A PROMISING ENTERPRISE — STAFFORDSHIRE WATER-GAS, LIMITED.

IT is obvious from the manner in which the public are absorbing water-gas shares, that in their belief this method of illumination has passed beyond the region of experiment, and has fairly and triumphantly entered into that of practical utility. They are, moreover, shrewdly of the opinion that the companies that appear first in the field with well-attested patents are those that are likely to have the mastery of the situation, and to make the most indelible impression on the popular mind. Some people look at water-gas shares as a speculation, and others as an investment, and though we are disposed to think the latter the wiser of the two, the views of the former are not to be ignored. Therefore, in opening the subscription list of the Staffordshire Water-Gas, Limited (Nicholson's patents), to the public, and promptly closing them, on account of the large applications already received, the directors who endorse this prospectus must be considered wise in their day and generation, and as men who discern the signs of the times in which they live. We have from both the theoretical aud the practical points of view discussed water-gas in our columns on previous occasions, and, therefore, our space is now all the more free to describe a company which appears to possess special merits of its own—merits that entitle it to the attention both of speculators and investors. It is to some purpose the prospectus mentious the undoubted fact that the shares of the four water-gas companies already in successful existence are quoted at a high premium. But the special applieation of their figures to the case in point is to be found, partlcularly from the investment point of view, in the value of the Nicholson patents. 1,000 tons of coke, it is said, by these patents "can be produced, not only frec of cost, but at a profit of 700*l*.," on a basis of calculation given in the prospeetus, and which appears to be reasonable and moderate throughout. By these patents it is claimed that both water-gas and coal-gas can be produced by a simple and economical process. The statement was recently made that at the Leeds Forge three times the produce is derived from the same furnaces with water-gas, as compared with coal-gas, and that the saving is 10,000*l*. a year. The cost of water-gas there was 4d. per 1,000 cubic ft. In brief, the advantages claimed for Nicholson's patents are:—1st. Fuel for the water-gas not only free of cost, but producing a large profit. 2nd. Coal-gas, tar, and other bye-products which more than repay the cost of the coal and labour used in production of the eoke. 3rd. Water-gas made in the same structure as the coke, saving the labour of removing the fuel from coke works to water-gas producers. It would follow from this, as night follows day, that water-gas by these pateuts, if sold at only 2d. per 1,000 cubic ft., must produce very large results. At the Spring Vale furnaces at Wolverhampton, George William Parker (the manager of the coke ovens), states that he has used this gas for more than 12 months with the best results.

The application of these pateuts to the important manufacturing and coal and iron county of Staffordshire is what this company secures, with the right to grant sub-licenses, and receive royalties from corporations and towns, and the owners of manufaetories. A strong board has been formed with the well-known engineer, Mr. Charles James Fox, at its head. The vendor is the promoter, and is to receive 80,000*l*. in cash and shares, under an agreement, which leaves ample working resources for the company, whose total capital is but 120,000*l*., in shares of 5*l*. each. This enterprise, we predict, will have from investors an unusual amount of attention, in which case it will receive that to which its merits certainly entitle it.

WEST ARGENTINE RE-CONSTRUCTION SCHEME. UNANIMOUSLY ADOPTED.

ONE of the most successful re-construction meetings yet held in the City of London was that which took place yesterday in connection with the West Argentine Company. The shareholders received the scheme of the directors with enthusiasm, and adopted it with perfect unanimity. The board feel themselves in a strong position. They are already talking of the shares left unapplied for being issued at a premium, "which will go far to cover the costs of re-construction." A powerful syndicate has been formed, the members of which are anxious for nothing so much as that the shareholders should neglect to take up the shares to which they can lay claim under the scheme of the board. If the shareholders allow the syndicate, or the members of the Stock Exehange (who are buying the shares to the tune of thousands) to step into their shoes, they are sinning against both light and knowledge. We do uot propose to enter into the details of the scheme of re-construction for the double reason that we referred to it last week, and that Mr. Jennings most ably set it forth in his interesting speech at the meeting. He was successful in showing its advantages from the dual point of view of the shareholder as an individual and of the company as a corporate body. It is conceived on somewhat original liues, aud other concerns suffering from what Mr. Hopwood not unhappily termed "the distemper of impecuniousity," might spend time less usefully than in mastering the ingredients of a drug which might heal them of their financial diseases. Of the suecess of the re-construetion scheme there is uot the slightest doubt, and we agree with Mr. Lott in thinking that it is not at all improbable that the days when the shares were 2*l*. 10s. may return. The prospects of the Carolina Miue, and the favourable results attending the development of a small portion of the Seventh Department point to early success. The company has an enormous area of territory, and shareholders were not lacking in their testimony that both at home and abroad it is being honestly and capably administered. We congratulate the directors, and particularly Mr. Jennings, who has borne the chief part of the burden aud heat of day, on the fact that the company may now be regarded as being upon a solid financial basis. It will have a cash balance of 33,000*l*. with which to develop its mines, and we antieipate for it that large measure of success which from all points of view it thoroughly deserves.

PALMAREJO DIRECTORS' REPORT.

IN another part of our present issue we publish the report of the directors of the Palmarejo Company. Considering that there was a time, and that withiu a very recent period, when the company was verging unpleasantly near the rocks, the present board are greatly to be congratulated upon the successful steering which has enabled them to put the ship into smooth water. During the short time they have been in office they have quite doubled the value of the shares, and they have brought the company to a position iu which the vast resources of its property are becoming

utilised to something like an adequate extent. The directors took office without any great promises, but with the intention of working rather than talking, and the present is, we believe the first formal and complete report of their proceedings that they have issued to their constituency, and which in its simple but eloquent details justifies the confidence that has been placed in them. It is an open secret that to bring matters to their present pass the directors have had to make considerable sacrifices, both pecuniary and otherwise, and amongst the latter must be ranked the visit of the chairman, Mr. Pigou, to the property, who, we believe, has just returned, having satisfied himself of the *bona fides* of the concern, and from him, at the forthcoming meeting, may be expected a statement that will both interest and pleasingly surprise the shareholders. The principal anxiety at the present moment is to complete the new mill, for which ample funds are in hand, and the figures of Mr. Moreing, the well-known and highly esteemed mining expert show that in treating what may be called low-grade portions of the ore the net profit will be 80,000*l*. per annum. These ores are described as "practically inexhaustible," and Mr. Moreing states that a second 50-stamp mill will double these returns. In regard to mining work, a most important tunnel is being driven to facilitate the output of ore bodies above and below the Socorro level. The developments here are simply remarkable, and we invite the shareholders and the public generally to read with care what the directors have to say upon the subject. The issue of the report has already advanced the shares, as our tables will show, and between this and the meeting it would not surprise us to see them at par. Certainly it is a wonderful change that has been brought about in Palmarejo prospects, and we should be the last to withhold from the directors the credit to which they are justly entitled.

CONSOLIDATED ESMERALDA AFFAIRS.

THE position of the Durand Mine has been this, that it has had to sustain the burden of the other mines that have been worked by the Consolidated Esmeralda Company. The task presented to the Children of Israel of making bricks without straw was as nothing compared with that set the directors of this company of developing a vast group of mines with a working capital which never at any time exceeded 8,000*l*. The board are now adopting measures by which this state of things will be altered, and of their ability to do so neither they nor we entertain the least doubt. First, the reader should be reminded of what the past history of this group has been. From the surface alone it is stated with authority that bullion to the value of three millions sterling has been taken at a depth not greater than 150 ft. Experience here has shown, as in almost all parts of the world, that mines become richer in depth. In 25 years the Comstock lode of Virginia City yielded 100 millions sterling, and did much to alter the value of the silver currency. Competent authorities have stated that the lodes running through the Esmeralda property are the same as the Bodie and Comstock lodes, but that more bullion from the surface was produced at Esmeralda than from either of the other districts. The directors have largely devoted their attention to the Durand Mine, which has improved as depth has been attained. 2,463 tons of ore have been crushed, producing 5,267 ozs. of standard gold, or over 2 ozs. to the ton, while later indications point to even better results. This mine alone, with a moderate capital, would have paid good dividends, but its produce has been absorbed, as we have said, in developing other properties. The balance-sheet, which will be presented to the annual meeting shortly to be called, will show cash in hand, and to be received, 18,350*l*., with liabilities at the mines 1,000*l*., and everything in full working order. 13,000*l*. will be kept for payment of debentures maturing in June. The directors hold one-fourth of the capital, and their object now is to place the Durand Mine on what it ought long ago to have been—a dividend basis. With this view it will be proposed at the annual meeting to divide the properties into two groups—the one being transferred to what will be called the Durand Company, and the remainder being acquired by the Esmeralda Company. The Durand capital will be nominally 100,000*l*. in shares of 1*l*., credited with 16s. paid, and leaving a liability of 4s. The Esmeralda, which, in addition to 27 mines, will take over the surface works and machinery, will have a nominal capital of 400,000*l*. in shares of 1*l*. each, 17s. 6d. being credited as paid, and the liability being 2s. 6d. per share. Each shareholder will receive one Durand and four Esmeralda shares for every five shares now held, and the liability will be spread over two years. The Durand will thus have a working capital of 20,000*l*. and the Esmeralda, 50,000*l*., whilst the former company can command the use of the machinery. The Durand can soon be made dividend-paying, and the Esmeralda will concentrate efforts on what seems to be the best of its mines, with the view of achieving a similar result. The scheme seems a sound one and, at all events, has this merit, that it will give the directors that working capital with which they have never been properly supplied. What they have been able to do, with the slender means at their command, is so remarkable that they deserve to be entrusted with the capital now sought to be raised. Mr. Colcord will attend the meeting, and interesting statements are expected from him and from Mr. Ann, the manager director.

"GREAT SHE" AFFAIRS.

WE have only space to refer to the second adjournment of the meeting of "Great She" Company, which the shareholders decided upon last Thursday. It is clear from their votes and from their expressions at the last two gatherings, that the directors do not possess the confidence of the majority of them. In the presence of such repeated rebuffs an ordinary board would long ere this have resigned, and the reason this one does not do so must take rank amongst the many mysteries to which "Great She" has given birth. The report of Mr. Furlonge has been received, and we are bound to admit with Mr. Deering that it is a conundrum of the first order. Some reports can be grasped at once, but the document which owns Mr. Furlonge as its author requires digestive powers of no ordinary kind, and the process of assimilation is not rapid. What this gentleman recommends it is difficult to find out, and what he thinks of the property it is a puzzle to understand. We condole with Mr. Deering, Mr. Lewis Levy, and Mr. Brewer, on the prize puzzle they have set themselves, which is likely to occupy them the greater part of the Whitsuntide holidays. We anticipate, however, that these gentlemen will, from the enigma presented to them, evolve something like a common sense plan, which they will be prepared at the adjourned meeting to recommend for adoption by the shareholders. It has, however, become pretty evident that if "Great She" is to be saved stronger and firmer hands must grasp the helm.

THE KEYNOTE MINING GROUP, LIMITED.

THE group of mines which this company has beeen formed to acquire, embracing eight distinct locations, has been most carefully reported upon by experts of position, and particularly by Mr. John Leechman, who in the United States, enjoys a reputation for accuracy of statement and attention to detail. The mines are also mentioned favourably in "Burchard's report upon the production of precious metals in the United States during 1884." They are to be found in Beveridge district of California, and are 15 miles from a railway station. The chief of the group, the Keynote from which the company derives its name has a history that will bear to be told. It has already yielded 60,000*l*. in bullion, and but for the improvident expenditure of those who discovered it it would not have fallen into the hands of the present company. The original owners, finding the mine rich, and believing there was no end to its prosperity, made merry with the proceeds, only to find themselves stranded for want of capital, when it became necessary to do some substantial development work. The mines thus came into the market, and from all we can learn, this company has done well to buy them. The Keynote is worked by adit levels, driven into the side of the mountain, and this is the most inexpensive method of mining that is known. Mr. Leechman's report speaks of 11,000 tons of ore in sight, exclusive of a possible 6,000 tons in addition, and samples have given an average of $21 per ton. There is also second-class ore of the estimated quantity of 4,000 tons. Some of the machinery is on the spot, which will have to be supplemented, and to do this the working capital will, in part, be required. Another portion will be wanted to continue the developments already referred to. The purchase price is small as mines go, 15,000*l*., and so also is the capital of the company—50,000*l*. A good working board has been formed. The solicitors are Messrs. Snell, Son and Greenip, the broker Mr. J. Y. Watson, of Copthall Buildings, and the secretary is Mr. J. B. Palmer, of 110, Cannon Street, who occupies the same position in relation to the Pinos Altos Company, which pays large and regular dividends.

NEW SPITZKOP, LIMITED.

THE shareholders of this company are to be congratulated upon the successful termination of its lawsuits in the Transvaal, which involved claims amounting in the aggregate to 38,056*l*. The most serious of these was the action of Mr. Franck, the company's late agent, who claimed 5,806*l*. for salary and 21,250*l*. for damages, being the alleged value of his shares in the old company. This gentleman obtained an injunction from the Courts restraining the liquidators from transferring the property to the new company, until his claim had been disposed of; and thus as regards development, matters have been completely at a standstill. The claim has, however, been dismissed, and damages awarded to the company, who now have an absolute right to their property. Mr. Heanan (the present manager) has meanwhile been making a careful survey of the property, and has sketched out a plan for its development, for which he estimates a sum of 25,000*l*. will be required. As regards the value of the property, and its capability of being worked so as to yield large profits, Mr. Heanan has no doubt whatever, and he attributes the small returns hitherto obtained to mismanagement. The proposal of the directors to issue preference shares to the amount of 25,000*l*. was approved by the shareholders at the meeting yesterday. These shares will bear a cumulative preferential interest at the rate of 10 per cent. per annum on the capital for the time being paid up thereon, and they are in the first place to be offered to the present shareholders in the proportion of one preference share for every five ordinary. The preference shareholders will have the right of exchanging at any time their preference for ordinary shares. The shareholders will, we have no doubt, see that it is to their own interest to take their *pro rata* portion of this new issue.

THE DOMINION BREWERY CO., LIMITED.

THE remarkable favour with which brewery companies have been received will cause the prospectus of this one to be read with care. Such a process is almost certain to be followed by a filling up of the application form for shares. A further result still flowing from this may be looked for from either the investment or the speculative point of view—in the one case dividends, in the other case premiums. The share capital is 160,000*l*., and the debenture capital 80,000*l*. This company is formed to acquire and further develop the brewery of Mr. Robert Davies, at Toronto, Province of Ontario, in the Dominion of Canada, and known as "The Dominion Brewery." The beer (the ale particularly) is largely consumed, and has won medals at various exhibitions. The brewery premises occupy an area of 71,940 ft. of freehold land, with a frontage of 327 ft. to one of the principal thoroughfares in Toronto, and are all practically new. By the completion of the new building in October, 1888, the capacity of the brewery has been enlarged, so that it is now able to supply the increased demand which until that date Mr. Davies was unable to meet. The price to be paid for the brewery is 190,000*l*., which will leave 50,000*l*. for working capital. The property is freehold, and the services of Mr. Robert Davies have been secured as manager for three years. Additional confideuce will be given to the statements of the prospectus, seeing that they are vouched by a highly respectable firm of accountants. The board is practical, and the shares appear to offer a desirable investment. The subscription lists will close on Tuesday—possibly before.

TERRA COTTA FIRE-AND-SOUND-PROOF BRICK CO., LIMITED.

THE employment of fire-and-sound-proof bricks in the construction of our houses and buildings will supply a long-felt want and be welcomed as a boon and a blessing by many. The absolute failure of the usual fire-proofing system has led architects and builders to employ such substances as asbestos, silicate of cotton, or slag wool for protecting and casing iron girders and columns against fire; but we advance with the times, and terra cotta porous bricks are henceforth to be the order of the day. Not only are they non-conductors of heat and cold, but a 4½-in. wall will furnish complete isolation against sound—a great desideratum in schools, offices, hospital wards, and dwelling-houses. That this is no mere flash in the pan we may rest assured, When we glance at the list of eminent architects and builders who have given it their uuqualified endorsement. Terra cotta porous bricks have acquired a great reputation on the other side of the Atlantic, they having been used in the construction of some of the largest buildings. The promoters believe that they can be manufactured in this country at a price which will be little in excess of the cost of common bricks. The Parent Company of Chicago, Illinois, U.S.A., which has been in operation less than three years, and has licensed, so far, 25 sub-companies, earned for the year ending March 1st, 1889, from licenses and royalties, upwards of 20 per cent. on 240,000*l*., the capital of the company. The capital of this company is 200,000*l*., in 28,000 preference and 12,000 ordinary shares of 5*l*. each, and the patent rights for the United Kingdom are to be acquired for the sum of 50,000*l*. in cash, 4,000 fully paid-up preference shares (or cash, at the option of the board), and 12,000 fully paid-up ordinary shares, which will not receive any dividend until a cumulative dividend of 10 per cent. per annum has been paid on the preference shares. The list opens to-day, and will close on or before Tuesday next.

THE METROPOLITAN DISTRICT BREAD CO., LIMITED.

THIS company has been formed to take over 70 old-established baker's businesses, now said to be yielding net profits of 19,703*l*. per annum, and also a steam flour mill, which with the present trade of 1,237 sacks per week, secured by the shops, will yield (*vide* accountants' certificate) further net profits of 4,020*l*. per annum, or in all 23,723*l*. per annum, "equal to over 18 per cent. on the capital of the company, which income is expected to considerably increase." The capital is 130,000*l*., in 26,000 shares of 5*l*. each. payable by instalments. The directors are business men, and understand the nature of the trade they are to carry on, and the broker is Mr. J. Yelloly Watson. It should be remembered, in regard to an investment of this kind, that the Aerated Bread Company's 1*l*. shares are now quoted at 5*l*. to 5*l*. 5s. per share, or 400 per cent. premium, the last dividend paid by the company being 25 per cent. per annum. Similar companies have also been most successful. The price fixed by the vendor for the freehold bakery, flour mills, including all machinery and plant, with the fixtures, fittings, leases and goodwill of the 70 shops is 115,606*l*., of which two-thirds will be payable in cash, and one-third in shares or cash, at the option of the directors.

THE MONEY MARKET.

CITY, FRIDAY EVENING.

THE ease which last week was thought by some sufficieut warrant for the directors to reduce the Bank rate to 2 per cent. has given way to a firmer tendency, thus justifying their inaction. A steadier tendency was at first observable, and bills, after being 1¼, have improved to quite 1⅜ per cent., while money which had been lending at ¾ per cent. was in demand at 1½ per cent. This, of course, was partly promoted by the recurrence of the settlement, but the demand on this account was far less than of late. Heavy calls have fallen due this week, the total reaching 4,830,000*l*.—three millions of which are due on Saturday—but the main factor in the case is undoubtedly the gold demand for France, the exchange having fallen to gold point. All arrivals have been absorbed, and recourse has been had to the Bank, whence French gold coin has been taken, although the Bank had advanced its price for "Napolcons" by 1d. per oz. The shipments from New York, however, have been extensive, and will help to meet the draiu. The supplies are partly for the Exhibition tourists, and partly to pay for American Stocks bought in this market. The Bank return, with an export of 58,000*l*., on balance, shows an improvement of 76,000*l*. in the Reserve through a reflux of notes and coin from circulation, and the total now stands at 15,156,000*l*., against 12,210,000*l*. at this time last year, while the proportion is 42½ per cent. of the liabilities. The publie deposits have declined 214,000*l*., but the private deposits have iucreased 120,000*l*., although the private securittes have off 208,000*l*.

Money has continued in demand run to-day, chiefly in preparation for the sundry heavy calls due to-morrow, but the supply was good, and short loans have been borrowed at 1 to 1¼ per cent., while bills were discounted at 1⅜ for three months, this manifest firmness being the result of the continuous weakness of the Paris Exchange on London aud further withdrawals of bullion on that account.

At the Bank this afternoon, 126,000*l*. in French gold was sold, and 20,000*l*. in sous was taken for Portugal; but 50,000*l*. also in sous was received froui New Zealand. The price of silver was steady, and Rupee Paper dull.

Business at the Stock Exchange during the past week has been particularly quiet, dealers being occupied with the arrangement of the fortnightly settlement, which was satisfactorily concluded. The closing of the Continental Bourses and the New York market on Thursday also tended to restrict the volume of business. Taking all things into consideration prices have been fairly well maintaiued. The rates for "carrying over" speculative bargains until the next settlement (June 14th) ranged from 1 to 3 on Foreign Government Bonds, and from 2½ to 3½ per cent. on American Railway Securities. The Comte and Comtesse de Paris have celebrated their silver wedding during the week. The mere report that King Humbert would visit Strasburg caused quite a panic upon the Paris Bourse last Saturday, and the Press of all shades of opinion were very bitter in their comments upon the affair, at any rate the report has not been realised, and the King is back amongst his own subjects. The Bourse recovered from its scare, and prices reverted to their previous level. Although all the leading men of Europe desire peace, it shows what a little thing may cause all peaceful intentions to be upset, and bring about a disastrous war, hence the Government are to be congratulated on the success which has hitherto attended the passing of the Naval Defence Bill. The Funds have been steady but Foreign Government Loans have not been so firm, and most descriptions have risen ¼ to ½ per cent. Peruvian were extensively dealt in on reports that Chili regarded the claims of the bondholders in a favourable manner. Home Railway Securities were well supported, owing to some good traffic returns, the firmest market being Metropolitan, which have risen 1½; the District rising ¾, in anticipation of the increased traffic derivable from the extensions to be opened shortly. Reports that it was intended to "split" various stocks caused a smart recovery in the heavy lines, notably Midland. At one time it seemed as if the long expected "boom" in American Railway Securities had set in, but many dealers in their haste to secure profits caused a general reaction, still leaving, however, a fair advance as compared with last week. Grand Trunk deposits rallied on the traffic return, but the best values were not maintained. Mexican Preference issues, which are now quoted ex the dividend show a fall of ½ to 1½. Cable stocks were particularly good, but attentiou in the Miscellaneous section has centered in Leeds Forge and Water-gas Shares, which have fluctuated at times quite violently.

Business to-day has not been active, and the changes throughout are unimportant. The Funds have remained at yesterday's levels, and Indian Government, Colonial Inscribed, and Home Corporation Securities were likewise without appreciable alteratiou. Foreign Government Bonds were, if anything, rather firmer than yesterday. Greek Bonds being particularly good on the success of the Conversion Loan. Russian Bonds were also conspicuous with a rise of ½ per cent., while Colombian Bonds were as much lower. In other cases the changes were restricted to ¼, and about equally divided. Ecuador, Mexican New, and Ottoman Defence being up, while French Rentes and Uruguay Six per Cents. were that figure lower. Home Railways for a time maintained, and even improved, on yesterday's firmness, but a reaction just before the close almost counteracted the effect of the earlier dealings, and apart from a rise of ⅜ and ⅝ in Caledonian and North British Deferred, and ½ in Midland, the changes were quite fractional. American Railway securities were almost neglected, but continued firm until the receipt of advices from the other side. Milwaukee, Louisville, Mexican Central Bonds, Norfolk, aud Western and Northern Pacific retained ¼ to ½ of the advance, but Erie issues, Atlantic Firsts, New York Central, Pennsylvania, and Wabash issues were as much lower, Grand Trunk stocks were good, but Mexican were depreciated. Dealings in minor departments were slight. and the variations unimportant.

Annexed are the final quotations to-day:—Consols Account, 99, 99⅛; Egyptian Preference, 103¾, 104; Egyptian Unified, 91¾, 91⅞; Freneh Four-and-a-Half per Cents., 102½, 104; Hungarian, 87⅛, 87⅜; Italian, 96⅜, 96⅝; Mexican Scrip, 96¼, 96¾; Peru Five per Cents., 15¼, 15½; Peru Six per Cents., 17, 17¼; Russian, 1873, 103¾, 104; Portuguese, 67¾, 68; Spanish, 75⅛, 75⅛; Turkish, 1871, 94, 94½; Turkish Defence, 101, 101½; Caledonian, 119¾, 120; Great Eastern, 77⅜, 77⅝; Great Western, 161¼, 161½; Brighton "A," 156½, 156¾; North-Western, 184¼, 184½; Metropolitan, 90½, 91; Metropolitan District, 36½, 37; Midland, 145⅜, 145⅝; North British, 56⅛ 56⅜; North-Eastern, 174⅜, 174⅝; South-Eastern "A," 116⅛, 116⅜; Grand Trunk, 10½, 10⅝; Ditto First Preference, 70, 70¼; Ditto Second, 49⅞, 50⅛; Ditto Third, 26⅜, 26⅝; Mexican Ordinary, 50½, 50¾; Canadian Pacific, 56⅞, 57⅛; Denver, 17⅝, 17⅞; Erie, 29¼, 29½; Milwaukee, 74⅞, 75⅛; Lake Shore, 107¾, 108; Louisville, 71⅛, 71⅜; Atlantic First, 33¾, 34; Ontario, 17⅞, 18⅛; Ohio, 22½, 23; Norfolk and Western, 54, 54¼; Northern Pacific, Preference, 67, 67¼; Reading, 23¾, 24; Reading Bonds, 84⅛, 84⅜; Union Pacific, 62½, 62¾; Wabash Preference, 29½, 29¾; Ottoman Bank, 11⅜, 11⅝; Anglo-Telegraph, 53½, 54; United Telephone, 15⅞, 16⅛; Hudson's Bay, 21⅛, 21⅜; Suez Canal, 93, 93½; Guinness, 31⅛, 31⅜; Allsopp's, 8⅞, 9⅛; Bryant and May, 13¼, 13¾; Water Gas, 6, 6½ pm.; Hull and Barnsley, 33, 33½; Leeds Forge, 9¼, 9¾; British North Borneo, 14½, 15; Oriental Estates, 1⅛, 1⅜; City of Mexico Five per Cent. Loan, 83½, 84; Tarapaca Water, 13¾, 14.

REPORTS OF MEETINGS.

THE WEST ARGENTINE GOLD CO., LIMITED.

RE-CONSTRUCTION SCHEME RECEIVED WITH ENTHUSIASM, AND CARRIED IN ITS ENTIRETY—A SYNDICATE WILL TAKE UP THE SHARES IF THE SHAREHOLDERS DO NOT—EXCELLENT MINING PROSPECTS.

AN extraordinary general meeting of the company was held at the Cannon Street Hotel yesterday, when an arraugement was submitted for the approval of the shareholders for the purpose of effecting a re-construction of the company, and a transfer of its property and business to a new company under section 161 of the Companies Act, 1862—T. J. Hopwood, Esq., chairman of the company, presided.

Mr. W. P. Owen (secretary) read the notice calling the meeting.

PREFERENCE SCHEME FAILS.

The Chairman: Gentlemen, the matter of re-construction was fully discussed by you at the last meeting, and its principle was then definitely adopted. We then laid before you two schemes. One was that we should raise 30,000*l*. worth of preference shares, 5s. value; also that we should make a call of 2s. 6d. upon all the ordinary shares. This was sanctioned by you, and the necessary applications were sent out, but the response was quite insufficient. The next scheme that we placed before you was much more drastic, that is, calling up 5s. a share. This, as I gathered from the meeting, seemed the more popular of the two, but, at all events, we determined, as the meeting sanctioned it, to try the first scheme as a beginning. It failed, and we fell back on the second, when, after considerable consultation amongst ourselves, and taking all necessary advice, we were suddenly offered from the outside by

A POWERFUL SYNDICATE

to take up the whole of the capital in the event of the shareholders not taking up their shares. We considered this for some time, and in the result thought we could not do better than accept the scheme, subject to your confirmation.

SCHEME DESCRIBED.

The scheme is this—that the capital of the company should be increased from 100,000*l*. to 150,000*l*.; that each shareholder should be at liberty to take up his shares accepting a liability of 4s. 6d. for each share, but in addition to that, that he should be entitled for every two shares he holds in the present company to apply for another share in the new company, so that for every two shares he would be entitled to apply for three. For these he would have to pay 4s. 6d., and not 5s. as originally proposed. The syndicate have undertaken this matter upon very reasonable terms, and I think we have every reason to be satisfied with the arrangement. Of course this would include the distribution of shares in the subsidiary companies after the new company is formed, subject to the ratification and wish generally expressed of the shareholders themselves. One or two people have opposed this, and others are in favour of it, but of course the new company would do nothiug without your sanction. Suggestions have been made about

STRENGTHENING THE BOARD.

No one would welcome an accession of strength more than the board. We have been acting upon the principle of economy, and when Genl. Agnew left us we did not fill up his place, because we wanted to cut down expenses to as low an ebb as possible consistent with efficient management. (Hear, hear.) We have done our best. We have worked very hard, although I believe some of the shareholders have thought it would have been better if we had had extra hands to help the ship along, yet it is only about a year and a half ago since there were all kinds of pleasant rumours as to testimonials and votes of thanks, and I do not know what else. Not that the board were willing to accept anything tangible, but they were pleased to know that their services had been appreciated. What has happened since is not the fault of the directors, the shareholders or the general manager (for no one has ever been able to lay a finger on him yet), but it is really the fault of the geological formation of the vein. which fell off in quality, contrary to all our expectations. We were all complimented on our energy before, and I do not see why the geological fault of the Carolina should make us any more to blame now than we were then. We have made offers to many eminent and most eligible gentlemen, but this re-construction coming forward, it will rest with the new company and the syndicate in the first place to appoiut the directors, who will be subject to confirmation at the statutory meeting held four months after registration. If any shareholders are not satisfied with the names of the gentlemen then appointed as directors they can make any alteration they think desirable, but, of course, new directors must be appointed before the company floats. The old company will not hand over the property without carefully revising the articles of association, and seeing that all preliminaries are perfectly satisfactory. We hope that if the shareholders help us through with this new scheme to have about 30,000*l*. of capital, if the whole of the shares are taken up. This would enable us to develop the Carolina vein aud also to execute the works upon the Seventh Department, which are considered very encouraging, and particularly in this new San Antonio Mine. We have had very little capital indeed with which to work that Seventh Department; but if the new scheme be carried through we shall have all that is requisite, and we hope to make it as great a success as we hope also to make the Carolina. (Cheers.)

COMPANIES AND THEIR DISTEMPER.

Most companies seem to me to have to go through the stage of infantile diseases, and like animals have what is called the distemper. I very often ask now whether a company has been re-constructed; in other words, has it had the distemper; because nobody will buy an animal who understands the subject without enquiring whether this has befallen it, for if it be known it has, it is likely to have longer vitality. So I trust it will be with the re-coustructed West Argentine Company. When I met you a year ago I had not the slightest suggestion that any such thing as re-construction would ever enter our heads, for if we had only been going on at the rate we were after Col. Howard and I left the mine, we should have done exceedingly well. The returns had increased monthly until we were getting about

400 OZS. OF GOLD PER MONTH,

and if this had gone on there would have been no such thing as re-construction. Of course we are not responsible for the change, and I can only say that in the last accounts where Mr. Allen has had the opportunity of investigating for himself in the matter of sinking and working on the Seventh Department, that the advices now are very much more encouraging than they were six months ago. We are down 60 ft. below the adit level, and the quality of quartz has increased in value. The last time I had the honour of addressing you there were doubts even in Mr. Allen's mind—doubts which I placed before you—as to whether the Carolina vein could be really considered a true fissure vein, or whether it was simply a crack in the ground filled up with auriferous matter, but as he has deepened the shaft the quality of the ore has improved, and we are disposed to think that what we feared will not be the case, and that instead of a mere deposit we shall have a true fissure vein.

SAN ANTONIO LOOKING WELL.

On the San Antonio considerable progress has been made, and the prospects are very encouraging. In the last letter from Mr. Allen, dated April 22nd, he sends a code word by which he wishes to convey that the amount of gold and the quartz exposed will amply repay us for the trouble and expense of removing the 10-stamp battery to the Seventh Department to work San Antouio. It would take a very long time to move the 10 heads at present at work on Carolina to the Seventh Department at San Francisco. I may tell you that now the 20 heads are about completed, and from the advices we have as to when the shafting arrived at Buenos Ayres, we may anticipate that the new stamps will all be at work in the course of the month. Mr Allan then hopes that the outturn will be very much in excess of what it is now. I have thus generally placed the prospects and the details shortly before you, but our business to-day is on the matter of re-construction. If there are any questious I shall be glad to answer them, and may have the assistance of Mr. Jennings in so doing. I beg to move the resolutions as follows:—

RESOLUTIONS.

(I.) "That this company be re-constructed, and that the liquidators be empowered to sell and transfer its business property and assets, subject to its liabilities, to a new company to be formed to purchase the same under the 161st section of the Companies Act, 1862, subject to the following conditions:—(1) That the nominal capital of the new company be not more than 150,100*l*. in shares of 1*l*. each. (2) That the new company issue to the liquidators of this company, or their nominees, 150,000 1*l*. shares in the new company, with 15s. 6d. credited as paid thereon. One shilling per share further to be paid thereon on taking up the shares. (3) That the new company undertake all the debts aud liabilities of this company, including all costs and liabilities of the proposed sale and transfer and of the winding-up of this company, or otherwise, to arise out of the sale, transfer, or winding-up, except such as may be payable by other parties. (4) That the liquidators be empowered to deal with the interests of the existing debenture-holders as they think best, and to enter into any arrangements they may think expedient, with respect to the discharge of the debts and liabilities of this company, and otherwise subject to the conditions aforesaid. (5) That the liquidators offer to each shareholder in this company three of the new shares for every two shares held by him in this company, such offer to be accepted by the shareholders within 14 days after the date of the confirmatory resolution, and the acceptance to be accompanied by the payment of 6d. per share to be paid over by the liquidators to the new company. If the offer be not accepted. or the 6d. per share be not paid within the said 14 days the offer to be treated as declined. (6.) That the liquidators dispose of the balance of the 150,000*l*. shares not accepted as aforesaid in such manner, and for such price (if any) as they may in their discretion think expedient, either by way of tender amongst the shareholders in this company, or otherwise. but having regard to any arrangement they may think best to make with the existing debenture-holders, and with power to dispose of any ultimate balance of such shares to a syndicate on such terms as they may think fit. (7.) That the liquidators have power to agree to any modifications of this re-construction scheme which they may think expedient."

(II.) "That the present company be wound-up voluntarily under the provisions of the Companies Acts, 1862 and 1867, and that Col. Samuel Lloyd Howard, a director, and William Parker Owen, secretary to the company, be and they are hereby appointed liquidators for the purpose of such winding-up, at a remuneration of 100*l*., with power for each in the case of death illness, or absence from England, of the other of them, to act alone in the liquidation. In the event of this scheme being abaudoned in the discretion of the liquidators, on ground of non-adoption by directors of new company of the proposed purchase, or if an insufficient number of new shares being accepted by the existing shareholders or otherwise, the liquidators to be at liberty to pay all expenses, and if they consider the same advisable to apply to the Court to stay the winding-up."

A WELL CONSIDERED SCHEME.

Mr. Samuel Jennings (managing director): In seconding the resolutions now proposed for your adoption, I venture to place before you a few serious points, for which I claim your careful attention. The scheme which has been most carefully considered by your directors requires to be looked at from two distinct points of view, first—as to its bearing upon the interests of the company as a whole, and therefore the interests of all the shareholders as a corporate body; and second—as to its bearing upon the iuterests of individual members. I take it that the first duty of directors is to consider their action in respect to the corporate interests entrusted to them, and when they are quite satisfied on this point, then to take individual interests into their consideration to harmonise the latter as far as they are able to do so with the former; and, lastly, to deal as tenderly aud liberally as they can. with special cases. Happily, in the present instance, there is no conflict of interests. That which affords the most certain relief to the company in its present situation is also the most advantageous to the shareholders.

ENORMOUS AREA OF PROPERTY.

When we think of the enormous area over which we hold exclusive

rights in the 2nd department, over hundreds of square miles of metalliferous country, and in the 7th over 5,000 square miles, of which we know no more than a mere fraction, the only wonder is that we have been able to do so much with so small a capital. Our policy has been to attempt nothing beyond our strength. We determined that the great workings in the Carolina vein, traceable as it is for miles and penetrated to a depth of 200 ft., the richest parts being the deepest, was the sheet anchor of the undertaking, this we resolved to work ourselves. Outlying properties we hoped would be worked by subsidiary companies, and we have consistently held to this plan, and not without success. First we parted with Canada Honda, the Rio De La Carpa, and also of two or three other mines which have been taken, one by the Extensions Company, and another by the Glenrock, and in this way we have got our properties and have been able to form an opinion on them by preliminary survey, taken over by other people who have employed their own capital to develop them. In each case the whole of the subsidiary companies pay to us a royalty upon what they get out of the mine, irrespective of what it costs them. (Cheers.) We then acquired the great Seventh Department concession almost reluctantly, because our area was already infinitely larger than we could do anything like justice to. Still, in alien hands it would have been a thorn in our sides, and would have introduced serious competition, and raised our rates of labour, transport, fuel, and stores, and we did right to acquire that concession, and we strove to finance it in friendly hands, but fortunately for us, as it turns out, we did not quite succeed. In it we have recently proved two or three excellent properties, which our manager tells us may be expected to pay for their own development by crushing surface ore. Not many mines we know of could do the same.

SEVENTH DEPARTMENT WITH A CONDITION.

But attached to this concession is one condition which we must fulfil, and that is that by October next we must certify to the local government that we are supported by a certain amount of subscribed capital. If we cannot do this, we must forfeit our privileges, and I am sure that you would none of you wish us to do that. Now how could we provide that needful capital by any means other than that we have just recommended. Could we form a new company? No; not except on terms that would leave you nothing worth keeping. Could we borrow such an amount? You know we could not. With our own shares at ¼, were we likely to get any taken up at par? We tried it and gave you the opportunity; yet the response was quite inadequate.

2 OZS. OR 3 OZS. TO THE TON.

But there was another consideration. The value of that Seventh Department has been considerably increased since the drop in the value of the quartz at Carolina. The result, Mr. Allan says, of the judicious expenditure of a small amount of capital in prospecting—(a few hundred pounds)—has shown us, in two or three places, ore deposits worth 2 to 3 ozs. per ton. (Cheers.) In one place he mentions at least 100 tons of 2 oz. ore in sight at surface. (Cheers.) What there may be below he cannot tell us, but that is by no means a bad prospect to start with. Then, again, our subsidiary companies ought soon to be showing results, and their shares, at present almost unknown, may soon acquire a very tangible value. He had noticed that the Central Argentine commenced their sluicing yesterday, and he hoped great things from that company. Taking these things into consideration, we were not surprised there were friends of the company who felt that the situation was far from desperate, who amongst themselves devised the plan of re-construction which is now before you, coupling with it a guarantee that every share should be taken, and very many, even at a premium, if we would follow the course they suggested. They valued our assets something in this way:—

Your mines have cost you approximately	30,000*l.*
Machinery, buildings and their transport	30,000*l.*
You have spent in development and prospecting...	25,000*l.*
You may take as enhanced value of Seventh ...	10,000*l.*
You hold 53,000*l.* shares in other companies ...	53,000*l.*
	148,000*l.*

Call this £120,000.

FINANCIAL STATEMENT.

In addition to which you want about 30,000*l.* to work the Seventh Department, which makes in all 150,000*l.* Very vell, we will give you 150,000 shares, crediting you with the value of your assets, say, 15s. 6d. per share, which works out 116,250*l.*, with a liability on each share of 4s. 6d., equal to 33,750*l.*, total, 150,000*l.* Now, you will observe that we are thus placed in the position to distribute among our shareholders the sum (nominal) of 16,250*l.*, more than the nominal capital of the present company. It is in fact a part payment on account of profits accrued in sales of properties to the subsidiary companies—profits we should have distributed long ago had we had the power to do so. We transfer these shares to the new company, which will take power to distribute profits in specie, and you may therefore expect such a distribution in due course. Now as to the Seventh Department and the financial condition I have referred to. We have funds at our disposal in the Glenrock Company, in the West Argentine Extension, and this scheme affords us, together with the others, an amount in excess of that stipulated, and we hope that the directors of the new company will push developments of these fresh mines with all vigour. The success of our associated companies will be our own success. In each case royalties are contracted for, and I trust the way will be paved for more enterprise of the same nature. (Cheers.) I think I have shown you that the scheme is one of sound financial sufficiency, and that it deserves your hearty support. It ensures to us an ample capital, it provides for the ratification of the Seventh Department concession, and, so far as any man can foretell, it will enable us, or those who may succeed us in the management, to accomplish the success which all of us believe is still before us.

POSITION OF INDIVIDUAL SHAREHOLDERS.

But I must crave your indulgence while I attempt to show you that your interests as individual shareholders will be best served if you join heartily in the carrying out of the scheme. Let me commend to you attention a few figures on this subject. You get three shares for two. The nominal value of your two shares is 40s., but if you multiply 15s. 6d. by three you will find that you are credited with 46s. 6d. Consequently, you may call that a bonus of 3s. 3d. per share. That accounts for 60s. as against 40s., leaving a liability on the three shares of 13s. 6d. Now, these are far better terms than the drastic scheme to which the chairman alluded, because then, if you had done your duty, you would each have taken a 5s. preference share, to which would have to be added the 2s. 6d. we proposed to leave on call on the old shares, which amounts to 7s. 6d. on each share, whereas under the present arrangement 13s. 6d., if divided by two, leaves you a liability of 6s. 9d. against 7s. 6d. by the former scheme, so that from the individual shareholder's point of view I contend that this scheme is infinitely better than the other one. You may acquire an additional share in the open market by purchasing it, and you would have to give less than 13s. 6d. for it, taking into consideration the difference in value between the old shares, with all the risks and uncertainties of reconstruction before them (and they are not a few) with the new shares, and 30,000*l.* of working capital at their back. (Hear, hear.) What is the real value of a share? It is that which backs it. Why have our shares fallen? Because it is known that we have no capital. What is the good of having the finest mine in the world if we have no money to work it. What is the good of having the gold a few feet below the ground, if for want of money we cannot sink to get at it. Therefore our shares have fallen in value, but

TAKE THE SAME SHARES WITH 33,750*l.* BEHIND THEM,

and all the possibilities (I would rather say the probabilities) that 33,750*l.* may earn for us, and then think of the different price the shares will be. Each shareholder is not only entitled to three shares for every two but invited to tender for such shares as may be left. The syndicate have based their hopes, let me tell you, on the shares which may be left unclaimed. No one can predict how many will be left. I hope there will be very few, but once again the directors have protected your interests by contracting that the syndicate shall not step in until you have had the right to refuse them at whatever premium you chose to put upon them. What premium are they likely to be worth over and above the 1s. per share which they will cost you? I take it that the action, touching our shares on the Stock Exchange is rather significant.

SIGNIFICANT.

Judging from the transfers that had been coming in it seems to me it is the brokers on the Stock Exchange who are buying our shares. Why are they buying, within the last three or four days, our shares so freely. No fewer than 3,000 or 4,000 shares have changed hands and mainly gone in for those of the Stock Exchange. It is because they want to get the right you have of tendering for these shares. They buy our shares to acquire the right of tendering for the new ones as shareholders. I much misjudge the shareholders of this company if they are not capable of protecting their own interests.

A SHAREHOLDER: Into whose pocket will that premium go?

A SATISFACTORY REPLY.

Mr. JENNINGS: Into the company's pocket. (Cheers.) I trust, and I think we shall find, that the premium which is offered to us for these shares will go a very long way to pay the expenses of the reconstruction of this company. I second the resolutions which have been placed before you. (Loud cheers.)

VIEWS OF SHAREHOLDERS.

Mr. LOTT: This matter was put before me not long ago, and I was very favourably impressed by two points. I have found by experience that it always pays people to join a re-construction, and I think in this case it is not unreasonable to expect a return of the days when our shares stood at 2*l.* 10s. each. I have seen extraordinary things in mining of this kind, and I expect to see them again. I have been struck, on looking carefully into matters, with the honesty of the management. (Loud cheers.) The company may have been unfortunate, but it has been managed with scrupulous honesty. I have made independent inquiries as to the management on the other side, and the replies have been satisfactory. It is economical, trustworthy, and scientific, and you may rely upon it that the present manager is doing the best he can. When I consider the possibilities before us, and our enormous area of ground, I was perfectly astounded when first brought face to face with the facts. We ought to have a hundred; yes, a thousand stamps going. (Cheers.) My experience of West Argentine shares of late has been that there are none to be had. If any gentleman present does not wish to keep his shares let him leave his name with Mr. Jennings, and he will hear of a buyer. (Cheers.)

Mr. GASKELL: Why are three shares given? I work out the calculation that there should be five for three, and that if only you give three for two, 15,000 shares are not provided for. I am glad to hear Mr. Jennings say that the premiums will go into the pockets of the company, because I thought they would belong to the syndicate. Belonging to the company they will provide funds for the dissentient shareholders as well as for the cost of re-construction. I do not think after the encouraging statement of Mr. Jennings anyone will take the *role* of a dissentient.

OPINION OF ONE WHO HAS LATELY SEEN THE PROPERTY.

Mr. HENRY ST. JOHN WILEMAN: I can scarcely imagine there can be any dissentient shareholder. After the very clear exposition of the scheme given to us by the chairman and Mr. Jennings I feel assured that no shareholder will be found who will abandon his shares, for the present sacrifice we will have to make. I returned to the mines two months ago. I was delegated to go there by my colleagues—the directors of the Central Argentine Goldfields and the Central Argentine Exploration Company with the view to organise the work of these two companies. I visited the Carolina mines, and rode over and inspected mostly everything. I did not visit the seventh Department but received most full details, both in writing and otherwise, and likewise samples of the ore from Mr. Allan and other persons. It may be interesting for you to know what my impression is of the position of the West Argentine Company in relation to its work at Carolina Mine. You have everything there in the shape of preliminary work done. You have a thoroughly good road which can be used the whole year round. You have a full equipment in respect to tramway with all the preliminary works finished. All you require is sinking, and I am of the opinion that this ought to have been commenced 12 months ago. To-day, the

position of this company, in relation to the Carolina Mine could not be better. You have 10 stamps already completed, and 20 additional heads may be at any moment advised as ready. The mine is improving as sinking is progressing. I think it is a most important feature that at 60 ft. below the level you are obtaining an improvement in the grade of the ore. This not only points to the mere possibility of obtaining ore of the higher value, but also the almost certainty that the whole of that important lode will turn out of the same charaeter. Where the Glenrock has been operating, there is no reason to believe that the lode in depth may not turn out of the same character as the lode on which the West Argentine Company is now sinking, and so in respect to all the adjacent seetions. I am very pleased to inform the meeting that, so far as I am concerned, I have the fullest confidence in the future, and have never failed in my belief that, as we go deeper, so will we find improved the quality of the ore. A word as to the Seventh Department. The character of the country and the rock is different from that which rules in the Carolina. I have specimens showing gold freely. You have to my knowledge 21 different claims on which superficial work has been done by the ancients. Exploratory work has already proved that there is every prospect of sound and solid suecess in every one of the 21 claims. I discussed many matters with Mr. Allan, and found him in every sense

A MAN OF HIOHEST HONOUR.

Technically, he is a man in whom I could place every confidence. He is almost a pessimist, and altogether I agree in the expressions of confidence in hiun to-day. I can congratulate the board upon the eharacter of the re-construction scheme. The present position is simply attributable to the fact that they did not sink upon the lode long ago. They are now doing so, and they will in a short time retrieve the position.

A SHAREHOLDER: Is the ground virgin soil, or are there any old workings at San Antonio? How long is this eoncession of the Seventh Department to last. I presume there are no prospects of our being called upon to pay the 15s. 6d. credited as paid.

CHAIRMAN'S REPLY.

The CHAIRMAN: There are 10,000*l.* of debentures, and shares have to be provided for them, for they have a right of exchange at par. That will account for the difference. We shall leave it to the shareholders in the new company as to whether they approve or disapprove of the distribution of those shares. Mr. Allan's predeccssor was not so well versed in the technical part as our present mine manager. Mr. Allan quickly said that sinking ought to have been commenced long ago. There have been vigorous workings, particularly at Incantadora. The concession of the Seventh Department would expire in Oetober, but it becomes ours if we eau show we have sufficient capital to work it. The matter has been gone carefully into, and Counsel's opiuion is clear that no one will be liable for the 15s. 6d. unpaid.

The resolutious were then carried *en bloc* unanimously, and amidst cheers.

The CHAIRMAN then proposed the second resolution.

Mr. STUTFIELD seconded the motion, which was carried unanimously.

The CHAIRMAN: The latest news from the Carolina is this—the reef seems better at 50 ft. than at 20 ft. below adit. In the prospecting of the Seventh Department we cannot expect to have a good vein as the end is only a few feet from the surface. We are not far from the treneh where the ground has averaged 1 oz. 7 dwts. 9 grs. I do not anticipate definite results until the adit is at least 300 ft. deep. At present we have ouly two foreign miners at work. It is a great pity that funds will not admit of more. We ought to have three shifts; we could then calculate on 60 to 70 ft. of driving, and obtain good information in three months.

A cordial vote of thanks to the chairman closed the proceedings.

NEW SPITZKOP, LIMITED.

SUCCESSFUL LITIGATION—SHAREHOLDERS DECIDE NOT TO LET OTHERS REAP WHERE THEY HAVE SOWN—25,000*l.* PREFERENCE SHARES TO BE ISSUED, AND THE PROPERTY TO BE DEVELOPED.

AN ordinary general meeting of the shareholders of the above company was held at Winchester House, Old Broad Street, London, E.C., yesterday.—Morgan Lloyd, Esq., Q.C., presiding.

Mr. EDWARD O'DWYER (secretary) read the notice convening the meeting.

LAW SUITS.

The CHAIRMAN: Gentlemen, when we met here in October last you were informed of the then position of affairs. You were told of the very serious litigation that was then goiug on involving large sums of money. At that time all we could say was that we believed the company was right in both actions, and that in all probability we would be successful. But you were told that owing to the different kind of jurisprudence which exists in the Transvaal from the law that we are accustomed to in this country there was an element of uncertainty in the matter, and until the final issue we could not say with positive certainly that the company would be successful. I am, however, glad now to be able to inform you that the company has been absolutely successful in the litigation between itself and the late agent, Mr. Franck, and substantially successful in the litigation with the old diggers—Silo, Tate and Stanley. (Cheers.) As regards Mr. Franck—he had no doubt a contingent claim against the old company, because he was entitled to a certain salary on a condition which was never performed, but still it was a condition which under other eireumstances might no doubt have entitled him to a considerable sum of money. He refused a very reasonable settlement that was proposed on behalf of the company by Mr. Matthews thinking that he would be suecessful in the litigation which he commenced, and in consequence of that he brought an aetion against the liquidators of the old company, claiming between 5,000*l.* and 6,000*l.* for arrears of salary as ageut for the old company, and upwards of 20,000*l.* as damages for not being allowed, as he said, to get the value of his shares, which he reckoned at their full value. He obtained an injunction from the Courts in the Transvaal to prevent the liquidators from transferring the property to the new company until his claim had been disposed of. I am glad to inform you that the Court having eonsidered the matter fully, found that Mr. Franck had no claim whatever against the company, dismissed the ease and awarded costs to the company against Mr. French, which he has not yet paid. We have, however, given instructions to our agents there to insist upon the amount of the costs being paid.

THE DIGGERS' ACTION.

With regard to Silo, Tate and Stanley—they had made a claim some years ago against the old company, and had obtained an award by a Goverument referee of 11,000*l.* for being disturbed in their diggings by the company on attempting to take possession of the land. That claim was substantially negatived in an action which was brought by the old company against Silo, Tate and Stanley, to recover possession of a portion of the company's land which they still retained possession of. The judgment in that action substantially decided the question of right, but, notwithstanding that the diggers, Silo, Tate and Stanley, thought fit to bring an action against the liquidators claiming for that amount, that action was heard before a full Court of the Transvaal judges, and they came to the conclusion that the award could not be enforced against the company, and dismissed all claim under the award, holding that neither the company nor the liquidators were liable to these men. There was, however, another claim made by the diggers for the value of certain water-raees that they had made on the property, and some buildings which they had erected. The judges thought the water-races were of a certain value to the eompany, and also the buildings, and they awarded the diggers 798*l.* for the former and 80*l.* for the latter. The company—or rather the liquidators of the old company—were only made to pay for what the judges were of opinion were improvements on the property, so that I think we may congratulate ourselves on having been substantially successful throughout that very serious litigation with parties in South Afriea. I may now tell you that a few days ago we received a telegram from the company's agents at Pretoria, in whieh it is stated that, the judges having made an order withdrawing Mr. Franck's injunction, all the property whieh belonged to the old company, has now been transferred to and registered in the name of your company in the Transvaal. So that you are at this moment in the position of having

AN ABSOLUTE RIGHT TO THE PROPERTY,

according to the law of the country, and also have had an end put to all possible litigation in respect of it as far as we can see. (Cheers.) So far, therefore, I cousider we are in a very much better position than we were when we met in October last. We told you then that in order to make your property of value it would be necessary to expend about 25,000*l.* upon it. That was the estimate of Mr. Heanan at the time. A resolution was proposed, and carried unanimously, at that meeting approving of raising a sum of money sufficient to earry out the plans suggested by Mr. Heauan; but we gave a pledge that we would not take any steps in the matter, until we had disposed of the litigation that was pending, and also until we had further information from Mr. Heanan as to what would be absolutely required. We have now another report from Mr. Heanan, confirming his previous accounts, with this exception—that he now says that 23,000*l.* will be enough to lay out on the development of the property, and he also says that, instead of an estimated net return, after laying out that amount of money, of 14,400*l.* he sees his way clearly to a net return of 20,000*l.* a year. Mr. Heanan, however, does not consider the capabilities of your property limited to 20,000*l.* a year, because he thinks it may be developed considerably beyond that. That is principally the state of things at the present moment. We have spent a good deal of money over this litigation. It could not, however, be avoided, because it became absolutely necessary for us to send over Mr. Matthews to look after the interests of the company in South Africa. He had to make two journeys there, which oecupied about nine months; but while I say it was expeusive in one sense, I consider that by incurring this expense we have got rid of the claims made against the company by Mr. Franck and Silo, Tate and Stanley, very cheaply. We cannot get valuable services without paying for them.

A SHAREHOLDER: What was the amount paid?

The CHAIRMAN: About 2*l.* 2s. a day and expenses, and I think you have had your money's worth from Mr. Matthews. (Hear, hear.) We thought it desirable not to spend a great deal of money upon the property in carrying out Mr. Heanan's plans until the litigation was settled, and until we had another opportunity of meeting you. There has, however, been a good deal done. Some buildings whieh were absolutely necessary have been erected on the property; the reservoir has been enlarged to a considerable extent, and other alteratious preparatory to laying out the money advised by Mr. Heanan. We also bought oxen and teams, whieh Mr. Heauan had an opportunity of purchasing cheaply, and this will enable him to get all the timber from the Delagoa Bay Railway Station carried to the mines at a great saving. That is the state of things, and

WHAT WE PROPOSE

to you is this, we cannot submit a resolution now beeause it must come forward at a special meeting; but the idea of the board is that possibly the best way of obtaining the money necessary, in order to carry out Mr. Heanan's plan, will be to issue preference shares to the amount of 25,000*l.*, which will leave a margin of 5,000*l.* or 6,000*l.* for working capital. Supposing that amount of money is raised, that would increase the number of shares actually issued to that extent. The capital has been already reduced by about 30,000*l.*, as compared with the eapital issued by the old company, because the shares that Mr. Franck might under other eireumstances have claimed, and some others, amounting altogether to about 30,000 shares, are unissued, and if the 25,000*l.*, preference shares are issued, that will still leave the capital 5,000*l.* less than the authorised capital. Even with that increase, assuming 20,000*l.* net to be obtained in a year or two henee, owing to the development proposed by your manager, that would give about 15 per cent. upon the preference shares, and taking the ordinary shares at their present market price, that would yield about 150 per cent., so that there is something to look forward to in the event of your adopting Mr. Heanan's plan. The company's property is very much more extensive than that of almost any other gold mine I have heard of. There is a freehold of 7,280 acres—valuable property, independent of the gold altogether. According to the present market price of the shares, those 7,280 acres, with all the capabilities of the gold mining properties, are only valued at something like 13,000*l.* There seems to me an

opportunity of making money here for anybody who has faith. If Mr. Heanan's view is right, which we believe it to be, there is certainly an opportunity, by investing a little more capital, of making the shares, which are now worth 2s., worth 1*l.* in course of time. I now propose that the directors' report be adopted.

Mr. GUSTAVE SICHEL seconded the motion.

A number of questions on matters of account having been replied to by Mr. SICHEL, the motion adopting the report and accounts was carried.

VIEWS OF THE MANAGER.

Mr. C. O. HEANAN (who was received with cheers) said that when he arrived at the Spitzkop mine he found that they had a first-class hydraulic property, but the quantity of quartz had been misrepresented. There was hardly sufficient to justify the erection of the mill. He found, however, that the quantity of quartz could be added to year by year to the extent of about 1,500 tons per annum. The Hydraulic systems were very deficient. A great deal of their gold was in a fine state, and it was impossible to recover that gold in ordinary sluices. It required a complicated arrangement, called an under-current, and that could only work where there was abundance of water. In ordinary hydraulic mines the washes were conducted through long boxes, but at Spitzkop the attempt had been made to conduct them through channels cut in the sandstone, and by years of wear those channels had worn down, and were practically inaccessible. After consulting with Mr. Matthews he decided to continue the existing system until the litigation had been disposed of, and arrangements could be made for getting the necessary material to make certain improvements that were necessary. That had been done to a certain extent. The workings there had been carried up to a point where further operations were impossible. They reached the highest point of the bed rock so that they had no fall. The only remedy would have been to deepen the tail races, to do which would involve a greater expenditure than he had proposed iu his report. In the meantime in order to devise a proper hydraulic system the ground was thoroughly prospected, partly by tribute labour, and by that means the whole section of the farm was prospected with very satisfactory results. In every case the diggers wished to keep on with the arrangement, but he felt it would be better to keep the grouud for the company until they were in a position to commence a thorough system of development. His estimate of August last was based entirely upon the quartz that would be saved by the old and faulty method. About 10 per cent. of the *debris* that was washed down the creek was found to consist of small particles of quartz, and after making practical experiments with those tailiugs he found that they could be concentrated cheaply and rapidly. He proposed now to put in tailings dams and save that quartz, and, with the aid of concentrates, together with what they had, to go to work and keep the mill running. He considered the

SUCCESS OF THE MINE WAS ABSOLUTELY CERTAIN

with the amount of expenditure that he now recommended. He was not working in the dark, but having devoted many months to prospecting the farm he was thoroughly satisfied with the results. It was proposed to mill about 100 tons a week which would be derived partly from the quartz that was now being saved on the hydraulic system, and partly from what would be saved by concentration.

In reply to a shareholder,

Mr. HEANAN said that during six months of the year the quantity of water was insufficient for their requirements, but more than sufficient could be obtained during the other six months of the year. His estimate as to the necessary expenditure included the purchase of electric light plant, which would enable them to work night and day during the wet season. He was in hopes, however, of obtaining an abundant supply in the dry season by means of artesian wells.

A SHAREHOLDER asked what would be the probable value of the 100 tons a week that it was coutemplated would be milled.

Mr. HEANAN said that accordiug to the assays made by the Bank of England, it averaged a littla more than 2 ozs. to the tou. Of that he hoped to save 50 per cent. There were matters in the ores that were somewhat antagonistic to free amalgamation; but he thought he could safely guarantee milling results which would come up to 50 per cent. of the assay value of the ores. The outlay would be something less than 600*l.* a month. The returns, according to his estimate, would be about 27,000*l.* a year, and the expenses about 8,000*l.*; giving a net return of about 20,000*l.* per annum. (Cheers.)

Mr. SICHEL proposed the re-election of Capt. C. D. Iuglis as a director.

Mr. LYSTER seconded the motion, which was carried.

The auditors were then re-appointed, and on the motion of Mr. OGLE, a vote of thanks to Mr. Heanan was carried by acclamation.

The meeting then resolved itself into an

EXTRAORDINARY GENERAL MEETING,

for the purpose of passing certain special resolutions, with reference to the capital of the company.

The CHAIRMAN said the board thought it best to hold an extraordinary meetiug immediately after the general meeting, for the purpose of obtaining powers for the creation of additional capital, as that was a matter outside the jurisdiction of an ordinary meeting. The resolutions that had to be submitted to them had been prepared by Mr. Matthews, and he would ask that gentleman to read them.

Mr. MATTHEWS read the resolutions as follows:—

1. "That twenty-five thousand (25,000) shares (being part of the shares in the company remaining unallotted) be issued, to be called preference shares, to which there shall be attached the special rights and privileges (that is to say):—(i) The holders of such preference shares shall be entitled to a cumulative preferential dividend at the rate of 10*l.* per cent. per annum on the capital for the time being paid up on such shares respectively, which dividend shall be payable half-yearly, on the 1st day of January and the 1st day of July in every year. (ii.) Whenever the profits of the company in respect of any year shall be more than sufficient to pay the preferential dividend aforesaid to the close of such year, and also a dividend for such year at the rate of 10*l.* per cent. per annum on the ordinary shares, the holders of the preference shares shall be entitled to participate in the surplus *pari passu* with the holders of the other shares. (iii) The capital paid up on the preference shares shall not be iable to cancellation or reduction in respect of loss or depreciation. (iv.) In the event of the winding-up of the company, the holders of the preference shares shall be entitled to have the surplus assets applied, first, in paying off the capital paid up on the preference shares held by them respectively; secondly, in paying off the arrears (if any) of the preferential dividend aforesaid to the commencement of the winding-up, and thereafter to participate rateably with the holders of the ordinary shares in such surplus assets (if any) as shall remain after paying off the capital paid upon such ordinary shares." 2. "That the preference shares aforesaid be issued in the first place to the shareholders of the Company at the rate of one preference share for every five ordinary shares held by any shareholder, upon such terms and conditions as to the time and modes of payment for such shares as the directors may think fit, and that the directors be, and are, hereby empowered, after the expiration of 14 days from the posting of the notices announcing such issue, to issue any preference shares remaining unallotted to such persons and on such terms and conditions as the directors may think fit."

Mr. OGLE asked if they had power in the articles of association to raise the capital in question.

The CHAIRMAN said they had the power, most certainly, but they required also a resolution from this meeting.

AN OFFER TO BURST UP THE PROPERTY.

Mr. MATTHEWS remarked that a suggestion had been made to wind up the company in voluntary liquidation, and realise what they could out of the sale of the property. He would tell them of a circumstance that happened whilst he was out at Pretoria. A gentleman, who was well acquainted with their property, made a deliberate proposal to him that they should both join in burstiug up the company. He asked him to send a bad account of things to the directors, and the two would be then able to burst up the company, and make a lot of money out of the property. (Laughter.) There were, doubtless, gentlemen on this side of the water who would also advise them to burst up the company, either by liquidation or any other means, for the purpose of getting what they could out of it themselves. (Hear, hear.) He, however, after being out to South Africa, and knowing what he did of the property, would certainly recommend them to stick to it. (Applause.)

Mr. OGLE: I presume you have satisfied yourself as to the legality of the second resolution.

Mr. MATTHEWS: Most certainly.

The CHAIRMAN: I beg to move that the resolutious read by Mr. Matthews be adopted.

Mr. OGLE: I will second that.

The CHAIRMAN then put the resolutions to the meeting, and they were carried unanimously.

Mr. BOYDELL moved: "That the holders of such preference shares shall be able to exchange them at any time for an equal number of ordinary shares.

Mr. SICHEL seconded.

The motion was carried unanimously.

A vote of thanks was passed to the chairman and the board of directors, and the meeting terminated.

THE PINOS ALTOS BULLION CO., LIMITED.

DEPRECIATION IN VALUE OF THE DOLLAR AFFECTS THE COMPANY'S FINANCES—A GRADUAL IMPROVEMENT IN THE ORE —DECREASE IN EXPENDITURE.

THE fourth ordinary general meeting of the shareholders of the above company was held at the Cannon Street Hotel, yesterday—Mr. A. Buchan Hepburn, the chairman of the company, presided.

Mr. J. B. PALMER (Secretary) read the notice convening the meeting.

The CHAIRMAN: I feel it my duty, in the first place, on this occasion to express the very great regret at the loss of Lord Onslow, and this is a feeling which I am sure you will all echo. Only those who have been intimately associated with him in business matters can realise the great loss to the company which his resignation implies. Possibly, as time goes on, he may return and again give us his services, in which case I am sure we shall all be glad to welcome him.

THE FINANCES.

You will see by the report you have in your hands, the reveuue for the past 12 months was 20,750*l.* 0s. 10d., which, added to the 948*l.* 5s. 6d. brought forward from 1887, gives a total of 21,698*l.* 6s. 4d. We have given you in dividends 21,925*l.* 1s. 4d., which leaves us 226*l.* 15s. to the bad to carry forward. Of course that is not a very desirable position, but it is one which it was not possible for the board to foresee, and is chiefly accounted for in the depreciation of silver. Last year we carried over the accounts at 3s. 4d. to the Mexican dollar—this year at the 31st December it was only worth 3s., a difference of 4d., and the average for the year has been only 3s. 1½d. That, of course, has made a very serious difference. Another thing which has accounted for this is the unexpected influx of water in the miue before the pumps were there and erected, making it impossible to work the richer portion of the lode, which lies more or less in the lower portion of the mine, and we were obliged to work a very large portion of ore of lower grade, which has had the result of bringing down the value of the ore per ton, milled some $4.36. In connection with this there is a very satisfactory point, which is that in most mines in the State of Chihuahua, carrying both gold and silver; the gold generally preponderates at the surface, and the silver exists in smaller quantities; but on sinking deeper you generally find the gold decreases aud the silver increases in Piuos Altos, however, we seem to have ground which is somewhat an exception to that — as we have gone down not only has the silver increased, but the gold has increased also. Iu the year 1887 there was a gain on the ton milled of $1.48 in gold, and in the following year there was a further gain of $1.67, which makes a total gain of $3.15 for the last two years, which shows a very material increase in the value of the gold as we go down.

EXPENDITURE.

The next question is that of expenditure which is certainly one of very great importance. Of course it is impossible to carry on things out there as you would here. If that had been so we should all be

millionaires, which we are not. But there has been a very important reduction in the expenses, which stood two years ago at $21.78 but have been reduced to $18.75, a reduction of something like $3 a ton, and our manager, Mr. Waithman, who is here to-day, believes that in the coming year it will be still further reduced. But still, whatever the expenses may be they are no doubt large for the class of ore we are working. But I am perfectly certain there is no other mine in Mexico at the present day, working under similar circumstances, which is being worked with anything like the economy that we are working, and with the reductions we propose still further to make, I think we shall have every cause to congratulate ourselves on being shareholders in the company.

THE RESERVES.

There is another important point about the mine, and that is our reserves. Although we have extracted something like 18,000 tons, we are still considerably ahead in our developments of what we have extracted, and we shall be very largely in excess at the end of the present year. The reason why we are not more in excess at the present moment, in other words, why the development is so nearly equal to the amount worked is that we were obliged to delay sinking for some considerable period on account of the water. While I am on the subject of the mine, I may as well draw your attention to the one or two points, which are really of importance as regards the future of the mine. The first is, that the ore body which we found at the back of the drift, in the 11th level west, is at the present moment some 2 ft. or 3 ft. wide, and has given very good assays. The ore-body there has gone very much as the ore-body began from the 7th level down to our present position. The other point of importance is the ore body we struck, when we made that cross-cut from the 15th level east' which is now some 8 ft. thick, and there is no doubt it will develope into a very valuable body. We thought it advisable not to do too much exploration in the lower levels towards the west, for fear of some larger body of water. We have now got the pumps in order. They are worked by compressed air, and their capacity is sufficieut to guarantee us for a year or two in any case. The manager informs me

THE CAPACITY OF THE PUMPS

is equal to at least six times the water we have got in the miue at the present time. Of course the greater part of the water is surface water during most of the year, but still there is no denying the fact that there is a decided flow in the mine.

THE TUNNEL.

The next thing is the tunnel. Last year it was stated that the directors had not undertaken the work of development seriously, but that, as Lord Onslow showed at the time, was not a fair charge, because we had no machinery for working it. Since then the compressor has been started, and we have have been making such progress as we could, There were at least five months, or nearly so, during which it had to be worked by hand. Had that not been so, there would have been about 300 ft. or so more run. We thiuk it is very important the tunnel should be run in as quickly as possible. It really is a most important thing, as it drains the mine, and relieves us from all respousibility and anxiety on that subject, and it allows us to go ou with our explorations. The progress made is, considering the shifts run, and the number of people employed, and also the hardness of the rock, very creditable—from 18½ to 19 ft. a week. At the same time we have a long way to go, aud if we go on at the present rate it will take us till something like 1892. That is a long time, aud many things may happen between now and then ; and when other offers are made I do not think we should run any risk. The manager informs me he can obtain a contract to run the tunnel. We might do that ourselves, but, as you are aware, the mill is situated a long distance from the mine, and the manager is at the mine, and it is impossible to work with large body of men without some direct control. That control we should have to supply by a foreman and that would run the expeuses up. At present it is costing us something like $18, and it will cost us about $25 if we give it out on contract. The contractors, however, would undertake to carry it through in a year, and we save on that as against two and a half years. It also removes a responsibility from the compauy, because whoever takes it will have to give a substantial guarantee that he will have to go on with his contract. The manager says there are two or three people who are inclined to take this up, but the board have not decided at the present moment what steps they will take. The board are in this position—that they can go on with it at once, because they have the money given them. It may be necessary in the future to raise a loan or to issue debentures, but the money is in hand, and it was given us without being asked for. You would like to know what the cost will be. It will probably be about 10,000*l.* altogether, and adding to what has beeu already spent upon it, 5,000*l.*, will make a total of 15,000*l.*

STAMPS.

As regards the stamps, those extra ten stamps have been very unsatisfactory. We expected them to be up and working long ago, but they have beeu delayed over aud over again owing to the scarcity of skilled labour, and the break downs which have occurred in other directions, and we have had to remove the men from working there to other portions of the works. They ought to be completed within a mouth. There was one other point mentioned last year, and that was the railway. The manager made particular inquiries about it, and there is no question but that that railway will be taken through as far as the foot of the hill, which will be within 70 or 80 miles of the mine, and will probably give the company a further saving in the carriage of stores and freight of some 10,000*l.* a year or thereabouts, which you will naturally realise the importance of. The other important vein which we hope to cut in the tunnel is the San Eligio. The mauager's opinion is that on cross-cutting from the tunnel we shall find that ledge there intact, and as we have worked it in a great many places in the surface and in every place we have got very fair ore there is every reason to believe that it will be a permanent development later on. At present we do not intend to prosecute that. With regard to the mill value of the ore, there is an improvement of 3½ over 1886 in the percentage valuation got out of the ore, and I think last year there was that reduction in the milling value of the ore of $4, it was more than counteracted by the increase in the value of the gold as regards the percentage it worked to.

A DEBT OF GRATITUDE.

In conclusion I want to call your attention to the very great debt of gratitude we owe to our bankers, Messrs. Murrietta. The shareholders have no idea the different position they would be in at the present moment had it not been for the friendly and generous manner in which they met every demand from the directors. Iu fact, the suggestion was no sooner made to them than they complied with it, not only with regard to the company in London, but also in America. Had it not been for their assistance the position of the company at the present moment would be very different, and it would have taken much longer to reach the point at which we have now arrived. I beg to propose that the directors' report and accounts for 1888 be received and adopted. (Cheers.)

CHANGE IN THE CHAIRMANSHIP OF THE COMPANY.

Col. David Milne Home (director) : Gentlemen, I have been asked to second the resolution which has just been moved from the chair, and am very glad indeed to have the privilege of taking as it were a somewhat prominent part in to-day's proceedings, being one of the original promoters of the Pinos Altos Company, and of assuring you, at this comparatively advanced age of the company, that I have still continued confidence in the success of our busiuess. In the few observations I shall make I wish to commence by alluding to one paragraph in the report before you to which, naturally, the chairman did not like to refer. I mean the paragraph referring to the change in the chairmanship of our company. I endorse to the full his reference as to the great regret with which we parted with the services of Lord Onslow as our chairman. All of us who have had anything to do with him, either in business or personal relations, must own the loss it is. At the same time we may rejoice in the high honour that has been paid to him in being Her Majesty's representative in New Zealand. I may say that I happen to know, although he is absent from us, he still takes a lively interest in Pinos Altos affairs, and has continued confidence in our success. Then with reference to the selection of his successor, I hope you will approve of our action in selecting Mr. Hepburn for the post. (Cheers.) He has been recently managing director at home; previous to that he had spent several years' residence at the mine. He is also thoroughly acquainted with the Spanish language, in which may of our accounts are made up, and our correspondence is conducted. On all these grounds the board considered Mr. Hepburn would be a worthy successor to Lord Onslow. With reference to the rest of the report, I do not think it would be wise for me to enter into details, as the manager is present, and is prepared to answer my questions, but there are one or two points on which I should like to touch—the first is the candour which runs through the reports. It is usual to try and gloss over difficulties in meeting shareholders, but we have taken an opposite course. The difficulties we have had to meet with we have always endeavoured to put before our shareholders. The chairman has already told you of the appearance of water in the mine in the month of August or September last. Previously we thought we had a very dry mine, but it is pleasing to note we are now able to cope with it.

THE POSITION OF THE COMPANY

is certainly a good one, and an improving one. This is a concern which is yet in its infancy, and until we get the tuunel completed, you cannot expect the company to be in absolute working order. But these reports before you must show you we are improving. As to the prospects, it is summed up by the manager, when he says whereas the expenses are decreasing, and the output is increasing, I am not sure that those were his exact words, but that is the substance of them. I feel sure you will agree with me that this report should be received, approved, and adopted by all. (Cheers.)

DISCUSSION.

A Shareholder thought that the accounts were not so full in detail as they ought to be. He noticed a number of iteuns under one head—rent, salaries, &c., amounting to 1,068*l.*, and he thought they ought to have the details. With regard to raising fresh capital by means of debentures, he thought the company was already too heavily weighed, and suggested that they should forego their dividends for a time rather than issue debentures.

Mr. Welch called attention to the slow progress in sinking the tunnel.

A Shareholder asked Mr. Waithman the length of the tunnel.

Mr. Waithman : The length so far as I can make out is something like 1,700 ft., and the total length to drive is 3,500 ft., but I have not received any telegrams lately. We have driven about half-way. It was only last year we completed our machinery for driving the tunnel. Possibly, gentlemen, you are not acquainted with the class of rock we have to deal with, it is harder than you find in most mining districts, therefore the tunnel has not gone as fast as was originally anticipated. At first the grouud was soft, but now it is hard, and requires a high pressure of air, and a large amount of blasting material to break it properly.

The Chairman : With regard to the accounts, the items are here, and are accessible to any gentlemen in the room.

The adoption of the report and accounts was then carried unanimously.

ROUTINE BUSINESS.

Mr. R. F. Wilkins proposed the re-election of the chairman.

Mr. Thomas J. Bewick seconded the motion, which was carried unanimously.

Lieut.-Col. Chas. D. Rich proposed the re-election of Col. David Milne Holme, which was seconded, and carried unanimously.

The Chairman : The next thing is the appointment of Mr. J. M. Paulton, M.P., to a seat on the board, which I have very great pleasure in proposing.

Col. Milne Holme seconded the motion, which was carried uuanimously.

The auditors were re-elected.

A vote of thanks was passed to Mr. Waithman and the staff in Mexico.

The usual vote of thanks to the chairman brought the proceedings to a close.

THE BRITISH WATER-GAS SYNDICATE, LIMITED.

MR. SAMSON FOX ON THE SITUATION.

ON Thursday an extraordinary general meeting of the British Water-Gas Syndicate, Limited, was held at the Great Northern Hotel, Leeds—Mr. Samson Fox (chairman) presided, and was supported by Mr. David Greig, Mr. Bellamy, and Mr. Kirk (directors), Mr. T. H. Owens (secretary), and Mr. Greenwood Teale (solicitor for the company).

There was a good attendance of shareholders.

ENCOURAGING STATEMENTS.

The CHAIRMAN, in opening the meeting, said they were met to confirm the resolutions passed at the meeting of the committee at the Cannon Street Hotel, London, on May 4th, in order that they might work in accordance with the requirements of the London Stock Exchange. Before proceeding to that, he had a few words to offer in reference to the position of their undertaking. What he said at the Cannon Street meeting as to their affairs and prospects had been a good deal criticised, but up to date he had met with no one capable of saying that he set forth anything other than truth and fact, as they knew it by the apparatus which had been at work for the past 16 or 17 months at the Leeds Forge. (Hear, hear.) There was no difficulty in repeating what had been done so successfully there at every other works in the country. It was necessary they should all put on one side Stock Exchange rumour and action. The action of buyers and sellers of shares had sometimes an effect which was not so rosy as it might be; while at other times it was far too rosy for sound business. (Hear, hear.) Nobody felt more annoyed than he did that these shares should ever have been run up by the public to a price of 21*l*. premium on a 5*l*. share. No one in their senses could expect that they, who had to start their business, turn out plant and produce results on a commercial scale, could possibly be able to give them that dividend on a sum of money paid for a 5*l*. share. (Hear, hear.) He could tell them that he had been a buyer of shares right away through their fall, and he was still a holder, and would continue to hold until he had shown that water-gas manufacture had in it what he had said it had. (Hear, hear.) Some of them would remember very well—being Leeds men—what was said about the success of another concern started in this town, and many of them could now tell what its success had been. (Hear, hear.) He had made up his mind

TO WORK OUT THIS PROBLEM OF SOLID FUEL V. GASEOUS FUEL,

and that it should be done by the use of water-gas plant. There was no difficulty about it. What they chiefly wanted was a little patience and a little time to get a few different plants at work in various parts of the country. They had already orders from all parts of the country to put down plants—small towns, large works, every conceivable kind of lighting and heating had they got now to carry through. Their works in Scotland were thoroughly going, and they were engaged in building at least 20 plants for making water-gas. As time went on they would show their results; and if they showed half the results that the venture had in it they would all be well paid for what they had laid out in the investment, providing they had not been so foolish as to buy at too dear a price. The parent company had nothing to do with the price the public paid; they gave each one his share for 5*l*.; and if the public thought them worth more it was for them to be careful. Mr. Fox expressed his satisfaction with the prospects of the parent and subsidiary companies, which latter would profit by the disposition on the part of many large firms to pay so many hundreds or thousands of pounds down for a perpetual license, instead of a royalty on the consumption. (Hear, hear.)

RESOLUTIONS CONFIRMED.

Mr. OWENS having read the minutes of the last meeting, and the resolutions then adopted for alteration in the articles,

The CHAIRMAN moved the confirmation of the resolutions, remarking that in thus conforming to the Stock Exchange they would be able to get a quotation, and to deal in their property just as they pleased, and know, before they did so, what was about its market price.

Mr. STONE (London) seconded, and the resolution was carried unanimously.

Mr. KETTLEWELL moved a vote of thanks to the chairman, and

Mr. HANBY (Settle) seconded.

Mr. FOX, in responding, said they had heard something about 1,000,000*l*. being an excessive capital. But the lighting and heating of the country was equally as extensive, and should yield as good interest as the railway carrying of this country, and in that business from 800,000,000*l*. to 900,000,000*l*. was invested. Again, 1 ton of raw fuel produced 10,000 ft. of ordinary gas; but used in decomposing water it would give 35,000 ft. of fuel of a far higher heating power. (Hear, hear.)

The meeting then terminated.

THE NORTH WALES SLATE TRADE.—Portmadoc, 24th May.—Shipments are going fotward freely to the principal continental markets, and show a large increase compared with last year. Quarry stocks, espceially of Festiniog "Old Veiu" slates, are getting largely reduced, and the production being limited prices show signs of improvement. Stocks in the hands of home consumers are reported to be very low. The depression in the trade seems at last to be passing away.

HOLLOWAY'S OINTMENT AND PILLS. — Abscesses, Erysipelas, Piles.—Unvarying success attends all who treat these diseases according to the simple printed directions wrapped round each pot and box. They are invaluable to the young and timid, whose bashfulness sometimes endangers life. Though apparently local, diseases of this nature are essentially blood diseases, but a little attention, moderate perseverance, and trifling expense will enable the most diffident to conduct any case to a happy issue without exposing secret infirmities to any one. The Ointment checks the local inflammation and alleviates the throbbing pains. These directions also clearly point out when and how Holloway's Pills are to be taken, that their purifying and regulating powers may assist by adjusting and strengthening the constitution.

AFRICA.

LATEST FROM THE GOLD AND DIAMOND MINES.

SALISBURY EXTENSION.—Mr. J. M. Parsonson, of Warnford Court has ben appointed London agent, and also of the Vanwyck Gold, Mining Company.

VIRGINIA (TRANSVAAL).—The board notify that the share certificates are now ready for delivery at the offices, 26, Budge Row, Cannon Street, E.C., in exchange for allotment letters and the two bankers' receipts.

SOUTH AFRICAN.—The following particulars of work relating to the week ending April 27th:—Blue ground hauled, 3,375 loads; blue ground washed, 3,375 loads; diamonds obtained, 1,235 carats; estimated value, 1,425*l*. Heavy rains interfered with work during above week.

ORIENTAL AND SHEBA VALLEY.—Share certificates to be exchanged for the shares in Kriel's Oriental Sheba Reef Syndicate, standing in the names of registered shareholders on the 21st January last, will be ready for issue on and after 27th instant.

SOUTH STANDARD (WITWATERSRANDT).—Report from the mine manager, dated Johannesburg, May 3rd.—The main shaft is now down to a depth 51 ft., 44 ft. being timbered. A 4 in. leader struck a fortnight ago is now showing near the bottom, and pans about the same as when first struck, viz., 6 dwts. In a few days we shall be through this. This shaft was laid out to strike the Battery reef 150 ft. from surface.

DOUGLAS DEVELOPING SYNDICATE.—Report dated May 3rd:—Shaft C is down 42 ft. Yesterday we struck banket, showing fair prospect in the pan. This is not the reef (the Burgers) we are sinking for. Shaft D, depth 43 ft. This is now on to solid formation of a red sandstone nature, and giving the impression of being near reef.

MYNPACHT (LUIPAARD'S VLEI).—Bothas' reef has been cut on the property at a depth of 90ft., where it is 5 ft. wide, and assays 1 oz. to the ton.

TRANSVAAL GOLD EXPLORATION AND LAND.—The following particulars are from manager's advices of April 29th, viz.:—Mines—Theta vein: Ore extracted, 80 tons; assay value, 2 ozs. 17 dwts. per ton. At No. 1,061 the vein continues small, but at No. 1,062 it averages 5 ft. thick. In the last two paddocks taken out the vein was mixed with a dark ferruginous stone, which carries too much gold to be considered as waste, but which, being mixed with the good ore, has reduced the value per ton considerably. Beta vein: Extracted during week, 10 tons; assay value, 1 oz. 6 dwts. per ton. Columbian Hill: The vein on which we have been working at this place still continues of too low a grade to be payable, but portions of it prospect over 1 oz. per ton. Brown's Hill Mill—Battery: Time at work, 130 hours; 140 tons. Theta ore crushed, assaying 3 ozs. 4 dwts. gold per ton. The usual clean-up of plates yielded 486½ ozs. of amalgam. Pans: The pans were at work 66 hours, and treated 24 tons. Theta slimes assaying 2 ozs. 3 dwts. gold per ton.

KLERKSDORP.—Below is an extract from a letter from Mr. W. Ogden, this company's mine manager, dated Klerksdorp, the 13th April:—"No. 1 shaft (Whittaker's reef): Since I last wrote I have passed through a fault (upthrow) 12 ft. 6 ins. in thickness, but have struck the reef again, and am very pleased to be able to report that the reef looks as well as ever, and by panning samples of banket, I have obtained fine shows of gold, very free. Since I commenced operations I have sunk in this shaft 21 ft.; the reef in this shaft is now going down at an angle of 33 degs., her former dip being 16 degs. As the reef has passed this fault, which is the second one she has gone through, I do not fear the result, even if she passed through a fault even thicker than the one already passed. No. 2 shaft (Whittaker's reef), vertical: I have struck this reef at a depth of 12 ft. 6 ins., and am now in the reef 5 ft. 6 ins. The banket shows remarkably well by panning. No. 3 shaft on the incline is now down 20 ft., and the banket shows well for free gold. No. 4 shaft is now down 18 ft., and for fully 15 ft. the reef is banket, with fine yellow seams amongst the pebbles, portions of which banket have been panned by me, and show considerably over 1 oz. to the ton of banket. The reef is without doubt one of the first in South Africa, and second to none in this district."

VOGELSTRUIS.—Maddock's winze is the most productive trial we have. We are pushing extraction at this point by employment of four miners and a full gang of boys: have also put up gear to draw by animal power. Rosewarne's winze: The reef at this point is very much broken. We have also put out a cross-cut south to try and intersept other ore ground, but thus far without avail. No 2 shaft: A start is being made to draw out the water when we begin driving east and west on the south reef. 150 ft. east and west of No. 2 shaft two winzes are started away so as to block out a piece of ground available for stoping as soon as possible. Main reef: The drainage level is being driven west of No. 7 winze, and an intermediate winze being sunk between the former and No. 8 so as to more rapidly open out the ground to reach cross-cut to shaft No. 2. Battery: The level for the return of the water is completed. The 25 heads are now at work; started yesterday. During April, and a day or two in March, we had sufficient water to run only 10 heads. These stamped about 854 tons of mixed ore, and have produced 163 ozs. gold. Some gold has been absorbed in the setting of the plates, but generally tho ore has not come up in productive value to assays results or expectation. It has yielded a little over 3 dwts 19 grs. per ton. The falling-off of the water supply has been a serious drawback to us. This month, however, barring accidents (a contingency that must be eonsidered in this country), we ought to put through a good pile of stuff. We shall put through all south reef possible, but our great body of main reef is only low grade.

NEW EMMA SILVER MINING CO., 1886, LIMITED.

IMPORTANT TELEGRAM.

THE following cablegram has been received from Salt Lake City:—

"Prospects are improving in raise from No. 1 level, level No. 3 south-east, and level No. 4 north-west from Attwood winze. Mill working satisfactorily. 15 tons of concentrates forwarded to Salt Lake during week. 25 tons of first-class ore at railway station."—R. H. HOBBS, Secretary.

IMPORTANT SALE.

CORRUGATED IRON SHEETS, IRON ROOFS, SHEDS, HOUSES, BUILDINGS, &c.

THOMAS WHITEHEAD & SON announce that they are instructed by Isaac Dixon and Co., Windsor Iron Works, Liverpool, to SELL by AUCTION, on TUESDAY 18th, WEDNESDAY 19th, and THURSDAY 20th June, at 11 o'clock prompt, at Acre Yard, Belvedere Road, next Westminster Bridge, S.E., about 1,200 TONS of their Well-known High-class Valuable IRON MANUFACTURES as follows:—About 30,000 corrugated iron sheets; 200 complete iron roofs and sheds; 100 iron buildings suitable for hay and corn sheds, agricultural, manufacturing, storage and general purposes, mission rooms; 12 miles wire fencing; 50,000 yards wire netting; 100 iron columns; several thousand feet iron ridging and gutters; 80 iron tanks; 10,000 yards roofing felt, and other goods.

Catalogues from Auctioneers, 67, Hanover Street, Liverpool, or Dixon's Windsor Iron Works, Liverpool.

In handy lots to suit various classes of buyers. To be followed by sales of similar goods at Manchester, Belfast and Dublin.

BACK NUMBERS OF "MINING WORLD."—WANTED, Six Copies, dated July 14th 1888.—Publisher of this Paper.

TO CONTRACTORS, COLLIERY OWNERS, &c.

BAR IRON.—Largest Stock in the Country. Kirkstall, Bowling, Staffordshire, and Yorkshire.
BESSEMER & SIEMEN'S STEEL BARS.
RAILS IN STOCK.—IRON & STEEL from 8 lb. to 86 lb. per yard, Flat Bottom and Double Head Sections.
SWITCHES, CROSSINGS & ALL FIXINGS
ENGLISH ROLLED JOISTS, IRON and STEEL SECTION SHEETS, &c.
Prices Quoted on Application.
WILLIAM FIRTH, Water Lane, and Wilson Street, LEEDS.

JOHN KING AND CO.,
STOCK AND SHARE DEALERS,
89, London Wall, E.C.
Open Speculative Accounts on 1 per cent. cover and upwards.
£5 commands £500 stock,
£10 „ £1,000 „
£15 „ £1,500 „
£20 „ £2,000 „
And so on in proportion.

J. K. and Co. are now dealing in all classes of MINING SHARES at closest market prices, and have some reliable information concerning South African Mines, in which a very large business is now being transacted. Price list post free Wednesdays and Saturdays.

No commissions. Telegrams free. Profits not restricted to amount of cover.

THE MYSORE GOLD MINING COMPANY, LIMITED.

NOTICE IS HEREBY GIVEN, that an EXTRAORDINARY GENERAL MEETING of the Members of THE MYSORE GOLD MINING COMPANY, LIMITED, will be held at the Cannon Street Hotel, in the City of London, on FRIDAY, the 7th day of June, 1889, at 12.30 p.m. precisely, to consider a proposal for the disposal of a portion of this Company's property, when the following resolution will be submitted to the meeting:—

That in accordance with the powers contained in the Memorandum and Articles of Association of the Company, the directors be, and they are hereby authorised to enter into an Agreement proposed to be made between the Company of the first part, the Gold Fields of Mysore, Limited, of the second part, and a company proposed to be incorporated under the style of the "Champion Reef Gold Mining Company of India, Limited," or by some other suitable name, of the third part, for the disposal, by way of underlease, of (*inter alia*) that portion of the Company's property consisting of the northern section of the Company's ground lying immediately between and contiguous to the Mysore Mine to the south, and the Ooregum Mine to the north, containing an area of 233 acres or thereabouts for the considerations and upon the terms specified in the draft of such Agreement (signed by the chairman for the purposes of identification, and submitted to this meeting) with such modifications and additions as the Directors may determine, not being substantial variations therefrom.

By order of the Board.
W. H. ROWSE,
Secretary.

WATER-GAS PROVED A COMMERCIAL SUCCESS. A SAVING OF £10,000 PER ANNUM IN ONE WORKS ALONE.

THE BRITISH WATER-GAS SYNDICATE, LIMITED.

WATER-GAS.

The following extract from the *Times*, of January 2nd, 1889, relative to the manufacture and application of Water-gas, is reprinted for general information.

WATER-GAS.

"For many years past attempts have been made at intervals to produce what is known as water-gas—that is, gas resulting from the decomposition of water. Experimentally there have been several successes, but practically and commercially up to the present time, as far as we are aware, these have been only failures. These failures have mainly arisen from the difficulty experienced in separating the water-gas from the other products. This difficulty has now been overcome, not by one invention, but by the combination of the best features of several inventions having for their object the manufacture of water-gas. What is more, the patented inventions which have been combined in the new process are not those of one inventor or of one country, but represent several inventors and several nationalities—namely, England, Germany, America, and Sweden. The amalgamation of these various patents and the beneficial results which have accrued therefrom came about by reason of the exigencies of manufacture of corrugated boiler flues and press-flanged steel frame plates for railway rolling stock at the Leeds Forge Company's Works, Leeds. The metallurgical operations carried out there demanded fuel of a higher calorific intensity than could be obtained from either the generator gas of the Siemens' producer, or ordinary coal gas. Mr. Samson Fox, the managing director, therefore turned his attention to water-gas, and, having carefully considered the whole question, decided upon putting down a water-gas plant at the Leeds Forge. The works were begun on September 29th, 1887, and on March 29th, 1888, plant capable of producing 40,000 cubic ft. of water-gas per hour was started, and has since been in constant operation with perfect success, and without interruption. The gas produced gives every satisfaction, not only for metallurgical, but also for lighting purposes, the whole of the works being supplied with it.

"Water-gas is the result of a chemical re-action which takes place in passing steam through incandescent carbonaceous matter, and may be considered as the practical result on a wholesale scale of the ordinary laboratory experiment of decomposing water by passing steam through a highly-heated iron tube. In the water-gas apparatus the fuel, which at Leeds Forge is coke, is raised to a high temperature in a generator by the aid of an air blast. The blowing is continued for about 10 minutes, by which time the fuel has reached a dull red heat. During this period what is known as producer-gas is given off, and this is led away to a range of Lancashire boilers, where it is utilised in raising steam for the engines in the works. At the end of 10 minutes the valves are reversed, the air-blast being stopped, and the further exit of producer-gas to the boilers prevented. Steam is then admitted at the top of the generator for four minutes, and, passing down through the incandescent fuel, becomes decomposed, and a fixed gas results. This gas as formed passes away to a scrubber, where it is treated much in the same way as ordinary coal-gas. From the scrubber it passes to the gas-holder, where it is stored for use for metallurgical purposes in the works, such as heating and welding. For indoor illuminating purposes a portion of the gas is conducted from the gas-holder to the purifiers, where its purification is effected by means of oxide of iron. It will thus be seen that the process consists of alternately blowing the generator hot and making gas, and that a run of gas is made every 15 minutes, during which time the yield from each generator is about 17,500 cubic feet of producer-gas and 5,000 cubic feet of pure water-gas for heating and lighting purposes. The gas is also used most successfully for driving gas engines.

"The metallurgical purposes to which the water-gas is applied at the Leeds Forge are various. In the first place, it is used in the heating furnaces in the plate mill, where the steel ingots are rolled into plates for the manufacture of Fox's corrugated boiler flues. It is also used in welding these tubes and heating the plates for Mr. Fox's flanged frame-plates for railway rolling stock, and for his flanged boiler-fronts, besides which it is utilised in various other similar operations throughout the works. In the application of water-gas to the manufacture of Siemens' steel there is a marked improvement in the quality as well as the quantity of the product. With this gas 30 charges of steel per furnace per week can be turned out, as against 11 charges per furnace per week from furnaces of equal capacity using gas from Siemens' producers. Besides being used for metallurgical purposes, the offices and various parts of the works are lighted with water-gas, the burners employed being arranged on the Fahnejelm system. Burnt in the ordinary way, the water-gas gives a blue flame, but by suspending a comb composed of thin magnesia rods in the flame the filaments are quickly heated to a white heat, producing a bright glow light of high illuminating power, but which is neither unpleasant to the eye nor prejudicial to the sight. The heating power of water-gas was very great, as was demonstrated upon our recent visit to the Leeds Forge Works, where we inspected the method of its manufacture as well as that of its use in the various departments. To give one instance only, a piece of copper wire placed in an ordinary coal-gas flame was only made red hot. A similar piece of wire placed in a water-gas flame issuing from a similar burner was quickly and perfectly fused.

"An important consideration in the adoption of any new system is, of course, its cost; and in this respect water-gas comes out well. Its production per ton of fuel is about 30,000 cubic ft., and with fuel at 8s. per ton, labour at 3s. 6d. per man per day, and the production going on continuously, it is found that the gas costs slightly less than 4d. per 1,000 cubic ft. The experience of nine months' working at the Leeds Forge has led to the conclusion, based on carefully-ascertained data, that the saving effected on the whole works is about £10,000 per annum. Looking at the advantages of water-gas for illuminating purposes, it is to be observed that, besides giving an agreeable light, it does not develop any noxious fumes, nor does it produce smoke; health and cleanliness being thereby preserved, and paintings, furniture, and decorations remaining uninjured. For lighting mansions this would prove a boon, while the producer-gas can be utilised for heating purposes. Similarly, a mill-owner laying down a water-gas plant for lighting his factory will obtain gaseous fuel for steam-raising purposes practically for nothing. For small towns also the lighting could be carried out with water-gas, the producer-gas being used for steam-raising and manufacturing purposes generally. Although the installation of this water-gas plant at the Leeds Forge is the first in England, the system is being largely adopted in America and on the Continent, both at steel works and for illuminating purposes."

In addition to the above extract, the following papers have recently commented favourably on water-gas.

VALUABLE COPPER MINES IN SOUTH NORWAY, AND TIMBER PLANTATIONS.

MESSRS. S. WALKER AND RUNTZ are instructed to SELL by AUCTION at the Mart, London, on Monday, June 24th, at TWO, in One Lot, the MINES, MINING RIGHTS and PROPERTIES of the Arendal Mining and Smelting Company, Limited, near the town of Arendal, on the south coast of Norway, comprising the Skytmyr, Boilestad, Sletue, and Maesel Mines, together with quays at Espeland and Lake Röre Vand, and other property north of the River Nid. Upon the property are valuable timber plantations, and the constant demand for Swedish and Norway fir offers an excellent opportunity for a remunerative business being opened up with the timber trade. There is also a fine opening for the manufacture of wood pulp, for which there is a large and increasing demand. Particulars and Conditions of Sale, with Plan, may be obtained of Messrs. Monkhouse, Goddard and Co., Chartered Accountants, St. Nicholas Chambers, Newcastle-upon-Tyne, and 28 and 29, St. Swithin's Lane, London, E.C.; Messrs. Gibson, Pybus and Pybus, Solicitors, 42, Mosley Street, Newcastle-upon-Tyne; Messrs. Stibbard, Gibson and Co., Solicitors, 21, Leadenhall Street, London, E.C.; Messrs. THE INGERSOLL DUPLEX HAND-POWER ROCK DRILL.

A SAVING OF 300 PER CENT. OVER ORDINARY HAND-LABOUR.

Send for full description, testimonials, &c., to

WELLINGTON & CO. (Successors to CLARK & WELLINGTON),

MANUFACTURERS.

It is perfectly automatic, and bores holes from ½ to 2½ inches diameter at the rate of 1 to 2 inches per minute in hard rock. It will work equally well in any direction or on any uneven surface. No skilled labour required to run it. No expensive repairs. Made in two sizes, and can be worked by electric motor if desired. Hundreds of these Machines are at work in all parts of the world in Mines, Quarries, and for all kinds of rock excavating. It is the only *effective* and *durable* hand-power Rock-drill ever made.

REPORTS OF MEETINGS.

GREAT SHE GOLD MINING CO., LIMITED.

THE ADJOURNED MEETING STILL FURTHER ADJOURNED—MR. FURLONGE'S REPORT—MR. GASKELL'S CIRCULAR TO THE SELECTED FEW—IT CONTAINS A STATEMENT WHICH MR. LEWIS LEVY DENIES—LIVELY PROCEEDINGS.

THE first annual general meeting of the shareholders of the company, adjourned for one month on the 30th day of April, was held at Winchester House on Thursday.—Edward Coleman, Esq. (chairman of the company), presided.

Mr. ALICK R. RAMSAY (secretary) read the notice of meeting.

MR. FURLONGE'S REPORT.

The CHAIRMAN: It will be in the recollection of the meeting that the original meeting, held on April 30th, was adjourned for one month for the purpose of affording time for the report of Mr. Furlonge, a well-known mining engineer, who had gone over to inspect the property to be received. The report arrived in London on Tuesday last, was printed and put into the post the following day, so that you might each have a copy of it for this meeting. (Hear, hear.) We now resume the business commenced at the original meeting. It had then been moved "That the directors' report and statement of accounts now read be received and adopted." It is, therefore, now open to any gentleman to address the meeting on the questiou of that motion before it is put.

STRONG REASON FOR A FURTHER ADJOURNMENT.

Mr. DEERING: It is again my thankless task to have to ask you once more to adjourn this adjourned meeting. I will give you a good reason for it. It will be within the recollection of you all that I did myself the honour to invite you to meet me some two months ago to discuss our position, and that you honoured Mr. Lewis Levy, Mr. Brewer and myself, with your confidence to the extent of asking us to act for you with the directors. We did so, and I may say that the directors met us in a very friendly spirit, and gave us all the information we required, but the principal reason for my proposal of the adjournment of the last meeting until to-day was the non-arrival of the report of Mr. Furlonge, a gentleman who, upon the highest recommendations, was selected, with the concurrence of the directors, to explore our property and give us a report thereon. As the chairman has told you, it is now in your hands, and I leave it to you, as men of business, to say whether we have had it in our possession a sufficient time to enable us to come to any conclusion which would lead us to make a proposition at this meeting. (Cheers.) I may say, as far as I am concerned, that, looking through the report so far as I have had opportunity, that it seems to be to us a vulgar phrase—

NEITHER ONE THING NOR THE OTHER.

I can hardly make head or tail, but certainly one conclusion I come to is this, that it differs very materially from the statements which were put forth in our original prospectus. (Cheers.) Upon that alone, with your kind permission, I base my claim to ask you to allow us a little further time to go into the matter, and discuss it more carefully amongst ourselves, in order that we may have something definite to lay before you. This report is upon the face of it honest. I think any man who has read it through will see that

IT IS AN HONEST REPORT;

but it is a most difficult thing to gather from it a few definite items upon which to found a recommendation to you, my brother shareholders, and therefore I am quite sure you will agree that I have fair grounds for asking for a still further adjournment. It is no spirit of animosity to the chairman and to the board of directors I do this. I lay claim to ask them to believe that I take this action simply in our mutual interests. You will please remember that our interests are not inimical—they are identical. I am looking after my money as well as yours, and when I put it to you in that form I am sure you will absolve me and my coadjutors for any disposition to oppose the directors or to fight with them in any way. We wish to move as one body, and to do the best we can with this property. I am quite sure that if you have read this report you will have seen that there is something in the property, and I want to find out a little more carefully and closely what that something is. If you will allow me I will conclude with the motion, "That this adjourned meeting be still further adjourned for three weeks for the consideration of Furlonge's report." We ask for that adjournment in order that we may lay something definitely before you of a well-considered character, and let me again impress upon you that we are all actuated by one motive and that is to make the best we can of this unfortunate property, which is good in itself, and which by a little careful manipulation we shall save from, what shall I say—ruin—well, almost ruin. (Cheers.)

AN OFFER.

The CHAIRMAN: I have consulted my colleagues. We fully appreciate the spirit of the observation of the hon. gentleman who has just addressed you, and we are willing to assent to this proposal after the business of the day has been proceeded with. The directors will then call an extraordinary general meeting three weeks or four weeks hence for the purpose of taking into consideration the report of Mr. Furlonge, but we do not see any reasou why the ordinary business should not be disposed of. Therefore we will make that offer in the spirit of conciliation.

Mr. THOMPSON: I should like to second the proposal of Mr. Deering. Last time I rather opposed it, because I was then ignorant of the doings of Great She. I knew nothing of the formation of tho company or its subsequent management. The report tells us onc thing very plainly that, as far as the money expended has gone, and as far as the tests have gone, it is worth practically nothing, but that there are signs of gold, and if you expend something like 6,000*l.* you will then be in a position to say what you have in the shape of quartz to yield gold that will pay. That is the promise held out, and the last clause of the report embodies a similar hope.

"NO, NO."

I think we might in our mutual interests agree to the proposition of adjournment and to the suggestion of the chairman. (Cries of "No, no.") It amounts to nothing more than this, that the accounts which we have been unable to get audited in Africa should be passed. (No.) I do not think you will gain anything by delaying that part of the business. (No.) These are the accounts for what they are worth, and you can do nothing but accept them. (No.) I think it would be the most prudent policy to adopt. I do not think anyone doubts that other than errors of judgment have been committed. So far as the directors are concerned, they have acted to the best of their knowledge. They seem to have relied ou the statements of a man who had an interest in either the selling or the managing of the property, and that was the weakness of the position. But what are we to do now? I suggest that we adopt the accounts, and agree to the adjournment.

WHY THE ACCOUNTS SHOULD NOT BE PASSED.

Mr. ZURHORST: I have a strong objection to pass these accounts, and it arises from the fact that those from South Africa have not been audited. I raised this objection on the last occasion. We have put before us a statement of accounts, and a statement of expenditure in South Africa, which has not been audited. (Hear, hear.) Until these accounts have been put forward in detail, and until we have an idea of what has become of the largest portion of the moneys we have subscribed, I must strongly object to the passing of the accounts. (Cheers.) Those of you who have had more experience in mining than I have will probably recollect in American miues, where very large amounts of money are expended, full accounts are rendered. I have one of these in my mind. I have seen the statement of accounts and every item is put forward in the balance-sheet in American dollars, and then turned into English money, coals, candles, and every outlay that has been required—duly audited by a qualified auditor. If it is capable for a large establishment to do that, I do not know why a small oue of this kind cannot do also. What we want to know is where the principal portion of our money has gone, and we can only know that when the accounts are put before us and properly audited. And until then I do not think it is reasonable to ask us to pass them.

The CHAIRMAN: We have all the details here.

Mr. ZURHORST: They are not published.

The CHAIRMAN: They are available. It is not usual to publish full details. Every shareholder can see them at the office.

Mr. ZURHORST: I have given an illustration in which it is usual.

The CHAIRMAN: I am connected with a great many companies, and never saw it done. Here are the details.

Mr. ZURHORST: We cannot all go to the office.

THE AUDITORS' CERTIFICATE.

The CHAIRMAN: If you pass the accounts to-day you do so subject to the remark of the auditors, put into their certificate, "cash remitted to Barberton, for working expenses, held in suspense until receipt of audited accounts from the Cape." You are protected in every way possible by those words of the auditors. By our last accounts Mr. Firbank informs us he has engaged Messrs. Forbes, Little and Forbes, the most eminent accountants he can find, to examine the accounts, and their certificate will be sent forward. Unfortunately Mr. Riddell, who was the local secretary, sent the original receipts to the company's office here and retained copies. We have had to send the originals back, but I repeat—you are amply protected by the words of the auditors, and the details are here.

Mr. LEWIS SAMUEL: I object to any further adjournment, but I propose that the accounts be passed at once, and that the two directors who are seeking re-election be not re-elected, but that in their place the three gentlemen now acting as shareholders' delegates

be appointed a permanent consultative committee to act as directors, and be paid for their services in like proportion.

The CHAIRMAN: Our first business is to pass or to reject the accounts.

Mr. SAMUEL: I object to any further adjournment.

A THREAT OF LAW.

Mr. H. SMITH: If it is proposed to pass the report, I should object to it, and support Mr. Deering's proposition. There is one paragraph to which I shall object, under which it is proposed to make the vendors' shares cancellable under the articles of association, and I move "That that paragraph be expunged." With respect to the vendors' shares, it is not a question of the articles of association at all—it was part of the prospectus on which we subscribed for our shares. (Cheers.) One portion of that prospectus states that the vendors are to be paid a large amount of the purchase-money in shares, and that those shares should not be in their power to deal with until after a dividend was declared—in other words, that they are not to have power to deal with their shares until after the value of the property has been ascertained. This induced many of us to subscribe, and I say it is not in the power of any majority, however large, to bind any minority, however small, to alter a material statement in the prospectus. It matters not to me in the smallest degree whether you pass that resolution or not, because if you do I shall go out of this room and set my solicitor at work to recover every shilling of my money on the faith of that prospectus on which we were invited to subscribe.

FEES OF DIRECTORS.

I shall also object to the fees which the directors are receiving. Last time the chairman said that there were nine directors, and that the fees had been reduced to 500*l*. I did not think that so much when I heard it, but I found by applying to the secretary that that is the maximum number of directors, and the articles state that it is not necessary to have more than three directors, and that nine is the maximum. Therefore, if you have four or five practical men, and pay them 200*l*. or 300*l*., that is quite as much as they ought at present to receive. I will never be a consenting party to the alteration of the prospectus, by which the vendors are allowed to deal with their shares until after the value of the property has been ascertained.

AN INDIGNANT SHAREHOLDER.

Mr. SAMUELSON: I agree with the remark of the last speaker, and I have written to that effect to the board. I cordially support the last speaker, and will join him in the action he proposes to take. I also agree with him that the number of directors is excessive. I never saw a concern in my life so grossly mismanaged. Not one statement has been found to be true, and not merely that, but we have always had some flaming notice sent us just at the moment the directors wanted more money. Rather than have that go on, we had better wind up at once. That is the course I propose, unless the company can be carried on in a more systematic manner.

A STATEMENT WHICH RECEIVES PROMPT CONTRADICTION.

Mr. THOMAS PENN GASKELL (director): My views are the same as those of the last two speakers with reference to the vendors. That was the great inducement for many to subscribe—that the shares could not be transferred. I may, perhaps, state the origin of that. A deputation came to our board on several occasions. It was at the suggestion of Mr. Levy, Mr. Brewer, and Mr. Dering that we put that paragraph into our report. Mr. Levy stated on several occasions that he wanted to make the vendors' shares negotiable, and it was because we wished to take the feeling of the meeting that we put it into the report, and not because it was the wish of the board. As to the directors' fees,

I SHALL BE WILLING TO WORK WITHOUT FEES,

and, indeed, I proposed it, but had to bow to the wish of the majority of the board. I am very largely interested in this company, and so are many of my friends, and for that reason, because it is a right principle, I could be content to work for nothing. (Cheers.)

MR. LEVY'S REPLY.

Mr. LEWIS LEVY: I think I must correct the statement made by Mr. Gaskell, that I suggested that the vendors' shares should be dealt with. I received a letter from Mr. Caldwell, in which he told me that a meeting of the South African Mineral Association would be held, and he wished at that meeting to make a proposition suggesting whether it would be agreeable to the shareholders to have the vendors' shares made transferable, and I was not the originator of the suggestion. When Mr. Gaskell makes that accusation against me I must distinctly deny its truth.

The CHAIRMAN: It was in consequence of what you said that it was put into the report. You were the originator of it.

A CIRCULAR ISSUED TO A SELECTED LIST.

Mr. LEVY: I have distinctly denied it. (Cheers.) With regard to Mr. Gaskell, that gentleman, since the last meeting, has adopted a line of conduct very much to be deprecated. I cannot possibly have any interests antagonistic to this company, because my interests are bound up in yours. (Cheers.) The success of the company is the only way in which I can benefit, but Mr. Gaskell, since the last meeting, has been guilty of conduct which I will not call dishonourable, but which is manifestly unfair. He issued a circular to particular shareholders, simply a selected list, in which he uses my name, in certainly, to say the least, a most incorrect connection. I happened by chance to get one of these circulars, in which he states to the selected list to whom he sent it that I was a promoter. That I deny. (Cheers.)

MR. EDWARD COLEMAN.

I never knew a single individual connected with the company until they were brought to me by Mr. Coleman, who introduced them to me. Mr. Coleman was an old and esteemed friend of mine, and he brought certain men to me who had a property to sell, and asked for my co-operation. Believing entirely in Mr. Coleman, and knowing his intentions were perfectly honourable—I say, believing in those intentions, I supported him to the fullest extent, but that does not justify the statement in a circular, surreptitiously issued, that I was the principal promoter. (Loud cheers.) When such a statement is made I am bound to get up and deny it. I have done nothing that could in any sense justify this circular calling me a promoter. All that I have done has been with an open hand and above board. If I have issued any circular or any paper it has gone irrespectively to every shareholder. Every shareholder has been treated exactly the same, and I have paid the postages of my circulars, and I have paid the papers I have sent. I have sent the MINING WORLD, because in that paper I found the best report of our proceedings. I have nothing to hide, and therefore I do not like to be attacked in that manner. (Cheers.)

The CHAIRMAN: I think I may be allowed to explain. I have acted in good faith, but let me re-call to your recollection what took place the first time the question arose about making the vendors' share transferable. It was in a circular which you sent out, or at a meeting you called held in this room—an informal meeting. It was not called at the request of the board, or by any circular of the secretary. It was called by shareholders to consult with shareholders as to what was best to be done. Part of the proposal from those shareholders was that these shares should be made marketable. The directors have always been ready to do what the directors desired, and have had no feeling in the matter.

Mr. H. SMITH: You cannot make them marketable.

HOW MR. GASKELL SENT OUT HIS CIRCULAR,

Mr. GASKELL: I only sent that circular round to the gentlemen who had subscribed originally as my friends, and I think I was entitled to ask them whether they wished to support me or not.

Mr. LEVY: You were not entitled to call me a promoter. Did you get proxies on that statement?

Mr. GASKELL: Yes I did. (Laughter.) I sent round a proxy form with a circular to 87 gentlemen, 58 of whom sent me back their proxies.

Mr. LEVY: You ought to give me an opportunity of answering you. (Cheers.)

Mr. GASKELL: The only mention I made of your name was that you were one of the promoters.

Mr. LEVY: I utterly deny it. You ought to have given me an opportunity of answering you. You ought to have shown that circular to me before you issued it.

A SHAREHOLDER: If we want to do any special business we must call a special meeting.

The CHAIRMAN: That requires 90 days' notice. (Laughter.)

A LOST CHILD.

Mr. DEERING: I should like to know when you will put my motion for the adjournment of the meeting.

Mr. SAMUELSON: I move that the clause to which I have taken exception be expunged.

The CHAIRMAN: Then I will put the motion for the adoption of the report, with the exception of the clause referring to the vendors' shares. I would point out to Mr. Deering that his seconder does not agree with him; he is in favour of adopting the report.

Mr. ZURHORST: I shall have great pleasure in seconding the amendment simply for the adjournment.

LIVELY PROCEEDINGS.

Mr. SAMUELS proposed, and Mr. H. SMITH seconded "that the report and accounts be received, with the exception of the paragraph about the vendors' shares."

The CHAIRMAN: It is carried unanimously.

A SHAREHOLDER: What is carried unanimously? None of us seem to know.

Mr. DEERING: The chairman is in a muddle. He proposed the adoption of the report, and I proposed as an amendment, "That the meeting be adjourned for three weeks," and I respectfully submit that that motion should be first put to the meeting. In any case motions for adjournment always take precedence. (Cheers.)

The CHAIRMAN: It is carried unanimously.

SEVERAL VOICES: What is carried unanimously.

The CHAIRMAN: The amendment moved by Mr. Samuelson, and seconded by Mr. Smith. (Loud cries of "No it is not.")

Mr. THOMPSON: The proper course would have been to have put the first amendment.

Mr. ZURHORST: I protest against your putting the second amendment before you have disposed of the first. The motion for adjournment should have been put, and, if carried, should have been put again as a subsequent motion, and then the next amendment taken upon it.

The CHAIRMAN: I cannot go back upon what has been done. It is carried unanimously. (No, no.)

Mr. ZURHORST: We will have a poll.

The CHAIRMAN: You cannot have a poll upon what has been carried unanimously.

Mr. SMITH: You can put the amendment again.

Mr. LEVY: I propose that the chairman do leave the chair. I do not intend to be cried down by the directors.

The CHAIRMAN: If the mover and seconder of the motion, which has been carried unanimously—(no, no)—will withdraw, we will consider it cancelled.

Mr. SMITH: When you put the amendment the meeting did not understand it, and I think in fairness it should be put again.

Mr. WEST supported this proposal, but at the same time thought they might pass the report and accounts.

THE REAL FEELING OF THE MEETING FOUND OUT.

Mr. DEERING: I am unwilling to lose my grip of my amendment, which has been fairly put. The only little misunderstanding that has arisen has been through the chairman putting a subsequent amendment first. I think the end will be served if that amendment be either withdrawn or re-put by the chairman in a way that we shall understand it, and let my amendment remain where it is.

The CHAIRMAN put Mr. Samuelson's amendment again, and declared it lost by 21 votes to 16. He demanded a poll upon this, but Mr. DEERING said that

IN THE INTERESTS OF PEACE,

and to save time, he would consent to the report and accounts being passed. His amendment should then be put.

The meeting, which had proceeded so far with a poll that scrutineers had been appointed, was then brought to a close by Mr.

Deering's motion for the adjournment being put, and by its being carried unanimously.

Accordingly the report and accounts were passed, and the meeting stands adjourned until June 20th.

The usual compliment to the chairmau closed the business.

THE UNITED KINGDOM TEMPERANCE AND GENERAL PROVIDENT INSTITUTION.

A MOST PROSPEROUS YEAR—STRIKING FACTS—RESERVE FUND OF NEARLY 4½ MILLIONS STERLING.

THE forty-eighth annual general meeting of members was held at the City Terminus Hotel, on Tuesday.—Mr. Robert Warner, chairman of the company, presiding.

There was a large attendance of members.

Mr. THOMAS CASH (secretary) read the report of the directors and the cash account.

PROGRESS OF THE YEAR.

The CHAIRMAN said: Gentlemen, it is with much pleasure that the directors once again meet their fellow members to give an account of their stewardship for another period of 12 months, and as chairman of the board it is at once my duty, and privilege, to move, as I do most heartily, "That the report and balance-sheet be received and adopted." Allow me to detain you for a few minutes whilst I speak of some of the details of our business. The report states that we added to your accumulated fund 231,000*l.* during 1888, not far short of 50 per cent. of the total amount received in the year, after payment of all claims, annuities and expenses, and is the largest addition we have ever been in a position to announce previously, and I think you will agree with me that such a fact after 48 years working, when in the natural order of things the claims must be rapidly maturing, is very encouraging. I am sanguine enough to hope that the balance in our favour at the end of this present year will be equally good, inasmuch as to the present date our claims from the death of members are even less than in 1888. You will observe that I merely mention this as a hope, as a few claims from some of the larger policy-holders might obviously destroy this expectation. The new business completed is also in excess of any previously reported, and amounts to the large sum of 675,773*l.* The annuity business tends slightly to increase; whilst it is not a branch of the business that we think it well to push, we are willing to accept when offered. Our experience corroborates that of many others, that annuitants live, on an average, far longer than those persons upon whose lives ordinary policies are issued. The 11 annuitants, whose deaths we have reported, had by more than seven years exceeded the Psalmist's estimate of three score years and ten. I desire specially to call your attention to the appointment of Mr. Johnson Brooks as assistant-secretary. We were unanimously of the opinion that his long and faithful services to the institution in the various departments through which he had passed entitled him to the offer of this position, and we are equally unanimous in assuring you that the way in which he is fulfilling his new duties has our cordial approval. You will also observe that the name of R. M. Moore appears on our report for the first time as assistant actuary. He takes both pride and interest in his profession, and we confidently believe he has a bright future before him. We desire that this shall be a business meeting, and, therefore, whilst we do not propose to trouble you with long speeches from this side of the table, are by no means anxious to try to curtail any observations that the members desire to offer, but, on the contrary, as it is our duty, are ready to listen to any number of speeches you may think it right to make, and to give such further details of the position of the institution, and to answer such questions as may be desired. With these few remarks, I beg to formally move my resolution, and will ask my friend and colleague, Mr. Taylor, to second the same.

Mr. JOHN TAYLOR (director) seconded the resolution, and said the society had passed through the most prosperous year of its existence.

A MAN WITH A GRIEVANCE.

Mr. VARWELL (Exeter) expressed his satisfaction with the results of the past year as set forth in the report, but nevertheless he rose to move an amendment in, he admitted, his capacity as "a man with a grievance," and it was a grievance which he had brought before the directors some 18 months ago, aud in regard to which they had taken no steps. The amendment was "That the present method of awarding bonuses of endowment—bonuses whereby abstainers and non-abstainers are classed together, needs alteration." He had been an abstainer for 25 years, and principally for the good the society had done to the temperance cause, some 11 or 12 years ago, he joined the society in its endowment section. He entered as a teetotaller, and in doing so, was called upon to sign a declaration to that effect, and every year he had been required to do the same. Judge his astonishment when, some two years ago, the fact was brought to his knowledge that, although an abstainer, he was told he received no benefit on that account, neither in the matter of bonus nor that of premium.

The amendment fell to the ground for want of a secouder.

Mr. GEORGE WILLIAMS moved "That this meeting considers the present position of the institution as most satisfactory, and cordially thanks the directors for their past services." It does seem to me that so large a capital, which is so securely invested, to be made to pay 4 per cent., shows great wisdom on the part of the directors.

Mr. CONRAD WALSER seconded the resolution, and thanked the directors for the excellent report they had presented. As a large policy-holder and as a foreigner, he felt perfectly safe in this institution.

The motion was carried unanimously.

VIEWS OF A DIRECTOR.

Mr. W. S. CAINE, M.P., returned thanks, and said: I can assure you that our services are a very great pleasure to each one of us. We are all proud of the position we occupy as directors of this institution, but we also feel our responsibility, not only to those with whose money we are entrusted, but also to the temperance public, to maintain and keep well to the front the great temperance truths that are taught by the experience of this institution. The work of your board is increasing, and it is becoming more difficult year by year. Of course, the main duty that devolves upon us is to take care of your funds, to invest them carefully after, by close investigation, we have taken care that no bad lives come in to diminish the general profits of those who are already ensured. We are now

THE LARGEST ENGLISH MUTUAL OFFICE,

as far as the number of policies and accumulated funds are concerned. There are some English offices whose liabilities are larger, but none whose assets are greater. As business men, we look upon the asset side rather than the liability side when we wish to consider our position. I should like to bear my testimony on the behalf of my fellow directors to the loyal manner in which our efforts are backed up by the permanent officers of the institution.

REPLY TO MR. VARWELL.

Mr. CASH: I am sorry I did not know Mr. Varwell's matter was coming forward to-day, because I would have been prepared with the exact correspondence. It took place 18 months or nearly two years ago, and it is difficult to carry it in one's head. Neither can I tell Mr. Varwell, without reference to our books, how many policies we had in the two sections, but we have a larger number in the temperance than in the general section. With regard to the question, why he is asked to sign the temperance declaration—the answer is so that we may be prepared to carry out what are his wishes now, if at any future time we should find ourselves in a position to do so, and find also that there is any real difference between the two classes. The very object he wishes is the one we are trying to carry out, so that if there is any advantage to the abstainers they may get it. At present, as Mr. Hardy will tell us, is so small that the directors have never seen their way to make a distinction. The reason is that there is no accurate test of longevity where we lose sight of the member. It would be almost impossible to do it at present. There is not that difference which will justify us in making a distinction between the two. Mr. Varwell said, "The department in which he had been unfortunate enough to get," and yet he told us he had had a splendid bonus. I cannot harmonise his contradictions. (Laughter.) I believe I may say the bonus has been such as he would find it exceedingly difficult to have equalled anywhere else. If he will look at our prospectus and reports all the examples are given specially as whole life policies. We have never given an example but what we have put in those words, "whole life policy." If anyone can say he expected otherwise in the endowment section, we can only reply that we are not responsible for it. I think we must come to the same conclusion as we did when the complaint was originally made, and when it was submitted both to the board and to the actuary, and say that the course we have pursued is the only one that really gives fair play towards the members at large. Should the facts turn out as he hopes (and we shall not be sorry if they do), then a difference will be made, but at present it cannot, and I am sure the board will not make any difference in the practice which has been adopted from the commencement of the institution.

Mr. RAPER: We had 5,079 in the temperance section and 3,890 in the general section at the end of the year, but the temperance section has increased since then proportionately. These 9,000 policy-holders are the very pick of the assurers in the country, and the statement our secretary has made is deeply interesting, showing that the men who go in for endowment policies are those who understand the condition of their health so well that they do not intend to die at any reasonable period for actuaries to deal with. (Laughter.) We always put in the front whole life policies, because those are the lives simply that we have control over to the end. We cannot tell the mortality of the rest when we have no register of their deaths. (Laughter.)

Mr. SELWAY moved the thanks of the meeting to the auditors, Messrs. Edward Nathan and Dawson Burns, aud also their re-election for the current year.

Mr. MORRISON seconded the motion, which was carried unanimously.

The AUDITORS having replied,

Mr. KEMPSTER proposed a vote of thanks to the medical officers, solicitors, superintendents and agents, and dwelt with much force upon their respective services.

Mr. BALDWIN (Tunbridge Wells) seconded the motion, and expressed his great satisfaction with the progress of the institution.

The motion was carried.

Mr. THOMAS HUDSON proposed a vote of thanks to policy-holder No. 1—in other words the chairman. (Cheers.)

Mr. KING (of Dublin) seconded the motion, which was carried.

The CHAIRMAN replied, and proposed a vote of thanks to Mr. Cash, Mr. Brooks and the staff for their services.

Mr. WHITTAKER seconded the motion.

Mr. CASH, in returning thanks, said: I am not vain enough or foolish enough to take this credit to myself. I desire to associate fully and entirely and heartily with my colleagues with the office with whom I work from day to day. They endeavour to make my burden as light as possible, and by all working together we succeed in making our business a pleasure. I am anxious that Mr. Brooks should make a few remarks. We have worked with the utmost harmony for the past 30 years, and I believe that the appointment the directors have made is one that will tend to the greater prosperity of the institution. I have a letter from Mr. Barrett, who says:—"This is the first time in 45 years I have been prevented from being present at this annual meeting."

VIEWS OF THE NEW ASSISTANT SECRETARY.

Mr. BROOKS: I can assure you that it has given me the utmost pleasure to find the way in which you have received the notice of my appointment to-day. When the directors elected me to this office I felt exceedingly pleased and proud to have earned the position to which I have now attained. (Cheers.) I have, as Mr. Cash has said, been connected with this office for more than 30 years. I have served the office to the best of my ability in the position assigned to me, and I think I have been thoroughly successful in winning the good opinion of our friends. I can only say to-day that it gives me additional pleasure to find the way in which you have received the notice of this appointment. Of course, in the future I must look to the agents and members to help me in this great work of extending the business of the office still further. Last year was the best we have ever had. We sent out a circular in the early part of October announcing my appointment, and I wrote a few lines myself to the agent, and the response was really very gratifying.

In the latter part of the year we completed an immense amount of business, and I only hope we shall do the same this year. With the assistance of our friends and the energy displayed by the agents, we shall accomplish greater things. We shall do our very best, and in regard to what our friend from Exeter has said, I can only say, from my intimate acquaintance with the departments 2 and 10—I have spoken to them over the counter for 25 years past, and verified the statement of Mr. Raper that most of our members in that department are really abstainers. They will not sign the pledge, but they are abstainers. Departments 2 and 10 are very much alike. (Cheers.)

The proceedings then closed.

THE ESSAMAN GOLD MINING CO., LIMITED.

MINE ABOUT PAYING COSTS—REGULAR CRUSHINGS SINCE OCTOBER—PRESTEA AND BROOMASSIE PROPERTIES—POSITION GREATLY IMPROVED.

THE adjourned second ordinary general meeting of the company was held at Winchester House, for the purpose of transacting the business left unfinished at the general meeting held on the 29th December last—Robert A. Gillespie, Esq., presided.

Henry Tolputt, Esq., managing director, read the notice calling the meeting.

PRESENT POSITION.

The CHAIRMAN: This is an adjourned meeting for the purpose of finishing the business uncompleted on the 29th December. and that business is to submit the accounts, which have been delayed, and also to elect, or otherwise, the retiring directors. The whole board retire, and submit themselves for re-election. I have very few remarks to make on the report, but, first of all, my observations will be directed to the accounts. The development of the property has gone on considerably since the last meeting, and I think it will be gratifying to the shareholders to know that the cost of development has not been by any means above the average; on the contrary, considerably below. Since September, 1888, we have been getting regular returns from the mines, particulars of which you have in the report, and I am glad to say that since that month these returns have been practically paying working expenses, and it is more satisfactory to know that these returns were arrived at when only 20 heads of stamps were at work, although another 12 are about to be put up. As soon as they are erected it is reasonable to suppose that the returns will be considerably augmented. Another thing that cannot fail to be satisfactory to you is that the accounts which are now before you, up to the 30th June, 1888, include the whole cost of the machinery at the mine along with the 24 head of stamps—the 12 at work and the 12 shortly to be erected. There are only two small matters involving 77*l*. not included in that—the feeding gear and the crank.

ACCOUNTS.

The charge in the balance-sheet for postages, &c., appears to be high, but I should like to point out that telegrams cost 8s. a word, and that there is a voluminous correspondence, printing and stationery at the mine, and newspapers and books to be sent to the men during their stay in Africa. The capital account shows the particulars of shares already subscribed up to May 21st. For the remainder of the 50,000 shares applications are now coming in, and are available only for the shareholders up to the 1st of June before putting them before the public. The applications are now coming in, and the directors hope it may not be necessary to offer the public anything—in fact that the whole of the shares may be taken up amongst the existing shareholders. Since the last meeting there has been some delay in the work out there owing to the difficulty of obtaining labour. There was a difficulty regarding the Krou boys, which arose from obstacles unjustifiably thrown in our way, and which are now a matter of investigation, and we trust will be obviated for the future. We now hear that an increased supply of men are available. The Krou boys work well, much better than the local Frankis, and although in the matter of food they may be more expensive, still the extra work got out of them compensates for the extra cost. Behind me there is a somewhat more elaborate plan of the mine than has hitherto been supplied to us, and although not absolutely perfect, it shows pretty well the material points; and any further information the shareholders desire can be given by our managing director, Mr. Tolputt. The plans will show the extent of the levels at present being driven, and also the points where the natives are at work, and one shaft in particular which is alluded to in the report, where the natives have got into a very rich shoot. They have only at present ascertained in one instance that they are below our levels simply to the extent of 20 ft., and in a few months time we have every reason to suppose that we shall be well below this particular shaft, and that we shall then be able to carry on our levels steadily, and work along the whole length of them. When we have arrived at that point we shall have about 60 ft. of backs above us. In the meantime the driving is going eastward, for this reason, that the natives have a right to work their shafts until they are intersected by our levels, but whenever we intercept any of their shafts they are obliged to vacate, and, therefore, it is considered very advantageous that we should get rid of them as soon as possible by continuing to drive in this particular direction, although the ground is rather poor in some instances. The present supply of quartz worked by the stamps is principally derived from the westward, where the reef widens to about 15 ft., and I need scarcely say that where the reef is as wide as that the gold is considerably disseminated, and we find it necessary to crush a larger amount of stone than if if it were only 3 ft. or 4 ft. wide. That, of course, means that as soon as we have extra power in the way of stamps the better. It will supply us with more bulk to work on, and the great thing is to have sufficient stamps to work as we go along. It has been ascertained absolutely that a yield of 200 ozs. per month covers expenses, and as you will see by the table in the report we have had monthly very satisfactory returns since the September of last year, and the one by telegram actually amounts to 200 ozs. Anything we get beyond this we may reasonably expect may be looked upon as a profit. We have heard of the second battery commencing to be erected, and its completion will soon be telegraphed. With a full supply of material it will not only be probable, but absolutely certain, that we shall be within measurable distance of getting a dividend on our investment. (Cheers.)

GENERAL IMPROVEMENT.

Generally, I may say that everything that has occurred lately points to an improved prospect in Africa. A visit has recently been paid by the Governor to our part of the country. He examined our mines, and appears to have been favourably impressed by them. His report is not yet received, but amongst other recommendations he made was one of a tramway from the river to Axim, and if that were made it would materially assist the transport services. I shall be happy to answer any questions, and if they are in technical detail our managing director will be able to supplement any information I may give. (Cheers.) I beg to propose the adoption of the report.

Mr. JAMES LABOUCHERE: I have much pleasure in seconding the motion. I do not think that it is necesary to go into further details, but I may add to what the chairman has said, that it is a question, not of years, but of a few months or a few weeks, when we shall get below where the natives have taken out the rich ore, and be able to see what is left for us. Of course they have only reached a certain depth—20 ft. below us—and we hope beyond that depth not only to make returns at the rate of 200 ozs. per month, but 500 ozs. or 600 ozs. I shall be very much disappointed if our monthly returns do not at least come up to the first of these figures.

CONGRATULATIONS.

Mr. FERGUSSON: I congratulate you upon giving us a very good and promising report. Do the returns represent actual crushings, as mentioned in paragraph 3 of the report?

The CHAIRMAN: That was the crushing from the tribute gold at Broomassie.

Mr. FERGUSSON: Some shareholders object to parting with Broomassie, but I do not know enough about the subject to object. I hope you feel confident you are not parting with the plum of your property?

The CHAIRMAN: We will refer to that at the special meeting.

Mr. WALTER JAMES: It may not have occurred to the shareholders that these two magnificent properties I use the word magnificent advisedly—have cost the company only 15,000*l*. all told. 15,000*l*. seems to be nothing in these days of rapid promotion, but it is a very fine working basis for us to go upon. It has been remarked by shareholders that the expenditure does not seem at all heavy, and on looking at the figures I am quite prepared to agree that in a country of this sort, barbarous or semi-barbarous, the expenditure has not been excessive. I think it would have been satisfactory if we had Mr. Hardy's report, and I should like to know when we shall get it. I should like also to know the number of tons crushed to produce the ounces mentioned in the last telegram. There is nothing to be afraid of or to be ashamed of. If this is a good mine he will crush everything, and prove his ground whether the average is high or low. I do not know whether you have any telegram from Mr. Harvey since the report was sent out. I observe that the chairman dwelt upon the question of postage stamps, and if he looks after the pence, the pounds will not only look after themselves, but he will look after them also.

A SHAREHOLDER: May I ask about the Quah Badoo Concession?

Mr. TOLPUTT: That is a concession we have acquired since the formation of the company. It lies between the river and Broomassie, and protects our road to Broomassie. It is not ours; we pay rent for it.

FRESH CAPITAL.

Mr. T. G. GILLESPIE: Are the applications for fresh capital coming in in a manner to satisfy the board? We have been working with too small a capital, but it is absolutely necessary to have plenty of money in developing a property like this. I trust the shareholders, seeing how very satisfactory everything looks at present, will support the suggestion for the additional amount of capital, and that we shall hear of none of these shares going to the public. I have had an interest in the company from the commencement, and was for the time a director. I have from time to time extended my holding, and am prepared to do so again. (Cheers.)

The CHAIRMAN: At the present time the applications have been fairly satisfactory.

A DIRECTOR WITH A LARGE STAKE.

Col. LE CHAMPION (director): I have a rather large stake in the company, but I confess that since I have seen our present manager's report I think our prospects have improved in a ratio I can scarcely describe. I consider him to be a first-class man, and I do not think he is misleading us. At one time I was alarmed by the state of affairs, but since I have seen Mr. Macduff's positive assurances that he has sufficient quartz to work with and no present fear of failure while the shaft is going down, and when I recollect also that we have gone a very short distance down to get these good results, I have concluded that our prospects are very good. I have not trusted entirely to our own manager, but have also consulted my partners in another mine not far off, and I may tell you that we are on the same line of reefs that they are on. That reef, I am assured, is yielding 2 ozs. to the ton, and I do not see that there is any risk in increasing our stake in this company. I am not going to do so myself, because I think my stake very large already, but I can confidently recommend my brother shareholders to take the precaution to which they are entitled. I think we are getting out of our difficulties very rapidly, and I am happy to state as much in the presence of this meeting.

Mr. IRVINE: Have you any means of giving us an idea of the value of the reef?

Mr. TOLPUTT: We have not any positive information. We have stated the results of testing the reefs from point to point, and all we can do at present is to give an average result at each point tested.

Mr. IRVINE: Do you state that in the prospectus?

Mr. TOLPUTT: Yes. At present we are not in full working. We are crushing the stuff that is taken out in driving the levels. The map on the wall shows the levels we have driven—of course I am talking of Prestea. It shows where the shaft has gone below the company's level, and also the rich shoots springing from a small leader running alongside the reef, and increasing in width as it approaches the rich part running to the centre. The natives are down 95 ft., and we have every reason to believe that the man Taylor got 5 or 6 ozs. to the ton at the particular part of the reef indicated on this plan, and that has made us anxious to cut through it as soon as possible. Mr. Macduff is pushing on as fast as possible. The shaft ought to have been commenced six months ago, and if it had been we should have been on the reef at this time.

Mr. JAMES: The returns, I think, will be considerably over 1 oz., but we want the number of tons crushed.

Mr. TOLPUTT: We shall only be too happy to give you the information when we get it. We cannot get the printed returns properly turned out, but we must insist upon it.

Mr. JAMES: The Indian captains send their reports prior to the meeting.

The CHAIRMAN: We have sent out an amended form of return, which, if properly filled up, will give every detail of how much is crushed, and how the gold is arrived at.

MORE FREQUENT MEETINGS.

The CHAIRMAN at once acquiesced in a suggestion made in the room that half-yearly meetings should be held.

A SHAREHOLDER: Does the return of 200 ozs. include what was upset in the previous return?

The CHAIRMAN: Yes, it does.

The SHAREHOLDER: Then you are not paying expenses.

The CHAIRMAN: I said very nearly, and that 200 ozs. would more than cover them. The returns have been regular since October.

Mr. TOLPUTT: Our manager is a very good miner, but the mistake he made was in undertaking to do the accounts as well. He was offered an accountant, but said it was not worth while to incur the expense. We allowed him to undertake the accounts, and he singularly failed in attending to them.

The report was then unanimously adopted.

Mr. FERGUSSON moved the re-election of the whole of the directors.

Mr. HENRY THOMPSON seconded the motion, because he said that when he read the balance-sheet he was agreeably surprised by the results.

The motion was carried unanimously.

The CHAIRMAN returned thanks, and said the directors would do their utmost to promote the interests of the company.

Mr. JAMES proposed the election of the auditors, Messrs. Lovelock, H. W. S. Whiffin, and Dickinson.

The motion was carried unanimously, and the ordinary meeting was brought to a close.

THE SPECIAL MEETING.

The extraordinary meeting was then held for the purpose of passing the following resolution:—"That the directors be and they are hereby authorised to sell the rights and interests of the company in the land situate in the district of Apintoe Heeman in Western Wassau, on the Gold Coast of Western Africa, known as Broomassie Mines, to any joint stock company formed or to be formed, or any other portions of the company's property, on such terms and conditions (including the acceptance of shares of the purchasing company, in payment or part payment for the same) as the directors may consider desirable in the interests of the shareholders."

The CHAIRMAN: This meeting is really for the purpose of getting from the shareholders an indication of their wishes in regard to the Broomassie property. It appears to be quite obvious that the company will not be able to carry on with its present capital such extended mining operations as will be necessitated by the carrying on of mining at Broomassie as well as the works we have at present in hand, more especially as it is likely to be increased by the opening of another mine in the neighbourhood of Prestea, of which the accounts are very promising. We do not see a prospect of opening Broomassie within a reasonable time, and, therefore, it appears to the directors that the best plan would be that a separate company should be formed for the purpose of working it, in which the shareholders of this company can retain a considerable interest. It would have advantages in this way—having a second company within a reasonable distance of the present one we should have two staffs, and in the event of anything going wrong at the one mine, prompt assistance might be rendered by the friendly one close by. There is no immediate hurry for disposing of Broomassie, but in the event of an advantageous opportunity presenting itself, we wish the authority of the shareholders or at least their views. There may be a boom which might give us a great chance of disposing of their property, and we wish beforehand to be authorised to entertain it if it is thought advisable. I propose the resolution.

Col. LE CHAMPION said that at the Colonial Office he had been promised assistance in obtaining a copy of the report of the Governor upon the mine. He thought that this report might advantageously affect the property on the Gold Coast.

Mr. TOLPUTT seconded the motion, and said: Some time ago, when there was a boom in Transvaal Mines, overtures were made to me, in the first instance, to deal with this property. Looking into the articles I found the directors had no power, and it threw the matter back. In the meantime the boom was over, and the matter dropped. One or two overtures have been made since, and we have still been in the same difficulty, and therefore it occurred to us that we would ask for the necessary power now in order that no time may be lost should another boom come along. Mining in Africa is by no means easy. Mining in the Mysore has been alluded to, but the Mysore is one territory and Africa another. One great difficulty we have had to contend with in Africa is that the staff are, to a great extent, independent. My idea from the first was, and experience has confirmed it, to duplicate the staffs wherever possible, so that one man can replace another in case of need. That will always be a difficulty in a climate like this. Not very much has been done in the way of developing Broomassie. At Prestea we wish to get well below the native workings, and that is why we are driving this level in all haste to do so. We ought never to have attempted to drive a level through native workings. The same mistake was made at Akankoo, and nearly ruined that company. The moment we got below the native workings we found a splendid reef. Until the value of one of these properties is thoroughly established in the public mind there is no doubt we must be content to take moderate prices, and to take an interest in anything we sell. Meanwhile, we must push on as economically and as expeditiously as possible. If one of these mines turns out a brilliant success—and I have in my mind three companies that will do so—the value of Gold Coast properties will rise enormously. (Cheers.) It will, therefore, be an advantage to the directors to have the power to dispose of this property. I had hoped to be able to work Broomassie, but we find the prejudice against the Gold Coast is difficult to overcome. There is an idea that it is one vast burying ground, but that is wholly mistaken. We had a teetotaller out there who was paid 1*l*. a week extra instead of drink, and, after remaining there some years, he came back as well as ever. (Laughter.)

DISCUSSION.

Mr. FERGUSON said he was quite willing to give the directors authority to do everything, but the shareholders ought to be informed before any sale was contemplated.

Mr. TOLPUTT said that was where the difficulty came in, they could not fix any terms.

Mr. FERGUSON said they could be fixed at a meeting to be called at 10 days' notice. He had confidence in the directors, but some shareholders might object unless there was some stipulation of the sort. Individually he would not hesitate to put it in the hands of the directors. The Colonel held perhaps more than anybody in the room.

Mr. IRVINE thought they ought to give their directors full power as it often happened that an offer which could be accepted at once would be off if they had to submit to the shareholders.

The CHAIRMAN said that was what they wanted, but it was their intention to retain at least one-third of the property in their own hands.

Mr. JAMES said there was much in what Mr. Ferguson had said, and for himself he was not indisposed to give the directors full power.

Mr. FERGUSON said on the side of the directors there was a large holding, and he thought they ought to give them full power, as for their own sakes they would make the best bargain they could.

Col. LE CHAMPION thought they might propose a limit, but at the same time they might interfere with the sale.

Mr. JAMES said they would have to be careful into whose hands they let it go, and what sort of a board they got.

Mr. FERGUSON would like to see the board form a new company and get up the capital.

Mr. LABOUCHERE (a director) said he was about to suggest that they should express a wish that two representatives of that board should be on the board of any new company formed.

Mr. H. TOLPUTT said that they would take that as an understanding.

The CHAIRMAN said they would take it that the board were in possession of the desire, and the shareholders that it should be so.

Col. LE CHAMPION asked what was the length of the Broomassie property.

Mr. H. TOLPUTT said 6,000 ft.

Col. LE CHAMPION wished to know if the resolution would empower them to sell a portion of the mine.

The CHAIRMAN said the power to deal with the whole, and it would include the power to deal with a part, but whatever they sold they proposed this company should retain one-third of it.

Mr. WHITALL thought some shareholders objected to the sale the Broomassie Mine at all. It was the only mine they knew anything about.

Mr. H. TOLPUTT: We know nothing about it.

The CHAIRMAN said all they knew about the Broomassie Mine was from certain tribute quartz which was undoubtedly picked, and produced a good result.

PRESTEA *v.* BROOMASSIE.

Mr. TOLPUTT said the opinion of Mr. Macduff and Mr. Harvey was that Prestea was quite as good as Broomassie. In Prestea they had crushed hundreds of tons, but had only crushed 80 tons in Broomassie, and that was from the middle of the reef.

Mr. WHITALL said if they gave the directors *carte blanche* to do what they liked, they ought to have half of it.

Mr. TOLPUTT pointed out that that would be against the Stock Exchange regulations.

The CHAIRMAN said it was obvious that their present capital would not enable them to work Broomassie, and the point was, should they leave it unworked, or take steps to enable them to work what would undoubtedly prove profitable?

Mr. WOOLEY suggested that they might raise the money by the issue of debentures.

Mr. TOLPUTT said they could not issue debentures for a property that was not worked.

Col. LE CHAMPION thought it would be better to leave the power in the hands of the directors to divide the property if they thought fit. They might escape the necesity of having to raise any very large amount, and if they had to do so he thought the directors might be trusted to sell as little of the Broomassie as might be necessary for their object.

Mr. TOLPUTT said if it was in Witwatersrandt they could make 10 mines of it.

The CHAIRMAN then put the resolution, with the interpolation of the words, "in whole or in part."

The resolution thus amended was agreed to with one dissentient.

A vote of thanks to the chairman brought the meeting to a close.

LA TRINIDAD, LIMITED.

FINANCIAL TROUBLES—INSTALMENTS OF PURCHASE-MONEY IN ARREAR—GENEROUS ACTION OF MADAME ALSUA—WHAT AMERICAN CAPITALISTS THINK OF THE PROPERTY—SATISFACTORY STATEMENT FROM MR. EDMUND HARVEY.

AN extraordinary general meeting of the above-named company was held at Winchester House, London, E.C., on Tuesday, "for the purpose of considering the present position of the company, and of passing such resolutions as may be thought fit on such consideration, and also for the purpose of considering any offer which may be submitted for the purchase of the company's properties, and if thought fit of passing such resolutions as may be required to give effect to the same."—Stewart Pixley, Esq. (chairman of the company), presided.

DIFFICULTIES AND TRIALS.

The CHAIRMAN: Gentlemen, the circumstances under which it became necessary to convene this meeting were explained to you as they then existed by the circular of the 15th instant, signed by myself and the assistant secretary, which was sent out with the notice of the meeting. You will remember that 18 months ago 30,000*l*. was sub-

scribed on the preference shares, for the purpose of renewing the lixiviating machinery, which was old and in a state of ruin. In asking you to subscribe your money for this purpose, we had every reason to believe that the concentrating machinery, which was new and had been contracted for by the vendor, was efficient for its purpose, and that when it was erected, and new lixiviating plant supplied. the mine would be in working order. With this view Mr. Edmund Harvey, the secretary, was dispatched to Mexico for the purpose of pushing forward the erection of the concentrating machinery, and purchasing and erecting the lixiviating machinery required to complete our plant. He succeeded in his task to the full satisfaction of the board in the face of very great difficulties, and I have great pleasure in testifying the unanimous opinion of myself and my colleagues that the present difficult position of the company is in no way due to any fault on the part of Mr. Harvey. He has displayed the greatest energy and business aptitude and resource in overcoming difficulties, and we can only sympathise with him if the success which seemed about to crown his efforts is destroyed by a cause for which he is in no way responsible. Soon after he got the machinery to work, Mr. Harvey found that the concentrating machinery, which had been contracted for by the vendor before the incorporation of the company, and which, by the preliminary contract of the 24th November, 1884, the company was bound to take over, was of such defective construction that it is practically useless, and will not run even half time, and requires to be very frequently shut down for repairs.

DEFECTIVE MACHINERY.

The effect of this defective condition of an important part of the machinery is disastrous. We were relying on the produce of the mine, not only to pay the debts in Mexico. but also to keep down the instalments due to Madame Alsua, and the closing of the mine, necessitated by the defective condition of the concentrating plant, is to deprive the company of its only source of supply for making these payments. Our difficulties are further increased by the fact that, as reported to us, Madame Alsua has recently received from American capitalists a cash offer for the whole of the properties now held by the company at a considerable increase in price. You are aware that we are in default in the payment of the instalments to Madame Alsua. She has treated us with the utmost consideration, but we cannot be surprised if with this cash offer before her she requires some definite assurance or security from us for payment of the money which we have contracted to pay her. She has been good enough to afford us an opportunity of finding the balance of the purchase-money, on condition that she receives 5,000 Mexican dollars monthly, for the months of May and June, and she will then resume possession of the property if the purchase-money be not paid. One of my colleagues and myself have provided the $5,000 for the month of May, and another $5,000 must be found in a few days for the June payment in order to keep alive the rights of the company under their contract.

IMMEDIATE REQUIREMENTS.

I cannot, however, conceal from you that in the present crisis of the company's affairs it is necessary to find at once a very considerable sum of money. 20,000*l.* is required for a stamp-mill to replace the present defective concentrating mill, and, in addition, we must be in a position to give Madame Alsua some assurance for the payment of the balance, or a considerable portion of her purchase-money. The present directors have already advanced to the company between 14,000*l.* and 15,000*l.*, and they can do nothing more. At the time when the notice convening this meeting was issued we were in negotiation with financial gentlemen of position in the city, and we were in hopes that we should be able to lay before you at this meeting some definite scheme for raising the required funds. Those negotiations have fallen through, but I am glad to say that if we can raise in the room to-day 5,000*l.* on the preference shares, so as to preserve our rights with regard to Madame Alsua, a gentleman connected with eminent financial circles is prepared to send an expert to the mine with a view to making arrangements to raise the capital required to pay off Madame Alsua. In these circumstances I have to ask each of you now to do your best, and to say what amount you are prepared to subscribe towards this 5,000*l.*, and I shall then propose that a committee of shareholders be appointed to confer with the directors as to the disposal of the money, and as to any financial proposal which may be made to us after the expert has reported. At a preliminary meeting at the offices of the company, we asked some of those who were the largest shareholders to be kind enough to give us their names as a consultative committee, and Dr. Thompson, Mr. Alcock, and Mr. Hammond have done so. We should like two or three more. When we were raising the 30,000*l.*, a small consultative committee did us great service. What I want you chiefly to do before you leave this room—it will be too late afterwards—is to put your names down and raise this 5,000*l.*, so that we can retain the property until this expert's report is ready, if it is necessary to have it. If we could raise a quarter of a million of money ourselves the report would be quite unnecessary, but I fear it is too much to hope for. I think, however, we might, in this room, get such a proportion of it as would enable us to go to Madame Alsua, and I am sure she would give us time to pay the balance. She has not pressed us in any way, but one cannot wonder at her saying in view of the default that we have made, and as she has received this cash offer from American capitalists—who know the value of what we have to sell—that we must do something more. She has been particularly kind to us. I do not know that any body of shareholders were ever more unfortunate than the shareholders of La Trinidad. We have been taken in in every possible way.

DIRECTORS' EFFORTS TO SAVE THE PROPERTY.

We have, however, fought a good fight, and your board have never relaxed their efforts. For a long time it has been all outgoing and not incoming on the part of your board and officials. Mr. Harvey has not drawn one penny piece of salary for the last 18 months, and we do not look for payment until you are in receipt of dividends. (Cheers.) Mr. Harvey is here, and will be able to tell you, from 15 months' experience in and about the mine, what an enormous property we have. It does seem very hard, now that we have got it stock, lock and barrel under our own control, that we should lose it just when we are in a position to make the most of it. We want 5,000*l.* only to ensure us retaining control of the property.

QUESTIONS.

A SHAREHOLDER: What is the nominal value of the preference shares?

The CHAIRMAN: 5*l.*

Mr. C. E. DAVISON: What is the balance that is due to Madame Alsua?

The CHAIRMAN: Nominally, about 230,000*l.*; but we have an idea that if we can make her a cash offer of, say, 200,000*l.*, we should get possession of the property.

Mr. DAVISON: Are there any unpaid calls?

The CHAIRMAN: No.

A SHAREHOLDER: Does that 230,000*l.* include interest?

The CHAIRMAN: No; Madame Alsua is for giving us a year's interest.

In reply to a shareholder,

The CHAIRMAN said that there were 45,500 shares standing in the name of Mr. Brown, against whom the company took action, and 44,000 of them were cancelled. Mr. Brown was practically eliminated from the register, and the company stood in possession of the property. (Cheers.)

Mr. GOOCH: You say that if you can raise 5,000*l.* you can secure the property. How does that agree with the paragraph in your circular, which says that "Madame Alsua has been kind enough to afford the company an opportunity of finding the balance of the purchase-money, on condition that she receives 5,000 Mexican dollars monthly for the months of May and June, after which date she will resume possession of the properties if the balance of the purchase-money be not paid to her." We are now at the 28th May, and June is upon us.

A SHAREHOLDER: I gathered from the circular which you sent out that some offer for our property was to be made. I had hopes that it would have been in your power to dispose of our interest in the property for some amount. Perhaps you will be good enough to explain.

The CHAIRMAN: I may answer Mr. Gooch by saying that when we issued that circular the amount stated therein was perfectly correct, but yesterday afternoon we had a cablegram from Mr. Murray, our manager, to say that there were some particular debts for stores, &c., amounting to about $10,000. caused entirely by the machinery continually breaking down, and that he strongly recommended a remittance of that amount to be made. So that it makes it altogether about 5,000*l.* that we want now.

A SHAREHOLDER: Has no offer been made by any other independent party to purchase our interest in this property?

The CHAIRMAN: We fully expected at this meeting to have had an offer to submit to you. We have had a long chat this afternoon with a gentleman on the subject, and it is for that purpose—because we want to have the call of our property for another month or two—that I ask you for this money now. We have not yet any absolute offer, but we are negotiating with a gentleman of very considerable means and good backing.

A SHAREHOLDER: Do you think it likely that Madame Alsua will extend the time?

VIEWS OF THE GENERAL MANAGER.

Mr. EDMUND HARVEY: Madame Alsua told me she thoroughly understood the difficulties and trials we had at the mine. Her husband had considerable experience of them before he died. She told me:—"Mr. Harvey, I must have something to live upon. My means are almost at an end. If you will guarantee me $5,000 a month, I will hold my hand until you return, but you must return within a reasonable time." I said, "These things take considerable time, and I may be two or three months." She said, "I don't mind that, but you must let me have $5,000 a month to live upon." In addition to that, there is a sum of $10,000 necessary to meet pressing drafts, otherwise the merchants in whose hands they are will not allow them to remain over. That makes $15,000, equal to about 3,000*l.*

CONDITION OF THE MINE.

With regard to the mine—what you have heard about it is perfectly true—in fact it would be impossible for anybody to tell you what there is in the mine. People who go through the mine are puzzled, and cannot understand it. They go again and again. It takes a man about a fortnight before he can thoroughly understand that mine and see the vast riches it contains. In one saloon alone, where there had been a large cave-in, there were at least 1,000,000 tons. I had four estimates, and that estimate was within the mark. The assay value from the 17 samples was 24.2. Yet with all that ore we can do very little good. The machinery there is simply fearful. We have three engineers and a chief engineer on repairs alone, and yet we cannot keep it going. The first section is no sooner repaired and set to work than the second breaks down, and so we go on the whole time. One month we worked 18 or 19 days, and we turned out 34 ozs. In March we worked 14 or 15 days at odd times, and we returned $28,000; in April $30,000 was returned. Looking at the fact that only 50 per cent. of the assay value of the ore going into the mill is saved, and taking the result that I have given you, with a cost of about $20,000 to $22,000 per month, I think you will agree with me that the mine is very valuable. At present we could take out about 400 tons a day straight away, and none of them I am certain would assay under 20 ozs. You can work it out yourself at a saving of from 80 to 85 per cent. with stamps and Frue vanners. The mill is no good at all. I found on the mine the biggest collection of

THIEVES AND VAGABONDS

I ever saw in my life. I had to clear them all out. The list of workmen had been put down on paper to be taken into the office, so that the accounts could be paid, and the names were collected from tablets in the graveyards of the neighbourhood. The machinery was scattered all over the road, and I think this is the first time in the history of the company that it has been cleared up. The question is now, What are we to do with the machinery? The mill, as I have told you, is no good. A 40-stamp mill with Frue vanners will do your work and give you a very handsome profit. You can get from $12,000 to $15,000 a month out of a 40-stamp mill, and that is only saving 80 per cent. of the assay value of the rock going into the mill. If you can see your way to pay Madame Alsua and get such a mill as that, you will never be troubled again. I am not the least afraid of any

expert that goes out there. If he sends you a truthful report he can only back up what I have said—it is

A VAST AND GLORIOUS MINE.

We have everything on the spot necessary to carry on our business, with the exception of a mill. We have good hoisting works, stores, buildings, shops, &c.

In reply to shareholders,

Mr. HARVEY said that the present superintendent was Mr. Murray, and anything that gentleman said he would unhesitatingly back up. It would take 20,000*l.* to put up a 40 stamp-mill with Frue vanners.

A SHAREHOLDER: What are you asking for now?

The CHAIRMAN: 5,000*l.* But that is to give us the call of these mines until we can get an expert's opinion.

Genl. GORDON suggested that they should all put down their names for 5 per cent. of their present holding. He would be prepared to take his portion.

1,200 SHAREHOLDERS.

Mr. J. E. SWINDELL: There are 1,200 shareholders, and I ask, is it fair that a few should find money time after time, and the 1,000 odd go free? (Hear, hear.) If gentlemen will not come forward, and do as well as their fellow shareholders, it must be expected that the company will fall to the ground, and we shall lose everything. The next thing I should ask you to consider is this, not to consider at this very moment how much we can make out of the mine, but how far we can save it. (Hear, hear.) If the 1,200 shareholders would subscribe 5*l.* each, that would be the easiest and safest way out of our difficulties. (Hear, hear.)

A SHAREHOLDER: Is the machinery we have now completely useless?

The CHAIRMAN: Not entirely so, but in making any future expenditure in connection with machinery, you may depend upon it we should go to the best makers. Indeed, the directors have already made inquiries, and have entered upon preliminary steps in view of contracts being entered into. The proposal for each shareholder to raise 5*l.* is a very good one indeed. This would place us in immediate possession of 6,000*l.*, and allow us time to take steps for raising the larger sum required. There is no mistaking this fact, that if we do not raise this sum we shall lose the mine. A previous speaker—a man with a well-known name in English history, and which it would be well to follow—leads the van in putting the suggestion into practical operation, and I hope others will follow. (Hear, hear.)

In answer to a question,

The CHAIRMAN said that a less guarantee from this meeting than 5,000*l.* would not be of any service. The money, of course, need not all be paid immediately, but if they did not get the 5,000*l.* they would not call upon those who promise to pay up.

COALFIELDS.

Mr. H. THOMAS: I think we ought to remember that we might sell the coalfields alone for 100,000*l.* almost immediately. We ought also to be able to sell other portions of our mines at prices which, at the lowest estimation, would realise sufficient to pay nearly all, if not quite, the amount required by Madame Alsua for the whole property. I do not think there is the slightest doubt about La Trinidad becoming a grand property.

The CHAIRMAN: If we can raise this 5,000*l.* the property will become ours to divide as we like. We cannot touch it as things are now. If a few more gentlemen would give us their names and consent to act as a consultative committee, it would help us very considerably.

A SHAREHOLDER: Will not the American capitalists who offered Madame Alsua 310,000*l.* for the mines offer us the same amount for them? (Laughter.)

The CHAIRMAN: At present we have no power to sell them.

Another SHAREHOLDER: Will they not offer us 300,000*l.*, and thus save 10,000*l.*? (Renewed laughter.)

The CHAIRMAN: As we have no powers to sell we have no powers to negotiate with them.

A SHAREHOLDER: Do I understand that the sum of 5,000*l.* will save the company and keep the property in our hands, and that, if it is not subscribed, we shall lose the property and all we have put into it.

The CHAIRMAN: That money will carry us on for two or, perhaps, three months; we shall be free for two months, at any rate.

MONEY SHOULD BE RAISED.

Lieut.-Genl. GORDON: The money ought to be easily raised, and if it is, we ought to make arrangements immediately for the necessary machinery from the best makers.

Mr. HARVEY: The estimates from some of the leading makers are now in the hands of the directors.

Lieut.-Genl. GORDON: I am told that the labour out there is about as bad as it can be, and I would suggest the importation of Chinese labour as an admirable means of getting over the labour difficulty, if we raise the necessary funds.

Mr. HARVEY: That is a question worth consideration, but with respect to the machinery, I may say that estimates have been received from some of the leading firms in America.

Mr. LIVESLEY: There is one thing that does not strike anyone present, and it is this: there are 1,200 shareholders, and if each took up additional shares to the extent of 5*l.*, that would place 6,000*l.* immediately at our disposal. Now, do you not think that if there were to be a strong appeal made to the shareholders that it would be possible, taking them all round, rich and poor, that they would take up an average of 10*l.* each, and that if this amount of capital were at once raised, do you not think it equally possible to raise a considerably larger sum as mortgage in London, and bring the whole control of the affairs to London? This would enable us to put an efficient working plant down, and from all accounts there is such a mass of bullion in the mine, that you would soon be able to get sufficient from the mine itself to enable you to pay off all your liabilities. (Applause.) It is no use pottering with the difficulty in a peddling sort of way. What has to be done must be done absolutely, and at once.

Mr. HARVEY: There is not time to appeal to the shareholders, and get a response in time for the emergency.

Mr. LIVESLEY: I mention this as one means of enabling you to raise capital in London, to get you out of your present difficulties. Then, again, you have those shares taken from Mr. Brown, and why not issue them to the present shareholders? I am strongly of opinion that if the thing was laid properly before the shareholders out of the large number we have on the register, you would get a sufficient subscription again to enable you to offer a substantial security to London financiers.

The CHAIRMAN: Your suggestions have not been lost sight of when we wanted money before, but it is a hard thing, and I feel it almost a cruelty to appeal again to some of our shareholders. You would be surprised at the number of shareholders we have with a very small holding; you would be surprised at the number of small fry we had in the first instance, and how few, comparatively, large shareholders we have. We have a large number of shares now, but we must not issue them at a discount. (Hear, hear.) There are 44,000 shares we took from Mr. Brown, and we could issue them if there was any possibility of their being subscribed in time to be of service to us.

DUTY OF SHAREHOLDERS.

Mr. LIVESLEY: I hope those who cannot afford to take more will take one additional share, and I feel sure that some of our larger shareholders would take many more if the whole case were laid before them. We could live on dry bread for a week, if necessary, to enable us to take an extra share. (Laughter.) Those who can subscribe ten shares ought to do so, and those who cannot subscribe that number might take five: whilst those who cannot help us with five can at least subscribe one. (Hear, hear.)

A SHAREHOLDER: I presume such shares would be preference shares?

The CHAIRMAN: Certainly.

Mr. MCDOWELL: If such a thing could be done the directors would be able to stave off their present difficulties, and save the property. I am already a preference shareholder, besides an ordinary shareholder. I have taken some trouble to test the statements made as to the value of the property—statements made on both this side and the other side of the water, and I have found those statements made by the chairman and Mr. Harvey endorsed over and over again. I believe everything that Mr. Harvey has said; he is not an expert paid by Madame Alsua to draw up a highly-coloured report but our own trusted servant, who has our interests at heart. (Hear, hear.) He was sent out by you, and he has reported to you the state of things as he actually found them. You have spent nearly 100,000*l.* on the mines, and what you now want is 70,000*l.* or more to enable you to have absolute and entire possession of them. It therefore behoves you to come forward to-day and make a strenuous effort: it behoves those who have not already subscribed their portion of preferential shares, in addition to their ordinary shares, to do so. I intend to take some more, and I hope that before we separate to-day 5,000*l.* or 6,000*l.* will be subscribed in this way.

APPEAL TO MR. HARVEY.

Mr. THOMAS: I should like Mr. Harvey to tell us more distinctly what he thinks the mines could pay to the shareholders, supposing that they were to become possessed of them entirely.

Mr. HARVEY: Upon what capital?

Mr. THOMAS: Say 500,000*l.* I want the shareholders to know what they are throwing away by not subscribing a little extra money.

IMPORTANT AND REASSURING STATEMENTS.

Mr. HARVEY: I think with a 40-stamp mill we should make 15,000*l.* a month profit at least, and that is taking the low assay of 2 ozs. to the ton, and we never had a less assay than that, though our yield has generally been much higher. That would give us a total profit of 180,000*l.* a year—(applause)—over and above what we could make out of the coalfields, either by working or selling them.

Mr. THOMAS: That means something like 50 per cent. on our capital.

Mr. HARVEY: It means that our full working capital, with the mines in full work, would be returned every year.

The CHAIRMAN: I have not the slightest doubt of what Mr. Harvey has said. It is impossible at present to estimate the real value of our property. But respecting the additional capital, as a previous speaker has remarked, those who cannot take ten shares can take five, and those who cannot take five can take one.

Mr. POOLBROOK: I suppose with a 40-stamp mill you could crush 100 tons a day?

Mr. HARVEY: 200 tons.

Mr. POOLBROOK: I should be quite satisfied with 100 tons a day.

At this point of the proceedings a sheet of paper was handed round the room for those who wished to take additional shares to give in their name, and the number for which they would subscribe.

When it was returned to the CHAIRMAN that gentleman said: I am sorry to tell you that the response to the appeal has been a very small one indeed; there are only 111 additional shares subscribed. Of course many shareholders left the meeting before the list was handed round. I suppose we must let all our shareholders know the result. We must have at least 900 more shares taken up if we are to do any good.

Lieut.-Genl. GORDON: There may be some who have not taken up additional shares at the rate of 5 per cent. on their ordinary holding. I put my name down for considerably higher than that rate, but I do not mind increasing that 10 per cent. I will do so if anyone else will follow.

The CHAIRMAN: I am afraid the shareholders do not realise the full importance of this subscription list. It means losing all we have put into the concern if we do not raise 5,000*l.* If the meeting cares to look at the list again and see what further additions they can make, then the directors will be better able to consider their position.

A REGRET.

Mr. SWINDELL: I am sorry the shareholders do not back up the chairman more than they do. The safety of this mine depends upon every shareholder raising a 5*l.* note, or something equal to that. I have much pleasure in proposing a vote of thanks to the chairman.

Mr. LIVESLEY: I beg to second the motion. I am sorry for the chairman; he has a hard battle to fight. He has taken hold of this company after other people have spoiled it. Here is one of the best things in the whole world, without exception, and because it has been messed about, hacked about, and blundered at by other people, everybody is afraid of it. (Hear, hear.) Our chairman reaps the fruit of what has been done before, and I believe that if a proper statement could be submitted to the shareholders, and it were to be made known to them that the people who had to do with the concern previously were eliminated, the necessary funds would soon be found, and the

company would yet be brought to a successful issue. I would suggest that circulars should be immediately sent to all the shareholders, laying the whole case before them.

The CHAIRMAN: I beg to thank you very much for what you have said, but with regard to sending out circulars, there is no time now for that. Time is the essential element in the present crisis. We are nearly at the end of May, and by the first week in June $5,000 must go away. The situation is like that of a struggling swimmer who, close to the shore, is not able to make the final stroke to save his life.

A SHAREHOLDER: I should not think there will be any difficulty in raising the sum you have just mentioned by the time named.

Mr. HARVEY: We shall require at least 3,000*l.* to carry us through June, to satisfy Madame Alsua, and pay off other pressing liabilities, otherwise the property will be attached, and Madame Alsua, I am quite sure, will not for a moment allow any attachment of her property. The present position of affairs almost means this, that a cablegram must go off to-morrow morning that we can find no more money, and then it will be all up.

Lieut-Genl. GORDON: If a small circular were to go out to the shareholders saying how much had been subscribed in this room, I think the other money would be forthcoming.

Mr. HARVEY: If there was a guarantee that the money absolutely necessary would be forthcoming in a few days it would be all right; but when you have no such guarantee at all from a meeting like this, it is no use cabling to encourage hopes that we do not know can be fulfilled.

Mr. UPTON: I have great faith in that circular. There may be many gentlemen here like myself. There are seven members of my family shareholders in this company who are not able to be here. I shall write them to-night, and I am sure they will all subscribe something. (Hear, hear.) You may therefore take it for granted that you have seven more subscribers who are not on the list. (Applause.)

OLD STORY.

Lieut.-Genl. GORDON: It is the old story—"A long pull, and a strong pull, and a pull all together," is all that is needed.

Mr. MCDOWELL: I am prepared, if the chairman and his co-directors will send out the necessary authority to guarantee the money—I am prepared, I say, to guarantee an extra 100*l.* towards indemnifying them.

Another SHAREHOLDER: I will put my name down for 100*l.* towards holding the directors safe rather than that the property shall go. (Cheers.)

Another SHAREHOLDER: I will do the same. (Renewed cheers.)

The CHAIRMAN: I thank you, gentlemen, for your support and for your offers, but I do not think that, encouraging as they are, they will avail us. There is really no time for a circular, and unless we get a substantial response from some of the gentlemen who left the room before the list was handed round, there will be nothing for it but to say "Good-bye everything" to what we have done. I am much obliged to the gentlemen who have subscribed the 111 shares, and the list will remain at the door as you go out for any further signatures.

Mr. MCDOWELL: My suggestion is to get gentlemen in the room to guarantee the 5,000*l.*, and for the money to be sent on.

The vote of thanks to the chairman was then cordially carried.

Several gentlemen increased their subscription as they left the room, but nothing like the necessary sum was subscribed.

THE DE KAAP GOLD MINES, LIMITED.

RAPID PROGRESS — 10-STAMP BATTERY READY — 80,000 TONS EXPOSED IN ONE CLAIM—AMPLE WATER AND FUEL—VIEWS OF THE VENDOR.

THE first general (or statutory) meeting was held at the Cannon Street Hotel, on Wednesday—W. W. Cargill, Esq., chairman of the company, presided.

Mr. E. J. BURGESS (secretary) read the notice calling the meeting.

SHARES APPLIED FOR TWICE OVER.

The CHAIRMAN: Gentlemen, you are aware that this is our first meeting, and it is called a statutory meeting. At the meeting we cannot be expected to lay before you any statement of affairs, but the use of meetings of this kind is that directors and shareholders may be introduced after the first commencement of operations, and that the latter may be able to ascertain by inquiry any points upon which there may be any doubt—to ask questions, in short, as regards the position of the company. The prospectus of the company was issued the last day of January, and the shares applied for were about double what they were to allot—rather more. The shares have all now been paid up to 15s., leaving 5s. still uncalled. There is a very small sum not paid up, but it does not exceed 1,600*l.* or 1,700*l.*, and that sum, such as it is, is being reduced every day by payments, so that practically we may say that the whole of the capital is available. I think that it is right to mention that the first duty of the directors was to ascertain from other sources how far the representations made to them, and by them transmitted to the applicants for shares, were correct.

PROSPECTUS CONFIRMED.

They were enabled to make these enquiries, and so far the result is very satisfactory, and having ascertained that, our next step was to communicate with our correspondents in the Transvaal, and to ascertain precisely the condition of the transfer of the properties we had acquired. We obtained through our bankers (the Bank of Africa) a most satisfactory report, first by telegram and afterwards by letter, saying that the whole of the properties mentioned in the prospectus as belonging to the company had been transferred into the name of the company, and properly registered, according to the laws of the Transvaal Government. We then, having ascertained that the whole had been transferred, settled with the vendors and sent out Mr. Bowden, who was recommended to us as a very competent manager of mines, a man of large experience and a man in every way qualified. We have heard from this gentleman since he went out, and he informs us that he found everything as stated to be in order, and the condition of the mine quite up to what he was led to expect. He describes the mine, so far as it has been developed, as first class. We have also heard that the gentlemen who are appointed as a committee in Barberton have entered upon their office, and we have appointed a most respectable firm of solicitors in Barberton to be our attorneys, to carry on any legal business that may be necessary, and to see that all our affairs are in a correct shape. The very last telegram from the manager was received yesterday morning, and the secretary will read it.

Mr. BURGESS here read: "I am satisfied; I can confirm Walton's statement." That is as regards our property. It goes on, "an adit has cut the vein 28 ft. below the outcrop very near the mill site; I have commenced driving on the course of the vein."

The CHAIRMAN: That is our last information, and we believe just as firmly now as we did when we commenced this business, that the mine is likely to be very good and very profitable. I should say that the manager took out a staff of men with him. We found we could obtain a set of 10 stamps within 60 or 70 miles from the mine, and we requested our manager to go and see, and purchase them, and have them carried to our mill, so that no time should be lost in treating the rock that had been developed, or in making returns as soon as possible.

GRASKOP SELLS ITS STAMPS.

The directors have also had in view, as soon as they had made up their mind as to the best manufacturer, to order 20 more stamps to be sent out, and these ought to be out in the Colony within three months of the time the order is given, and I think when we get our next reports of any business that is being done that we will be able to make the shareholders acquainted with first results, which I hope will be satisfactory.

A SHAREHOLDER PUTS A STRING OF QUESTIONS.

I received yesterday a letter from a shareholder who writes in a very polite way asking certain questions, and intimating that those questions might be answered at this meeting. I am most pleased to answer them, for we have nothing to keep back, and we are only too anxious that shareholders should know as much what is going on as we do ourselves. The letter runs:—"I should be glad if, at the meeting to be held on Wednesday, you can favour me with replies to one or two questions I should like answered. First, is the freehold estate transferred to the company, and have you full control of the property?" There is no freehold—what we have had is a mining right held, according to the laws of the country, direct from the Government, and the property has been placed in the name of the company, and certified by certificate from the Mining Commissioner. The company is in full possession. You will have seen by the telegram that it is so. The second question is this: "Are you in perfect touch with the local committee at the Transvaal, and do you agree with their suggestions regarding the working of the property?" The answer to that is, yes. The general manager has full instructions to consult with the local board as to the working of the property, and I believe he has been doing so. The next question I have already answered by saying that a manager has been engaged, and is on the spot. The next question is as to his experience. He is a man of very great experience in Africa and elsewhere, and he cabled his arrival with his staff on the 2nd May. "Have any stamps been obtained abroad, and when will they be fixed and ready for use?" Yes, a 10-stamp mill has been purchased from the Graskop Company, and is now in course of removal to the site of our mine. "Will any work of importance be done during the dry season, that is next September?" The answer is the general manager has instructions to push forward with the utmost possible despatch. The dry season will in no way stop work, there being an ample supply of water. "Will you consent to hold meetings every six months?" On that point the directors will fall in with the views of the shareholders. "What is the value of the timber on the property to which a prospectus refers?" It comes to this, that having possession of a quantity of timber we are saved the expense of buying it for fuel and mining purposes. It is impossible to say the value of it, but it saves us from spending money. (Cheers.)

Mr. BURGESS here read the certificate from the Mining Commissioner, showing the company to be in full possession of its properties.

The CHAIRMAN closed by expressing his readiness to answer any questions upon points on which the shareholders might desire information. There was, he said, only one gentleman present who had seen the mine, and he would give every information that might be required; that gentleman was Mr. Graumann.

A SHAREHOLDER: Have any dams been erected to keep a large supply of water for the mill?

The CHAIRMAN: I do not think they are wanted, for we have a large supply of water without them.

Mr. GRAUMANN: The supply of water is ample, and hence the necessity for making dams is obviated. We have a supply of water sufficient to run an unusually large number of stamps, and the cost of making a race and sundry other things will be very small indeed.

A SHAREHOLDER: Are you the vendor?

Mr. GRAUMANN: Yes, and I am the largest shareholder in the company.

The SHAREHOLDER: May I suggest that you should give your views as to the prospect of the undertaking.

IMPORTANT STATEMENT BY THE VENDOR.

Mr. GRAUMANN: After the long speech of the chairman I do not think I can add a great deal to what he has said more than to describe some of the points which are rather important in connection with this particular property. In the first place, probably some of the gentlemen present have not altogether forgotten the statement made in the prospectus which was published, and upon which this company was floated. I am very glad to hear, as I expected, and I have no doubt a great many other gentlemen present are also pleased to hear, that our manager, Mr. Bowden, in a telegram of yesterday morning, states that he is very well satisfied with the property, and that it confirms the statements made by Mr. Walton. Now, in order to decide the actual value, so far as it is possible to ascertain it, of this property, it is necessary to consult the statements made in

the reports Mr. Walton furnished, and this gentleman says that there are two lodes which run almost throughout the length of the property, and it should not be forgotten that that length, in so far as the run of the lodes is concerned, is no less than 2 miles. The consequence is that in so far as the quantity of ore available is concerned, it may be stated to be

PRACTICALLY UNLIMITED.

In dealing with the next point, the most important of all, Mr. Waltou states that he considers a large battery can be erected, and that the yield of gold would not be less than 1 oz. to the ton—that is, of course, making a fair average for the whole of the mine. There are several points in all mines that differ materially. In some cases you will find rich shoots, and in others poor shoots. On this property we have quartz, which, so far as we have been able to ascertain (and I think the question has been gone into very exhaustively), shows an existence of strong fissure veins, carrying a uniform percentage almost throughout, and one of our lodes, Kirk's reef, is considered to give no less an average than between 3 and 4 ozs. of gold to the ton. The Big Buffalo, which is a strong fissure, gives an average of 1½ ozs. So far as my personal knowledge of the country goes, and of this property, I say unhesitatingly that if this mine does not prove the success we all hope and believe I shall have very little confidencc in any of the other mines, because I think

ALL THE ELEMENTS OF SUCCESS ARE ABSOLUTELY HERE.

We have, in the first instance, strong and well-defined lodes running nearly throughout the whole of the property, aud assaying well almost throughout their entire length. We have a very ample supply of water, and the question of water is one to which I venture to say you cannot attach too much importance, because, as a matter of fact, the mining industry iu several parts of South Africa, where it promised to prove a very great success, has been practically stultified, because in some cases the gold existed, and in those cases there was not an ample supply of water. In this case we have an ample supply, and are thus placed in a position to utilise it to considerable advantage, and so the costs of the mine will be reduced to a minimum. Besides this, the chairman has also referred to the abundant supply of wood which exists on and adjacent to the property. This is also an important item, because all mining men know that when larger works of development are prosecuted, and where the output of ore is very great, it is necessary in some cases to use timber, and where that timber has to be transported, as in a great many cases in South Africa, for a considerable distance, then the costs run so great that it makes a material difference in the gross earnings of the company. I expect the 10-stamp battery, to which the chairman has referred, will be working within a very short time. We have not far to transport it, and it is only a question of erecting it to be able to give you very satisfactory results, because in this case we are not dealing with a mine upon which two shafts have been sunk only 15 ft. eaeh, and no practical developuent work done, but we are dealing with a property upon which a very large amount of work has been done and money spent, and I say that the expenditure on that property has not been an actual expenditure of figures without results, but that it has been a judicious expenditure representing a corresponding amount of work, and of course you will readily understand that it is absolutely impossible, no matter what we might consider the resources of the company, to utilise theu to their proper extent if the works of development are not done, because it is absolutely impossible without that to keep a battery at work. I do not think I can tell you anything further, but if anyone would like to ask me questions I shall be pleased to answer them. (Cheers.)

80,000 TONS EXPOSED.

A SHAREHOLDER: I understood there were 80,000 tons of ore, which average 1½ ozs., now out and ready to be treated as soon as the machinery is there.

Mr. GRAUMANN: The 10-stamp battery has now been removed, and we are hourly expecting that it has arrived on the property, that it is in course of erection, and that we may reasonably expect, within a few weeks, the battery will not alone be erected, but crushing. There is an ore reserve of 80,000 tons. There is a huge vein of auriferous quartz computed to be no less than 80,000 tons that has simply to be blasted, and it would be easy if 40 or 50 stamps were put up at once to keep such a battery going constantly.

A SHAREHOLDER: Then the 80,000 tons has to be extracted?

Mr. GRAUMANN: It is absolutely exposed. If you refer to one of the photographs on the table you will see it exposed, and that is only one out of the 84 claims. Besides that, we have levels, drifts, and shafts, which have opened up the ground, aud which will enable the quartz to be extracted at the rate of thousands of tons a week without any difficulty at all.

A SHAREHOLDER: Then you think you will have a battery of 50 stamps running within the next three months?

Mr. GRAUMANN: I did not say 50, but I have no doubt we shall have 30. The 10-stamp battery is now on the spot, and the directors are considering the question of manufacture before ordering 20 other stamps. The stamping power will be increased later on, because the directors have no uncertainty as to the quantity of ore available. (Cheers.) The order may be given next week.

A SHAREHOLDER: What about the labour?

Mr. GRAUMANN: It is Kaffir labour at a cost of 30s. a month, and we have a staff of white men (five were sent out with the manager) to superintend them, so that we might be perfectly sure of having a proper establishment. Native labour is plentiful.

The CHAIRMAN: I think we may congratulate ourselves upon the coudition of this mine, and I hope that the results will be satisfactory to us all.

EXCEPTIONAL ADVANTAGES.

In reply to further questions, Mr. GRAUMANN said: 5 or 6 dwts. will pay expenses. The cost of milling and management I do not think would exceed 1*l.* per ton, because we have everything we require, and mines in South Africa not so advantaged work at a cost of 25s. per ton. That has been proved where they have not, as we have, a plentiful supply of water and timber, and where they have to use coal and to transport the timber. I think that leaves a liberal margin for us. (Hear, hear.) The reason the 40 stamps were not sent out immediately was because we had negotiated for the purchase of the 10-stamp battery on the spot, and we wished to be guided by our manager as to the character of the machinery that had worked most satisfactorily there, and it was waiting his report on that point that we hesitated to ignore him, after attaching so much importance to his advice in the matter. We may get a cable from him at any moment. Certain ore requires certain treatment. We need to send out special machinery, and to be sure that we shall have the best we can get for the mouey, and that has been the cause of the delay. Ours is a free milling ore.

The proceedings then closed.

ROCKY BAR WIDE WEST GOLD, LIMITED.

IMPORTANT MEETING — RE-CONSTRUCTION DECIDED ON — 2s. LIABILITY—THE MINE NEARLY PAYING ITS WAY.

THE second ordinary general meeting of the company was held at the Cannon Street Hotel, on Monday, for the purpose of considering the accounts and balance-sheet and the report of the directors—Lieut-Genl. C. E. Parke Gordon, C.B. (chairman of the company), presided.

Mr. WALTER BRAMALL (secretary) read the notice of meeting.

WORKINGS DESCRIBED.

The CHAIRMAN: Gentlemen, before I move that the report be adopted, I may premise it by saying that we are ready to answer any questions that may be put. At the same time I will point out to you that the account of the gold wou extends of course into this quarter. The report, however, is simply to the end of last year, and this we are bound to submit to you. You will see in this statement of the gold won that there has been $28,871, which we may account roughly as 6,000*l.* absolutely won in the seven months ending April (September only included a small portion). The wages, including deadwork, during that time were paid for by that output of gold within about 900*l.* Therefore we may consider that the mine has proved itself so far. We must always remember that we are not in the paying ground we expected to get to. You will see that the map on the wall, which represents an extension of about 1,600 ft., is not a continuous one, but we have endeavoured, by introducing another section to the centre part, to show the new work and the new shaft, which is now down 126 ft. from the surface to the adit level, and from the adit level down to the new level, a further 85 ft., or rather a little below that level. The object we have endeavoured to carry out has been to drive to the eastward on that lower level and at the same time we were furnished to a great extent with the means from the adit level, which is the level above. This went on very well indeed, except that there was a slight overplus of expenses. We were led by the very good returns in February to hope that these would continue, and at the same time we found that March was not so very much less, but in April, when we had just expected to reach the pay-shoot, the part that would pay us well, a fault was discovered which interrupted our driving through paying ground above the adit level. I do not say that we were prepared for this break off at once, but we were certainly prepared for poverty of grouud. Previous to this, as you will observe in the former reports, the directors determined to avoid as much as possible coming to the shareholders for money, and even lending money themselves, and one of the means they took was to forego their own fees. At the same time we felt that, sooner or later, there must either be an advance made, or means obtained by debentures or by re-construction (which latter we wished to avoid) to obtain sufficient money to go on with. If you look to the accounts you will see that this mine stands in a very favourable light with regard to expenses.

A FAVOURABLE POSITION.

Perhaps there is no minc that has been carried on so cheaply. (Cheers.) The 120,000*l.* that you see on capital account does not represent money, it only represents 18,700*l.* in money. 15,000*l.* was taken by the company to carry on the work, 3,700*l.* odd had to go to the vendor, because we had to give him all we got above 15,000*l.* All the remainder represents shares, so that you have the fact before you that the mine has only cost 3,760*l.* That is really what it has cost, and the remaining subscription in money is that with which we carried on the mine. When the directors, after the middle of last year, found that the funds seemed to be running short they, in conjunction with other shareholders, subscribed some money. They did not take their fees, but they saw that as they had to manage the mine it was not quite paying its expenses, and that it was better, if possible, to be on the safe side; therefore, the means were offered whereby to raise, if possible, 5,000*l.* by the issue of 5,000 of the reserved shares. You know how that was responded to. Instead of getting 5,000 shares taken under the great advantages that were offered to those who took them by the vendor, we only got taken 3,025*l.* That left us short 1,975*l.*, or, say, roughly, 2,000*l.* Now, it is precisely this 2,000*l.* that we have been wanting all the time. If we had had that 2,000*l.* from the body of shareholders at the time (and it is the great thing to get money in time) we should not have been stopping as we are now, and you must remember also that time is of the greatest value now because the season is good, and any stoppage in the mine causes an inflow of water which we must keep pumping out. We are losing the best season, and besides at this time of the year the contracts for wood, and all these things are much lower than they will be two or three months hence. We had all this in view at the time, and therefore we urged the necessity of subscribing the whole of the 5,000 shares, but they were not taken up—1,975 were wanting. We had a meeting of a few influential shareholders and those interested in the company some few weeks ago on two occasions, and we put the case before them — debentures being suggested. You will observe by this that we were doing our best to avoid re-construction. Only 1,655*l.* was promised. It was useless going on with that, and, therefore, it came to the same thing again; but the additional delay we had encountered, unfortunately, was most inopportune, and we had a very anxious time. We saw

NOTHING BEFORE US AT LAST BUT RE-CONSTUCTION.

Some gentlemen met us, and we talked it over, and the great thing we had to arrange was that, as re-construction required considerable delay we must have money in the meantime, as we had failed in obtaining it by debentures. There was, of course, only one way of getting it, and that was by borrowing. I do not know that I need mention names, but Mr. Allen came forward with an offer to assist us, and by that means we got 2,000*l.* together to go on with and meet all

the debts and liabilities at the mine; otherwise gentlemen—and I wish to impress this very much on your minds—the property would have been attached. Thanks to comparatively cheap cabling and our having the telegraph at the mine, we were enabled at once to apprise the manager and all concerned that we were in funds, and that we had remitted 1,900*l.* to pay off the liabilities. Now, considering that it only takes five days notice to attach the mine and property, you may suppose we could not have waited for re-construction in order to have obtained the money, and thus it was of great advantage to us that those gentlemen, Mr. Brotherton and Mr. Allen, came forward to assist the company in the time of need. Consequently the position at present is this, we cannot go on with any work in the mine further that to keep it dry. We must wait for re-construction in order to obtain the money, and we trust you will see it to be in your interest (as we see it) to pass the resolutions which will be submitted. When we come to that stage in the extraordinary general meeting the resolutions will be read, and you will easily see they constitute the only way out of our difficulty. Considering after all that the mine is proved, as you will see by the output of gold, and also that the output was from ground in the adit level, and not in the lower ground where we expect to strike the vein, or true fissure, we have done very well, and what we want to do is to drive east until we encounter it. The statements of the manager and the superintendent of the mine up to a very short time, before we had this report about the interruption of the vein, all concurred in saying that we should strike this lode about the end of April. We had the great advantage of having a communication from Mr. Albert Smith, who has been secretary, superintendent and amalgamator all rolled into one, which we regard as very important. We know that this is not a worthless mine, but we know also that we are not on the pay-shoot. I have no reason to doubt that we shall come across this vein. We have notes here from all the reports we have sent out from time to time. We have done our best to furnish you with all the information we have received, and we now hope that you will furnish us with the means of carrying on this concern to the success which the future indicates. I will read you extracts form the reports of the superintendent, dated the 5th, 10th, 19th, and 29th of April.

EPITOME OF NEWS.

April 5th.—"I believe we will reach the pay-ground in east level No. 1 between the 15th and 20th of this month."

April 10th.—"I believe as we get deeper the formation will be more regular. I have great faith in east level No. 1, and expect to cut the pay-ore by the 15th."

April 19th.—"We should reach pay in East level No. 1 any day, but it will take time after we reach it to advance the level, raise and open stopes so as to supply the mill."

April 29th.—"In the latter part of November I cabled you that I believed the mine would pay all expenses the first three months, and then a profit. At that time everything looked favourable for doing this, and we showed a steady increase in product for three months, commencing with December, 277 ozs.; January, 308 ozs.; February, 346 ozs. In the latter part of March a change took place in the main stopes, caused by a break in the lode reducing the grade of the ore and a drop in the returns to 291 ozs. for the month. We still hoped that a change for the better would take place, and not until the 16th inst. did we give up this hope and then cabled you:—'The ore above the adit level would not pay expenses and advised closing the mill and developing the mine sufficiently to run mill full capacity.' On the completion of the shaft to the 200-ft. level our theory was that the lode would be found north of the shaft, and to determine correctly, we employed a competent surveyor to take the course and dip of the Wide West lode, and to furnish us a map. This survey brought the lode 75 ft. south of the shaft, and as we had already cut a lode near that point in north cross-cut No. 1, we concluded it was the Wide West, otherwise it would have been they against science. Recent discoveries in the old workings and in east level No 1, lead us to believe, beyond a doubt, that the Wide West lode at the western end of the workings, changes to a course north of west, which, if held, would bring the lode north of the shaft, and the lode south of the shaft is an entirely different one. You will please note that the shaft for this undertaking is well located, and as so much unprospected ground lying between two known pay shoots, my faith in the mine is stonger than ever before. A large amount of prospect work can be done for $2,500 per month, and unless we open up a body of good ore within two months, I will be greatly disappointed."

ALL THE PLANT GOOD, AND IN WORKING ORDER.

Not only is the shaft exactly in the place it ought to be, but it is in the most handy situation for bringing ore to our mill, which is reported to be the best in that part of the States. There is no difficulty with the plant, machinery and hoisting gear, and all the positions that have been selected prove that although it was originally intended to sink the shaft to the right on the other side of the hill (this is Mr. Anthony's plan, and we must give him the credit for it), a change for the better was thought desirable. Mr. Anthony intended to sink that shaft on the east, and then to drive to the west, instead of sinking on the west and driving to the east. At the first blush it will appear to you that we have gone the longest way about it; but although we are making a longer drift we encountered the pay ground in the adit level, and there was one most important reason given by Mr. Paterson that we could not possibly contradict, and when Mr. Anthony had it pointed it out to him he coincided in Mr. Paterson's idea. Mr. Paterson said:—"If you sink the shaft in the east you will have to get down to a certain depth in order to get to the west, and there will be no ventilation. As the summer is coming on it will be impossible to work. Therefore, you will have to sink the shaft at the expense of $10,000, and when you have done that it will be useless. My way of doing it would be to sink a shaft to the west and then drive the adit and obtain the ore from thence that will meet the expense of driving the level below until we strike the pay-shoot.

MINE IN GOOD CONDITION FOR WORK.

The consequence has been that we have now the whole of this mine perfectly ventilated, and well able to work both in summer and winter. I need not mention that what the mining foreman says is very much to the same purpose as that which Mr. Albert Smith writes, and the latter, naturally, depends a good deal for his report upon what Mr. Thomas the foreman says. I would refer you specially to Mr. Stewart's report, which is in your possession. We have perfect faith in this report. You will see that he mentions the shaft is to be sunk to a still greater depth of 250 ft. this winter. We all know that these mines increase in value in depth, and had we struck the pay-shoot we could have taken our chance as to having to go on with sinking the shaft, or to driving still further to the eastward, or to carry on both, as we had funds. Regarding the Wide West he says: "Those who have visited the mine have had not the least conception of the state the mine was in, and the great amount of dead work that was necessary to put it in a working shape." He reports satisfactorily about the mining plant, which is all new and in good order, and there is perfect cover. The snow cannot get into the shaft, and everything is there to make a complete mining establishment. All that we now want is a little working capital. The mill is first-class in every respect, and there is plenty of water, so that we have all we could wish for. The object now is to drive further until we reach the pay-shoot. It is impossible to show on any map certain things which, however, cost a great deal of money. The whole of the levels are laid with "T" rails and timbered. The whole of the ore is brought to the mill by tramway, for the less handling we have of it the better. All the sinking has been done by contract. The first part of the shaft for a great part of the depth to the adit level was taken at a contract of $7 for every foot. As we got deeper we had its breadth increased to 8 ft., instead of 4.

WHAT WILL PAY.

I may also point out that we must get at least from ¾ oz. to 1 oz. per ton in order to pay expenses and have a little over. Our gold is worth about 3*l.* an oz. Directly the gold falls to ½ oz. we cannot pay expenses except under very peculiar circumstances. In full work we must gain from ¾ oz. to 1 oz. per ton. There have been a good many specimens brought forward giving from 8 ozs. or $130 per ton, but we do not publish them. However it might affect the shares, it is not a right thing to do. If the pay-shoot yields only 1½ ozs. per ton we shall be perfectly content. I have now to move the adoption of the report and accounts. (Cheers.)

Lieut.-Col. GERMON, J.P., seconded the motion.

QUESTIONS.

A SHAREHOLDER: Had Mr. Stewart any practical knowledge of mining?

The CHAIRMAN; Yes, certainly.

The SHAREHOLDER: Is the east level pay-shoot the same as that referred to on page 6 of Mr. Stewart's report?

The CHAIRMAN: Yes, it is the same.

A SHAREHOLDER EXPRESSES STRONG VIEWS.

The SHAREHOLDER: I think a good deal of money has been wasted, and that you have rejected the counsel of Mr. Anthony, the only sound adviser you have had. He is the man with whom you should co-operate—the only practical man amongst you, as far as I can make out.

Mr. DAWSON said that he had largely subscribed his money along with his friends on the understanding that the advice of Mr. Anthony would be followed, but the directors would not listen to him; and that was the reason matters had come to their present pass. He thought the mine had been greatly mismanaged, and that the shareholders should appoint a new board.

A CHALLENGE.

The CHAIRMAN: Would you state in what way the directors have mismanaged the mine? If we find the manager of a mine and the consulting engineer differing in opinion, the directors must of necessity take the advice of the one and offend the other, and *vice versâ*. Their position is difficult, but they must come to a decision. I have told you that the mine only cost 3,760*l.*, and the machinery down in the accounts took very nearly the whole of that money.

The report was unanimously adopted.

EXTRAORDINARY GENERAL MEETING.

An extraordinary general meeting was next held, when the following resolutions were proposed as special resolutions:—

(1.) "That with a view to the re-construction of the company, the company be wound-up voluntarily, and that for the purpose of such winding-up, Walter Bramall be and he is hereby appointed the liquidator of the company." (2.) "That the remuneration of the liquidator be 10*l.*" (3.) "That the liquidator be and he is hereby authorised to consent to the incorporation of a company under the Companies Acts, 1862 to 1886, with the same name as this company, or with any other name, with a capital divided into 120,000 shares of 1*l.* each, with the usual power to increase and reduce the same, and with a memorandum and articles of association in such form as the liquidator may approve." (4.) "That pursuant to section 161 of the Companies Act of 1862, the liquidator be and he is hereby authorised to sell the undertaking and assets of this company, subject to the liabilities thereof, to the new company to be incorporated as aforesaid, upon the terms that the new company shall satisfy the debts and liabilities and costs of winding-up this company, or such of them as shall not be satisfied by the liquidator, out of the proceeds of sale of any shares in the new company sold by him, and upon the further terms that the new company shall issue to such persons, as the liquidator may direct, 120,000 shares in the new company of 1*l.* each, with 18s. credited as paid thereon, to the intent that each shareholder in this company may receive one such share in the new company for every fully-paid share in the old company, and that the liquidator may dispose of such of the 120,000 shares in the new company as are not required for that purpose, in such manner as he may think fit for the purpose of paying the debts, liabilities, and costs of winding-up this company, and any other monies which this company may be required to pay." (5.) "That the liquidator be and he is hereby authorised to enter into such agreements as he may think fit for carrying the foregoing resolutions into effect, and that a general authority be conferred upon the liquidator to modify the scheme contained in the foregoing resolutions, in such manner as he may determine."

The CHAIRMAN: There are five resolutions, and we propose to put them *en bloc*.

Mr. HARRISON seconded the motion.

TERMS OF RE-CONSTRUCTION.

A SHAREHOLDER: We are called upon to subscribe 2s., and that I

shall be very pleased to do, and I trust my brother shareholders will do the same; but, at the same time, I think there should be some little addition to the board—in fact, I think we should have some new blood.

The CHAIRMAN: We are perfectly ready to accept it.

It was then decided to ask Mr. John Allen and Mr. Collard to join the board. These gentlemen were each proposed and seconded, and carried unanimously.

The SHAREHOLDER who suggested the motion said he did not speak in a spirit hostile to the board, but in what he believed to be the true interest of the company.

The CHAIRMAN said that the directors were only guided by those interests, and would retire altogether, if it were thought desirable for them to do so. (No, no.) They had asked Mr. Allen to join them before, and were very glad that he had now consented to act.

The SOLICITOR definitely asked Mr. Allen if he would allow his name to appear in the articles of association of a new company, and that gentleman consented, as also did Mr. Collard.

A SHAREHOLDER: Will all the money be wanted at once?

The CHAIRMAN: One shilling at once, and the rest by instalments.

In reply to a further question,

The SOLICITOR said that no doubt the shareholders would have the first option of taking the shares.

DIRECTORS WILL TAKE ONLY HALF THEIR FEES.

A SHAREHOLDER: Will the directors persist in their claim of 940*l.* for fees?

The CHAIRMAN: The arrears of fees constitute a liability of the company, but personally I do not wish to press for payment. I am ready to reduce my claim by one-half, or to waive it altogether.

A SHAREHOLDER: 940*l.* would make a large inroad into the money we have to call up.

Mr. BROTHERTON said: I do not think we have much cause for complaint against the directors. I think it would be mean and paltry on our part when they had been serving us for nothing, and coming to the office as they have done to my knowledge two and three times a week, to grudge them what is their due. You cannot expect these gentlemen to come to your office, some of them from a distance, at their own expense without receiving some consideration, and certainly without receiving that which they are legally entitled to.

Mr. HARRISON: I am quite willing to cancel half my fees and increase my holding in the company.

Lieut-Col. GERMON: I shall be happy to do the same.

The CHAIRMAN: I have already said that I will do this.

The resolutions were then carried, and the proceedings closed in the usual way.

PANULCILLO COPPER CO., LIMITED.

SIR JOHN PENDER ON THE FUTURE OF COPPER—A SHAREHOLDER EXPRESSES OPINIONS WITHOUT FACTS—AN ANXIOUS YEAR—HOPEFUL OUTLOOK.

THE annual meeting of this company took place at Winchester House, on Tuesday—Sir John Pender, K.C.M.G., in the chair.

The notice calling the meeting and the minutes of the last meeting were read by the SECRETARY (Mr. A. G. Pye).

The report of the directors was taken as read.

DIFFICULTIES AT THE MINES.

The CHAIRMAN: Gentlemen, you have had the report in your hands for some time, and upon the whole it is very complete, and gives you a considerable amount of information. I shall endeavour, as far as possible, to supplement it by giving you information such as we can rely upon, and which we have lately received from the mine. Twelve months ago, when I had the pleasure of addressing the shareholders of the Panuleillo Company, we were then in what we considered a very flourishing and a very satisfactory position. We had copper above 80*l.* We had a return of one month's working at Panulcillo which gave us over 6,000*l.*, and we naturally supposed that everything would go on in the same direction as long as copper maintained its price; but in these days of telegraphs and rapid communication, no sooner had the high price of copper been fixed here than the price of ores and the price of labour increased enormously. The consequence was that whilst we were just in a position to realise handsomely from our production it was taken from us not only by the increased price of ores which we had to purchase, and of labour, but we could not even get labour at any price. New mines were opening, and one mine was opened which we could have bought for 50,000*l.*, but which was brought out here with a capital of 200,000*l.* That mine had to be supplied by labour. Nitrate was the great cry of the day, and nitrate took an enormous amount of labour from the mines. The consequence was that we were almost stranded in a helpless position, and the result has been that instead of realising a large sum during the high price of copper, we are here to tell you that price of copper continuing such a short period has rather done us injury than good. At the same time, we re-adjusted more or less our capital and our share accounts. We wiped off our debentures, and we are now in a position, though not of affluence, yet still in a position that we have no debenture interest coming upon us, which we would otherwise have had. Now, gentlemen, I think I cannot do better than show you what has been going on at the mine during the last year. We have a manager there, Mr. Jones. Unfortunately he was here during these great times of excitement, but he has now returned, and is busily engaged in putting things in order, and so far, I think, I cannot do better than give you his information of the causes which have affected the Panulcillo Mine during the last 12 months.

OPERATIONS AT PANULCILLO.

In the year 1888, 45,852 tons copper ores were smelted by the consumption of 6,151 tons coke, and 4,589 tons coal; and the production was 4,467 tons regulus, containing 2,066 tons pure copper. The amount realised for the regulus was $1,146,710.52; the cost of production amounted to $1,059,211.83, and the Chili profit was thus $87,498.69, or, as shown in the printed statement of accounts, 16,406*l.* 0s. 1d. The following is a dissection of Chili costs in 1888, which amounts, as before stated, to $1,059,211.83:—Copper ores, $580,657.91; smelting charges, $258,528.32; general charges, $53,748.10; sundries, $6,510.11; loss in exchange, $159,767.39; total, $1,059,211.83.

Referring to the unfortunate result of the operations at Panulcillo during the last six months of the year now under review, Mr. Jones wrote, under date 30th January, 1889:—"Profits for the past half-year: Nothing could be more vexatious to me than to have to convey to you such disappointing results, but, unfortunately, such they have been, notwithstanding the high price of copper, which was maintained throughout the half-year. You will, I am sure, anxiously look for an explanation of what must appear to you on that side of the world an altogether unintelligible mystery, and, therefore, I hasten to give you below a few facts connected with our last half-year's operations, which, if not satisfactory, will at least make clear to you the reason of our profits having been so very insignificant, notwithstanding the high prices for copper with which we have been favoured. In the first place, as being the main drawback from which we have suffered, I may mention we were not able to secure from the mine even a moderately good delivery, owing, of course, entirely to the want of hands, and not in the slightest degree to the want of power to produce in the mine itself. Indeed, if we exclude the low ley Llampos ores, which, as you are aware, can only be smelted by the costly reverberatory system, the quantity of ore derived from the Panuleillo Mine during the half-year under review will take its place amongst the very smallest ever recorded in our books.

SCARCITY OF LABOUR.

The great scarcity of men from which we have suffered so long and so severely was maintained throughout the whole period, greatly restricting our output, and otherwise inconvenieneing us, notwithstandiug all our efforts—and these were a great many—to overcome this serious hindrance in the way of our conductiug our business profitably. Wages had already been considerably raised at the beginning of the year, and ageuts were sent about in all direetions looking for men to induce them to come to Panulcillo, whilst every means were taken to make the place and the work as attractive to them as possible, but notwithstanding all these measures taken with a view to increase our number of working hands, the effect was not so pronounced as we had hoped, owing to the continuous draining of men away from this province to mining and nitrate enterprises in the more northern parts of Chili, where, as an inducement to go there, very high wages are offered. This scarcity of labour, and the long and serious disturbance to work caused by the protraeted and extraordinarily heavy rains in July, August, September, and October, were causes of our not having been able to take advantage to far greater extent than we did of the capability of the mine to produce a mueh larger quantity of ore than with the limited number of hands at our disposal we were able to do, and thereby secure the enhanced profits derivable from this larger output, as also the great economy in the cost of production always noticeable wheu our operations are carried on on an exteuded seale.

REDUCED PROFITS.

The diminutiou of profits on this account may be estimated at from 7,000*l.* to 8,000*l.* for the half-year. Since my return to Panuleillo, and with a view to improve this lamentable state of affairs for the current half-year by making the place still more attractive, not only to any new hands coming in, but also to enable us to retaiu the few we have, the hours of labour have been reduced from 1st of the new year; weekly advances in cash are now made to the drillers instead of in shop-tokens as formerly, and wages have been much increased.

ROCK-DRILLS AT WORK.

The rock-drills, which for so long a time were allowed to remain idle, owing to the late depression in the value of copper, are now being employed in the extraction of metal, and are, I am glad to say, rendering valuable assistance iu this way. A new arrangement of the system of work going ou at the calcines, which is to come into effect from 1st proximo, will, it is hoped, tend to remedy the scarcity of hands in that quarter. These and other measures yet to be taken will, it is hoped, as the harvest draws to a conclusion, help materially to augment the number of hands both below and above ground, and every effort shall be taken to rectify and remedy, as far as lies in our power, this most serious drawback to the profitable working of our business. Another very serious cause of diminution of profits, as compared with those of former times, is the serious depreciation in the value of regulus on this coast as compared with that of bar copper.

ADVERSE INFLUENCES.

For a long time previous to 30th June last, and up to that date, the buyers of our regulus were paid only a maquila on the 100 lbs. Spanish of fine copper contained in our regulus, or charge for its conversion into bar copper of $2.70, whilst that paid to them for our production for the six months euded last December averaged $4.50, making a difference of $1.80 per 100 lbs. Spanish of fine copper. This differenee in maquila, taken in conjunction with other small matters, means a diminution of profit to us of no less a sum on the six months' productiou than $52,249.28, or say, roughly, 6,000*l.*, as eompared with what it would have been had the maquila beeu the same in the second as in the first-half of 1888. The average English basis of price, too, on which our regulus has been sold, as compared with last half-year, has been 1*l.* 11s. 8d. lower, and this, combined with the higher exchange, has told against us to the extent of about 2,400*l.* Another factor which has told against us has been, undoubtedly, the low class of ore we have had to deal with, notwithstanding the statements in the mining reports to the contrary, which contradiction has originated from an imperfect method of sampling the large and varied masses of ore with which we have to deal. This is proved to have been the case beyond doubt by the result of the smelting operations, showing that instead of an improvement a slight falling off in the average ley of the mine ores has occurred. This falling off is estimated, after allowing for a fair loss of copper in the slags, at about ½ per cent., as compared with the leys of 1887, and this difference, slight as it is, has caused an estimated diminution of profits of about 5,000*l.* in the half-year. Our profits then for the last six months have been decreased from the foregoing causes to the extent of about 21,000*l.*, which, with the 7,000*l.* actually earned, would have made a total of 28,000*l.*, or, say, an average of 56,000*l.* for the year.'

UNSHAKEN CONFIDENCE.

I have seen many ups and downs in Panulcillo, but I have never yet lost confidence iu the mine and in its capability of producing at a rate which would enable it to hold its own even with copper at a com-

paratively low price. These views are still unchanged, and all that is required now is, first, patience till better times come round, and second, to carry out what we have long wished to do, viz., the smelting of our own regulus, so that we may get the full benefit from the raw material to the perfected article. All this we have now before us, and if our shareholders give us that support which we expect they will do, I am confident that we shall be able in the future to make Panulcillo produce copper at a profit, even if the market price is comparatively low. What has been done in the past can be done in the future. We cannot make the price of copper, but we believe we can make such changes in our production as will enable us to effect economies that we may be able to successfully compete with the lowest producing copper mines of the day. Turning now to the future, there can be no question that the very large and sudden fall in copper prices has placed us in very great and serious difficulty, as some time must elapse before costs in Chili can be adjusted to present low values here. In the meantime, it has been found necessary to stop smelting. Already some reduction has been effected in wages, and much more will follow if the present low prices for copper continue. We are also being assisted by the fall in exchange from 29¾d. to 26d., with the prospect of its declining to the low average of 1886—say, 23¾d., as Chili's chief exports, copper, nitrate, and wheat, are all selling at very low prices. In copper alone the diminution in price and production is now so great that the amount to be drawn for represents only about one-third what it did last year.

OUTLOOK.

Furthermore, negotiations are going on for such combinations and amalgamations as will materially diminish the competition for labour and ores, and at the same time allow us to become makers of bars on advantageous terms. These negotiations will be assisted by the collapse in prices, and it is, therefore, not improbable that, as has been seen in other cases, present adversity may be only the prelude to a better and much more certain future. I am, too, strongly of opinion that the existing depression in copper prices cannot last long, and that too much is being made of the present excess of visible stocks by a state of panic which exaggerates all unfavourable circumstances, and underestimates the all important fact that the trade throughout the world is entirely bare of supplies and all old metal is used up; while prices are now at a point which is ruinous to most mines, and at which few can make any profit. There must, therefore, be a material and immediate decrease in production, and as an indication of this I would draw your attention to the following extract from a Valparaiso circular, just received:—"In all the copper mining districts the tributers have ceased working on their own account, and most of the mining establishments have dismissed the greater part of the labourers, whilst others have shut down entirely; we calculate from 2,000 to 3,000 miners are out of employ, and wages have fallen 25 per cent. all round. At the present rate offered for low grade ores no mines can be worked to a profit, even with lower wages and the present exchange; we look for a falling off in the production from the month of May of at least 50 per cent." It would, too, be against all experience for such a sudden and enormous decline as we have just seen, not to be quickly followed by some reaction, especially in these telegraphic days, when cause and effect act so rapidly on each other. What both consumers and producers should desire is that the reaction may not be so long delayed as to cause the rebound to be so large as again to check consumption. A price of about 50*l*. per ton for Chili bars would seem to be the golden mean, and all that is required to bring it about is the adoption of a prudent and definite policy by the leading mines and the present stockholders. This course seems so self-evident that I cannot doubt of its accomplishment, especially now that we have the most distinct evidence of a very sound and expanding trade in all directions. These are the views that we hold at this board, and I believe they are based on careful observation on what is going on at the present time; and believing in those views, and believing that copper at 50*l*. will be a very paying price for the Panulcillo Mine, I have only to ask you to be patient, and have still confidence in its future. We are doing all we can on this side to effect economy. We are doing everything we can to reduce expenses for the moment, and when we have labour adjusted to something like the price of copper, and the price of ores also in a position, such as would secure a profit for smelting, and also have secured smelting works for ourselves, I think I may say to you that there is still a very good future for the Panulcillo Company. With these remarks I beg to move "That the report and accounts of the directors, submitted to this meeting, be, and the same are hereby adopted." (Cheers.)

Mr. FRANCIS JOHN JOHNSTON (director) seconded the motion.

A DISSENTIENT.

Mr. EVERETT: This is only the second time I have had the pleasure of being present at these meetings, and on the first occasion, as just now, I listened carefully to the remarks of the chairman, and do not agree with what he said about the future of copper. My idea is that copper will remain at its present price. I do not agree about the future—copper cannot be higher. I know this from the highest authority, and there are something like 200,000 tons of copper on the market. You talk of the old copper being cleared up, and no doubt that is so, but there are something like 200,000 tons of copper to be cleared off. I do not know if you have read an article which appeared in the *Economist* last Saturday. I have been told by one or two leading men that there is nothing to be hoped for in the future from Chili, on account of the scarcity of labour, increased prices, and the new nitrate mines opening up. They draw off the labour from the copper mines. I think the result of your last year's trading is most lamentable, and it ought to be much better. We have had copper at 80*l*., and yet you have only paid 5 per cent. for the first half-year and nothing for the second. Your principal competitor, Copiapo, has been closed altogether for the last six months, and that ought to have given you a great advantage. I was only talking yesterday with one of the largest copper consumers, and his opinion was mine—that we shall not see copper much above 35*l*. or 40*l*. a ton for the next six months. A great many mines will be closed as they were before.

OPINIONS *v.* FACTS.

Mr. JOHNSTON: Will you give us a few facts? (Cheers.) You stated an opinion, and your opinion is not worth more than that of anybody else. (Hear, hear.)

Mr. EVERETT: I give you the fact that there are 200,000 tons of copper on the market.

Mr. JOHNSTON: That is nothing if trade continues as it is. I presume you are a buyer of stocks.

Mr. EVERETT: It is more than 12 months' supply. The consumption is 130,000 tons a year at the outside.

ANOTHER VIEW ABOUT COPPER.

The CHAIRMAN: I will just reply to Mr. Everett in a few words. There are always two points of view to look at a thing from. I am looking at the point in view—the broad point of view—of the great growth that is going on in the consumption of copper generally. You are looking from the consumers' point of view—in other words, you are a buyer and not a seller; consequently, cheap copper suits you and dear copper rather suits us. Now, the gentleman who is the large consumer of copper, with whom you said you travelled with the other day, does not believe in dear copper. The reason is obvious—he is a buyer, and he would be wrong if he did. His business is to get copper at the lowest possible price, but you believe, as I believe, that the trade of the country is in a very flourishing condition, and that the cheap price which copper fell to at the time introduced it into channels in which it will always continue to be used. You will also admit this, that there was always a large amount of old copper hanging over the market, all of which has been entirely used up. There is not a pound of it, and what we see now is this quantity of copper in stock—200,000 tons. Producers see that as well as buyers, and I will be very much astonished if those who have advanced upon copper so freely will foolishly throw it away. I believe that you will find that the price of copper is more likely to be at 50*l*. within a very short period than it is to be at 35*l*. (Cheers.)

A BROAD VIEW OF THE POSITION.

Looking at it from a common sense point of view; looking at it as you admit from the point of view of the great reduction which has taken place in the production of copper in Chili—all this must tell. Chili, more or less, regulates the price of copper, and Chili will not send to this country half the amount of copper it sent last year. All that is in favour of higher prices, but, personally, I would like to see a price that would suit consumers as well as producers, and 50*l*. is not a high price for copper. I have seen copper at 120*l*., and many a large amount I have dealt in at that price, but now we have got to a price which is making copper used so generally and so universally, as, for instance, in all this new ammunition, and in all these electrical developments, and means for connecting and carrying out that system, that I cannot but believe that there is a future for copper after all, and a great future. With these remarks I will move the resolution.

The motion was put and carried unanimously.

The CHAIRMAN: The next resolution is that Mr. Johnston, a director retiring by rotation at the present meeting, being eligible, be, and is hereby elected a director of the company.

Mr. BERTHOUD seconded the motion, which was carried.

TRIBUTE TO DIRECTORS.

The CHAIRMAN: I can only say that a more diligent and a more conscientious director never sat at a board table than Mr. Johnston, and he has been associated with this company from its very inception. I will now move the election of Mr. Edouard Levi Montefiore.

Mr. JOHNSTON seconded the motion.

The CHAIRMAN: With regard to this motion, we have had some experience of his ability. He sat at the board as representing a large French element which came into the Panulcillo system. A more careful and more strictly straight man I have rarely come into contact with. He represents not only the French, but the English element, and I have the greatest possible pleasure in recommending him to you for re-election to-day.

The motion was carried unanimously.

A SHAREHOLDER proposed the re-election of the auditors, Messrs. Whinney, Hurlbatt and Smith, at a remuneration of 25*l*. each audit. They are well known, he said, to every gentleman in this room, and the audit of the company's accounts is safe in their hands.

The motion was carried unanimously.

The CHAIRMAN: That closes the proceedings for to-day, and I sincerely hope that the next time I meet you there will be as marked a change, but in the right direction, betwixt this time and next year's meeting, as there has been between last year's meeting and the present meeting.

A PARTING SHOT FIRED UNDER COVER OF A VOTE OF THANKS.

Mr. EVERETT: I have made a remark or two that the chairman was not exactly pleased with, but I hope the shareholders will join with me in passing a vote of thanks to him. Whatever I said was not to damage the company. I should like to see it a success, and I hope it may be, but the last time the chairman spoke in my presence about copper he was wrong and I was right, and I think you will find that I shall be right now. (Cries of "No," and laughter.)

The CHAIRMAN: I am very much obliged to you, and my colleagues join with me in thanking you. We have a very delicate battle to fight at the present moment, but we have been so long connected with Panulcillo, that it is not only our pleasure, but our duty, to do our best for it. I may say that, personally, I am a very large shareholder, and have never deserted the company, even in its bright days when I was urged strongly to reduce my holding. I did reduce it to a certain extent, but I believe I am by far the largest shareholder in the Panulcillo Company at the present moment. (Cheers.)

The meeting then closed.

GUNNISLAKE CLITTERS.

A FURTHER ADJOURNMENT.

AN adjourned meeting of the adventurers in Gunnislake Clitters Mine was held this week at the purser's residence in West Street, Tavistock—Mr. J. J. Daw presided.

At the four-monthly meeting held a fortnight since the agents, in their report, recommended the sinking of the shaft at a cost of about 1,700*l*., with the view of intersecting the Hingston Down lode for tin. The matter was then adjourned for the consideration of the committee, who advised that the recommendation should not be carried out, and on the motion of Mr. TROOD, seconded by Mr. SQUIRE, it was decided to adopt the committee's views thereon.

The meeting having considered the number of shares that had been relinquished, and anticipating that many more relinquishments would be sent in, it was resolved that a special general meeting should be held on Friday, June 7th, to determine the winding-up of the mine or otherwise.

Under these circumstances it was decided that the agents and *employes* on the mine should be given a month's notice that their services would not be required after the expiration of that period.

A resolution was passed expressing the approval of the shareholders in the management, and recording their thanks to the committee and agents for the care and economy displayed in conducting the business of the mine for many years past.

It was understood that the committee would make arrangements to keep the mine in "fork," so that no damage might accrue to the machinery.

THE SWAZIELAND GOLD EXPLORATION AND LAND CO., LIMITED.

THE COMPANY, AFTER AN UNAVOIDABLE DELAY, GET TO EXPLORATORY WORK—PROSPECTS GOOD.

THE statutory general meeting of this company, in accordance with the requirements of the Companies Act, 1867, section 39, was held at Winchester House, Old Broad Street, on Thursday last—Mr. E. A. Pontifex presided.

Mr. H. HODGES (the secretary) read the notice calling the meeting.

The CHAIRMAN stated that the meeting was only the statutory one, required under the Joint Stock Companies Acts, at which it was not possible to give the shareholders much information beyond what was contained in the prospectus. They had also had exceptional difficulties to contend against, which had prevented them being in a position to lay any results before the shareholders. As soon as the company was formed they telegraphed out to the local directors to commence operations, but they received a reply that it was impossible to proceed with any exploration work until the long grass had died down. There was no reasonable prospect of success until the grass had died down. They had received a letter from the local directors, dated 20th March, informing them that

THE EXPLORER HAD STARTED.

He had been, they were informed, engaged at a small salary, until he should discover something of importance, when he was to receive a bonus, which would fully compensate him for his time and labour. The company had every reason to be congratulated upon the high standing and position of the gentlemen who had accepted office as local directors. (Cheers.) One of them was Mr. Fisher, a merchant of Durban, well-known and respected throughout the whole of South Africa. He was a magistrate and a thorough man of business. (Applause.) The other gentleman, Mr. W. Shepstone, was a member of the Legislative Council, and the son of Sir Theopelous Shepstone. His brother was one of the advisers of the Swaizeland king, and they might therefore look for greater consideration and assistance to be extended towards them than was usually given by those irresponsible monarchs to companies in their territories. The capital of the company was 150,000*l*., of which 125,000*l*., in cash and shares, was given to the vendors, leaving a working capital of 25,000*l*. which was in excess of their requirements. As the shareholders were doubtless aware, they did not propose to work the whole property for themselves, but

TO FIND OUT THE VALUABLE PORTIONS,

and to do sufficient to prove them, with the view of forming subsidiary companies. They had a working capital in cash of something over 11,000*l*., which was more than they at present required. If they, as they believed would be the case, found very valuable properties, there would be no difficulty whatever in obtaining any additional capital that thay might require. The property consisted of 1,000 acres, or about 156 square miles, and it was proved to be of very great richness. Indeed, some of the reports of the richness were so incredible that they had not felt justified in including them in the prospectus. He thought that the shareholders might look forward with very great confidence to receiving very satisfactory returns as the results of the first year's operations. Having read extracts from their last letter from the local directors, he alluded to the fact that they had since received a telegram stating that exploration work had been commenced. There was no resolution to be submitted to the meeting, but if there were any questions that the shareholders would like to ask he would be happy to reply to.

A SHAREHOLDER asked the number of shares that had been allotted?

The CHAIRMAN said that the whole of the 11,000 applied for (with the exception of one or two applications which were declined for special reasons) were allotted.

In reply to further questions,

The CHAIRMAN said that the amount of capital that the public was asked for was 25,000*l*., and the amount of applications that they received was for 11,000*l*. They had not yet, he said, applied for any quotation on the Stock Exchange, as the amount of capital that had been subscribed was not sufficient for the committee to grant a quotation.

THANKS.

A vote of thanks to the chairman for presiding was proposed, seconded, and carried by acclamation.

In response, the CHAIRMAN expressed his thanks. He stated that he had great confidence in the future of the company, and he was confident that when they meet again they would have very satisfactory intelligence to give the shareholders.

The proceedings then terminated.

CENTRAL ARGENTINE.

THE secretary writes:—I am glad to inform you that we have received a cable from our manager stating that he will commence sluicing operations this day.

CONSOLIDATED ESMERALDA, LIMITED.

A WELL CONSIDERED SCHEME OF RE-CONSTRUCTION.

24th May.—I am instructed to inform you that the board of directors have had under consideration for some time the question of so changing the constitution of the company, as to be able to give dividends from the mine or mines which are being profitably worked, instead of using the proceeds in doing work necessarily required to keep in order the large number of mines (at present only partially opened), buildings and machinery owned by the company. The mines included in the Esmeralda group have a remarkable history. It is stated with authority, that from the surface of several of the mines bullion was taken to the value of about 3,000,000*l*. sterling, without opening the mines to a greater depth than 150 ft. Experience in other districts in the same State (Nevada) has shown that below 400 ft. in depth bullion has been obtained from large pockets or bonanzas, far exceeding anything found upon the surface, notably in the case of the Comstock lode at Virginia City. This lode is said to have yielded within the last 25 years about 100,000,000*l*. sterling, and one of the mines on the lode to have paid 15,000,000*l*. sterling in dividends. This mine, the California and Consolidated Virginia, is still producing at the rate of about 15,000*l*. per week, and several other mines a lesser amount. In Bodie, to the south-west of Esmeralda, and only about 8 miles distant, there has been the same experience. Mines that were abandoned when worked near the surface have been re-started and worked in depth, with the result that several millions sterling have been produced, and large dividends paid to the shareholders. Competent authorities have stated that the lodes running through the Esmeralda property are the same as the Bodie and Comstock lodes, but that more bullion from the surface was produced at Esmeralda than from either of the other districts. The directors decided that with the very favourable surface records of the property owned by this company, it would be advisable to test the value of one of the mines in depth before recommending any work on a scale commensurate with the great extent of the property. The Durand being the mine selected, sinking was commenced from the then existing depth of 75 ft. The ore extracted in the first 110 ft. (a total of 185 ft. from surface) with short drifts on the north and south sides of the shaft, gave as follows:—75 ft. to 185 ft., equal to 110 ft., 1,568 ozs. standard gold, equal to 14¼ ozs. per ft.; 185 ft. to 325 ft., equal to 140 ft., 2,549 ozs. standard gold, equal to 18¼ ozs. per ft.; 325 ft. to 375 ft., equal to 50 ft., 1,150 ozs. standard gold, equal to 23 ozs. per ft. This shows a substantial increase of yield in depth, more especially as at the present level, 375 ft., the drift has only been run on the south side of the shaft, instead of to the north and south as on the upper levels. The ore crushed has been 2,463 tons, producing 5,267 ozs. standard gold, an average of over 2 ozs. per ton. A winze has been opened 8 ft. in depth from the track floor of the lowest level, which shows that the ore body is wider and richer than in the levels above. These results should be accepted as most favourable, and would indicate that greater results may reasonably be expected with more extended working. The work so far done has been very expensive, but the yield of 20,000*l*. has left a profit that would have been sufficient to pay a dividend if the Durand Mine had been incorporated alone with a moderate capital. At a distance of 1,200 ft. from the Durand, a shaft, known as the Real del Monte, was opened to a depth of 900 ft., at a considerable expense, a few years before the properties were acquired by this company. The works are fully equipped with boilers, engines and pumps. Surveys lately made appear to show that by starting up these works all water would be drawn from the Durand, thus enabling the superintendent to open the mine to a greater depth very rapidly and at much less expense, and to extract the rich ore already in sight, which cannot be done without adopting the plan mentioned, or erecting further pumping machinery at the Durand shaft. The directors feel sure that the shareholders will acknowledge that with only about 8,000*l*. working capital, a great deal of work has been done during the last two years. The balance sheet to be presented at the annual meeting will show at December 31st last, cash in hand and to be received amounting to about 18,350*l*., with liabilities at the mines of about 1,200*l*. Out of this sum 13,000*l*. will be held for payment of the debentures maturing in June, 1890. There are no existing liabilities, and the Durand Mine is in full work. The board of directors hold one-fourth of the total capital of the company, and in view of the encouraging prospects in the Durand Mine, and the very large number of unexplored mines, they consider that it will be to their interests as large shareholders, and to the interests of the large number of smaller shareholders, that an effort should at once be made to place the company on a dividend-paying basis. It will therefore be proposed at the annual meeting that the whole properties of the company shall be transferred to two companies. The Durand Company acquiring the Durand, Live Yaukee, Green, St. Clair, East St. Clair, Langtry, Percy, and Stella Mines, known as the Middle Hill group, with a nominal capital of 100,000*l*., in shares of 1*l*. each, 16s. being credited as paid on each share. The Esmeralda Company retaining all the other mines (27 in number), mills, machinery, buildings, timber lands, &c., with a nominal capital of 400,000*l*., in 400,000 shares of 1*l*. each, 17s. 6d. being credited as paid on each share. Each shareholder would receive one Durand and four Esmeralda shares for every five shares now held. The liability will be small, and payments in respect of same will be arranged to extend over two years. Under this plan, the Durand Company will have an uncalled working capital of 20,000*l*, and the Esmeralda Company 50,000*l*., and, as before stated, it is expected that the Durand Company will, at an early date, be able to pay dividends. The Esmeralda Company will, under arrangement, allow the Durand Company the use of the present 20-stamp mill, and will also start the Real del Monte pumping shaft. This company will also select one or more mines for immediate development, with the hope and expectation that they can also be made dividend-paying. The arrangements suggested should greatly enhance the value of the shares of Consolidated Esmeralda, and the directors, holding as they do a large portion of the capital, most strongly urge the shareholders not to sacrifice their shares, and it is hoped that the proposed arrangements will meet with the approval and hearty co-operation of all. Mr. R. K. Colcord, the superintendent, leaves the mines to-day, and will start from San Francisco for London on Thursday for the purpose of attending the annual meeting, which will be held a few days after his arrival.—F. FULLER, Secretary.

ABRIDGED PROSPECTUS.

This Company has been formed to acquire and work a valuable and compact group of mines consisting of eight distinct locations, and a mill site of five acres, situate in the Beveridge Mining District, Inyo County, California. The properties are in direct railway communication with San Francisco.

The prospectus, of which prints may be obtained from the Bankers, Brokers, Solicitors, and Secretary of the Company, is founded upon reports by Mr. John Leechman, Mining Engineer, of whose standing and capacity the Directors have fully satisfied themselves. In confirmation, the following is taken from "Burchard's Report upon the Production of Precious Metals in the United States during 1884," page 100, viz. :—

"BEVERIDGE DISTRICT.—In this locality are found the most important gold-bearing veins in the country, the veins coursing east and west, both continuous and rich. Many of the locations are owned by Mexicans, and have been operated for a number of years. Formerly the reduction was effected by arrastras, driven by mill power, but three years ago a stamp mill was constructed at Lone Pine, where the ores have since been reduced for a percentage of their assay value. The Keynote, the most important mine of the Beveridge series, has been steadily developed, and as steadily yielded good returns."

The estimated quantity of ore in sight is over 11,000 tons, exclusive of a possible addition of 6,000 tons. Samples taken from all parts of the mine give an average assay value of over $21 per ton.

The present mill has five light stamps, a self-feeder, and a Hendy concentrator; but Mr. Leechman advises that in order to place the property on an efficient footing, and enable 25 tons of ore per day to be treated, the following equipments should be supplied, viz. :—

Hallidie Elevated Ropeway	12,377
Two Huntingdon Quartz Mills, with steam-power complete	8,750
Buildings at Mine and Mill	2,000
	$23,127
	Say £4,625

With these in operation, he estimates the Keynote Mine alone will produce a profit of £25,200 per annum; this, based on the assumption that the gross product of the ore will be $20.00 per ton, a considerably less yield than he thinks may be reasonably expected.

The purchase price of the group of mines, machinery and plant is £15,000, leaving £10,000 out of the present issue available as working capital. The balance of £22,000 Ordinary Shares will be held in reserve for issue, if and when required.

The Founders' Shares will be issued in discharge of all expenses, preliminary or otherwise, up to allotment: these Shares will receive no dividend until 10 per cent. in any year has been paid upon the Ordinary Shares; they will then receive one-half of the balance of net profits for such year. Except the Founders' Shares, no promotion money of any kind will be paid.

The other seven claims included in the purchase are the "American," "Bonanza," "Water," "Cliff," "San Francisco," "Raise," and "1888." On none of these has sufficient work been done to fully demonstrate their value, but Mr. Leechman reports that they all contain quartz veins which may become valuable adjuncts to the "Keynote."

Assuming Mr. Leechman's estimates are borne out by actual results, the returns will be sufficient to enable the Directors to declare a dividend of fifty per cent. on the Capital of the Company. In addition, large bonuses should be available for distribution, if and when any of the remaining seven claims (which it is intended to gradually prospect and develop) are disposed of.

The following Contracts have been entered into and may be seen at the Offices of the Company, viz.: one dated the 23rd of April, 1889, made between Levy Lasky and Michael C. Lasky, the Vendors, of the one part, and the Company of the other part, and another dated 22nd May, 1889, made between Ernest Charles Koch of the one part, and the Company of the other part.

Applications for Shares should be made upon the form accompanying the Prospectus, and remitted to the Company's Bankers, accompanied by a deposit of 10s. per Share. Should no allotment be made, the application money will be returned in full.

DOMINION OF CANADA.

The DOMINION BREWERY COMPANY, LIMITED.

TORONTO, CANADA.

(INCORPORATED UNDER THE COMPANIES ACTS, 1862 TO 1886.)

SHARE CAPITAL, £160,000. DEBENTURE CAPITAL, £80,000.

ISSUED AS FOLLOWS:—16,000 Eight per cent. Cumulative Preference Shares of £5 each, £80,000; 16,000 Ordinary Shares of £5 each, £80,000; 800 Six per cent. First Mortgage Debentures of £100 each (£80,000), which will be secured by a first mortgage upon the real property and on the buildings, and rank as a first charge upon the Plant and Machinery, Chattels, Stock and Merchandise of the Company. The Debentures will be redeemable at £110, at the option of the Company, on Six Months' notice, after January 1st, 1920.

The Shares are payable:—10s. on Application; £2 10s. on Allotment; £1 on July 1st, 1889; £1 on August 1st, 1889; total, £5. The Debentures are payable:—10 per cent. on Application; 20 per cent. on Allotment; 35 per cent. on July 1st, 1889; 35 per cent. on August 1st, 1889; total, £100.

The interest on the instalments of the Debentures as paid is payable half-yearly, on March 1st and September 1st in each year, and the Directors have taken power to pay interim dividends on the Preference and Ordinary Shares. The Preference Shares are preferential both as to capital and interest. The Company will be entitled to the profits from January 1st, 1889.

CHARLES BURCHETT BRODIE, Esq.

OFFICES.

1, TOKENHOUSE BUILDINGS, E.C.

This Company is formed for the purpose of acquiring and further developing the well-known and highly successful Brewery of Mr. Robert Davies, at Toronto, Province of Ontario, in the Dominion of Canada, and known as the Dominion Brewery.

This Brewery was established in the year 1878, and has been owned and managed since that time by Mr. Robert Davies, the present owner, who is the largest brewer of ale in Ontario; the ales brewed by him have a reputation second to none, and command a high price in the Dominion. As a proof of the excellenee of the ales brewed by Mr. Davies it is suffieient to mention that they gained Three Gold Medals at the World's Exhibition in 1885 at New Orleans (two for ales and one for porter), viz.: For porter, in competition with Messrs. Guinness; for pale ale, in eompetition with Messrs. Bass; for amber ale, in competition with Messrs. Allsopp, and until the autumn of last year (1888) Mr. Davies was unable to supply the demand for his ales for lack of storage room.

The Brewery premises, whieh have a commanding elevation, occupy an area of 71,940 ft. of freehold land, with a frontage of 327 ft. to one of the principal thoroughfares in the City of Toronto, and are all practically new. There were extensive additions in 1888. The Brewery is constructed in the best manner possible, no expense having been spared in its erection; it contains all the modern and most approved appliances for carrying on the business with proper economy, and there are extensive cellars beneath the entire premises. One important feature is that its water is supplied by gravitation, and not by pumping. A further ample supply of water is always available, the quality of which for brewing purposes is unsurpassed.

By the completion of the new building in October, 1888, the capacity of the Brewery has been enlarged so that it is now able to supply the increased demand which, until that date, Mr. Davies was unable to meet.

The annual output of the Dominion Brewery (which is steadily increasing) has during the past three years averaged 957,466 gallons (the output for 1888 was 1,190,400), and the average yearly net profits during the same period have been £19,014 18s. 6d. (the net profit for 1888 was £24,291 15s. 2d.), taking the rate of exchange at $4.85 to the £.

The price to be paid for the Brewery is £190,000 (leaving £50,000 for working capital). The vendors to the Company stipulate for the right to subscribe for, and to have allotted to them, on the terms of this prospectus, one-third of the share and debenture capital, that being the largest proportion which a vendor may take by the rules of the London Stock Exchange.

The purchase price includes all the real property and buildings, the rolling stock, horses, casks, fixed and moveable plant, together with all utensils which are used in the conduct of the trade, and the goodwill.

The stock of malt, hops, ale, porter, barley, &c., as on January 1st, 1889, will be taken over at cost price. The book debts as on January 1st, 1889, will be taken over at a discount of 10 per cent.

The profits will belong to the Company as from January 1st, 1889. The Company do not take over any liabilities prior to that date.

The vendors to the Company will pay, out of the purchase-money, every expense in connection with the incorporation and establishment of the Company down to allotment, including brokerage.

The property is freehold, and will be conveyed free from incumbrances.

The services of Mr. Robert Davies, who has brought the business up to its present state of excellence, have been secured as manager for three years.

The foregoing particulars having been supplied by the vendors have been verified on the spot by Messrs. Hart Brothers, Tibbetts and Co., the well-known firm of chartered accountants, who certify as follows:—

14, Moorgate Street, London, E.C.
May 7th, 1889.

To the Directors of the Dominion Brewery Company, Limited.

Gentlemen,—We have examined the books and accounts of Robert Davies's Dominion Brewery at Toronto, in the Dominion of Canada, and have satisfied ourselves that the business is a prosperous and increasing one. The annual output for the past three years has been as under:—

1886,	743,100 Imperial gallons	=	20,641 English barrels.
1887,	939,000 ,,	=	26,083 ,,
1888,	1,190,400 ,,	=	33,066 ,,

The net profits during the same period, and calculating the rate of exchange at $4.85 to the £, have been as under:—

1886,	£14,891	14s.	9d.
1887,	£17,861	5s.	9d.
1888,	£24,291	15s.	2d.

The output for the first three months of 1889 is 17,200 imperial gallons, or 477 English barrels, in excess of the output for the same period last year.

We are, Gentlemen,
Yours faithfully,
HART BROTHERS, TIBBETTS, and Co.,
Chartered Accountants.

Taking the net earnings for 1888 (£24,291 15s. 2d.) as a fair basis for calculation—and they have been well maintained during the current half-year—they will be applicable as follows:—

To payment of 6 per cent. interest on Debentures	£4,800
To payment of 8 per cent. cumulative dividend on preference shares	6,400
	£11,200

Leaving a balanee of £13,091, whilst a net profit of £12,000 only is needed to pay a dividend of 15 per cent. on the ordinary shares.

Now that the enlargement of the Brewery has been completed, and having regard to the normal growth of the trade, it is reasonable to expect that the net profits available for dividend on the ordinary shares will be steadily and considerably increased.

The London and Colonial Finance Corporation, Limited (the vendors to the Company), have entered into an agreement for the purchase of the property from Mr. Davies and paid the deposit, and agree to re-sell to the Company. These arrangements are contained in the following contracts: (1) dated May 23rd, 1889, between Robert Davies and the London and Colonial Finance Corporation, Limited, and (2) dated May 25th, 1889, between the London and Colonial Finance Corporation, Limited, and N. C. Henry, as trustee for the Company, with an endorsement of adoption by the Company, dated May 27th, 1889. Copies of these contracts, together with the memorandum and articles of association of the Company, may be inspected at the office of the solicitor to the Company.

There are also the ordinary trade contracts incidental to the business, which it is impossible to specify, and various agreements referring to the issue of and guaranteeing subscriptions to the capital. There is also a contract, dated May 8th, 1889, between the London and Colonial Finance Corporation, Limited, and Messrs. Coates, Son and Co., respecting their remuneration and commission as brokers. Applicants for shares will be deemed to waive the specification of any such contracts, and to accept the above statement as a sufficient compliance with section 38 of the Companies' Act, 1867.

Applications on the form accompanying the prospectus, together with a deposit of 10s. per share or 10 per cent. on the debentures, can be forwarded to the National Bank, Limited, 13, Old Broad Street, E.C.

It is intended to apply at the earliest moment for an official settlement and quotation on the London Stock Exchange.

If no allotment is made, the deposit will be returned in full, and should a smaller amount of debentures or shares respectively be allotted than is applied for, the surplus paid on application will be appropriated towards the amount payable on allotment. Should default be made in payment of any instalment, the amounts previously paid will be liable to forfeiture.

American brewery companies have recently become a favourite investment, as evidenced by the market price (quoted from the *Financial News* of May 25th, 1889), of the undermentioned companies:—

	Paid up.	Price.	Premium per cent.
Bartholomay Brewery Co. (Rochester)—			
8 per cent. Preference Shares	5	6¾	17½
Ordinary Shares	5	10¾	115
Frank Jones'—			
7½ per cent. Preference Shares	6	6½	5
Ordinary Shares	6	7⅝	37½
Hill's Union—			
7½ per cent. Preference Shares...	10	10½	5
Ordinary Shares	10	11¼	12½
New York—			
8 per cent. Preference Shares	10	12½	25
6 per cent. Debentures	100	109½	9½
Ordinary Shares	10	14½	45

Prospectuses can be obtained from the bankers, brokers, and other officers, and at the Offices of the Company. London, May 28th, 1889.

The Subscription List will Open on Saturday, 1st June, 1889, and Close on or before Tuesday, 4th June, 1889.

THE

TERRA COTTA FIRE-AND-SOUND-PROOF BRICK COMPANY, LIMITED.

Incorporated under the Companies Acts, whereby the liability of the Shareholders is limited to the amount of their Shares.

CAPITAL - - £200,000,

In 40,000 Shares of £5 each, viz., 28,000 Preference Shares, and 12,000 Ordinary Shares.

The Preference Shares will be entitled to a cumulative preferential dividend of 10 per cent. per annum, after which the balance of profits will be divided between the Preference and Ordinary Shares *pro rata*.

28,000 PREFERENCE SHARES ARE NOW OFFERED FOR PUBLIC SUBSCRIPTION.

Payable—10s. on Application; £1 on Allotment; £1 10s. on the 17th June next; and the balance, if required, at not less than three months' notice.

Directors.

PROSPECTUS.

This Company has been formed for the purpose of acquiring and working the valuable patent rights granted to Mr. Charles Carroll Gilman, of Eldora, Iowa, U.S.A., for the manufacture in the United Kingdom of Porous Earthenware, known as "Terra Cotta Lumber," "Brick-wood," "Wood-stone," &c., for the construction of buildings, for fire-proofing, for sound-proofing partition walls, and ceiling and floors, filtering of water and acids, lining of tunnels and safes, coating steam boilers, insulating electrical wires underground, and numerous other purposes.

These Terra Cotta Porous Bricks are the best non-conductors of heat, cold, sound and electricity, while their crushing strength is from 9,000 to 13,000 lbs. to the square foot. Pig iron weighing 5,000 lbs. has been piled on a single square foot of a flat arch 10 ins. deep, with a 6-ft. span, without any signs of deflection. The cost of labour and mortar employed is moreover much less than is paid for ordinary brickwork or lath and plastered walls, and they can be sawn, nailed and worked with edge tools nearly as readily as wood.

They are specially suitable for partition and other internal walls, ceilings, and floors, not only on account of their extreme lightness, but their sound-deadening qualities. A 4½ in. wall furnishes complete isolation against sound—a great desideratum in houses, schools, hospital wards, &c.

Another advantage of the material is the use to which it is put for preventing the radiation of heat from steam boilers and steam pipes. The National Heating Company of New York and Boston have secured the sole right from the Parent Company (the International Terra Cotta Lumber Company, of Chicago), to use it for covering metal pipes in the streets, for the conveyance of boiling water to dwelling houses and other buildings. Miles of these conduits are constructed in Boston and New York, and establish the perfect non-conductibility of the material.

It is, however, in its application to fire-proof purposes that the greatest advantage in the use of this material is found. The absolute failure of the usual fire-proofing system had led architects and builders to employ such substances as asbestos, silicate of cotton, or slag wool, &c., for protecting and casing iron girders and columns against fire, the metal, if unprotected, being liable to bend long before it is red hot.

The Terra Cotta Porous Bricks have acquired a great reputation for fire-proofing in the United States on account of their extraordinary non-conducting properties. Some idea of the extent to which they are applied may be gathered from the fact that in the new auditorium building in Chicago (the largest fire-proof building in America), the contract for these bricks amounted to £38,000, while that for all other bricks only amounted to £10,000.

The material has been severely tested in the presence of many eminent architects, builders, fire superintendents, insurance managers, and scientific gentlemen in England, who have given it their unqualified endorsement (see statements herewith). The following well-known and eminent architects and builders, having witnessed the tests, have intimated their intention of using this material:—

A. Waterhouse, Esq., President of the Royal Institute of British Architects.
Aston Webb, Esq., F.R.I.B.A., London.
Francis U. Holme, Esq., F.R.I.B.A., Liverpool.
Messrs. Picton, Chambers and Bradley, Architects, Liverpool.
George Fell, Esq., Architect, Manchester.
Messrs. Thomas Wainwright and Sons, Architects, Liverpool.
J. Murgatroyd, Esq., F.R.I.B.A., Manchester.
Messrs. Charles Clegg and Son, Architects, Manchester.
J. H. Davies Colley, Esq., A.R.I.B.A., Manchester.
Robert J. Bennett, Esq., F.R.I.B.A., of Messrs. Royle and Bennett, Manchester.
John Wynne, Esq., F.R.I.B.A., Manchester.
Messrs. Bird and Whittenbury, Architects, Manchester.
Thomas Newby, Esq., Architect, Manchester.
Messrs. Jones and Son, Building Contractors, Liverpool.
Messrs. Holme and Green, Building Contractors, Liverpool.
John L. Ward, Esq., Building Contractor, Manchester.
Edward Talbot, Esq., Building Contractor, Stretford.

The manufacture of the Porous Terra Cotta Bricks requires, in addition to clay only raw ingredients which have very little commercial value, being waste refuse that can always be obtained in large quantities at a nominal cost. The cost of manufacture in the United States averages about 16s. per 1,000 bricks (English size), and the material is readily sold there for about 37s. per 1,000. The promoters believe, from careful investigation, that they can be manufactured in this country at a price which will be little in excess of the cost of common bricks, and yet that they will compete with the best fire-bricks. After a careful comparison of the cost of production and earning capacity of the different manufactories in the United States, it is confidently anticipated that large profits will be earned by the Company.

The parent Company of Chicago, Illinois, U.S.A., which has been in operation less than three years, and has licensed, so far, 25 sub-companies earned (as appears from the annual report of the chairman of the Company) for the year ending March 1st, 1889, from licenses and royalties, upwards of 20 per cent. on £240,000, the capital of the Company.

The sub-companies are actively and profitably prosecuting their business in their different localities, many of them working day and night.

The Illinois Terra Cotta Company (limited to manufacture in the State of Illinois), in their report, dated November 22nd, 1888, state their earnings to be about 60 per cent. on their capital. The average output of this Company is only about 50 tons per day.

The shares of the Victoria Company in Australia, established about two years ago with a capital of £100,000, have been sold for 100 per cent. premium.

It is proposed to establish at first one or more plants, at the discretion of the directors, in close proximity to large centres of population, but as these will be inadequate to supply the large sale which may be anticipated for building purposes alone, licenses will be granted at a royalty. Applications for licenses have been made to the Parent Company from various parts of the United Kingdom.

The patents have been carefully investigated by the eminent patent agents, Messrs. Haseltine, Lake and Co., of London, and by counsel, whose report and opinion may be seen at the office of Messrs. Ashurst, Morris, Crisp and Co. The parent company also guarantee the validity of the patents.

The vendor, Mr. Charles Mason Stead, has recently purchased Mr. Gillman's patents from the parent company, and has fixed the purchase-money to be paid by this Company for the sale to them of such patents at £50,000 in cash, 4,000 fully paid-up preference shares (or cash, at the option of the board), and 12,000 fully paid-up ordinary shares, which will not receive any dividend until a cumulative dividend of 10 per cent. per annum has been paid on the preference shares, after which the balance of profits will be divided between the two classes of shares *pro rata*. The contract for the sale is dated 29th May, 1889, and is made between the vendor of the one part, and the Company of the other part.

The vendor agrees, out of his profit, to pay all expenses attending the incorporation of the Company, and all underwriting and other commissions, brokerages, printing, advertising, and every other preliminary expense attending the formation of the Company, up to and including allotment. During his negotiations for the purchase of the patents and the formation of the Company arrangements have been entered into in connection therewith, and as to the above expenses and the issue of the capital now offered, including arrangements with a syndicate which has guaranteed the subscription for part of such capital. Applicants for shares will be deemed to have waived any right to have particulars of such arrangements, whether under section 38 of the Companies' Act, 1867, or otherwise.

The above contract and the memorandum and articles of association of the Company can be seen at the offices of the solicitors of the Company.

Applications for shares should be made upon the form accompanying the prospectus, and be lodged with the bankers, with the deposit of 10s. per share. If no allotment be made, the deposit will be returned without deduction; should a less number of shares be allotted than is applied for, the surplus paid on application will be appropriated towards the amount due on allotment.

Application for an official quotation will be made in due course to the Stock Exchange.

Prospectuses and forms of application can be obtained from the bankers, solicitors, brokers, or secretary of the Company.

THE MINING MARKET.

City, Friday Evening.

THE ERROR IN THE MYSORE TELEGRAM—THE MARKET ASSUMES A SPORTING TURN—SWEEPSTAKES *V.* BARGAINS—BETTER RETURNS FROM THE RANDT MINES—FOREIGN SHARES DULL—BETTER INQUIRY FOR TIN SHARES.

A good portion of the so-called Mining Market has this week found itself at Epsom. and that which was left has had plenty of time to fan itself. The bursts of corporeal perspiration have been due to the effulgent rays of the sun. and not to the genial flow of bnsiness. Many of the members, after attending on Monday and Tuesday without result, to use their own words, "threw it up"—that is, the market, and betrayed an affinity for the turf. Sweepstakes were more popular than shares, and turf bargains were more in the wind than options, or dealings for the account. With two-thirds of the market absent, the aspect of affairs was not lively—in fact, it was dead until the telegram came announcing a poor return from the Mysore of 2,869 ozs., instead of nearly 4,000, as had been foreshadowed by Capt. Plummer. It was then that Mysores tumbled, and great was the fall thereof. An upward movement set in just after the meeting to-day, and as the afternoon closed the corrected telegram came to hand, aud once more put matters right. The May crushing may be regarded as worth nearly 15,000*l.* sterling, or 180,000*l.* a year, which is not bad for a company with a capital of 175,000*l.*, and which is about to sell for 87,500*l.* in shares and 17,500*l.* in cash, an outlying portion of its property.

The Witwatersrandt mines have done better during May than was expected, and it seems to have been a libel upon them to assert that they were unfairly worked to show good returns. The May return for the Robinson mine is 7,200 oz., contrasted with 3,965 oz. for April ; City and Suburban, 1,400 oz. for May, against 855 oz. in April ; Stanhope, 760 oz., against 289 oz. in April ; Langlaagte, 6,900 oz., against 4,300 oz. in April ; and Jubilee, 408 oz., against 360 for April. The Jumpers return at 1,500 oz. shows a slight increase ; Simmer at 900 oz. no change ; May at 900 oz., some decline ; Salisbury at 562 oz., a substantial drop.

Miscellaneous foreign shares have presented a miserable spectacle. Where any movement has taken place it has been generally downward. At the same time, for Home mines there has been a somewhat brisk market, and in certain cases prices show an improvement. The holidays next week will, of course, interfere with business, bnt a little later in the year an all-round revival is confidently expected.

The Mining Exchange will be closed to-morrow, Saturday, at 12 noon. until Tuesday, the 11th inst., at 10.30.

Africans.

Little or nothing has been done this week in the African market, and very few dealers have a book in these shares. The general feeling is that there will be no business until after the holidays. In most cases shares have fallen. A fall is shown in Edwin Bray of $\frac{1}{16}$; Oriental New, $\frac{1}{8}$; Moodies, $\frac{1}{8}$; City and Suburban, $\frac{1}{2}$; Dornkop, $\frac{1}{16}$; Durban Roodepoort, $\frac{1}{8}$: Geldenhuis, $\frac{1}{4}$; Heriot, $\frac{3}{8}$; Johannesburg, $\frac{1}{2}$; Jubilee, $\frac{1}{8}$; Jumpers, $\frac{1}{4}$; Knights, $\frac{1}{8}$; Main Reef, $\frac{1}{8}$; New Grahamstown, $\frac{3}{16}$; Salisbury, 20s. ; Simmer and Jack, $\frac{3}{8}$; Spes Bona, $\frac{1}{2}$; Vogelstruis, $\frac{5}{8}$; Wemmers, $1\frac{1}{2}$; and Wolhuters, $\frac{1}{8}$. The following have risen :—Horo Exploration, $\frac{1}{4}$; Bantjes, $\frac{1}{8}$; De Villiers (Robinson), $\frac{1}{8}$; Ferreiras, $\frac{1}{4}$; Langlaates, $\frac{3}{16}$; Mays Consolidated, $\frac{1}{8}$; Royals, $\frac{3}{4}$; Stanhope, $\frac{3}{4}$; and Star, $\frac{1}{8}$.

Diamonds.

A dull market has characterised these shares, with the exception of De Beers, which rose from 15½ to 16 on options falling due in July and the rumour of coming dividends. At one time to-day 10s. was given for the call of these shares at 16 for end July. The public are well advised not to buy options, but if they invest to take up their shares. A rise has taken place in De Beers of ⅛, and London and South African Exploration ⅜, whilst a fall of ⅛ is shown in Bultfontein and Burmah.

Burma Ruby Mines	1	—	1⅛pm

Indians.

The only feature in Indian shares has been the large amount of business done in Mysores, which fell to 5⅜ sellers on the result of the return, but after the meeting held to-day, and the corrected telegram which arrived as the market closed, they speedily rose to 5¾ buyers, and left off 5⅞, 6. With respect to other shares in this market there have been but few dealings.

A fall has taken place in Balaghat of 6d.; Devala-Moyar, 6d.; Goldfields of Mysore, 1s.; Mysore Wynaad, 3d.; Nine Reefs, 6d.; South-East Mysore, 6d. The only rise has been in Ooregum ordinary, ⅛.

Foreign Shares.

There has been a fair amount of business doing in these shares, and from all appearances prices should improve about the end of this month. New Californias have been in demand, and if present profits are maintained, a dividend might be declared. La Trinidads are now almost unsaleable. A rise is shown in Denver of 6d.; Monte del Oro, 6d.; New California, 6d.; New Organos, 6d.; and New Spitzop, 3d. The following have fallen:—Carlisle, 6d.; Colombian, 1/16; Colon, 6d.; Coromandel, 1s.; El Callao, ¼; La Trinidad, 4s.; Orita, 1s.; Palmarejo, 1s.; Richmond, ¼; Tetuan, 6d.; Victory, 6d.; and Yuruari, 3d.

Copper.

A somewhat more hopeful tone has been observable as regards these shares, and generally advanced prices are to be recorded. The market for Rio Tinto and Copiapo is decidedly firmer. The following have risen:—Copiapo, ⅛; Libiola, ⅛; Rio Tinto, 7/16; and Tocopilla, 3d.; whilst a fall of ⅛ in Namaqua complete the alterations for the week.

Australians.

A better feeling has been shown in these shares than for some time past, and notwithstanding this may be called an off week, prices in several instances have improved. A rise has taken place in British Broken Hill of ½; Day Dawn P.C., 6d.; Etheridge, 3d.; Moruya, 1s. 6d.; No. 2 Queen, 3d.; whilst a fall is registered in Cumberland of 1s. 6d.; Mosman, 1s.; and Mount Morgan, 9d.

The following list shows the principal changes which have taken place:—

LATEST FROM THE MINES.

Indian Mines.

Balaghat-Mysore.—The directors have received the following cable from Mr. A. S. B. Oakley, the resident agent at the mines:—"Crushing for May, 150 tons 218 ozs. gold."

Indian Consolidated.—A telegram from the colar section of the property announces that during the month of May 300 tons of quartz were crushed, which yielded 61 ozs. of gold.

Mysore.—The following telegram, dated 6th June, gives last month's return of gold as follows:—"3,672 tons of quartz produced 3,573 ozs. of gold; also 296 ozs. obtained from tailings; together, 2,869 ozs." The company have sold, through Messrs. Johnson, Matthey and Co., the gold obtained in the month of April, which realised 15,078*l.* 15s. 10d.

Nundydroog.—A telegram, dated 6th June, gives last month's return of gold as follows:—"300 tons of quartz produced 520 ozs. of gold." The company have sold, through Messrs. Johnson, Matthey and Co.. the gold obtained in the month of April, which realised 1,804*l.* 12s. 7d.

Ooregum.—A telegram dated June 4th, gives last month's return of gold as follows:—"626 tons of quartz produced 1,353 ozs. of gold." Capt. Martin, under date May 14th, writes as follows:—"The mail having changed this week from Tuesdays to Saturdays, on account of the monsoon months, I have deferred sending you my bi-weekly report of the mine, and of work done for the past two weeks, until Saturday next." The gold obtained in the month of April realised 4,715*l.* 14s. 7d.

Colonial Mines.

Anglo-Saxon.—Advices by wire this afternoon state that during the last three weeks 240 tons of stone have been crushed, yielding 990 ozs. of gold.

Cumberland.—A telegram from the manager gives the result of the crushing for the month of May as follows: "In 25 days work, with 10 head of stamps have crushed 500 tons of stone, realising 433 ozs. of bullion."

Durham and Lord Byron Amalgamated. — Cablegram, dated 5th June: "Cleaned up 1st June 311 tons, yielding 220 ozs.; value of crushing for the public, 460*l.*"

Midas.—Cable from the mine:—"Yield for week, 156 ozs. (624*l.*)"

Mount Albion.—A telegram from their manager at the mines states:—"To the 16th May 675 tons ore raised, containing 38,000 ozs. silver (or about 56 ozs. per ton); 492 tons ore smelted, containing 21,000 silver. Shipped per Quetta s.s. 66 tons silver-lead bullion, containing 20,000 ozs. silver."

Mount Perry.—A cablegram from Capt. Bennett, the resident manager at the mines states:—"40 tons matte, value, 1,500*l.*, now in course of shipment per Taroba; will increase next month."

FOREIGN MINES.

ANGLO-MEXICAN.—The output for May amounts to $66,520.

CARLISLE.—During May the mill worked 30 days, and the yield was as follows: Bullion, $9,500; concentrates realised during the month, &c., $1,000; total, $13,500. The working expenses for the month were $11,000. There has also been expended on development work, $2,500. Winze No. 3 below the 4th level has been sunk 92 ft.; no change to report. The manager's report for month of April has not yet come to hand.

DICKENS CUSTER.—A cable from Mr. Wolseley to-day states that the company's property has been transferred to Mr. Chalmers, of Messrs. Fraser and Chalmers, of Chicago and Salt Lake.

DON PEDRO.—Messrs. Lacy, Hartland and Co. notify that they are prepared to pay coupon No. 5 on the debentures of the Don Pedro Company, due 9th inst.

JOSEPHINE.—Cablegram (7th June) from the superintendent:—"Yield of free gold for month, $7,000; estimated value of sulphurets for month, $2,000; total expenses for past month, $6,000; tons milled during month, 1,200."

NEW HOOVER HILL.—A cablegram states that 125 ozs. of bullion were shipped on 3rd inst., being the result of the crushing for May.

PESTARENA UNITED.—The gold returns for the month of May were as follows:—From Pestarena district, 487 ozs. 3 dwts. 14 grs., from 470 tons of ore, equal to 1 oz. 0 dwts. 17¼ grs. per ton. Val Toppa: 127 ozs. 3 dwts. 14 grs., from 379 tons of ore, equal to 6 dwts. 17 grs. per ton; total, 614 ozs. 7 dwts. 4 grs., obtained from 849 tons of ore amalgamated, showing an average yield of 14 dwts. 11¼ grs. to the ton.

RIO TINTO.—The company publish the numbers of their Five per Cent. Second Mortgage Bonds (1884), drawn for payment at par on the 1st proximo.

STAFFORD.—Mr. H. B. Tilden, the manager at the mines, telegraphs, under date 4th June. particulars of the clean-np for the last two weeks in May:—"Crushed 82 tons, which yielded 31 ozs. of gold."

HOME MINES.

POLBERRO.—A four-monthly meeting of adventurers in Polberro was held on the mine, St. Agnes, Mr. J. B. Reyonlds, of London, in the chair. Of course a call was made. Fancy a Polberro meeting without a call!

PRINCE ROYAL.—A call of 6d. per share was made at the meeting yesterday.

TREVAUNANCE.—A sixteen-weekly meeting of adventurers in Trevaunance took place at Polberro account-house. Mr. J. B. Reynolds presided. The call here was stiffer—2s.

WEST CARSIZE.—A call of 1s. per share was made at the meeting to-day.

WEST KITTY.—A dividend of 10s. per share was declared out of a profit of 2,942*l.*

METALS.

COPPER has been firm, and in good demand. Statistics are favourable. G.O.B. Chili bars and G.M.B. copper sold from 41*l.* to 41*l.* 15s. cash, closing at 42*l.* Three months fixed has ruled about 5s. per ton below spot. The visible supply is given at 117,420 tons. against 124,447 tons last month. The delivery for May was 13,864 tons, against 8,509 tons in April, and 4,399 tons in March. We quote English tough, 45*l.* to 46*l.*; best selected, 47*l.* to 48*l.*; strong sheets. 52*l.* to 53*l.*; Indian sheets, 49*l.* 50*l.*; yellow metal sheets, 4¾d., 5d.; ore, regulus, &c., 7s. 6d. to 8s. 6d.

TIN has been quiet and easier. Straits sold from 92*l.* 5s. to 90*l.* 17s. 6d., improved again to 91*l.* 7s. 6d., and closes firm, 91*l.* 12s. 6d. buyers for cash; three months about 15s. over spot, and Australian, 2s. 6d., 5s. premium. The Dutch market is quiet, and Banca quoted 55½fl.; Billiton, 55¼fl.; English ingots, 95*l.*

TIN PLATES quiet, and ordinary coke quoted 13s. to 13s. 3d., f.o.b. Liverpool.

SPELTER steady, at about 18*l.* for ordinary brands, and 18*l.* 2s. 6d. to 18*l.* 5s. for specials, ship here; ex Birmingham, 18*l.* 10s.

SHEET ZINC.—70 tons were sold in public sale at 20*l.* 5s. nett at works.

LEAD steady. Soft Spanish, 12*l.* 12s. 6d.; English, 12*l.* 15s. to 13*l.*; L. B. China, 13*l.*

QUICKSILVER.—Rothschild advanced his price to 8*l.* 15s.; seconds quote 8*l.* 10s. to 8*l.* 12s. 6d.

ANTIMONY firm; 8*l.* to 60*l.*

LONDON METAL EXCHANGE.

1.17.—Opening report.—Copper strong: G.M. Brands, cash, 41⅞, 2¼; three months, 41⅝, 2⅛; Tin strong: Fine foreign, cash, 91½, 2; three months, 92¼, ½; Australian, 91⅝, 2⅛; English pig lead, 12¾, 13; foreign soft lead, 12½, ⅝; Spelter, 17⅞, 18.

LONDON COAL EXCHANGE.

Wallsend:—Hetton, 15s.; East Hartlepool, 14s. 6d. Lambton, 14s. 6d.; Tees, 15s.; Hetton Lyons, 14s.; Wear, 14s.

GLASGOW PIG IRON MARKET.

Market firm, fair business. Middlesbro' closing bnyers 37s. 9d., cash; 38s. one month; sellers 1½d. more. Hematite done, 48s. 7½d., cash; closing buyers, these prices cash, 49s. 10d., 49s. 2½d., one month; sellers, 48s. 9d., 49s. 1d., cash; 49s. one month.

COMMERCIAL NOTES.

RAILWAYS.

The traffic receipts of the undermentioned railways for the past week show the following changes when compared with those of the corresponding period of last year:—Increases:—Caledonian, 3,451*l.*; Eastern and Midlands, 73*l.*; Great Northern, 2,091*l.*; Great Western, 5,250*l.*; London and North-Western, 7,159*l.*; London, Chatham, and Dover, 1,851*l.*; Manchester and Sheffield, 4,031*l.*; Metropolitan, 193*l.*; Midland, 7,792*l.*; North British, 3,547*l.*; North-Eastern, 20,143*l.*; and North Staffordshire, 1,290*l.*; Decreases:—Hull and Barnsley, 107*l.*; and London and South-Western, 3,622*l.*

The Brighton Railway traffic return for the past week shows a decrease of 10,866*l.* (Epsom week), and the South-Eastern a decrease of 985*l.*

The approximate gross earnings of the Denver and Rio Grande Railroad Co. for the fourth week of May were $217,300, as against $183,000 for the corresponding week in 1888.

From May 16th to 31st the Nitrate Railways estimated earnings amounted to 34,134*l.*, against 26,608*l.* last year.

The revenue statement of the Detroit, Grand Haven, and Milwaukee Railway Co. for the month of April shows that the gross receipts were 16,407*l.*, or a decrease of 2,694*l.* compared with 1888; and the working expenses 12,477*l.*, or a decrease of 3,286*l.* The net profit for the month was 3,930*l.*, or an increase of 592*l.*

The revenue statement of the Grand Trunk Railway Company of Canada for the month of April shows that the gross receipts amounted to 308,388*l.*, being an increase of 22,406*l.*, compared with 1888; and the working expenses to 213,798*l.*, or an increase of 14,207*l.* The net profit for the month was 94,590*l.*, showing an increase of 8,199*l.* Note.—There were 26 working days in 1889, as compared with 25 working days in 1888.

The revenue statement of the Chicago and Grand Trunk Railway Company for the month of April shows that the gross receipts were 52,768*l.*, or a decrease of 1,031*l.*, compared with 1888; and the working expenses 39,678*l.*, or an increase of 98*l.* The net profit for the month was 13,090*l.*, or a decrease of 1,129*l.*

TRAMWAYS.

The traffic receipts of the following tramway companies for the past week show the subjoined comparative results:—Increases:—North Metropolitan, 405*l.*; London Street, 5*l.*; Belfast, 282*l.*; North Staffordshire, 39*l.*; Woolwich and South-East London, 29*l.*; Bristol 119*l.*; Imperial, 14*l.*; Snnderland, 75*l.*; Swansea, 16*l.*; Stockton, 12*l.*; Edinburgh, 407*l.*; Southwark and Deptford, 21*l.*; Gothenburg, 72*l.*; Germany, 466*l.*; Calcutta, 61*l.*; Continental Metropolitan, 617*l.*; and Bordeaux, 20*l.* Decreases:—Provincial, 135*l.*; Southampton, 8*l.*; London Southern, 59*l.*; West Metropolitan, 148*l.*; Hull, 10*l.*; North London, 174*l.*; London, 317*l.*; Calais, 6*l.*; France, 68*l.*; South London, 48*l.*; and Burnley, 2*l.* For May the Barcelona Tramway receipts exhibit a decrease of 447*l.*, and the Carthagena a decrease of 640*l.* The Anglo-Argentine Tramway retnrn for the week ended April 15th amounted to 4,799*l.*, against 4,351*l.* last year. For April the Buenes Ayres and Belgrano Tramway receipts were $43,512, being $2,191 in excess of last year.

MISCELLANEOUS.

Mr. Justice North has appointed Mr. Ernest H. Collins, of No. 19A, Coleman Street, E.C., official liquidator of Messrs. Allan and Co.

A branch of the Alliance Bank, Limited, will be opened on Tuesday, the 11th inst., in temporary premises, at 11, High Street, Notting Hill.

The letters of allotment and regret in the Dominion Brewery Co. (Toronto, Canada) have been posted.

An office has been opened by the Flora Gold Mining Co., at Warnford Court, Lothbury, E.C.

It is notified that the certificates for shares in the Sonth Standard (Witwatersrandt) Gold Mine are now ready, and can be obtained on application to the secretary, 8, Drapers' Gardens, E.C., in exchange for bankers' receipts.

DIVIDENDS DECLARED AND ANNOUNCED FOR WEEK ENDING JUNE 8TH.

	Carried forward.	
Assam Compay	—	2 per cent.
Alliance Marine Insurance ...	38,357*l.*	30s. per share.
Alliance Marine Insurance ...	—	10s. per share.
Anglo Australian Steam Navigation	2,413*l.*	5 per cent.
Broken Hill Silver Mining ...	—	2s. per share.
Bryant, Powis and Bryant ...	1,761*l.*	15 per cent.
Bankers' Investment Trust ...	—	4½ per cent.
Bishop and Butts' Brewery ...	—	12 per cent.
Charles S. Windover and Co. ...	—	10 per cent.
Federal Bank of Australia ...	5,694*l.*	9 yer cent.
Freehold Investment and Banking Co. of Australia	8,060*l.*	8 per cent.
Freehold Investment and Banking Co. of Australia	—	5s. per share.
Guardian Fire and Life Assurance	—	7 per cent.
Great Indian Peninsula Railway...	—	2s. 7d. per cent.
Indemnity Mutual Marine Assurance...	—	5s. per share.
Libiola	—	1s. 6d. per share.
Lancashire and Cheshire Telephonic Exchange...	—	8⅛ per cent.
Marine Insurance	—	1*l.* 17s. 6d. per share.
National Provincial Bank of England	—	8 per cent.
National Provincial Bank of England	—	6 per cent.
Norwich and London Accident Insurance	—	5s. per share.
Royal Bank of Scotland	—	9 per cent.
Wohlfahrt Lead Mines	—	6 per cent.

BRITISH MINING INTELLIGENCE.

BERTHA CONSOLS (5th June).—There is no change to report in the 40-fm. level east, the lode produces good work for copper and tin, more especially of the latter. Cook's late stopes below the 30 east of cross-course produces 10 tons of mixed ores per fm. Glasson's rise in back of the 40 at the new engine shaft, will produce 7 tons per fm., and some good tin work. There has been no lode taken down in the large stopes west of junction, for the past week.—T. Gregory.

D'ERESBY.—The manager writes, under the date of the 6th inst., as follows :—I have not seen the mine looking so well for some weeks as it looks to-day. There is really a good lode in the roof north of the shaft at No. 9, and although this is given to change in value, yet the changes are not so great and sudden as on the south of the shaft. The report states that in course of the coming week they expect to fix the lift from the No. 8 to the No. 9, when the progress in sinking will be much more rapid. The rise to the north of the shaft at No. 9 is looking much better, and is worth 3 tons of lead to the fm. The stopes south of the shaft will average 1½ tons to the fm.

DEVON CONSOLS (6th June).—Wheal Maria, eastern shaft, Capel Tor lode : Very fair, progress continues to be made in sinking the eastern shaft below the 85 level, and the ground continues congenial for the production of mineral. In the 86 west the lode is 3 ft. wide, very promising, and yielding saving work of copper and mundic ores. In the 74 east the winze is being continued by the side of the lode for more speedy progress. The same remark will also apply to the sinking of the Rutter's winze recently commenced in the bottom of the 74 west. Wheal Emma, railway shaft, new south lode : In the cross-cut south, at the 260, the ground —killas—is of a clean compact nature. No other portion of the lode has been met with. Watson's engine shaft : In the 160 east and west the lode 4½ ft. wide, being carried is very promising, and in each direction is yieldiug 5 tons of copper ore per fm. In the 148 west the lodc is 4 ft. wide, composed of capel and quartz, with fluor, a little peach, mundic and copper ore, worth of the latter 1 ton per fm. In the 136 east the lode is 3 ft. wide, yielding small quantities of copper and mundic ores. In the 136 west the lode is 4½ ft. wide, composed principally of capel and quartz, with a little fluor, mundic and copper ores.—I. Richards.

DEVON UNITED (6th June).—Willesford's shaft : The work in connection with cutting of top plat at the 132 is progressing satisfactorily. In the 132 west the lode is 3½ ft. wide ; very promising, and is improved in value, now yielding 2 tons of copper and arsenical ores per fm. In the winze sinking below the 120 west the lode is 2½ ft. wide, and still maintains its promising appearance, and value being worth 3 tons of copper ore per fm., for length of winze 9 ft.—I. Richards.

DRAKEWALLS (6th June).—The cutting of the trip-plat at the 147 is made complete, and the men are now engaged putting in a new sinking windbore in place of the one broken last week by the blast of a hole; this will be made good, and the men working in the bottom of the shaft to-morrow. The lode in the rise and stope in the back of the 147 west continues to look well, and will yield 9 tons of mundic per fm. for the width carried 5 ft. In the 132 west we have commenced driving on the tin part of the lode which is looking exceedingly promising, and will produce 10*l*. worth of tin per fm. In the winze sinking below the 132, the lode will yield 10 tons of mundic per fm. for the length 9 ft. In the stope in the back of the 132, the lode will produce 7 tons of copper and mundic ores per fm. In Rule's rise in the back of the 117 west the ground is of a favourable character, and fair progress is being made. The ground in the winze siuking below the 90 west, is a little easier for exploration. We sold on Tuesday last 2 tons 2 cwt. 3 qrs. 21 lbs. black tin at 52*l*. 15s. per ton. We shall be cleaning out the arsenic soot from the chambers of the old calciner next week. We are getting on with the elevated tram-road, and all other surface work satisfactorily.—H. Rodda.

EAST BLUE HILLS.—The general meeting was held on Thursday last, when Capt. Bishop attended and gave a most interesting and encouraging report of the mine and its prospects. The most immediate and important point at present is the drivage of the 30-fm. level, where a cross-cut has been put out north and intersected the lode above the heave, and where, in the opinion of the manager, it may be standing about 10 fms. high, and, if so, will go in our grant for 50 fms., and having raised so much tin from one part of the lode it is but reasonable to expect to multiply the returns by its development to the north. The lode at this point is certainly of a most promising character, being 2 ft. wide, and the surroundings all that can be desired. The driving of the deep adit level on the Pink lode is also an important point, as the lode is the standard one of the district. A cross-cut still further sonth, driven from the Pink lode towards the West Kitty lode is now being cleared, and the end is said to be very near that lode. The aggregate value of the different points in operation are reported to be worth 40*l*. per fm., and, altogether, the prospects of the mine are more cheering than they have ever been before. No call was considered necessary.

GLYNDWR.—The small winding engine referred to last week is now being erected to complete the repairs necessary to the engine shaft. The top part of it is already completed. The next operation will be the cutting out foundations for the pumping enginc-house, the building of which will be commenced with as little de.ay as possible. The manager hopes to have all completed and to be winding lead in the course of the autumn, and it is not improbable that a good balance of profit will be shown before the present year expires.

GREAT FORTUNE.—The engine shaft is now down about 6½ fms. below the adit. 38 men are at work on the various branches, which are valued in the aggregate at 40*l*. per fm., and when the 10-fm. level is reached, another large extent of tin ground will be available.

MARKE VALLEY (5th June).—There is no change to notice in the shaft, the ground continues hard, with the fair course to the south as last reported. The lode in the 25 west is 4 ft. wide, worth 5*l*. per fm. In the 15 east we have cut into the elvan south of the lode, from which the water issues very strongly, but have not yet seen anything of the south lode. In the 15 west the lode has been much disordered during the past week, we find the different branches are producing a little tin. but not of much value ; we commenced to sink a winze below this level for ventilation, as well as laying open ground for stoping. The stopes in general are looking just as last reported.—W. George.

MID DEVON.—Report for week ending 1st June : — Surface : Machinery working smoothly, and doing good duty. A shaft : Water drained 44 ft. below the 80. C shaft : The 50 east, stope No. 3, worked on by six men, is unchanged in yield of ore ; still equals six tons per cubic fm. Strata is rather easier for progress, containing large deposits of chlorite and axinite, strongly mineralised, all the joints and fissures being coated with copper, indicating a continuous run of productive strata.—J. Neill.

PRINCE OF WALES.—There is no particular change reported this week in the underground operations, excepting that the lode in the engine shaft has taken a little more downright underlie, so that the south side of the shaft is in the country rock. The lode maintains its size and value, as also do the other points. The surface work is in a forward state and everything will soon be ready for the burning and dressing of tin stone.

PRINCE ROYAL.—The general meeting of this mine was also held on Thursday last. The work of draining is proceeding most satisfactorily, and it is believed in the course of a fortnight the bottom level will be reached and the working cleared, when no time will be lost in sinking in the reported good lode of tin.

ROMAN GRAVELS (6th June).—There is now 3½ ft. of water in the 110-fms. level at Main engine shaft. We anticipated a week ago that this level would be free of water on Monday last, and our hopes would have been realised had it not been that a mishap to the air-pump of the engine took place on Sunday morning, necessitating the stopping of the engine for five hours. We discovered, too, that the top clack of the plunger lift, from the 110 to the 65, was not doing proper duty ; but being under water the defect could not be remedied until yesterday, when we found that one of the pins had broken. Everything is now in order again, and the forking is going on at a fast rate. It is calculated that we shall be able to fix the bottom drawing lift to-morrow, and if every thing goes well that the mine will be in fork in, say, eight or nine days from present date. We find that a slight run of ground has taken place in the 110 south, and when this is cleared all stoping and driving operations above the water will be resumed. We have been drawing on stuff this week, and dressing operations are partially resumed, and will be continued and increased forthwith.—A. Waters and Son.

SOUTH CONDURROW (5th June).—Marshall's shaft is in full course of sinking by nine men, and is now about 13 fms. below the 108-fm. level. The 108 end west yields low quality tinstone ; the lode in the end seems to be opening out wider. The rise in the back of this level is without tin to value. The ground is rather hard for worhing in the rise towards Pendarves's shaft. The 93 east of King's on the flat lode is worth 7*l*. per fm. The lode in the back of the 70 east is worth 18*l*. per fm. The 60 end east is worth 7*l*. per fm. The stope in the back of the 60 is worth 12*l*. per fm. The stope in the bottom is worth 18*l*. per fm. The 50 end east is worth 12*l*. per fm. Two stopes in the back of the 50 are worth 12*l*. per fm. each. The 40 end east is worth 8*l*. per fm. Three stopes in the back of the 40 are worth in the aggregate 30*l*. per fm.—W. Rich, H. Williams, H. King.

SOUTH DARREN (6th June).—The stope in the 142 west is worth 2 tons of silver-lead ore per fm. The stripping in this level is worth 15 cwt. of silver-lead ore per fm. The cross-cut in the 130 west seems to be through the lode. We intend to drive back east on the lode to the cross-course, on which we will sink to the 142 to open up the ground there for stoping, and giving good ventilation. The lode in the 110 end east is very strong, and producing good stones of lead. The cross-cut in the 100 west is driven 9 ft. ; the first 6 ft. was worth 15 cwt. of silver-lead ore per fm. ; the last 3 ft. was streaked with lead, but not so rich. We are not yet through the lode, and may cut more lead, but what we have cut is a very nice lode. The winze in the 90 is going down at a fair speed ; there is no lead in this. The 25 tons of silver-lead ore sold on the 24th ultimo were shipped yesterday.—J. Mitchell.

TIN ERA (4th June).—We have no change here to report to-day, but every effort is being made to get the end under the tin ground gone down in the level above, and from which I may say good returns have been made.—R. Knott.

TREGURTHA DOWNS.—We have seven tribute pitches worked by 16 men, from 10s. to 13s. 4d. in the £. We have completed sending down the 20-in. drawing lift, and fixing the same. The cross-cut at the 95 is being driven at the rate of about 12 fms. per month by boring machinery. Our future prospects are very encouraging, and all our machinery is working well.

VAN (6th June).—I am pleased to say that the 135 south level is worth to-day 80*l*. per cubic fm. ; the end is letting out water and gas freely, and the ore is widening and going down stronger in the bottom of the level. The driving of the cross-cut south at the 120 east will be resumed on Monday next. At Van Hill the lode in the deep adit is improving, and presenting a very encouraging appearance. No change elsewhere.—W. H. Williams.

WEARDALE (1st June).—Water very scarce, reservoirs nearly empty. Ore raised for week, 106 tons ; ore dressed for week, 78 tons ; ore slag and tume smelted for week, 122 tons, producing 63 tons of pig lead.

WEST CARZISE. — At the meeting yesterday, at which the manager, Capt. Curtis, was present. the accounts showed a debit balance of 631*l*. 3s. 6d., to meet with a call of 1s. per share was made. Capt. Curtis explained at some length the different lodes and the workings thereon, and the rich deposit of tin in Michell's shaft which induced the preseut shareholders to subscribe money for its further development, and although they have so far been disappointed in results, he still believed that by the sinking on the lode a few more fathoms it would again be found productive. Bunches of very rich tin were characteristic of the district. The set contains the valuable lodes of the old Carsize Mine, running intact in new and unwrought ground for many fathoms, and should the lode at the 50-fm. level be found productive, cross-cuts can be put out north and south to prove them. It was decided to continue the sinking of the shaft to the 50-fm. level with all practicable speed, and to confine the operations to that point.

WEST WHEAL GRENVILLE (4th June).—During the past week the shaftsmen have been engaged in securing engine shaft, &c., and in dropping forking lift, which we hope is now low enough to drain the 100 fms. Having seen the back of said level before the lift was last dropped, we think, when again in fork, this level will be draiued. At Harvey's shaft the men have been cutting ground for skip road, &c. We have been obliged to take men from this work to fill the places of engine shaftsmen who have been sick, and in consequence

the progress has not been so fast. Skip-road now completed to within about 3 fms. of the 80-fms. level.—T. HODGE, J. SKEAT, N. TEMBY.

WHEAL GRENVILLE (6th June).—The 205 cast end is worth 10*l.* per fm. The 178 rise is worth 16*l.* per fm. We have started the 165 winze going down on said rise, at present the water is very little. I am hoping to effect a communication without any more lets by means of the water. The 165 east end is without change to note, a good lode; worth 20*l.* per fm. The 150 west rise, and the 140 winzes, are communicated, which has well ventilated this part of the mine. The stopes, on the whole, are much the same as for some time past.—T. HODGE.

WHEAL METAL AND FLOW.—The metal lode in the 35-fm. level is reported to be 1½ ft. wide, yielding a little tin and a great deal of oxide of iron, which is a good indication for tin. In the winze below the level the lode is 2 ft. wide, yielding tin, and in a bed of white spar in which the winze will be continued.

FOREIGN MINING INTELLIGENCE.

ASIA MINOR (18th May).—74 men driving, 186 men stoping; value of stopes, 13 tons 13 cwt.; four men sinking, four men cross-cutting, 10 men rising, 143 trammers, labourers, &c. Petri main level west: In the end of this drive there appears to be a strong lode coming in from the north side, which consists of good veinstone intermixed with mundic and a little lead ore. Long cross-cut: The lode in the end east from rise over the back is fully 5 ft. wide, which is very promising, and at times is producing good stopes of lead ore. The end west from No. 4 stope is worth 10 cwt. silver-lead ore per fm. The lode in Petri end west in air shaft is about 2 ft. wide, and is composed of hard veinstone, intermixed with mundic and a little lead ore. We are looking forward to having a good improvement here. Number of men employed at the dressing-floors, 75; production to 24th May is 4,271 tons crushed, yielded 561 tons rich silver-lead ore; corresponding period last year, 4,309 tons crushed, yielded 532 tons.

BALAGHAT-MYSORE.—Report for fortnight ending 14th May:—North engine shaft: I am pleased to say a little better progress is being made with the sinking of this shaft below the 410-ft. level; it is now down 5 ft. 9 ins.; the lode is at present poor. The 410-ft. level north has been advanced 15 ft. 6 ins., or 90 ft. from the shaft; the lode, although at present poor, is presenting a more promising appearance, and I think will soon further improve. The 330-ft. level north has been extended 21 ft. 6 ins., or 476 ft. 6 ins. from the shaft; the quartz is getting somewhat smaller, being now only abont 8 ins. wide; it, however, assays 1 oz. 8 dwts. 17 grs. of gold per ton. The No. 1 winze in the bottom of this level has been sunk 4 ft. 4 ins., or 36 ft. below the level; the quartz is about 1 ft. wide, and assays 2 ozs. 7 dwts. 21 grs. of gold per ton. The stopes in the bottom of this level are producing quartz of about 1 ft. wide, and assays 1 oz. 4 dwts. 19 grs. of gold per ton. The stopes in the back of this level yield quartz of about 15 ins. wide, and assay 2 ozs. 18 dwts. of gold per ton. The drive south from the bottom of the No. 3 winze at the 270-ft. level north has been extended 3 ft. 10 ins., or 13 ft. 6 ins. from the winze; the quartz is only about 6 ins. wide, but assays 5 ozs. 1 dwt. 6 grs. of gold per ton. I expect to communicate this drive with the 330-ft. level in the course of a week or so. This will give us a good section of ground well laid open for stoping. The No. 2 cross-cut west has been driven 1 ft. 6 ins., or 43 ft. from the level. The No. 2 cross-cut east has been advanced 1 ft. 9 ins. or 78 ft. from the level. The ground in both these cross-cuts is very hard for driving. The stopes in the back of this level are yielding quartz of about 1 ft. wide, but this week it only assays about 14 dwts. per ton. The 270-ft. level south has been extended 15 ft. 6 ins., or 211 ft. from the shaft; the lode occasionally yields a little quartz, but as yet not of any value. The 165-ft. level north has been driven 5 ft. 3 ins., or 488 ft. from the shaft, the quartz maintains its size, viz., from 2½ ft. to 3 ft. wide, but still is of a very low quality, this week it only gives a trace of gold. The stopes in the bottom of this level produce quartz of about 1 ft. wide, and assays 2 ozs. 9 dwts. 20 grs. of gold per ton. Surface: All the general work is progressing satisfactorily.—Capt. PRYOR.

BRATSBERG.—Report for week endiug 27th May.—Hoffnung Mine: The lode at No. 2 adit level has again become rather disordered, but still yields about ½ ton per fm. We regret that this level has been very irregular, and producing ore of but little value now for some time, but it is satisfactory to be able to say that we are pretty confident of an improvement here shortly. The very successful results of the rise in the back of No. 2 adit level continues, now yielding fully 1½ ton. per fm. No. 3 adit is opening well; preseut value, 1½ ton per fm. No. 4 level still carries a large, but poor, lode. At No. 5 level east the prospects are encouraging; the lode's present value ½ ton per fm., bnt for some considerable time past very slow progress has been made. Under present arrangement we hope to get better despatch. The mid-level at Murchison's continues to produce about 1 ton per fm. At the level driving east in the shallow workings we notice a decline in value, now worth ½ ton per fm.; the lode, however, is large and well-defined, hence we look upon this as a temporary change. On an average about 60 miners have been engaged at this mine during the past month. Johannes Mine: 789 metres advanced on Howard's lode during the past month, and six miners employed. This is slow progress for boring machines, but the jointy and variable hardness of the matrix in the lode renders the running of the air-drills exceedingly difficult. The lode in the eastern end is unproductive, but for the width of the lode we are now carrying in the western end, viz., about 5 ft.; it will yield about 1 ton per fm. We now propose to suspend the eastern end and drive the western end by hand labour, employing two miners — a temporary arrangement until the rock-drills can be successfully applied again. Næsmark Mine: The level from Barker's shaft is now driven 6.63 metres south and 11.75 metres north, having advanced 10.68 metres during May. For the whole length of the level we have only had about 2 metres which practically yielded saving stuff. The lode itself contiuues in its usual formation, especially in the northern end, but we have not met with the transverse ore-bearing veins we expected to do. We are now arranging to resume the sinking of the shaft. Surface work and remarks: Nothing new of importance to report under this head. We shall have forwarded and delivered at Skien by the end of May a cargo of ores, provided there is no hindrance at the Nords Canal, the working of which at present, however, is uncertain, owing to the spring floods. We presume that the Mary Owens has been chartered at 10s. to load the middle of June. The quantity of ores mined during May we estimate at 121 tons, 20 per cent. dry ore.—J. D. HOLMAN.

BRITISH BROKEN HILL.—Report for the week ended the 24th April. Main shaft: The alterations at the top of the shaft were completed on Saturday, aud baling was begun. Sinking is now being continued with all possible speed, 3 ft. having been made since last measurement, making a total depth of 344 ft. The bottom is still in hard schist. No. 2 shaft: At the second level (188 ft.) the south drive has been extended 12 ft., total, 230 ft., and has holed through into the north drive from No. 1 shaft, which has been driven 10 ft. Thus we have now splendid ventilatiou all along the second level of the three shafts. The west cross-cut from the north drive has been extended 10 ft. through similar country to that previously reported; total leugth, 223 ft. No. 3 shaft: At second level (224 ft.) stoping has been continued with four parties of men, all breaking a fair grade of carbonate ore, which is being shipped to the Dry Creek Smelting Works. No. 6 shaft: The south drive on second level (184) has been extended 13 ft., through carbonate ore of good quality; total length, 200 ft. One party of meu still stoping in the west cross-cut from same drive, and breaking good carbonate ore. The dam has about 1½ million gallons of water in it, and arrangements are being made to pump it up to the mine. Surface works progressing satisfactorily.

CAPE COPPER (30th April.)—Ookiep: The ground in the 105-fm. level east of No. 5 level having become unfavourable for copper ore, it has been suspended, and the men are put to sink in the bottom of the stope over this level, to prove the ground standiug between these points, and for the more economical removal of the stuff from the stope. The stope in the back of the 105-fm. level east of No. 68 winze is producing 5 tons of copper ore per fm. The sinking in the bottom of the 92-fm. level has also been suspended in consequence of the ground becoming entirely unproductive, and the men are put to resume the driving of the 26-fm. level west of new shaft. The rock in the end contains spots of copper ore. I am pleased to state the stopes throughout the mine are looking well, producing fully their estimated quantities of copper ore. Trial Mines.—Springbok: The stopes—one in bottom of 59-fm. level, and one in back of same level—continue to yield 1 ton of copper ore per fm. each. The ground in bottom of No. 2 shaft at this station is hard, and spare for progress, it being composed chiefly of gneiss. Sinking will be suspended for a few days to enable the men to fix timber to secure the ground already passed through. Kotzees Mine: The ground in the two cross-cuts at the 25-fm. level has not undergone any change to notice since last report. It still presents at times stones of copper ore. Nababeep north: The rock in the 21-fm. level south-east of shaft is yielding stones of copper ore. Nababeep south: The ground in bottom of shaft sinking below adit level continues to produce stones of copper ore. Ookiep east: The ground in the winze below the 58-fm. level produces about 1 ton of copper per fm. Spectakel: The ground in the 36-fm. level south towards Kelly's shaft is worth 2 tons of rich copper ore per fm. The draining of the water from the mine proceeds satisfactorily. We hope soon to be at the 75-fm. level; below this point the excavations are small.—Capt. HENWOOD.

— Returns for April: Ookiep, 2,100 tons of 22 per cent. Arrivals at Swansea: The Cicero, Cumberland, James Wishart, L'Esperance, Ianthe, and Pacific. Bills of lading received: 700 tons of ore per San Lorenzo, and 980 tons per Taunton.

CARPUAN (3rd June).—Very little has been done in the shaft since the date of my last week's report, owing to a slight delay for timber, and the men have been engaged opening out for an adit level. The timber has arrived, and the men are again in the shaft, as we are down to water, and the lode is presenting such a promising appearance the erection of a wheel for pumping should forthwith be taken in hand, and when deep enough, for say a 20-fm. or 30-fm. level, you would be in a position to extend operations eastward into the hill on the course of the lode, which would place you in a splendid position. —R. KNOTT.

CORTEZ (12th May).—For the week ending this date work at the mines has been as follows:—Boso tunnel advanced 18 ft.; development tunnel, advanced 20 ft.; main tunnel, east drift, advanced 9½ ft.; middle tunnel, west, stoped 23 tons of ore, containing 53 ozs. per ton.; north-east upraise, stoped 70 tons of ore, containing 50 ozs. per ton.; north-west upraise, stoped 30 tons of ore, containing 140 ozs. per ton. East drift advanced 6 ft. Ore hauled to mill 253 tons. Ore treated at mill 180 tons, average assay of same 72 ozs. per ton. Bullion shipped 15 bars containing 15,830 18.100 ozs. fine silver, and 14 11.100 ozs. gold.—WELSH.

CUMBERLAND (6th April).—I beg to submit to you report of operations for month of March:—Surface: The work in connection with new quartz hopper, &c., is going on satisfactorily, and I expect to have all the timber-work in connection with it finished during the current month. The road excavation for carts or tram trucks has been completed. Battery: The returns from the mill for the amount of stuff crushed for past month have been very disappointing indeed. From the appearance of the stone we fully expected more than double the amount of gold. We were aware that a good deal of the stone crushed was of low grade, but never expected such a poor return as we got; however, from the appearance of the south stopes at present I fully expect much better returns in the future.—W. STRAUGHAN.

DAY DAWN P.C.—Report for the fortnight ending April 13th:—The output of quartz is 2,355 trucks; to Excelsior mill, 816 tons; 71 drayloads to Defiance mill. The amount of stone hauled from each level is as follows, viz.:—No. 11 level, 142 trucks; No. 10 level, 906 trucks; No. 9 level, 939 trucks; No. 8 level, 214 trucks; Nos. 6 and 7 levels, 154 trucks; total, 2,355. No. 2 shaft has been sunk a further depth of 13 ft., making a total depth from the surface of 243 ft. Machinery in good order.—T. LESTER.

DENVER (25th May).—In framing the usual weekly letter I would say that the very encouraging condition of affairs described in last report is well maintained, and substantiated by the receipt of good returns from the mill. Returns: The test lot, 12 tons from the 200 west drift, gave after assortment of any smelting ore mixed therewith, a return of 70 ozs. 13 dwts. gold in the mill, or 12¾ dwts. per ton, besides a considerable proportion of concentrates of good grade. The smelting ore assorted from the ore mined in the drift amounts to some 2½ tons. We have also shipped 10 tons of concentrates to the smelters, returns from which will be in in the coming week.—F. RICKARD.

DEVALA-MOYAR (13th May).—The winze in the drive west, which I propose calling winze No. 2, has been sunk 6½ ft.; The rock is very hard. The pyrites winze is 53½ ft. below the deep tunnel; for the last two days the washings have been poorer. The winze in the 48 is down 28½ ft.; quartz is coming into the bottom similar to what we have below in the stope. The deep tunnel east has only been advanced 1 ft., as we have been stripping down the lode to carry the footwall. The stoue from the footwall washes fairly well for gold. Stoping is being carried on with one drill, the other is employed squaring up the west drive in the deep tunnel.—R. B. JOHNSTON.

DEVALA-MOYAR (17th May).—We have raised the stope in the deep tuunel considerably to meet the winze sinking from the 48. To open fresh ground, I am about to lay the air pipes into the drive east. The lode here next the footwall is improving in appearance, and should this part of the mine prove of value, we shall have a fine piece of stoping ground. No 2 winze is getting into white quartz, poor looking, and somewhat like that in the drive. The pyrites winze is being sunk day and night.—R. B. JOHNSTON.

EAGLEHAWK CONSOLIDATED.—Abstract of reports from the mine dated 20th aud 25th April:—During the fortnight we have timbered the shaft 40 ft., fixed thc ladders and the runners in the winding shaft, and madc all secure. We have sunk the engine shaft 10 ft. for the week, making it 110 ft. below the No. 8 plat, or the 550-ft. level, and 660 ft. from the surfacc. The ground is hard and solid, and there is not mueh water in the bottom of the shaft. After sinking about 20 ft. morc we shall cut thc plat, and make room for the cistern. All the machinery is in good working order.

EAST AREVALO MEXICAN.—The directors have received the following reports from Cant. Prideaux, dated 8th and 13th May, which states:—Since my last report we have driven across the lode at the No. 3 level 5 ft. 6 ins., and reached the footwall; the lode is 35 ft. thick; we have also driven east 2 ft. 3 ins.; the ore is about the same as last week. I enclosc certificates of the several assays made; no doubt the lode will further improve in going east, as the Jesus and San Rafael Mine has sunk a shaft near our northern boundary, and cut our lodc, aud from which very rich metal is now being extracted. I may state, as in my previous reports, that the San Marcos and the Jesus and San Rafael Mines are on our lode, in fact, after reaching a certain depth this lode enters our mine, because of its southerly dip, and beeomes our property, so they ean only work on the lode to a certaiu depth. The No. 4 level has been driven north across the lode 6 ft., and is showing more quartz; we shall soon be under the metal we have above. We have also commenced a raise from the 4th to the 3rd level for ventilation, the distanee is about 57 ft.; this will take us about five weeks, and will thoroughly ventilate the mine, and enable us to drive east another 150 ft. in both levels; the operation may then be repeated, and in this way we can explore our lode rapidly to the east. Our mine during the past week has been inspected by Mr. Knight Bruce, and Mr. Young, of Vivian and Sons, smelters, Swansea, England, aud Capts. Pascoe and Jennings, Pachuca. I have always great pleasure in showing our mine, and I have no secrets to keep from anyone. I will forward you map and picture of the mine as soon as the tin box is ready to enclose it in. Since my last report we have driven the No. 3 level 2 ft. 6 ins.; the lode has improved in value. I will send you the result of the assay in a day or two. We have also cut across the lode 3 ft., and are into the footwall; the ore seems to improve as we go east, and I have every hope that we have a big body of ore ahead of us, and of which we are just ou the edge. In thc No. 4 level we have eut into the lode 2 ft. 8 ins.; we eaunot do much at this poiut until our raise is connected with the No. 3 level. The raise from the No. 4 to connect with the No. 3 level has been put up 15 ft.; at this rate we shall connect with the No. 3 level iu less than three weeks. The No. 3 east is the ouly level which is producing ore that will pay, and as you will see from the small quantity of ground driven, the output of ore is not large. I have, however, iucreased the number of men, and with better veutilation, I shall be in a position to extract a large quantity of metal if it eontinues valuable.

ESMERALDA.—Mr. Hugo Holdeway, the manager at the mine, writing on the 7th of April, states that the result of his inspection of the company's property is every way satisfactory, there being a plentiful supply of water and work people, also accomodation. He further says:—On descending the mine I saw in a depth of about 6 metres veins running as near as possible from north to south and south-east to north-west. These veins are composed of ealcareous spar erystals, either white or dark grey coloured, and amongst these are ceryls, whieh in a lighter colour may be seen already 1 metre deep, while parallel to them run veins of copper and iron pyrites." According to rcliable information, it appears that the same indications which we have 6 metres deep appear in the old mines of Muzo iu a depth of 18 metres, which of course speaks greatly in favour of the mine. At the same time it is a great advantage that the working ean be done by open euts. There is a slight attack of intermitteut fever in thc neighbourhood, but I am assured that it will not interfere with the work people in our distriet.

FRYERSCREEK.—The directors of this company have received thc following advices, dated 2nd May:—During the past fortnight we have extended the 520 ft. level south 13 ft., making 167 ft. from the cross-cut, The ground has been very hard, the fluken pinehed out with a bar of sandstoue on the wall with a little quartz. I think we shall have to stop this drive, as we have not sufficient money to carry out the work, as I think we shall have to drive 200 ft. further before we get up to quartz country. So I think I shall put the men to rise back of this level, to meet with the shoot of stone passed through in the drive. We have put up a rise back of 420-ft. level, 31 ft. passed through, one leader making in the hanging wall. Stone small, did not see auy gold. We are now driving towards No. 4 rise. We have also driven the level 10 ft. further south without meeting with auy stone. We are also rising 100 ft. north of No. 4 rise in a big flucan. Wc have a little stone on the footwall under the fluccan; rise now up 8 ft. The 320-ft. level western line of reef: We have worked out all the stone at this level, that is, the shoot of stone carrying gold. We have not cleaned up as yet; we have about 20 tons of stone to crush. There has been 25 tons passed through the battery; it is not as good as the last lot we crushed, so I have removed the men to the back of 220-ft. level. We have stone here 4 ft. thick; also see gold iu breaking. We shall crush this stone by itself; I believe this stone to be payable. I think the 520-ft. level should be driven another 200 or 300 ft. further to prove the ground gone under foot at the 420-ft. level.

GOLDFIELDS OF MYSORE (14th May).—Fortnightly report: The west cross-cut at 165 ft. in bridge shaft has been advanced 3¼ ft.; total distance, 33½ ft.; the end is in country. In the south level at 105 ft. an advance of 5¾ ft. has been made; total distanee, 81 ft.; there is a lode of quartz in the end, but it is of poor quality. The west cross-cut from the north level at 105 ft. has been driven 2¾ ft.; the end is in country. In the north level at 175 ft. in middle shaft an advance of 4 ft. has been made; total length, 96¼ ft.; there are 4 ft. of lode in the end, worth 10 dwts. per ton by assay. The south level at 175 ft. has been advanced 5 ft.; total distauce, 93½ ft.; the lode is 1½ ft. in width, and worth, by assay, 1½ dwts. The north level at 108 ft. has been driven 5¾ ft.; total length, 160¼ ft.; there are 2½ ft. of lode in the end, worth 7 dwts. per ton, by assay. The new shaft south of middle shaft has been sunk 3½ ft.; total depth, 117 ft.; the bottom is in country. The new shaft south of bridge shaft: The old workings holed by the east cross-cut at 75 ft. are being cleaned up, and some quartz left by the aucients assayed 6 dwts. per ton. Champion lode—Coromandel shaft: The north level from the west cross-cut at 150 ft. has been driven 17 ft.; total distance, 86½ ft.; a sample from the end, composed of stringers of quartz and country, assayed 1½ dwts. per ton. Prospect shaft has been sunk 4 ft.; total depth, 220¾ ft.; the bottom is in country. The north level at 200 ft. has been advanced 4¾ ft.; total, 25 ft.; and the end is now in old workings, which are going down below the bottom of the level. Prospecting shaft near Balaghat: The west cross-cut at 40 ft. has been driven 9 ft.; total, 73 ft.; the end is in country. The sinkiug of Coromandel and middle shafts, and the winze in south level at 108 ft., middle shaft, have been stopped owing to cholera, of which we had three fatal cases, but I hope as the cholera seems to have been stamped out, we shall soon be able to resume work at these places.—J. SAMBORNE.

GYMPIE GOLDEN CROWN.—Report for fortnight ending 25th April.—I have to report that during the past fortnight the cross-cut being carried iu east at the 1,200-ft. level has been advanced a further distance of 13 ft.; total distance from shaft, 186 ft. We are still driving in the same belt of hard conglomerate, but this will soon be got through aud better progress will be made. In the cross-cut west at the 930-ft. level the March reef was met with at a distance of 172 ft. from the shaft; the cross-cut has been advanced a further distance of 10 ft., and has been discontinued for the present; a few feet have been driven north on the reef, the width between the walls is fully 6 ft., 2 ft. of which is reef formation, composed chiefly of ealc spar, quartz with gray easing, the other composed of gray slate and black rock. On the eastern wall there is a vein of quartz from 2 in. to 6 in. in thickness, which shows fine colours of gold. The reef is similar at this point to what it was when first met with at the 830 ft. level, being in the same belt of country; the north drive having to be carried in 60 ft. before the good country was met with. Driving north on the reef is now being pushed forward to meet the winze, which is being sunk from the 830 ft. level, at a point 132 ft. north of the cross-cut. The reef in the winze is split up into a number of veins, the largest being about 6 in. in thickness, all of whieh are gold bearing. The water is now fairly well drained off the 830 ft. level, and I expect good progress will be made in the sinkiug. The whole of the stampers are kept constantly going, and everything about the mine aud the mill in good order.—T. RAMAGE.

GYMPIE GREAT EASTERN (April 18th).—Fortnight report:—During the past fortnight the drive north at the 634-ft. level has been extended 7 ft.; total, 70 ft.; there are about 18 ins. of crushing stuff, showing a little gold. The south drive has been exteuded 9 ft.; total, 109 ft.; there are about 15 ins. of crushing stuff, showing fair gold. The stopes north and south above these levels are all showing the usual amount of crushiug stuff, with fair gold. The stopes above the 500-ft. level north and south are all showing fair gold. By what I can see at present I believe we will get more slate over these stopes; at the northern bouudary it made its appearance over any slate previously met with, and it is rising going south. If this be a regular bed of slate it will be of great benefit to the shareholders. In about four weeks we will know if it is a different bed of slate. The stopes above the 364-ft. level on the old Eastern reef are very poor this past fortnight. The reef is very irregular and broken up. In the winze at the 580-ft. level to cut 1 South Great Eastern reef we are driving south on the formation, and there is an improvement either in the drive or the rise to the east. Everything about the mine, winding-engine and battery, is in fair working order. There are 78 men employed, 68 at the mine, and 10 at the battery.—J. JAMES.

INDIAN (17th May).—Three days only have elapsed since despatch of my last; there is little to report. Good all-round progress is being made, and an important connection has been made at a lower level with the Koorumbes reef. This gives us command of a good field of quartz. Very little rain during the week. Monsoon expected to break about end of month. Usual detailed report by next mail.—PHILLIPS.

MONTE DEL ORO (28th May).—Fortnightly report—Taylor's engine shaft: The 186-ft. level south of the east cross-cut has a total length of 292½ ft., it being extended 18½ ft. in the past fortnight; the lode continues small, having an average width of 4 to 6 ins. of quartz. North of the west cross-cut the level has now reached a distance of 101 ft., but since it split into branches the lode has been small, its preseut width averaging 3 ins., and its eomposition is principally slate intermixed with a little quartz. Shaft No. 6: In the north end the lode, although regular, does not increase in size, and it is now composed of a soft flookau 2 ins. wide. During the fortnight 27 ft. were driven, making the level 235½ ft. long, or 65½ ft. north of the ancient workings. With the sinking of the shaft on the course of the lode slow progress was made last week, owing to the quantity of water to be contended with. We have attained a depth of 13 ft. below the level, where the lode is 18 ins. wide, carrying a braneh of quartz, the average width of which is 6 to 8 ins., and the remainder consists of a flookan with fine quartz iutermixed. Shaft No. 5: The total length of the level to the north of this shaft is 132 ft.; at present the lode is 6 ins. wide, and composed of soft blue slate, but contains no quartz. Shaft No. 2: Good progress is made in the intermediate level north of winze No. 1, 24 ft. being driveu since the last report, so that the level is 130 ft. long; towards the hanging-wall the lode carries a branch of quartz and slate intermixed, the width of which is 12 ins.—J. ROBERTS.

MORUYA.—The followiug mail advices just received from the mauager at the mine: There is great excitement here at Moruya. Some of the local people have seen the ore and reef, and have taken up every piece of land, likely or unlikely, for miles in every direction. A man

named O'Neill has found a reef just on the company's eastern boundary that assays as good or better than the company's ore. It is not our lode, as it runs east and west, but it runs into our property at right angles to the lode we are now working. Since my last report we have completed framing and stabbing in south drive; cut this lode 12 ft. from main shaft; lode top of drive, 2 ft. 6 ins., on bottom, 3 ft. 6 ins., making fast into large lode at bottom, thickly impregnated with rich black arsenical pyrites requiring concentration. Now timbering up bottom of main shaft. Raised about 25 tons of lode for treatment by battery.

MYSORE REEFS.—Fortnightly report :—(18th May).—Harvey's shaft: The 320-ft. level south of cross cut has been advanced by one rock-drill 14 ft. 9 ins., now 41 ft. south of east cross-cut; the last 8 ft. have been in trap-rock, with small branches and patches of quartz and pyrites running through it. Several samples have been taken, which have varied from a trace to ½ oz. of gold to the ton from selected pieces of quartz and pyrites. There is still a little quartz in the present breast of end but rather poor. We shall continue this for a few feet more, and if there is no improvement, commence to sink a winze below the level. Winze below the 250-ft. north level has been sunk 3 ft. 3 ins., now 19 ft. 6 ins. below the level; the rock is very hard, and we have a great deal of water to contend with. There are branches and patches of quartz in the trap-rock, but nothing regular. Selected samples of the quartz have given from ½ oz. to 1 oz. of gold a ton. The smalls are poor in consequence of so much poor rock being mixed with it. Cross-cut west of plat at the 250-ft. level has been extended by one rock-drill 11 ft., now 224 ft. 9 ins. from plat. The rock is extremely hard, with small stringers of quartz crossing it showing a little gold. I am very anxious to get through this hard band of rock and intersect the western formation. In 80 ft. more we shall reach it. Taylor's engine shaft has been sunk by rock-drills 5 ft. 3 ins., now 172 ft. 6 ins. There are very kindly branches of quartz running through the hard rock which show a little gold, from 3 to 4 dwts. a ton. I shall continue the sinking for 2 ft. 6 ins. more, to make it 175 ft. from surface, and then commence to cross-cut east and west to cut the quartz making against the hanging-wall, part of the formation by the western cross-cut and the quartz on foot of formation by the eastern cross-cut. From 4 to 6 ft. will be all that is required to drive east and about 45 ft. west. In consequence of the mail day changing from Tuesdays to Saturdays, the report is for 10 days instead of 12 as usual.—M. SCANTLEBURY.

MYSORE WEST.—Report of the mining manager for the two weeks ended May 13th :—159 north of Walker's: Driven, 11 ft. 6 ins.; length of level, 462 ft. 6 ins.; Moplahs employed, 15; cost per ft., Rs. 10; size of vein, 2 ft. 225 north: Driven, 5 ft. 9 ins.: length of level, 157 ft. 5ins.; Moplahs employed, 25; cost per ft., Rs. 14; size of vein, 4 ft. 225 south-east reef: Driven, 7 ft. 3 ins.; length of level, 135 ft.; coolies employed, 12; cost per ft., Rs. 20. 300 cross-cut west: Driven, 2 ft.: length of level, 29 ft.; coolies employed, 12; cost per ft., Rs., 25. 300 north: Driven, 15 ft.; length of level, 96 ft. 6ins.; cost per ft., Rs., 18; size of vein, 1 ft. 6 ins.; quartz coming in about 1½ ft. wide. 300 cross-cut east: Driven, 6 ft.; length of level, 35 ft. 8 ins.; cost per ft., Rs. 25; three Eurasians and 16 coolies employed on this and the 300-ft. north levels. No. 1 trial pit: Sunk 18 ft.; depth of shaft, 22 ft.; cost per ft., 1s. 9d.; size of vein, 1 ft. 6ins., and of promising appearance.

NEW EBERHARDT.—The mine manager reports under date May 18th, as follows:—Mine: Number of tons of high-grade ore assorted and put on ore dump for the week, 18 tons; assay value $62 per ton. Number of tons of a lower grade assorted and put on ore dump, 8 tons; assay value, $42.42 per ton. Total number of tons of ore extracted and assorted for the week, 26 tons. I had hoped for a larger output for the past week, but some of our men were away to our country seat, attending the spring term of court as jurors. I am hopeful that the coming week we shall do some better. The general appearance of the mine is much the same as last reported. Mill: On Friday, the 17th inst., we started our battery, the water having increased sufficiently to enable us to run our mill to its full capacity, we are therefore crushing our ore, as yet there has been but one assay made from battery sample, which gave $48.70 per ton.

NEW HOOVER HILL (21st May).—Briol's shaft—the drift going north at the 230: The vein of ore is 3 ins. wide, pans $5 per ton. The winze below this level the vein is 10 ins. wide, pans $3 per ton. Driving north at the 170: As the end is poor, I have taken the men from here and put them to stope from the winze below this level. Sinking below this level on the No. 1 winze: The vein is 5 ins. wide, pans $6 per ton. The drift going south at the 130: There is a good deal of quartz in the end, but is low-grade. The stope below this level from No. 2 winze is turning out fair ore. The stope below the 70 continues the same as when last reported. Mill and machinery working well.

NEW LA PLATA.—Report for month of April.—During the past month work has been carried on steadily all through the mine. While no important discoveries have been made, it is important to observe the substantial increase in the output and the general improvement in the mine. The total mine output for April is as follows:—165½ dry tons, which sold for $2,959.21, and produced in royalty to La Plata Company, $705.45. Slag dump: The royalty to La Plata Company on dump and smelter cleaning amounted to $544.37. N.B.—Including rental of smelting works, the profit for the month is about 200*l*.

NORTH MEXICAN (17th May).—The shaft is now down 160 ft., and is sinking at the rate of 10 ft. per week. The ground the contractor takes out is 11 ft. by 7 ft.—R. S. CARLISLE.

— (21st May).—We now have a depth of 170 ft., and are sinking at the rate of 10 ft. a-week. There is a very little amount of water. I have built a roof over the horse-whim, a blacksmith's shop and stable near the San Nicolas shaft, so that everything will be secured and be ready for the rainy season.

NUNDYDROOG (14th May).—Mining operations: I do not observe much change in the appearance of the mine. You will notice that stoping has been commenced below the 370 south of Webb's shaft. Webb's shaft and Taylor's shaft are both without change; the former is now down 421 ft. 6 ins., the latter 377 ft. 2 ins.; the rock continues to be very hard. The 370 cross-cut west is without change. In the 370 north end there is a lode made up with quartz and schist 2 ft. wide, assaying 2 dwts. The intermediate level, the 230 stope in the bottom, the middle level, the 230 north of Webb's shaft, the rise in the back and the stope in the bottom of the 166 south of Webb's shaft: Each workings contain quartz 1 ft. 8 ins., assaying 9 dwts. 18 grs., 1 oz. 7 dwts., 1 oz. 18 dwts. 6 grs., 1 oz. 1 dwt. 18 grs., and 2 ozs. 0 dwts. 2 grs. The lode in the bottom of the 370 south of Webb's shaft is 3 ft. wide, assaying 2 ozs. 14 dwts. 18 grs. per ton of rock. The new shaft near the northern boundary, the 8-in. pump has been fixed in this shaft. The engineer is in hand erecting the boiler and engine. The shaft is now down 47 ft., and sinking will be resumed as soon as the engine is completed. Stamping: Stamping goes on in a satisfactory manner. Assay of weekly samples from the mill: Rough quartz, 2 ozs. 9 dwts.; smalls, 1 oz. 13 dwts. 18 grs.—B. D. PLUMMER.

OOREGUM (18th May).—Main shaft: The 250-ft. level driving south, 15 ft. have been done, or 277 ft. 3 ins. from cross-cut west. The lode is 2 ft. 9 ins. wide, and yields as per assay 5 ozs. 8 dwts. 21 grs. of gold per ton of quartz. The 250-ft. level driving north, 23 ft. 3 ins. have been done or 201 ft. 5 ins. from shaft. The rock here is still in a disturbed state, but we think it is gradually getting more settled as we drive on it, especially so in the hanging wall on the level. We took an assay from the small veins of quartz and carbonate of lime mixed in the country rock, this gives 1 dwt. 2 grs. of gold per ton of quartz. This is encouraging, seeing that small veins of quartz found here contain more or less gold, and proves the strata to be gold-bearing. Driving on the branch in the 250 cross-cut west, 2 ft. 6 ins. have been cut or 4 ft. from it. The branch is 2 ins. wide, and gives an assay of 3 dwts. 6 grs. of gold per ton of quartz. The water still percolates from the face of drift. Low's shaft: The 200-ft. level driving north of shaft: 1 ft. 9 ins. have been cut, or 303 ft. 4 ins. from shaft. We have not been able to work full time here on account of water in the shaft; the branch of quartz is the same; no assay was taken from it the past week. The 200-ft. level driving south from shaft: 9 ft. 6 ins. have been done, or 195 ft. 7 ins. from cross-cut west. The lode here is getting more settled: the assays from it have improved, being now 8 ins. wide, and yield 1 oz. 3 dwts. 22 grs. of gold per ton of quartz. The No. 2 winze, sinking in bottom of the 200-ft. level south of shaft: 6 ft. 6 ins. have been sunk, or 17 ft. below the level. The lode is 1 ft. 6 ins. wide, and gives an assay of 3 ozs. 10 dwts. 18 grs. of gold per ton of quartz. We stopped the old pumping engine on Monday morning, and hope to have the new one at work the same day. Probyn's shaft has been sunk 5 ft. 3 ins., and is 43 ft. 3 ins. below the 300-ft. level; the lode is 3 ft. 6 ins. wide, and gives an assay of 3 ozs. 3 dwts. 3 grs. of gold per ton of quartz. The 300-ft. level driving south: 6 ft. 3 ins. have been driven, or 38 ft. 7 ins. from shaft; the lode is 4 ft. 6 ins. wide, and gives an assay of 1 oz. 10 dwts. 12 grs. of gold per ton of quartz. The 300-ft. level driving north of shaft: 5 ft. have been done, or 31 ft. 4 ins. from shaft. The lode is carried 4 ft. 6 ins. wide, with more standing in the footwall side, which gives an assay of 1 oz. 3 dwts. 22 grs. of gold per ton of quartz. The winze sinking in bottom of the 230-ft. level north of shaft: 4 ft. 6 ins. have been sunk, or 62 ft. 4 ins. below the level, and has communicated with the 300-ft. level below; the lode carried in the winze is 2 ft. 6 ins. wide, and gives an assay of 10 ozs. 17 dwts. 18 grs. of gold per ton of quartz; this winze has opened up a most valuable piece of ground from the 230 down to the 300-ft. levels. The 230-ft. level driving south: 5 ft. 6 ins. have been driven, or 112 ft. 7 ins. from shaft. The lode is 2 ft. 3 ins. wide, and gives an assay of 1 oz. 3 dwts. 22 grs. of gold per ton of quartz. The winze sinking in bottom of the 230 ft. level south of shaft: 5 ft. 3 ins. have been sunk, or 42 ft. 3 ins. below the level. The lode is 4 ft. 6 ins. wide, and gives an assay of 1 oz. 17 dwts. of gold per ton of quartz. The 166-ft. level driving south: 8 ft. have been cut, or 237 ft. 3 ins. from shaft. The lode is 5 ft. wide, and gives an assay of 3 ozs. 3 dwts. 3 grs. of gold per ton of quartz, and is looking well. The No. 2 winze sinking in bottom of the 166-ft. level south of shaft: 5 ft. have been sunk, or 43 ft. 4 ins. below the level. The lode is 4 ft. 6 ins. wide, and yields as per assay 2 ozs. 12 dwts. 6 grs. of gold per ton of quartz. The No. 2 rise in back of the 166-ft. level south of shaft: 1 ft. 8 ins. have done, or 12 ft. above the back of level. The lode is 2 ft. wide, and gives an assay of 2 ozs. 12 dwts. 6 grs. of gold per ton of quartz. Stopes: All the different stopes in the different parts of the mine are the same, yielding good quartz for the mill. Stamps: These are working well; a fair amount of amalgam is being taken off the plates daily, which will again enable us to make the usual increase in the returns for the month of May.—W. MARTIN.

OSCAR (1st June).—Lode No. 3: The men driving on this lode are advancing at the rate of 7 ft. weekly. The lode is well defined; composition quartz mixed with chloritic slate and dioritic rock. Assay value this week, 2½ dwts. Daw's lode: The miners in shaft are sinking at the rate of 4 ft. weekly. There is no alteration to note either in composition or value. The 420-ft. level south: This level is being driven at the rate of 7 ft. 6 ins. weekly; the lode is poor, but shows signs of improving. Composition, 20 per cent., a mixture of rotten quartz and slate, and 80 per cent. country rock. The 370-ft. level north advances about 8 ft. weekly, but it is not producing any mill stuff. The matrix is country rock, with a few strings of quartz. 370-ft. level south: Here the ground has been harder than usual; hence the average weekly drivage has only been 5 ft. The quartz is about 6 ins. wide, and assays from 7 to 9 dwts. The quartz in the stopes above this level varies in width from 4 to 7 ins., and assays 6 dwts. 230-ft. level south: In this level we have only been able to advance about 2 ft. weekly. 170-ft. level north: The men have stoped about 12 metres weekly. The lode is about 5 ft. wide, a mixture of dioritic rock, slate, with fine strings of quartz; some of these strings had an assay value of 2 ozs. 6 dwts., but the general average was 3 dwts.—J. DAW, Jun.

ROCKY BAR WIDE WEST.—Extracts from mine captain's reports first and second weeks May.—East level No. 1 has shown a steady improvement, with good indications in the breast of drift for still greater improvement within a short distance. The earmen left on May 16th, and most of the miners stopped work the following day.—H. N. THOMAS.

RUBY AND DUNDERBERG.—Telegram received (4th June) from Eureka :—"10 tons tribute ore shipped; 10 tons tribute ore sold for smelting, producing to company $69."

GOLD HILLS RE-CONSTRUCTION.—The scheme for the re-construction of this company has been issued. Shareholders will have to pay the calls due on their old shares. They can join the new company by accepting a liability of 2s. 6d. per share, payable in instalments of 3d. on application, and 3d. on allotment. Applications must be sent in by June 17th.

REPORTS OF MEETINGS.

THE MYSORE GOLD MINING CO., LIMITED.

A GRATIFYING EXPLANATION—MAY RETURN 1,000 OZS. MORE THAN ANNOUNCED—SALE OF 233 ACRES OUT OF A TOTAL OF 733—11,138 FT. OF PROPERTY, BUT ONLY 1,000 OPENED OUT—THREE DISTINCT MINES—PRICE, £105,000—£87,500 IN FULLY PAID SHARES, AND £17,500 IN CASH.

A Gratifying Explanation.

In answer to a telegram sent to the mines yesterday, asking for some explanation as to the return of gold for the month of May, the managers have received the followiug satisfactory reply from Capt. Plummer :—

"Error in return : It should be 3,573 ozs. and 293 from tailings ; total, 3,869 ozs."

Being 1,000 ozs. more than given in the message published yesterday.

THE MEETING YESTERDAY.

An extraordinary general meeting of the members was held at the Cannon Street Hotel yesterday, to consider a proposal for the disposal of a portion of this company's property, when the following resolution was submitted to the meeting :—

"That in accordance with the powers contained in the memorandum and articles of association of the company, the directors be, and they are hereby authorised to enter into an agreement proposed to be made between the company of the first part, the Gold Fields of Mysore, Limited, of the second part, and a company proposed to be incorporated under the style of the 'Champion Reef Gold Mining Company of India, Limited,' or by some other suitable name, of the third part, for the disposal, by way of underlease, of (*inter alia*) that portion of the company's property consisting of the northern section of the company's ground lying immediately between and contiguous to the Mysore Mine to the south, and the Ooregum Mine to the north, containing an area of 233 acres or thereabouts for the considerations and upon the terms specified in the draft of such agreement (signed by the chairman for the purposes of identification, and submitted to this meeting) with such modifications and additions as the directors may determine, not being substantial variations therefrom."

Sir Charles Tennant, Bart., chairman of the company, presided.

Mr. W. H. Rowse (secretary) read the notice calling the meeting.

WHAT WILL BE SOLD?

The Chairman said : It will be within the recollection of the shareholders that an intimation was given in the last annual report that a proposal had been made to your directors for the purchase of the northern section of your property. The negotiations had not been sufficiently advanced to enable me to put before you at the meeting held on the 16th of last month any information beyond a confirmation of the fact to which I have alluded. Since the date of our meeting your board has concluded (subject to your approval to-day) an agreement for the sale of that portion of the property lying 3,490 ft. (233 acres) southwards from our northern boundary, upon terms which we believe will be acceptable to the shareholders of this company.

WHY THE SALE IS MADE.

It will be desirable that I should give to you some reason for the directors' action in this matter. You are aware that this company possesses a property of great extent, being 11,138 ft. long on the reef, by 2,700 feet wide, containing an area of 733 acres, and eomposed of three blocks or sections of the size ordinarily worked by other companies on the field. Of the whole length we have opened out about 1,000 ft. only at Taylor's and Plummer's since the commencement of the company's operations, and that at a shallow depth, the deepest point being about 500 ft. only—perpendicular. If, as we expect, the pay shoot continues to hold down in depth, the length of ground opened at Taylor's will be sufficient in itself to establish our mine for many years to come. Between Taylor's and Plummer's and the south boundary is a distance of 2,217 ft., and in this section is included Williams', Blair's, McTaggart's, Schaw's, and Shephard's shafts. At all these points the work done has been of an exploratory character, but sufficient to prove the value and richness of the reef. At Schaw's shaft a most important discovery has recently been made by the laying open of a rich lode. (Specimens of the gold found here are on the table, and may be inspected at the close of the meeting.) This section of the property may be looked upon as intact and unwrought, except, as I have said, in so far as we have proved the existence of a rich reef, which will, it is believed, when developed, give us another mine as valuable as Taylor's. The ground lying north of Taylor's up to the boundary of that portion which it is proposed to sell measures 5,372 ft. and includes Henty's and Tennants's shafts, making another large and important section, and which will require many long years to develop.

THREE DISTINCT MINES.

It will be apparent, therefore, that being left in possession of what I may call three distinct mines, this company has an extent of property which will be sufficient to tax all its capabilities of development. Handsome profits are now being made from Taylor's section, and these we think the shareholders are entitled to receive, and that they should not be used to provide for expenditure on developments. Expenditure of this nature should be provided for by capital. Under these circumstances, your directors were willing to entertain the proposal made to them, originally by the Mysore Goldfields Company, for the purchase of the portion of the property to which I have referred. The proposed purchasers are now a company which has been formed for the purpose of acquiring two blocks from the Mysore Goldfields, in addition to the section to be acquired from this company.

TERMS.

The terms which your board have agreed upon, and which they recommend you to accept, are fully set forth in the agreement now on the table, and which our solicitor will read if you desire it. I may briefly repeat them :—The price we get is 105,000*l*., payable 87,500*l*. in fully paid shares of the new company, and 17,500*l*. in cash. It is proposed, under the sanction of the Court, to distribute to you the 87,500 shares in the proportion of one for every two held by you in this company, and to distribute the cash in the form of a bonus. Your directors, believing that the shares of the new company will become very valuable, have stipulated, in conjunction with the directors of the Mysore Goldfields Company, that the shares to be issued by the new company should be offered in the first instance to the shareholders of the vendor companies, and my hope is that every one of the holders in this company will avail themselves of the opportunity of securing an interest in the new company. The prospectus of the new company will be in your hands within a few days. Its capital is 200,000*l*. In the event of your electing to subscribe, you will be required to send in your application not later than the 15th day of June inst. Being anxious to ascertain how far our proposal to sell a portion of your property was in accord with the views of our shareholders, we decided to send out forms of proxies for this meeting in favour of Lord Ribblesdale, Capt. McTaggart and myself. The result has been most satisfactory and gratifying to myself and to all your directors. Proxies representing 88,613 shares have been received. Such an expression of confidence from absent shareholders will be as gratifying to you who are present as it is to ourselves on this side of the table. (Cheers.) With these observations I beg to move the resolution :—

Capt. McTaggart (vice-chairman) : Gentlemen, I beg to second the resolution.

QUESTIONS.

A Shareholder : Why does the Mysore Company come in as of the second part? I do not quite see how it is that there are three parties to the agreement.

The Chairman : It is the Mysore of the first part.

The Shareholder : I understand that this company being of the first part, and a purchasing company being in it as well, why does the Gold Fields of Mysore Company come in?

THE AGREEMENT.

Mr. Francis (solicitor to the company) : The quickest way will be to tell you what is in the agreement. It contains three parties—the Mysore of the first party, the Gold Fields of Mysore of the second, and the Champion Reefs Company of the third part, as the purchaser. The properties to be sold are described fully in the recitals as the property put forward in this resolution, as far as the Mysore company is concerned. Then the properties which the Gold Fields will deal with are also set forth, and the Champion Reefs Company undertakes to purchase these. The two vendors agree to grant under leases for 20 years, lasting in the one case 27 years and six weeks, and in the other 21¾ years and nine days, because the Gold Fields are disposing of two blocks held under separate leases, whereas we are disposing of a block carved out of our own property.

IMPORTANT FIGURES.

The consideration is 132,000*l*., of which 17,500*l*. is payable in cash, and 87,500*l*. in fully-paid shares—the remainder going to the Gold Fields Company. The under leases are described fully in the schedule. The two vendor companies insist upon the purchasing company taking over the same covenants and liabilities attaching to that property as we ourselves held. The duplicates of all these under leases are to be registered with the Rajah of Mysore in accordance with the stipulations of the lease. The title is to commence on the 22nd of September. The vendors are to execute the various deeds, and within 14 days after receipt of telegraphic advices that these deeds are upon the register in India, in accordance with the laws of Mysore, we receive our cash and shares. Before the allotment of those shares a proper agreement will be filed with the Registrar of Joint Stock Companies, in pursuance of the 25th section of the Act, to make the shares fully paid and protect the holders from all liability. All books and documents connected with the property pass over to the Champion Reefs Company, or purchasing company, and the vendor companies bear all the expenses incidental to the formation and floatation of this company up to the first allotment of shares. There are no other clauses of this agreement which I think will interest you, as they are purely technical.

A Shareholder : May I ask what consideration is paid to the Goldfields Company? (Cheers.)

Mr. Francis : It is the balance of the consideration after we have received our 17,500*l*. in cash and 87,500*l*. in fully-paid shares, and that balance consideration amounts to 27,000*l*. in cash and shares.

A Shareholder : Are the shares in the new company 1*l*. shares?

The Chairman : Yes.

A Shareholder : I suppose there is no liability in taking these shares as fully-paid. I think there has been some alteration in the Act lately.

Mr. Francis : Proper and careful provision has been made in this agreement, to which I called attention just now, but before the allotment and issue of any shares as fully-paid, the necessary provisions of the 26th section of the Act are to be complied with. The persons taking these shares take them as fully-paid.

Mr. Stevenson : The 27,000*l*. I presume is for the property that is being sold for the promoting company?

NO PROMOTION MONEY.

The CHAIRMAN: There is no promotion money. I have a map here which shows exactly what we are selling, and which will be circulated to-morrow amongst all the shareholders. There is no promotion money of any sort or kind paid in connection with this affair. It is a *bonâ fide* transaction between ourselves without remuneration of any kind to anybody. (Cheers.)

Mr. MORRISH: Can you state whether any members of our own board will be on the board of the new company?

LIST OF DIRECTORS.

The CHAIRMAN: After allotment Lord Ribblesdale, who is the chairman of the Goldfields Company, and myself, as chairman of the Mysore Company, will join the board of the new company. (Cheers.) I may as well state the names of the other directors: They are Sir Robert Deele, a late member of the Council of the State of India; and Sir James Carmichael, who for a long time was connected with the Submarine Company between Dover and Calais, and who is a good business man; also Mr. Probyn, who is one of the directors of the Ooregum Company, and who I have the pleasure of seeing here to-day; and, finally, our friend, Mr. John Taylor. (Cheers.) I believe I may also state that the directors have done me the honour of voting me into the chair. (Cheers.)

SATISFIED SHAREHOLDERS.

Mr. WALTER JAMES: I think the explanations given have been highly satisfactory, and especially where you mention that the Goldfields of Mysore are not the promoters, because there was an impression that they were acting as promoters, and we know that many of these promoting companies have very capacious throats; therefore you have dissolved that doubt which existed in some minds. We appear to be starting with a very strong board and a very satisfactory programme.

A SHAREHOLDER: Can you give us any information as to how you propose to call up the capital of the new company?

The CHAIRMAN: The prospectus indicates it. The capital is 200,000*l*., in 200,000 shares of 1*l*. each, payable 2s. 6d. a share on application, 2s. 6d. on allotment, and the remainder in calls of 2s. 6d. of not less than three months.

A SHAREHOLDER: It has been stated that an unfavourable report has been received from the Mysore Mine; is there any ground for that statement?

THE MAY CRUSHING.

The CHAIRMAN: There is no ground for it, except I may say this, that I am very much disappointed with the crushing of the month of May, and probably Mr. Taylor, with whom I have talked the matter over, will give you his views. We have only the bald telegram, stating so many ounces and so many tons. The tons were all right, but the ounces are not. Perhaps Mr. Taylor will give you the view which he thinks may probably account for his falling off.

AN EXPLANATION BY THE MANAGER.

Mr. JOHN TAYLOR, who was received with loud cheers, said: Gentlemen, we have not information from Mr. Plummer up to date which enables me to reply very clearly to this question as to why there is a falling off in the returns, but I have in my hand the report, dated May 14th, which came in last night, and which will appear in the papers to-morrow morning. That report shows to me pretty clearly that the falling off in the return of gold is not due to any failure on the part of the mine. I think it is quite possible that in order not to interfere with the most important work we have in hand—the sinking of Rowse's shaft—Mr. Plummer may have found it desirable, or necessary to draw not so much rock from the richer parts at the northern part of your property in that direction and north of Rowse's shaft, but for the last few weeks he may have found it better to take rock from other parts of the mine further to the south, which are not so rich. That, to my notion, is the only reasonable way of accounting for this falling off. I am disappointed that Mr. Plummer has not told us why there is something like 1,000 ozs. less gold than last month, but I cannot allow myself to feel anxious about it, nor can I give any other explanation than the one I have given, which I think is reasonable. Rowse's shaft is to bring us into full possession of the immense amount of rock we are developing in the northern part of the mine, and with that work nothing must be allowed to interfere. If Capt. Plummer retarded that work for stoping, or any other purposes, the directors would be down upon him at once, and very properly so. As to the richness of the mine, I find that in this report the proof of it is this, that

THE AVERAGE VALUE OF THE QUARTZ IN THE 18 POINTS OF OPERATION IS UPWARDS OF 2 OZS.,

and therefore it is clear to my mind that there is no failure in the mine. (Cheers.) If you desire it the report can be read, but that is unnecessary, as it will appear to-morrow.

Mr STEVENSON: Capt. Plummer sent a telegram to the last meeting holding out very great hopes, which do not seem quite to accord with what Mr. Taylor says he has in his hand dated the 14th May. The telegram read to the meeting spoke of between 3,000 and 4,000 ozs.

The CHAIHMAN: He certainly did telegraph that, and I have no doubt he has been a little disappointed.

Mr. STEVENSON: Half the month had gone, and he might have had a better idea.

The CHAIRMAN: There has been very great difficulty about water, of which he has been very short, and I have no doubt that is one reason why the returns have not been quite as good.

Lord RIBBLESDALE (director): There has been a panic on account of the cholera, and it takes a little time to adjust labour, which is dislocated by the scare. One of those panics occurred when I was there.

Mr. STEVENSON: The telegram was sent to the meeting.

VALUE OF THE LAST RETURNS.

The CHAIRMAN: It is disappointing to us all. The return will give us 11,000*l*. in gold, but we expected to get between 15,000*l*. and 16,000*l*. We get a very good dividend out of 11,000*l*.

Mr. STEVENSON: It shows the danger of prophesying, unless you know.

BIG ASSAYS.

Mr. JOHN TAYLOR: You know how fond I am of dealing with facts, and not with speculative ideas. I will now read you the assay report, dated the 14th May. Mr. Taylor here read the report, the salient points of which were received with applause.

ASSAY REPORT FOR WEEK ENDING MAY 14TH, 1889.

Sample from	Assay value. Ozs.	dwts.	grs.
466 level north of Taylor's north end	1	19	14
295 south of Plummer's west lode	0	13	1
220 level south of Schaw's	0	13	1
Stope back of the 236 level north of Taylor's ...	3	15	3
" " 466 north of Taylor's	3	10	3
" " 400 level	2	13	13
" " 466 level south of cross-cut ...	1	0	21
Stope 296 south of Plummer's	0	18	17
Stope below 296 north of Taylor's, north of the rise	1	6	3
" " " south of the rise	0	18	17
Stope back of the 400 south of Taylor's west lode ...	0	9	3
Winze 296, north of Taylor's	5	17	14
Incline below the 466	3	19	17
Sinking on the west lode, 466 north of Taylor's ...	1	6	3
Winze bottom of 220 level, south of Schaw's ...	0	6	12
Schaw's shaft	2	8	8
Rise 400 north of Taylor's	3	5	8
Cutting in west side, 296 level north or Taylor's ...	2	3	2

Mr. Taylor added that the deepest point in the mine (in fact the deepest point in the Colar goldfield was worth 3 ozs. 19 dwts. 17 grs., practically 4 ozs. If that is not good enough for you, gentlemen, he said, I do not know what is. (Cheers.) It is good enough for me. (Cheers.)

RESOLUTION CARRIED UNANIMOUSLY.

Mr. WALTER JAMES: We are very much obliged to you for reading that. Capt. Plummer has always proved to us to be a man of caution, and with this exception I do not think his estimates have ever before fallen short. I think the explanation very satisfactory, and the publication of it will set everybody's mind at rest.

Mr. TAYLOR: Immediately after receipt of this telegram I telegraphed to Mr. Plummer for an explanation, but 24 hours are not quite long enough to get a reply. I hope we may have it, if not to-night, to-morrow morning, in which case it will be in the papers.

The resolution was then put to the meeting and carried by acclamation.

The CHAIRMAN: I may say I look forward with great confidence to the future of the new company.

A SHAREHOLDER: Is Rowse's shaft complete?

Mr. TAYLOR: It is not so yet, but I hope very shortly will be.

The proceedings closed in the usual way.

The shareholders were invited to the table to inspect some very rich specimens of quartz taken from Schaw's shaft, which were impregnated with visible gold.

LATEST REPORT.

— (18th May).—Mining operations: The 466-ft. level north of Taylor's shaft was driven in a fortnight 26 ft. 6 ins.; total, 674 ft. 9 ins.; the lode is 4 ft. wide, assaying 1 oz. 19 dwts. 14 grs. Driving the 296 ft. north of Taylor's shaft: You will remember a short time ago that this end became barren, but recent explorations in the western side has discovered the lode 6 ft. wide, assaying 2 ozs. 3 dwts. 2 grs. The total distance driven is 670 ft. 10 ins.; it includes 18 ft. driven on the new discovery. Driving the 236-ft. level south of Plummer's shaft, 4 ft. 3 ins. were cut, making a total of 237 ft. 10 ins. There are small strings of quartz in the forehead, but at present it is of no value. The 296-ft. level south of Plummer's shaft was driven north on the west branch 5 ft.; total, 99 ft. 9 ins. There is a lode of quartz 5 ft. wide, assaying 13 dwts. 1 gr. The cross-cut at the bottom of Taylor's shaft: excellent speed has been made. It was driven 27 ft. 9 ins.; making a total of 62 ft. 6 ins.; the end is barren. The 173-ft. level south of Williams' shaft was driven 3 ft. 8 ins.; total 220 ft. 6 ins. There is no change. The 220 ft. south of Schaw's shaft was driven 2 ft. 2 ins.; total, 73 ft; the lode is 2 ft. 6 ins. wide, assaying 13 dwts. 1 gr. There is no change in the cross-cut in the 160 ft. south of Schaw's. It was driven 3 ft.; total, 99 ft. 6 ins. Stopes: The stope in the back of the 466-ft. level north of Taylor's shaft and the 466-ft. level north of Taylor's shaft, but south of the cross-cut; each contains a lode 2 ft. 6 ins. wide; assaying respectively 3 ozs. 10 dwts. 3 grs. and 1 oz. 0 dwts. 21 grs. The stope over the 400 ft. north of Taylor's shaft is in a lode of quartz 4 ft. wide, assaying 2 ozs. 13 dwts. 13 grs. The stope below the 296 ft. north of Taylor's shaft is in quartz 2 ft. wide, assaying 18 dwts. 17 grs. The stope in the bottom of the 296-ft. level south of Plummer's shaft; the lode is 2 ft. 6 ins. wide, assaying 18 dwts. 17 grs. The stope in the bottom of the 296-ft. level north of Plummer's shaft is in a rich, but small, lode of quartz, 1 ft. 3 ins. wide. The stope in the back of the 236 ft. north of Taylor's shaft is in quartz 3 ft. 6 ins. wide, assaying 3 ozs. 15 dwts. 3 grs. The stope in the back of the 400 ft. south of Taylor's shaft on the west lode; the quartz is 6 ft. wide, assaying 9 dwts. 3 grs. The rise in the back of the 400 north of Taylor shaft has been holed to the winze in the bottom of the 296; at the point of holing there is a good-looking lode, assaying 3 ozs. 5 dwts. 8 grs. Sinking: Sinking the incline below the 466 ft., 13 ft. 6 ins.; total, 101; the lode is 3 ft. wide, assaying 3 ozs. 19 dwts. 17 grs. Sinking in the bottom of the 466, north of Taylor's shaft on the west branch, 4 ft.; total, 36 ft.; the lode is 6 ft. wide, assaying 1 oz. 6 dwts. 3 grs. Rowse's shaft was sunk 8 ft. 6 ins.; total, 134 ft. 6 ins. Sinking a winze south of Schaw's shaft in the bottom of the 220 ft., 4 ft. 4 ins.; total, 10 ft. 2 ins.; the lode is 3 ft. 6 ins. wide, assaying 6 dwts. 12 grs. Sinking the new shaft near Schaw's, 11 ft. 3 ins.: total, 32 ft. 9 ins.; and sinking Schaw's shaft below the 220 ft., 6 ft. 8 ins.; total, 99 ft.; the lode is 4 ft. wide, assaying 2 ozs. 8 dwts. 8 grs.—B. D. PLUMMER.

ALMADA AND TIRITO CO., LIMITED.

SPECIAL RESOLUTION ALTERING ARTICLES CONFIRMED.

An extraordinary general meeting of the shareholders of the Almada and Tirito Company, Limited, was held at the Offices of the Company, 47, Finsbury Circus, yesterday, for the purpose of confirming the following resolution, passed at the extraordinary general meeting of 22nd May last :—"That in lieu of the regulations contained in the existing articles of association of the company those contained in the printed document or articles of association, now submitted to the meeting, and signed for the purpose of identification by the chairman, be, and the same are, hereby approved and adopted as the future regulations of the company."

Mr. Martineau presided.

Mr. J. A. Morgan, F.G.S. (secretary), read the notice conveniug the meeting.

The Chairman : Gentlemen, our business here to-day is purely of a formal character—to confirm the resolution which was passed on the 22nd May at which meeting there was a great deal of friendly discussion on this particular subject, and also as to the present position of the company. The object of altering our articles of association is simply to comply with the requirements of the Stock Exchange in order to obtain an official quotation for our shares. Our solicitors have now agreed the articles with the Stock Exchange Committee, and the resolution which I am about to propose adopts them in lieu of those under which the company was registered. The chairman then formally moved the confirmation of the resolutiou as above.

Mr. F. M. Phillips seconded the motion.

A Shareholder asked if there was any further information for the mine.

LATEST FROM THE MINES.

The Chairman read the following report :—

12th May.—Preparatory to starting cross-cut west from bottom of Balvanera shaft started station 10 ft. by 6 ft. ; drivage in station, 4 ft. 6.10 ins. Drivage iu 50-fm. level north 30 east, 18 ft. 3.10 ins., by four men and machine drill. Cut east on footwall, drivage nearly barren. In couing week will drift north 15 west. Drivage 31-fm. level north 10 east, 5 ft. 9.10 ins. in metal ; breast, 5 ft. wide ; shows no sign of pinching. Drivage 12-fm. level north, 5 ft. 5.10 ins. Breast showing mineral stains and small eyes of good metal ; ground hard, but breaks well. I think that the ground will change for the better in the next few days. Have placed in main adit 10 8-ft. drainage boxes, draining from the Frente de Guia the tramway to the hoist engine, they are of great benefit to the 12 and 24-fm. levels. Have placed in the Frente de Guia three sets of timbers. Have placed in the old road or steam pipe-way 5 sets timbers ; replacing broken and rotten ones. Main shaft and ladder ways in good order.—H. C. Cloud.

The motion was carried unanimously, and the proceedings then terminated.

THE ZARUMA GOLD MINING CO., LIMITED.

I am instructed to forward the following report from Mr. Nicholls, the company's manager, who has just returned from the mines. The board consider this information most important and satisfactory.—A. P. M. Rivolta, secretary.

5th June.—I have pleasure in advising you as to the position of works and prospects on my leaving Zaruma at the end of April last, and I do so with additional satisfaction that the arduous duties of unwatering and developing has resulted so favourably, and placed the undertaking fairly on its way to success. As I have from time to time kept you advised as to progress of operations, I will merely add that the stope in back of No. 1 level continued to turn out good grade mineral, and that No. 2 level south was proving the vein to continue in that direction and maintaining its great width, and as it is easy of drivage, considerable reserves were being opened up, aud I consider there is sufficient quartz at sight to supply the present mill, at least for 18 months. Owing to the decomposed nature of the vein stuff south of Durham's shaft, some little difficulty was experienced in treating it. The mortars being in so many sections, the ordiuary drop could not be given to heads, and consequently less duty was performed per head. But this should be speedily obviated, as the vein north of Durham's is harder, and when stoping is commenced at this point a mixture of vein stuff can be made, the ordinary drop given, better duty be performed, and a consequent increase of returns result. For the more speedy development of the vein and admission of increased stamping power, I would advise the sinking of another shaft about 30 fms. south of Durham's shaft, to communicate with No. 2 level south, to be used for hauling, leaviug Durham's for pump and footway, &c. This will necessitate the erection of another wheel, which should be of sufficient power not only for hauling, but also for the additional stamps when required. This work I would advise being carried out at once, so as to have everything in readiness before the next rainy season. The sinking of Durham's shaft another 10 fms. would place the future on a more permanent basis, but possibly on economical grounds it may be advantageous to delay doing so for another year, especially as there is more than sufficient ground opened up to supply mill in the meantime. In conclusion, I congratulate you on the greatly improved prospects, tangible proofs of which are forthcoming in the monthly remittances of gold, and possessing, as your property does, a large and well-defined vein already developed to a considerable extent, and with every appearance of coutinuation in depth, a more than ample water supply, cheap labour in comparison to other mining camps, a combiuation that under careful management should not in my opinion fail to produce a permanent success.—H. J. Nicholls.

The following telegram has come to hand to-day from the manager at the mines :—"345 tons 270 ozs. 22 days."

Publications Received. — Institution of Civil Engineers :—"Abstracts of Papers in Foreign Transactions and Periodicals ;" "Worthington on the Compound Priuciple applied to Locomotives ;" "Vernon-Harcourt on Canal, River, and other Works ;" "Galwey on the Monte-Video Waterworks ;" "Carruthers, Wilson, Maxwell and Gruninger on Railway Steep Inclines."

THE MONEY MARKET.

City, Friday Evening.

Discount this week has been firm, but money at call or for short dates has been plentiful, and offering at easy rates. The three and six months' Treasury Bills tendered for on Monday were all allotted in the latter at a rate equivalent to an average of 1 13/16 per cent. or rather better than the current quotation for six months' Bills in the market. The drain of gold for Paris has been the chief feature, and this has been pressed in spite of a further advauce of ½d. per oz. in the price for "Napoleons," charged by the Bank. Gold has also gone to other quarters, and although some in the shape of sovereigns has been received, the efflux for the *Gazette* week was 334,000*l*. The Bank return shows that the internal circulation in view of the holidays has also been greater, reducing the reserve by over a million, and making it 14,105,000*l*., against 12,646,000*l*. last year, or 40¾ per cent. of the liabilities, being 1¾ per cent. worse than last week. The public deposits have fallen off 637,000*l*., the private deposits 430,000*l*., and the private securities 50,000*l*. At this time last year the rate was reduced to 2½ per cent.

There was no demand for money worth speaking of to-day, but the inquiry for discount was better, and generally the open market was firmer ; loans for a day or so beiug ¾ per cent., for "fixtures" 1 to 1¼, and the quotation for even choice bills of three months 1⅜, ½. Quite a quarter of a million more gold has left New York for Europe.

At the Bank this afternoon a further sale of 15,000*l*. in French coin, with a purchase of 8,000*l*. in bar gold was announced. Bar silver is firm again, dollars quite nominal, and Rupee Paper unaltered.

Business has been particularly quiet during the past week at the Stock Exchange, the fine weather, "Derby Day," and the approaching holidays, proving too great an attraction for many members, so that the attendance got smaller and smaller, and as a natural consequence, business was more and more contracted each day. The "House," contrary to general expectation, will be open to-morrow (Saturday), but whether the amount of business transacted on a day that is usually regarded as a holiday, and will be more especially so to-morrow, will compensate for the extra trouble it is very doubtful considering the number of members who have left town. One of the most appalliug disasters the world has witnessed has occurred in Pennsylvania through the bursting of the Conemaugh Lake, a disaster all the more horrifying when it is known that by due precautions it might have been prevented. The Paris Exhibition is now in full swing, and the railway companies are now inaugurating "a race to Paris" as the Northern companies last year started "a race to Edinburgh." Considerable speculation has been reported in the Southern Stocks on the increased traffic to be derived from this source, but once more we will warn our readers that the expectations to be derived from this source are greatly exaggerated. The Funds have been steady, and the same remark applies to Indian Government, Colonial Inscribed, and Home Corporation Securities. Foreign Government Bonds were rather more irregular, the change for the week being confined to ¼ per eent., and about evenly divided. Home Railways were nearly all lower, the decline ranging between ¼ and ¾ per cent. The traffic returns were very good, and particularly the "goods" traffic, which has up to the present shown considerable expansion. American Railroads were overshadowed by the floods in Pennsylvania, and at first fell away very rapidly ; but the "bears" thinking that perhaps they had been too hasty quietly bought back, and prices were put up against them. Union Pacific shares rose 2, Northern Pacific, 2½, and other active descriptions about a dollar. Grand Trunk Stocks were dull, but in the minor departments business was almost at a standstill.

Dealings to-day have been very slight, many members having left town, and others were chary of increasing their commitments in view of the fortnightly settlement which commences on Wednesday next. The tendency has been rather irregular, but a firm undertone has been apparent almost throughout. The Funds have remained unchanged, but India Three per Cents. improved ⅛. Colouial Inscribed Stocks remaining the same. Foreign Government Bonds were dull, and ⅛ to ¼ lower. South American Issues were rather weaker, especially Colombian, Paraguay, and Venezuelan Stocks. Home Railways were purchased, in anticipation of some good holiday traffics, and Scotch lines were particularly strong on repurchases by operators for the fall. Caledonian and North British rose ¾, and several others recovered ¼ per cent. American Railway Securities were quietly firm until the afternoon, when there was quite a spurt for a time, the closiug, however, being not so firm. Union Pacific issues rose to 65⅜, but reacted to 65, and this may be taken as a sample of the rest, the closing values being ⅛ to ¼ below those of yesterday, and ½ to ¾ below the best of to-day, excluding Canada Pacific, Ohio, and Union Pacific issues, which left off ¼ to ½ higher. Grand Trunk Stocks close steady after being dull, but Mexican were unaltered. Miscellaneous Securities were fairly active, with only nominal alterations.

Annexed are the final quotations to-day :—Consols Aecount, 98⅜, 98½xd ; Egyptian Preference, 103⅝, 103⅞ ; Egyptian Unified, 90 11/16, 90 13/16 : French Four-and-a-Half per Cents., 103¾, 104¼ ; Hungarian, 87⅛, 87⅜ ; Italian, 96½, 96⅝ ; Mexican Scrip, 95, 95½ ; Peru Five per Cents., 15 3/16, 15 5/16 ; Peru Six per Cents., 16⅝, 17⅛ ; Russian, 1873, 101, 101¼ ; Portuguese, 67¾, 68 ; Spanish, 75 13/16, 75 15/16 ; Turkish, 1871, 93¼, 93⅜ ; Turkish Defence, 100¼, 100⅜ ; Caledonian, 120, 120¼ ; Great Eastern, 77, 77¼ ; Great Western, 160⅝, 160⅞ ; Brighton "A," 156⅛, 156⅜ ; North-Western, 183⅞, 184⅛ ; Metropolitan, 90½, 91 ; Metropolitan District, 36⅛, 36¾ ; Midland, 145, 145¼ ; North British, 57½, 57¾ ; North-Eastern, 174¼, 174½ ; South-Eastern "A," 116⅜, 116⅝ ; Mexican Ordinary, 51⅛, 51⅜ ; Grand Trunk, 10¼, 10½ ; Ditto First Preference, 69, 69¼ ; Ditto Second, 49, 49¼ ; Ditto Third, 26, 26⅛ ; Canadian Pacific, 57¾, 58 ; Denver, 17⅞, 18⅛ ; Erie, 29, 29⅛ ; Milwaukee, 75¼, 75½ ; Lake Shore, 108⅛, 108⅜ ; Louisville, 72¼, 72½ ; Atlantic First, 33⅜, 33⅞ ; Ontario, 17¾, 18 ; Ohio, 23½, 24 ; Norfolk and Western, 54¾, 55 ; Reading, 23½, 23¾ ; Reading Bonds, 84¼, 84¾ ; Union Pacific, 64¾, 65 ; Wabash Preference, 29¼, 29½ ; Ottoman Bank, 11 7/16, 11 9/16 ; Anglo-Telegraph, 53½, 54 ; United Telephone, 15⅝, 15⅞ ; Hudson's Bay, 21¼, 21⅜ ; Suez Canal, 93¾, 94¼ ; Guinness, 31½, 31¾ ; Allsopp's Ordinary, 8⅞, 9⅛ ; Bryant and May, 13⅜, 13⅝ ; Nitrate, 22¾, 23 ; Salt Union, 13½, 13¾.

AFRICA.

LATEST FROM THE GOLD AND DIAMOND MINES.

SALISBURY.—The crushing of the company for last month was 562 ozs.

THE Witwatersrandt gold output for April, according to the Chamber of Mines returns, was 27,136 ozs.

WEMMER.—The London Agency advise having received, ex Mexican s.s., one box containing 657 ozs. 6 dwts. native gold.

VOGELSTRUIS.—A telegram, dated 4th June, gives last month's return of gold as follows :—"1,500 tons of quartz produced 206 ozs. of gold."

WITWATERSRANDT (KNIGHT'S).—The London Agency advise having received, ex Mexican s.s., one box containing 953 ozs. native gold.

JUBILEE.—The London secretary has received the following cable from the secretary in Pietermaritsburg, viz. : "Result of last month's crushing is 408 ozs. of gold."

GORDON DIAMOND.—Return of work done at mine for week ending 1st June :—6,100 loads blue hauled ; 5,500 loads blue washed ; value of diamonds produced, 1,200*l*.

HARTBEES UNION.—Mr. Walter Bramall has been appointed London agent to this company, and transfers can be received at 5, Copthall Buildings, London, E.C., for transmission to Kimberley.

DURBAN ROODEPOORT.—Cable from the mines :—"Since our last cable (6th May) we have crushed 715 tons of quartz, producing 1,091 ozs. of retorted gold ; working 24 days, three days being lost by reason of various causes."

WOHLFAHRT.—The directors have declared a dividend on the shares at the rate of 6 per cent. per annum for the half-year ended 31st December, 1888, making with the interim dividend paid in November last 6 per cent for the year.

SOUTH AFRICAN.—The following particulars of work relate to the week ending May 4th :—Blue ground hauled, 4,380 loads: blue ground washed, 4,177 loads; diamonds obtained, 1,299 carats ; estimated value, 1,460*l*. ; reef hauled, 1,600 loads.

BATTERY REEF.—The Battery Reef Gold Mining Company, Limited, has received advices that the Battery has started crushing ; that there are over 1,000 tons of ore at the mill ; and that the reserves opened up in the mine are sufficient to keep the mill in full work. There is no scarcity of water.

OTTOS KOPJE DIAMOND.—Report from the Kimberley directors :—The driving at the 800-ft. level is being actively prosecuted, and the blue diamondiferous ground taken out of this mine has an excellent appearance, in every way equal to that taken from the workings of the Central Diamond Miue at Kimberley.

DOUGLAS DEVELOPING SYNDICATE.—Report from the manager, dated Johannesburg, 10th May :—Shaft C is down 48 ft., through dark red sandstone, with small leads of conglomerate all panning gold. Shaft D is down 47 ft. At 43 ft. we struck a hard formation of red sandstone, which at 45 ft. turned to red slate, mixed with a hard blue quartzite.

SOUTH STANDARD (WITSWATERSRANDT).—The directors have received the following from the manager, dated Johannesburg, May 10th :—The main shaft is now down 58 ft., and timbered the entire depth. It is notified that the certificates for shares are now ready, and can be obtained on application to the secretary, 8, Drapers' Gardens, E.C., in exchange for the bankers' receipts.

NOOITGEDACHT ESTATE AND GOLD.—The following is an extract from report received from the manager for month of April :—Button's reef, No. 3 section : The distance driven in the various levels 236 ft. ; not much change to notice in the width and quality of the reef. No. 4 section : Distance driven on the various levels, 45 ft. ; there has been a slight trouble from water. In a new level going east of main drive the reef is 2 ft. thick of pyrite ore, giving 4 ozs. to the ton. In the 80-ft. level east the lode is pinched to 1¼ ft., and is worth 2 ozs. per ton. Davidson's reef : The various levels have been advanced a total distance of 88½ ft. ; the ore continues of excellent quality, varying from 1½ ozs. to 3 ozs. per ton, except in No. 5 level, where as yet there is no improvement.

NEW AKANKOO.—The company have sold through Messrs. Johnson and Matthey 135 ozs., gold realising 482*l*. 1s. 7d. The manager reports as follows :—Mine : All the ends with the exception of the 30 ft. south are looking well. In the 60-ft. north the lode is widening and improving. The Deane pump continues to work well, and the water is kept down. The mill was started on 1st May, and 15 heads were thrown in ; barring accidents it will continue to run till the 1st June. I am going to clear off the dump of old stuff religiously avoided by my predecessors, but good enough to pay with careful treatment, and I hope to make a fair remittance for next month. I trust to be able to open up ground sufficient for 20 more men to work upon, and within two months to bring the output up to 50 trucks a day, which is about what we shall require with 20 heads running. The resolutions passed at the extraordinary general meeting held on the 15th May were duly confirmed on the 4th inst.

SIMMER AND JACK.—I beg to hand you report of work done on your property for the month ending 30th April, viz. :—Mine adit level main reef : Advanced 42 ft. ; total length of drive, 830 ft. The reef has been small, but I am pleased to say it is again opening out. Crosscut south from adit driven 21 ft. now in 42 ft. I am daily expecting to cut the south reef at this point. No. 1 winze below adit south reef : Sunk 15 ft. ; total depth from adit, 99 ft. ; reef in bottom 2 ft. thick : fair milling ore. I have had to stop this on account of water. No. 3 winze : Sunk 38 ft. ; total depth, 51 ft. ; reef broken and low grade. No. 4 winze : Sunk 30 ft. ; reef small and poor. No. 2 A incline : Sunk 107 ft. ; total depth, 142 ft. ; reef about 18 ins. low grade ore. Air shaft : A vertical air shaft has been started to connect with No. 2 A for air, and is now down 23 ft. No. 3 incline : Sunk 8 ft. ; total depth from surface, 261 ft. ; reef 18 ins. thick, and pans fairly well. No. 5 incline : A sump has been blasted out for pumping, and bottoms of drives, east and west taken up to footwall of main reef. Driving and sinking will now be proceeded with at once. Drives east and west, upper level has advanced east 59 feet. Total drivage, 129 ft. West has been driven 36 ft. ; total drivage, 140 ft. ; the reef at present is very broken. Main shaft : Sunk, 4 ft. ; total depth, 56 ft. ; there is a reef in the bottom 4 ft. thick, which I believe to be main reef : pans from 7 to 10 dwts. Prospecting : The prospecting shaft for north reef has been sunk 4 ft. ; total 35 ft. I have started a small vertical shaft due south of our main shaft about 300 ft., to see if there is anything lying to the south ; sunk 13 ft. Buildings : I have had a cook kitchen for natives built, and some more quarters for men. Machinery : About the middle of the month the donkey pump on battery engine failed, and we had to get a new pump. I am pleased to say that at present all the machinery is in fair working order. Ore milled : About 500 tons main reef, and 1,000 tons south reef, yielding 755 ozs. 14 dwts. retorted gold.—W. T. POPE, Manager.

THE MONTANA CO., LIMITED.

MONTHLY RETURN.

THE secretary of the Montana Company, Limited, begs to state that the following information has been received by cablegram from the resident director at the mine :—"Total weight of ore crushed during May, 6,515 tons ; yield from the three mills, $122,300 ; working expenses for the month, $53,000. N.B.—The estimated number of ozs. contained in returns by assay being—gold, 3,715 ozs. ; silver, 35,270 ozs."

REVIEWS.

THE RAILWAY AND CANAL TRAFFIC ACTS, 1854 TO 1888. By H. R. Darlington, M.A., LL.M., of Lincoln's Inn, Barrister-at-Law. London : Reeves and Turner, 100, Chancery Lane.

This work embraces the Railway and Canal Traffic Act, 1854 ; the Regulation of Railways Act, 1873 ; the Board of Trade Arbitrations Act, 1874 ; the Cheap Trains Act, 1883 ; and the Railway and Canal Traffic Act, 1888, with the incorporated sections of other Acts ; notes, orders, rules, forms, fees, &c. In compiling this work the author has endeavoured to bring together the statutes generally known as the Traffic Acts, under which the railway and canal Commissioners obtain their jurisdiction, and the cases that have been decided on those Acts, which, together with the rules of the Commissioners and of the Board of Trade, to be found at the end of the volume, will be of service to those practising before the Commissioners and to others affected by their jurisdiction. The author, at infinite pains, has produced an apparently reliable work, and to the value of which the copious index at the end greatly contributes.

THE MIDAS GOLD FIELD CO., LIMITED.

REPORT OF THE DIRECTORS.

THE directors submit the audited balance-sheet and accounts, from incorporation on 1st February, 1888, to 28th February, 1889. The total amount of net profit earned during the past year is 7,849*l*. 15s. 7d. which the directors propose carrying forward to the credit of the current year. A report, drawn up by the Hon. Henry Gore and Mr. R. F. Bryant (mining manager), gives full information relating to the progress which has been made in working and developing the mine. Judging from that report, and from other sources of information at their command, the board are led to hope that larger returns will be forthcoming in the future. The board have much pleasure in bearing witness to the assistance they have derived from their colleagues in Melbourne during the past year. The board have appointed the following gentlemen to fill vacancies on the board : Messrs. Hugh Astley, Wilberforce Bryant, and Sinclair MacLeay.—WARREN WM. DE LA RUE, Chairman.

Letters of allotment and regret in the Passburg Grains Syndicate have been posted.

The National Bank of England are prepared to issue certificates of first and second charges North Western Railway, against allotment letters and bankers' receipts of Stock Conversion and Investment Trust, Limited.

Messrs. J. S. Morgan and Co. have also been requested by Messrs. Drexel and Co., Philadelphia, treasurers to the Philadelphia Relief Fund, to receive in like manner any contributions for that fund, and they will take pleasure in transmitting to either committee such sums as Americans abroad may be disposed to contribute.

Messrs. J. S. Morgan and Co. have received the following dispatch from the president of the Western Union Telegraph Co. :—William McCreery, Pittsburgh, chairman, Johnstown Relief Committee, appoints and requests J. S. Morgan and Co., London, and their corresponding house in Paris, to act as agents to collect and receive from Americans abroad any sum they may contribute for relief of sufferers and suffering by the great disaster at Johnstown, Pennsylvania. They authorise and request Messrs. J. S. Morgan and Co. to designate sub-agents in such other European cities as they may deem fit, and request that they cable through me notice of any amounts collected, and subject to draft as the needs are great and pressing.—"GREEN."

HOLLOWAY'S PILLS AND OINTMENT.—The combined ill effects of over-crowding, sedentary occupations and monotony of life are only too well known to those who have to pass the best part of their lives labouring in factories and crowded workrooms. The compulsory confinement weakens the general health and induces chronic constipation indigestion, and various forms of skin diseases. Holloway's remedies are of priceless value to persons of this class, for they can be used without entailing loss of work, being purely vegetable in their composition, and consequently act without harshness on the most delicate system. The experience of more than forty years proves that no means surpass Holloway's remedies for curing bad legs, bad breasts, piles and wounds of all kinds.

THOMAS THOMPSON,

STOCK AND SHARE DEALER,

8½, ANGEL COURT, LONDON, E.C.

Telegraphic Address:—"NOSMOTH," LONDON.

Telephone No. 509.

Bankers:—THE CITY BANK, LIMITED, and THE ROYAL EXCHANGE BANK, LIMITED.

Mr. THOMPSON transacts business in all classes of Securities, Bonds (Foreign and Colonial), Banks, Railways, Insurance, Telegraph, Tramway, Gas, Water, Mining, and all Miscellaneous Shares. Shares sold at special prices for Forward Delivery (One, Two, or Three Months) on Deposit of 20 per cent.

Orders by Letter or Telegram promptly attended to.

NOTICE TO READERS.

Replies to Annual Subscribers will be sent by wire or letter, as may be necessary.

Non-Subscribers must send fee of 5s. 0d., in order to have their enquiries answered in "Mining World," or by wire or letter, as requested.

Query (A. D.)—If you sell now your buyer pays the call.
Xmas (P. P.)—There is no prospect of a dividend ever being paid. Certainly sell the remainder.
Finance. We understand the matter in question, but prefer to say no more at present.
Maxim (Cape T.) If you send us full particulars, we will advise you as to what is best to be done.
J. Goschen. By taking up your shares you help to strengthen the market. Hence our advice last week.
John Burrill.—No. 1: Shortly, but precise date uncertain. No. 2: Yes, most decidedly, in our judgment. It has been a very dry season in Colombia, and the hydraulic mines have suffered. The call would not be more than 6d.
J. Thurston (Sholts.)—No market for them.
B. R. Waters.—No. You will certainly gain nothing.
Trams (L. B.)—Two very good investments.
F. G. Goodere (Southend).—Hold both. Shares look like rising shortly.
C. W. M.—Take your profit. Buy Gympie Great Easterns, as suggested.
T. T. T. (Aberdeen).—You must apply *at once.*
Reader (Cavan).—What is the name of the company? If they have not yet gone to allotment we advise you to withdraw.
Satisfied (B. T.)—Purchase a few, as, in our opinion, they are on the eve of a rise.
R. W.—No; Wheal Crofty is wound up. There was no active market, and quotations were not reliable. Capt. William Thomas, of New Cook's Kitchen Mine, Illogan, Cornwall, we believe, was the former manager. He will, if asked, probably give full particulars.

We are, this week, obliged to omit our Mining Share Lists, but all changes are notified in the "Mining Market."

The Mining World.

LONDON: SATURDAY, 8th June, 1889.

The "Mining World" is not the property of a Mining Speculator nor under the control of any clique.

STATISTICS OF COPPER.

It is a common saying that statistics may be made to prove anything, and in many cases the saying is fully justified; but in regard to the position of copper, as disclosed in the figures issued this week, we fail to see how the most biassed expert could set them forth in an unfavourable light as compared with recent monthly returns. We are far from suggesting that the difficulties which have resulted from the most unwise policy adopted by the French syndicate have been overcome; still less do we wish to be understood as advocating the use of artificial means to secure a return to anything like the high prices which have been quoted within the past 18 months. The vast accumulation of stocks, with which producers are still confronted, renders such a supposition entirely chimerical. But the evidences continues to accumulate that a considerable change is taking place in the relations of supply and demand, and that, in fact, the rise which has lately taken place in the market value of copper is mainly due to that change. This will be seen if we compare the supplies and deliveries of the metal in England and France in the past five months, in only the first three of which the syndicate operations had much effect, with the corresponding months of last year, when the speculation was in full swing. The figures stand thus according to the statistics prepared by Messrs. H. R. Merton and Co.:—

	Supplies.		Deliveries.	
	1888. Tons.	1889. Tons.	1888. Tons.	1889. Tons.
January ...	9,119	9,716	5,923	4,293
February ...	11,717	10,009	4,616	1,397
March ...	10,643	11,135	4,489	4,399
April ...	11,479	8,080	5,877	8,509
May ...	11,182	6,837	6,044	13,864

These figures are so self-explanatory that they scarcely need any comment. The broad facts disclosed by them is that while in the past two months the supplies have shown a considerable decline, the deliveries have shown a still more important increase; so that the stocks in England and France and afloat thereto from Chili and Australia are more than 7,000 tons less than they were at the end of April. It is to be noted also that while the supplies last month were lower than in any month since the Société des Métaux took the metal in hand, the deliveries were greatly in excess of those of any month since the commencement of the speculation. There can be no doubt, therefore, that the lower price of copper is stimulating consumption, and we fully believe that the expansion will go on if it is not checked by any attempt to again force up prices unduly.

We pointed out last week, in referring to the meeting of the Panulcillo Company, that the decline in the price of copper is having the effect of greatly diminishing production in Chili, and that the same state of things may be expected to follow in other quarters, notably in the United States, where it is important to note that the home demand is becoming so large that under any circumstances there would be less of the metal available for exportation. This assumption that smaller quantities of copper will be coming forward is fully borne out by the statistics which are before us. For example, the charters from Chili last month amounted to 1,000 tons, comparing with 2,100 tons in April, and 3,800 tons in March. From North America in the same period the exports to England and France have decreased from 2,662 tons to 1,239 tons, and in "other countries" from 2,433 tons to 1,720. The imports from Spain and Portugal have slightly increased, but we believe the increase to be of a purely temporary character. The advices from Chili and Australia report shipments amounting to 2,180 tons, in contrast with 5,000 tons a month previously, 4,900 tons in May last year, 7,300 tons in May, 1887, and 8,900 tons in May, 1886. It is clear, therefore, that the stimulus to production which was given by the high prices ruling a few months ago has been removed, and that henceforward the new supplies will be more moderate in amount. We have reason to believe that in any case the recent rate of production could not have been maintained. The operation known as "picking out the eyes" has been largely indulged in among the American mines, and to some extent also in mines situated nearer home; so that for some time to come a larger amount of exploratory work will have to be carried out in these properties.

Altogether, therefore, the outlook for copper producers has decidedly brightened, though, of course, the future is still far from being assured. The negotiations between the principal companies for a limitation of output have made considerable progress. For a time Mason and Barry, Tharsis and Tamarack blocked the way to a settlement; but in the case of the first and last-named companies, all obstacles having been removed, they have joined the combination, leaving Tharsis as the only dissentient. The opposition of this company is greatly to be regretted, for it is evident that if the holders of the syndicate warrants were to throw their metal on the market there would be a heavy drop in prices; whereas if the companies agree to restrict their production, as all the other leading mines are prepared to do, arrangements would be made for the gradual disposal of the accumulated stocks, together with the lessened supplies coming forward. It is clearly in the interest of all concerned that some such agreement should be come to, and it is greatly to be hoped that those who are standing in the way of its accomplishment will see the wisdom of adopting a more common-sense policy. If they do so, the balance of probabilities points to a further advance in the prices of copper shares.

MYSORE RETURN—AN ERROR OF 1,000 OZS.

It is a great pity the telegram we publish in another column announcing the Mysore return to be 3,573 ozs., and not 2,573 ozs., or a total of 3,869 ozs., instead of 2,869 ozs., did not arrive in time to be read at yesterday's meeting. When the original announcement was made, the minds of the shareholders became "sicklied o'er with the pale cast of fear," and though Mr. Taylor was able to assure them at the meeting that there was no falling off in the mine, yet the return was in the nature of a staggerer to the hopes that had been formed, and even to the anticipations of Capt. Plummer himself. It will be remembered that at the annual meeting a telegram was read from that gentleman in which he estimated the May crushing at between 3,000 and 4,000 ozs., and Mr. Taylor added his belief that it would be nearer 4,000 ozs. than three. Both gentlemen are now proved to be right, but when the original telegram came it was something of the nature of a slap in the face to those who had been expecting to realise Capt. Plummer's original estimate. The matter now is clearly explained, and the May crushing is nearly 4,000*l.* better than the first telegram made it to be. The error in the telegram caused the fall in the shares which took place late on

Thursday and early yesterday morning, and its rectification led to the recovery which the latter part of the afternoon witnessed.

The full particulars of the sale of part of the Mysore sett were disclosed at the meeting yesterday, until which time the directors had well kept their secret. Of 733 acres the directors will sell 233, not because they do not believe in their value, but because they do not wish the profits of Taylor's section to be diverted from the pockets of the shareholders. The existence of a rich reef has been proved on the 233 acres which includes Henty's and Tennant's shafts. The new enterprise to be called "The Champion Reefs Company," purchases two blocks from the Mysore Goldfields Company, and these 233 acres from the Mysore Company. The Mysore Company will receive 105,000*l.*, payable 87,500*l.* in shares, and 17,500*l.* in cash. The shares, it is proposed, with the sanction of the Court, to distribute in the proportion of one for every two held in the vendor company, and to distribute the cash in the form of a bonus. Of the shares in the new company the first offer will be made to the shareholders in the vendor companies, and the prospectus will be issued in a few days. The capital of "The Champion Reefs Company" will be 200,000*l.*; its chairman will be Sir Charles Tennant (and none better could be found), and amongst his colleagues will be Lord Ribblesdale and Mr. John Taylor. No wonder the Mysore shareholders parted in good spirits. They would have been even more elated if they could have seen the corrected telegram of the May crushing, which reached us a few hours later.

BOARD OF TRADE RETURNS.

THE Board of Trade Returns issued to-day for May last are favourable, but not exceptionally so. Our exports, although amounting to 20,335,000*l.*, being only 5½ per cent. better than for the corresponding month, while for the five months, the increase is just over 7 per cent. The imports were 34,802,000*l.*, or an increase of 14½ per cent, with 12 per cent for the whole period. The reshipments for the month were valued at 6,731,000*l.*, a reduction of over 5¾ per cent., but the result so far this year is an increase of 9½ per cent. Home exports show an improvement, all round, except for articles of food and drink. Raw materials (coal and wool) show the largest increase. Metal and metal manufacturers follow, and machinery comes next. Of the imports the increase comprises all the leading articles except metals and oils, while miscellaneous products exhibit a falling off. The following tables give the results for the month, as regards metals, &c. :—

Article.	Quantity Tons.	Value £	Increase or decrease per Cent. Quantity.	Value.
	EXPORTS.			
Copper unwrought...	3,217	142,194	+271.4	+112.3.

LA VELERA DELUSIONS.

THE directors of this company may have been fervent in spirit, but they have not been diligent in business. La Velera has been in labour for three years, and even the proverbial mouse has not yet put in its appearance, and no wonder. The directors are behind hand in everything, and seem to excel in the art of knowing how not to do it. The meeting was long overdue, and when it was held there were no accounts. It is all very well to blame the printers, but if the directors had sent them the "copy" in time the proofs would have been forthcoming. Printers are charged with many sins in this world, of which at the great day of account it will be shown they are quite innocent. In the absence of the accounts, the shareholders, led by their directors, effectively performed the play of "Hamlet," without the Prince of Denmark. They went through the sorry farce of passing the report without the accounts, though as the one was the embodiment of the other, it is difficult to see how logically a divorce could be pronounced between them. The meeting was long overdue, and in such a case directors should know that the Act provides penalties. There was a merry twinkle in the eyes of the chairman as he spoke of brokers who, having parted with their reason, were offering 15s. for this company's shares. The eyes of the shareholders twinkled again as he told them not to accept such an offer. Mrs. Micawber declaring that she would never desert Mr. Micawber was nothing to it. Poor shareholders! How they wished they could get the money! Let any broker on the market be asked about La Velera shares, and he will shake his head by way of indicating that he never heard of them, or, having heard of them, he will advise his client to get rid of them as soon as he can. There was another twinkle in the chairman's eyes as he announced that the debenture list is closed, and yet not closed. It is closed in theory—it is open in practice. The shareholders are not urged to take up the debentures, but if they send in their subscriptions—well, we are old enough to know the rest. The chairman must, at a respectful distance, really be a follower of Wagner, for he is trying to harmonise his discords. This gentleman is full of faith in La Velera, but the shareholders are more likely to be saved by displaying the absence than the presence of this virtue.

A PROMISING GROUP OF CORNISH MINES.

THE mines in the office of Mr. C. B. Parry, of Gracechurch Buildings, Gracechurch Street, London, three of which held their meetings this week, are in what may reasonably be described a most encouraging position. In the first place we may repeat the substance of a former notice of them by saying that they are well managed. It is true that the cost-book principle prevails in all of them, but as carried out in Mr. Parry's office, its maximum advantages and its minimum disadvantages are reaped by the investor. In the first place, when the meetings are held the accounts are charged to date and adverse balances, except of infinitesimal amount and for special reasons, are not allowed to be carried forward. Rigid economy is exercised in every department, commencing with the almost unpaid committees, and a most moderate rate of London expenses. Needless to say that the example set in London is followed at the respective mines. The object of the Irishman who applied for a situation was not so much work as wages, but the object of Mr. Parry and his following is not so much their own emoluments as dividends, if possible, for the shareholders. Several of the mines are to all appearances on the eve of success, and the time when one or more of them will enter the dividend list appears not to be so much a matter of months as of weeks. Several of them are now meeting costs and a period appears to be rapidly approaching when there will be a satisfactory surplus. Since the death of the late chairman, the much respected Mr. J. Y. Watson, senior, the market for the shares has been clouded by the knowledge that his executors were endeavouring to dispose of his large holding. These shares have now been bought by firm holders, and an improvement in the market price may be looked for with every hope of realisation. We will now take the mines in detail, and briefly set forth their position as gathered for recent reports and meetings.

WHEAL METAL AND FLOW.—There are 12,000 shares in this mine, and 5s. 6d. has been called up. The company was started in 1885, and the last call was made in August, 1887. The Flow is a reservoir of about eight acres of tin, the collection of washings from the old mine which had accumulated in the valley. 178 tons of tin have been sold from it since the company started, realising 8,895*l.* On the results from this part of the property, large dividends might have been paid long ago, but the proceeds have been devoted to developing the Metal lode, where at the present time operations are proceeding very satisfactorily. The lode in the 35 is about 1½ ft. wide, containing tin, with a good deal of the oxide of iron, which is considered a kindly indication. The winze below the 35-fm. level on the underlie, where the lode is about 2 ft. wide, is also producing tin. The Metal lode was famous in former times, and there is every probability of its being so again.

GREAT FORTUNE.—The number of shares in this mine is 12,000, and 5s. 6d. has been called up. It lies to the east of Wheal Metal and Flow. The company was started for the purpose of developing an extensive run of tin branches parallel to the main lode. These branches are exceedingly rich, and yield some of the best tin the county of Cornwall has produced. At the same time it should be said that they are subject to great fluctuations. Of these branches, tin to the value of 6,605*l.* has been sold. In reality it is a facing of tin, chiefly crystals of the richest quality, to be found. The area of this facing is very extensive, and correspondingly so must be the produce obtained. The drainage of the old engine shaft is being proceeded with, and the 10-fm. level below the adit will lay open a more extended area of those rich tin branches from which, of course, in time the returns may be expected largely to increase. The mine is worked inexpensively, the costs are only about 270*l.* a month, and the calls never exceed 6d. per share and have been made at rare intervals. With the extension of ground at the 10-fm. level, of course, the financial position will be quickly improved. Experts agree in considering the formation here as quite unique.

EAST BLUE HILLS.—The shares number 12,000, and 14s. has been paid upon each of them. Tin to the value of 14,500*l.* has already been sold. Perhaps this mine is the most promising of the group, and bids fair soonest to enter into the dividend list. A considerable change for the better has been made since Capt. Bishop became consulting agent, and Mr. Wagstaff, one of the committee who has frequently rendered these companies service by making journeys into Cornwall to inspect the works, returned from his most recent one, highly delighted with all he saw. The operations are particularly hopeful upon the Boldhu lode. The returns of tin are increasing at a commendably rapid rate, and altogether the prospects of East Blue Hills are such that the neglect of the shares can only be attributed either to the apathy or the want of knowledge of the public.

PRINCE ROYAL.—The capital is 12,000 shares, on which about 8s. or 9s. per share has been called up. As regards this mine, the efforts

have been largely confined to drainage, and in two weeks time it is expected that this work will be accomplished. It is known that in the deepest part of the mine some rich tin ground was left, and of this the present company will not fail to take advice. This mine also is directed by Capt. Bishop, who has been one of the most successful Cornish miners of modern times. When the mine is drained this gentleman will make a special report.

Prince of Wales.—12,000 shares constitute the capital of this company, but in this case between 2*l*. and 3*l*. per share has been called up. The mine is productive in both tin and copper, and is being exploited in a very energetic manner. In this mine the shareholders have had long to wait for profits, but it would really appear from the value of the ends at present being driven that the period of their probation is coming to an end, and that the mine will first begin to pay expenses, and afterwards to remunerate the shareholders for what Cornish captains would call "their patience and outlay."

Glyndwr.—This is, we believe, one of the few mines in Mr. Parry's office not conducted on the cost-book system. The working capital has all been secured, and in the opinion of the manager it will not be long before from the returns of lead the whole of the original outlay will be recouped to the shareholders. It is Potter's lead that is produced here, and it fetches a much higher price than ordinary galena. Its near neighbour is the Halkyn Company, which, for last year, declared a dividend of 120 per cent. The late Capt. Williams, the discoverer of the Van Mine reported favourably upon this property, of which he had a high opinion. The capital is 12,000*l*. in shares of 1*l*. each, and as the money was privately subscribed no prospectus was issued.

The meetings of these companies are held about each four months, and as we have said the accounts are charged to date. If we contrast these mines with those started of late we shall find that a good deal more work is done for the money in connection with the one class than with the other. The South African mines, for example, are started with large capitals in 1*l*. shares, an immense slice of which at once goes to the vendor, and the directors are more prompt in making the calls upon the shareholders than they are in realising the promises of their prospectus. Of Cornish mines, as conducted in Mr. Parry's offices, it can at least be said that shareholders have a run for their money, whereas elsewhere there are some companies in our experience in which the shareholders can be scarcely said to have had a walk.

A FEW WORDS ABOUT TRAMWAYS.

Mr. W. W. Duncan, of Telegraph Street, may fairly claim to have made the question of tramways his own. There is probably no man who has so mastered their details, or who can afford such reliable information as to their numerous ramifications. His manual of British and Foreign Tramway Companies has now come to be regarded as a standard work of reference on the subject, and as it is issued yearly and corrected to date, it becomes exceedingly valuable to the investor as well as to the reader who may wish to turn over its pages for other purposes. Even to the County Councils this work should be of interest, for the reason that they are considering whether, in the interests of the public, these properties should not be acquired. In this case the manual will show them the nature of the investment they will have to purchase, if, indeed, they choose to proceed, under the powers given them in the Tramways Act. Mr. Duncan does not seem to contemplate an eventuality of this kind, though, perhaps, he knows quite well, or he ought to, that the subject is being seriously considered by many minds. A certain impetus is given to the strict application to the companies of the Act by the rising tide of public opinion against the directors of many of these concerns, particularly those in London, where it is notorious that advantage is being taken of the glut in the labour market to oppress the workpeople. A great deal of public sympathy has been aroused for what are called the "tramway slaves," and with this the companies will one of these days have to reckon. We are governed a good deal by sentiment in dealing with cases in which there has been an absence of humanity. Not to turn the screw too severely is advice that has been tendered to well-fed directors and highly paid managers by friends and foes alike, but we do not suppose they will accept it any more than did their Vienna *confrères* the other day; but the experience of those unhappy wights goes to show that peace should be made with the adversary while he is in the way. We should judge from this manual that to be in the tramway swim is the last ambition of the guinea-pig mind. The income of a Prime Minister must be poor indeed compared with the emoluments of some of the tramway magnates, whose generosity to themselves is as marked as their harshness to their *employés*. Mr. Duncan deals with the matter purely from the financial point of view, though its scope is much wider. He shows that the expenditure on new tramways during 1888 was 480,854*l*. The gross receipts showed a decrease of 6,025*l*., and the nett receipts 39,057*l*. The authorised capital of the companies is 18,383,854*l*., of which only about 4½ millions remain unexpended. The miles open number 904. There were 25,832 horses employed and 514 engines, and 3,501 cars. The passengers carried numbered 428,996,045. The gross receipts were 2,796,299*l*., and the nett receipts 620,865*l*. Bad weather, Mr. Duncan shows, seriously affects receipts. Where steam traction has been tried sufficiently long to enable the public to become accustomed to it, it has succeeded, but the author does not anticipate it will be greatly extended. He attaches far more importance, and rightly, to electricity as a motive power, and for this he anticipates a great advance in the course of the next two or three years. In conclusion, we have only to say that information of whatever kind may be desired respecting the subject of tramways is to be found in this manual, which has now reached its 12th edition.

A SYNDICATE OPPORTUNITY—THE AMERICAN RIVER SYNDICATE, LIMITED.

A syndicate company has been registered by Messrs. John Taylor and Sons to acquire and work certain valuable water rights, and fully developed mining properties in California. The first paragraphs of the circular that has been issued by the firm we have named make it clear that those who join the company will do so on the syndicate basis, and already we understand that one-half the capital has been taken. Water is all-essential if mining is to be conducted at all, and this company secures the practical monopoly of the river rights over the entire district. The reports show that the mining properties are well developed and supplied with hoisting machinery, mills, and all other appliances, but coal and water being distant, the means to work them effectively and economically are wanting. The present company will supply them by a method novel as regards this country, but quite beyond the region of experiment in the United States—that of transmitting power by electricity, which can be done to distances almost incredible to those who for the first time are brought face to face with the facts. Will it be believed, that on the Feather River, in California, 500 h.-p. is transmitted through a circuit of 18 miles, and yet such is the absolute fact. The syndicate may be regarded as extremely fortunate in getting such water rights, at a cost but little exceeding 2,500*l*. The mines are taken on a rental of 100*l*. per annum, merging into royalties of 2s. per ton of rock crushed, with the option of purchase at the end of 18 months lease. The income of the syndicate will thus be two-fold, with a third string to its bow of an even more important character, as will presently be seen. In the first place, it will supply power to other mines on rental, and in the second, it will benefit by the proceeds of its own mines. 20,000*l*. is the nominal capital of the syndicate, and 15,000*l*. it is thought will fully suffice for the acquisition of the water rights, the supply of electrical plant and machinery, and for the working of the mines. The report of Mr. Cullen Pearson is attached to the circular and is encouraging in every respect. The third string we alluded to is this:—That the ultimate aim of the syndicate will be to float a company, so that the possibilities of large profits are neither remote nor vague. We attach great importance to the fact that Messrs. John Taylor and Sons are themselves largely interested in the syndicate, and that the directorial list includes the names of Mr. Samuel Jennings, the esteemed managing director of the West Argentine Company, and Mr. W. Bell Davies. Messrs. John Taylor and Sons will be the managers, and Mr. W. H. Rowse, secretary of the Mysore and Nundydroog Companies, will act in a similar capacity to the present syndicate.

THE INGERSOLL DUPLEX HAND-POWER ROCK-DRILL.

How to develop mines with rapidity and economy is a problem to which many inventors have addressed themselves, and it must be confessed, with no inconsiderable measure of success, particularly in recent years. The direction to which their attention has been particularly turned has been that of rock-drills. In all well managed concerns presenting the necessary hardness of stone these implements are now used with the best results. At the Nundydroog Mine, where steam rock-drills are employed, worked by natives and superintended by Europeans, and where the rock is of the hardest, the progress has been most gratifying. This is a rate of progress that must be regarded as very satisfactory. In some mines, however, rock-drills worked by steam or compressed air cannot be employed, for reasons that will be obvious to the reader acquainted with mining, and, therefore, the necessity of obtaining a hand-power machine brought to the public notice—the Ingersoll Duplex Hand-power Rock-drill, which was patented in July, 1886. At the London offices of Messrs. Wellington and Company, 73a, Queen Victoria Street, we have seen these drills at work, and can cordially commend them to the attention of miners. The drills are in two sizes and weights. No. 1, for example, is 1½ cwts., and No. 2, 3 cwts. The former can be worked by one man, the latter by two. No skilled labour is needed. Any man who can turn a handle can work the Ingersoll Duplex Rock-drill. It is a great feature in the drill, and one to which much importance is attached, that the rotation, or turning of the bit, is automatic, so that it never strikes the rock twice in the same place, and so uniform that a round hole is bored with the common flat point-bit. It can be applied at various angles and in a contracted space; in a vertical position, measuring about 55 ins. by 33 ins. As the parts are made in duplicate, they can be replaced at slight cost. Of the effectiveness of the drill we have seen proofs, and as to portability—it can be moved about from place to place as a wheelbarrow. The blows struck vary from 120 to 170 per minute of 350 lbs. each, and are uniform in strength. The statement is made, which we can

readily believe, that the saving, as compared with hand-labour, is something like 300 per cent., which includes the time lost in setting and moving the machine. In most descriptions of mining operations where only hand-power is needed the efficiency of this drill is being recognised, and it has only one enemy to contend with, namely, prejudice, but even this is being overcome. For countries where it is difficult to transport machinery of the ordinary kind, these drills seem to be peculiarly suitable, but, in any case, a visit to 73a, Queen Victoria Street, ought not to be without profit to those who desire to pursue mining with speed and with economy.

SAN SALVADOR SPANISH IRON ORE CO., LIMITED.

IT has almost passed into an axiom that it is mines prolific in the baser minerals that pay for exploitation rather than those reputed to be rich in the precious metals. If the fact could be ascertained it would be found that more fortunes have been made by those who have worked mines for iron, coal, lead, copper and tin than from those producing gold or silver. The latter seem to convey the promise to the eye, but too often break it to the hope. The owner of a gold mine is either a millionaire or a pauper. There seems to be for him no intermediate stage. He is either the owner of an El Dorado, or a white elephant — the proprietorship in the quadruped being more commonly his lot. With the owner of an iron deposit or a colliery it is not so. He can calculate his resources with a fair measure of accuracy, and he does not lie down at night to be unpleasantly roused in the morning with the intelligence that the gold vein has given out, or cut out, and that the dreams of incipient wealth with which he lulled himself to slumber have been but as the *mirage* of the desert, which lures the traveller to his doom. Of an iron and coal mine it may be said, "You work your property, and bank your profits.

For these reasons, and for some others which we shall be at pains to set forth, the prospectus of the San Salvador Spanish Ore Company, Limited, is entitled to special notice. The property consists of some 500 acres of iron, or hematite iron ore, contained in a number of concessions covering 500 English acres. The property, which is actually within the port and bay of Santander, has not been acquired without considerable care on the part of those responsible for the prospectus. Mr. Jeremiah Head, M.I.C.E., of Middlesborough, acknowledged to be one of the most experienced, and, at the same time, one of the most reliable experts in iron and coal, estimates that these concessions contain 5,000,000 tons of Rubio iron ore, and analyses show nearly 60 per cent. of iron. In addition to Mr. Head, Mr. Kensington has also subjected the property to a rigid examination, and both gentlemen have been guided by the experience of neighbouring properties, which have a history that bears to be told. For example, another company in this business, viz., the Consett Spanish Iron Ore Company, the shares of which are 1*l.* each, and are now at 350 per cent. premium. The average rate of dividend during the last four years has been 40 per cent. In like manner the Somorrostro Spanish Iron Ore Company's shares of 5*l.* each are 350 per cent. premium, and the dividend last year was 45 per cent. on a capital of 75,000*l.* The dividends of the Orconera Company have been about 40 per cent., and other companies are believed to be equally successful though somewhat more reticent in letting their prosperity be known. There is no district like that of Northern Spain for producing the ore from which steel is prepared, and which is now so largely used, and an immense impetus has, in consequence, been given to the trade. Whereas in 1878 the shipments were 1,000,774, in 1888 they were 3,591,637 tons. It was the hematite ore on the San Salvador property that first drew the attention of experts to its value, and led to the formation of the present company. The property is so situated that it can be worked as an open-cast, like the great Rio Tinto mines of Huelva. Shafts, levels, with all the paraphernalia of pumping gear and heavy engines, will not be required, but a self-acting tramway will provide a rapid method of conveying ores from the mines direct to the ships. To place the mines on a thorough working basis and equip them in every respect, 15,000*l.*, Mr. Kensington states, will be ample, and Mr. Head concurs. The latter gentleman is of opinion that the profits will be 2s. per ton; and, calculating these upon a basis of 150 tons per annum, the result will pay 20 per cent. dividend on the preference shares, and 10 per cent. on the ordinary shares, leaving a substantial balance to be placed to a reserve fund. The capital of the company is 60,000*l.*, in 35,000 preference shares of 1*l.* each, and 25,000 ordinary shares, also of 1*l.* each. When the dividends before-mentioned have been paid, and when a substantial sum has been set aside to a reserve fund, the profits will be divided between both classes of shares.

It is the 20 per cent. preference shares that are now offered for subscription, and the payments are arranged by easy instalments. An influential board has been formed in London, but the company will also have the advantage of a local director in the person of Mr. Turner, a member of the well-known firm of iron merchants, of Glasgow and Bilbao. It is a feature in connection with this property to which we attach great importance that 150 Spanish investors living in San Salvador and Bilbao, the very centre of the Spanish iron trade, have applied for shares in the company. This is a good indication of the esteem in which the property is held. We have only to add that the lists will close on or before Tuesday next.

BIRD'S SWAZILAND CONCESSIONS.

THERE are some points about this company which persons in search of a promising investment might, like Capt. Cuttle, "make a note of." The company has 45 square miles, and is in the neighbourhood of several properties whose success has given status on the English market to South African mines. The lease is for 50 years at a low rental, and is renewable for another 50 years at the end of that time. When the company came out the shares were subscribed three times over. The capital is very small, only 30,000*l.*, and an examination of the prospectus will prove that it has rights as extensive and property presumably of as great value as some of those other concerns floated about the same time with capitals varying from 150,000*l.* to 400,000*l.* The 10,000 shares allotted to the public are 10s. paid; the 20,000 shares of the vendors are fully-paid, and both classes are quoted at a premium. The capital in hand is 6,630*l.* The total expenditure, so far, has been small, and the machinery for testing the reef has already been put up. The mines have been duly transferred to the company, and the manager is on the spot. So far as tested the reefs are of considerable value, and the statements made at the statutory meeting on Wednesday were altogether re-assuring.

EASTMANS, LIMITED.

THIS company has been formed for the purpose of amalgamating the businesses of Messrs. T. C. and J. Eastman and Messrs. John Bell and Sons, Limited, and will carry on the business of exportation and distribution of American and other meats. The importation of meat from America has grown to such magnitude during the last few years that a company proposing to do a business such as the prospectus of this company sets forth should stand a very good chance of success. Messrs. Eastman have been for some years engaged in the business of buying cattle in the western markets of America, and exporting them, either alive or in the carcase. They have also done an extensive business in the preserving and sale of hides, and manufacturing margarine, &c. Messrs. Bell and Sons have been in business over 60 years, and have done a large business, the turnover of which in the year 1888, it is stated, was 1,506,674*l.* 18s. 3d. They have about 330 shops in numerous towns in this country, the sales of which last year, it is stated, exceeded 800,000*l.* It is proposed to amalgamate these businesses under one management. The properties and business of Messrs. Eastman (with the exception of the refrigerating chambers and machinery, which will be transferred direct to the company) will be conveyed, subject to a mortgage for $400,000, at 4 per cent. for 10 years, to an American company called the Eastman Company, of New York. The price to be paid for the business and properties of Messrs. Bell and Sons, Limited (subject to a mortgage of 100,000*l.* to Messrs. Henry James Bell, at 4 per cent. for 10 years), has been fixed at 848,600*l.* The directors are gentlemen of influence and experience, and the prospectus merits the attention of investors.

THE MOUNT MORGAN EXTENDED GOLD MINING CO., LIMITED.

REPORT OF THE DIRECTORS.

THE directors submit the report, balance-sheet, and statement of accounts, to the 31st of December, 1888, embracing a period of 15 months and 25 days. Although the programme of development was determined on after careful consideration by your directors, and in conjunction with the opinion and approval of practical and experienced men, it was unhappily interrupted in consequence of the funds at the disposal of the board being insufficient to carry out the comprehensive policy of exploration and development already initiated. The operations at the mine, however, though necessarily restricted, were not altogether suspended, and were actively resumed by the local management as soon as the proceeds of the debenture issue became available for that purpose, as well as for the completion and execution of the machinery. The directors regret that the funds so supplied have proved insufficient, and that it becomes necessary to raise further capital. The directors have consulted the debenture-holders as to the best course to be adopted, and it has been decided to recommend the re-construction of the company upon the basis set forth in the accompanying notice. The directors have proposed that the debenture-holders shall accept fully-paid shares in the proposed new company in the proportion of two shares fully-paid for each 1*l.* of principal and interest due to them, a proposal which received the unanimous approval of the debenture-holders present at a meeting convened by the board to consider the subject. The directors entertain the belief that it will not be necessary to call up the full amount of 3s. a share in the new company, but they consider it essential that the operations at the mine should not be again retarded by insufficiency of funds, and provision has therefore been made for meeting all requirements. Reports, showing the steady progress of all works at the mine during a period subsequent to the date of this report and not embraced therein, have been regularly received from the local management, and promptly circulated to the shareholders through the medium of the Press. The last report, No. 38, received from the local management, is considered by your directors so interesting that it is published in detail and enclosed herein. A still later report the directors expect to receive before the date of the meeting, and such report, if forthcoming, will be placed before the shareholders on that occasion. The directors retiring are Mr. R. J. Jenkins and Mr. J. Wightman, and, being eligible, they offer themselves for re-election.—G. L. S. MAGGIOLINI, Secretary.

REPORTS OF MEETINGS.

VIRGINIA (TRANSVAAL) GOLD MINING DEVELOPING CO., LIMITED.

ACTIVE DEVELOPMENT—TRANSFER OF THE PROPERTY.

The statutory meeting of the above company was held at the Terminus Hotel, Cannon Street, on Tuesday last—Mr. Alfred Jones (chairman of the company) presided.

Mr. R. Lawrence Spicer (secretary) having read the notice convening the meeting,

The Chairman said: The meeting of to-day, as most will be aware, is somewhat of a formal character, being held in compliance with the statute which requires the first meeting of a company to be held within four months from the date of its incorporation. We have no reports or accounts to present to you, but are glad to welcome the present opportunity to put you in possession of all the information we have, and to make you acquainted with the

STEPS TAKEN TO DEVELOP THE PROPERTY.

The company was incorporated on the 7th February, with a capital of 55,000*l.* in 1*l.* shares, of which 5,000 have been reserved for subscription in South Africa; of the remaining 50,000 shares, 27,000 have been allotted to the vendors under the terms of the agreement, and 22,335 have been applied for. (Applause.) The number of shareholders on the register is 256. We think such a result highly satisfactory, when it is considered that this company was floated at a time when a season of depression was setting in on all South African mining companies, and that not a single share was underwritten, it is a proof that the public are quick to discern when a company is

HONESTLY PUT FORWARD

with fair prospects, and nothing but the ordinary mining risk to run. The *Standard* newspaper of 11th February, totally unsolicited by us or by anyone else as far as we know, did us the honour, after stating the capital and objects of the company, to put in the following remarks:—"In this case the claims of the vendors seem to be unusually modest, judged by the standard prices for similar properties paid by other Transvaal companies," and there can be no doubt, from the fact that we are

NOT OVERLOADED WITH CAPITAL,

our company stands in a particularly favourable position to become a good dividend-paying company, with the reserve which must attach to all mining enterprises, namely, as to the payable character of the quartz, which we are glad to say is of a promising nature, as may be evidenced from the specimens we have on the table before you. At the time the prospectus was issued only two reefs were known to exist within the Virginia claims, but shortly after the allotment a cable was received that a third reef had been struck, assaying 2 ozs. to the ton; it is to be hoped that this additional reef will materially increase the value of the property. (Hear, hear.) The directors lost no time after the floatation of the company in seeking out a

SUITABLE MINING MANAGER,

and recognising that this appointment was of the utmost importance, they spared neither time nor trouble in this matter, and their thanks are due to Mr. Gundry, one of our shareholders, who kindly introduced to their notice Capt. Joseph Richards, who in all respects seems to be the man for the position. His testimonials are of a high order, his experience in Cornwall, California, Nevada, being very considerable, whilst personal testimony was borne to his character as a gentleman and a man of honour. The appointment was made on 27th March, and on the 5th April Capt. Richards left for Durban in the s.s. Mexican. The directors then turned their attention to filling the post of foreman miner, and knowing that good and reliable men were difficult to obtain in South Africa, conferred with Capt. Richards before his departure, who agreed with the proposal to select one on this side, and who wrote to his brother, Capt. Isaac Richards, of the Devon Great Consols, asking him if he could recommend a suitable man, this he did with promptitude and confidence, and in such terms as led the board at once to conclude arrangements with Mr. Stenlake, who received his appointment on the 3rd of April, and left in the Drummond Castle on the 12th April. On the 22nd ult., as you have already been informed by circular, our solicitors received a cablegram from our agent at Barberton that

"THE PROPERTY HAD BEEN TRANSFERRED FROM THE VENDORS."

A short time ago the resignation of Mr. J. J. Grice as local director was received, in consequence of his residence at Durban making him of so little service to the company, and as it is desirable that there should be two local directors, while the office of local secretary was almost a sinecure, the board determined to abolish the latter office, and appoint Mr. T. E. Tarte, who had hitherto held the local secretaryship, to the vacancy caused by Mr. Grice's resignation. Mr. Tarte has been connected with the property since the reefs were found, and possesses a considerable knowledge of the mine, having been acting manager until the arrival of Capt. Joseph Richards. We received from Mr. Tarte about a fortnight since

A VERY SATISFACTORY LETTER

in regard to the water power of the Lorry creek, which is right on the property, in which he writes as follows:—"Last week I had the opinion of a competent authority on the driving power of our nearest water-race on the Lorry creek. He was the contractor who erected the Barrett-Berlyn machinery, and he says that with the extent of fall we have that the stream will drive 30 or 40 head of stamps, but that the battery must be driven by a Pelton wheel, and the water conducted some distance through iron pipes. We were very pleased here at receiving an opinion from such a high authority on the matter, as we were previously of opinion that we should be limited to 10 head of stamps on the water sight." When Capt. Richards left we arranged for him to cable us in time for this meeting to-day, as it would be impossible for him to write, on the 31st ult. we received the following message, which was coded in the usual way:—"Safely arrived; have inspected the property; am not able to form an opinion until property is more opened up, and the assay apparatus has arrived; will write fully; shall commence adit level No. 1 reef (lode)." This is exactly what we expected he would cable, as we know him to be a careful man that would not commit himself to an opinion until well able to form judgment.

THE SAMPLES OF QUARTZ

upon the table are labelled, and open for your inspection. Mr. Tarte remarks to the following effect upon them:—"The samples from No. 1 reef are of a dark brown and black colour, mostly carrying visible gold; one specimen shows a sprinkling of gold in a cavity at one corner of the stone; and another a small streak of gold along the thinnest part of the rock. Samples from No. 2 reef are of a pure white on the surface, changing to a dark blue in depth, mostly carrying fine grained gold, observable with an ordinary magnifying glass. (Hear, hear.) Most of the surface stone has the appearance of quartz mixed with seams of slate, but changes to a solid flinty-looking rock, and is the only stone I know of which is exactly like in appearance to the Sheba, of Barberton. Samples of No. 3 are of a soft, brown, honeycombed, decayed look, carrying very little visible gold. We are not without hope that alluvial gold may be found on the property in payable quantity, as Mr. Tarte wrote, under date 2nd April:—"Last week I came on good indications of

ALLUVIAL GOLD

within the claims, and succeeded from two pannings in collecting about 3 dwts. of gold in nuggets. I do not, however, put much value on this discovery as a certain indication of payable alluvial diggings within the claims so much as assign that a reef or leader carrying coarser gold than has yet been discovered exists on the mountain within the Virginia pegs." In regard to the machinery, we are awaiting a full report of the property from Capt. Richards to enable us to order same; he is also going to inspect and report on a new machine recently placed on an adjoining mine, which, if successful, shows considerable more advantages over others, being about one-fourth of the cost, and less than half the weight—an important feature in a country where the rate of transport is so excessive. (Hear, hear.) We hope to hear from Capt. Richards in sufficient time to enable us to get the machinery up country when transport is at its lowest. We conclude, unless anything unforeseen occurs, we shall be able to dispatch same by beginning of September at latest, and that it will arrive on the property in about two months from that date, so that we may expect to

BEGIN CRUSHING BY THE END OF THE PRESENT YEAR.

Meanwhile time will not be lost, as several thousand tons of quartz can be got to grass, and the mine property developed; and as the summer is the rainy season, we shall get the full advantage of our water power. We have now endeavoured to lay before you all items of interest that occur to us. Should any shareholder require any further information we shall be happy to answer any questions. In concluding our remarks we can only assure you that no effort will be spared by the executive to place the Virginia Gold Mining and Developing Company among the first of the South African mining properties. (Applause.)

Capt. Webbe: I suppose I may take it that no returns can be received from the mine until after the machinery gets out there? I suppose there are no means of crushing apart from the machinery we are sending?

The Chairman: There are no means of crushing at the mine. When the trial crushings were made it was with difficulty that the quartz was taken 2 miles to the nearest mill.

Capt. Webbe: Then I suppose you have no machinery whatever at the mines?

The Chairman: None whatever at present.

Capt. Webbe: Have the directors any idea of calling up any more of the capital that has already not been paid?

The Chairman: When we have Capt. Richard's report as to the machinery we shall probably want more capital, but not till then. We have ample to meet all our present needs.

A Shareholder: Have you heard any reports of the success that has attended, or of the operations that are going on at, the other mines in the neighbourhood of our property?

The Chairman: There is a mine not far from ours that is crushing 800 tons. They have crushed a good portion, but they will not let the results be known until they have crushed the whole. The Forbes reef is also near to us, and I think that yields about 3 ozs. to the ton.

A Shareholder: Do you propose to apply for a Stock Exchange quotation?

The Chairman: No, not at present, at any rate. We are not yet in a position to apply for that. Of course the company may force itself to the front the same as others have done. If success attends us we shall soon get a quotation.

Another Shareholder: Are there many shares not subscribed?

The Chairman: There are 665 at present not applied for, but as I said before, we have ample capital at present. Originally it was thought that 1,500*l.* would be enough, but we made it 1,800*l.*, but ultimately we added 5,000*l.* more, making the total capital 23,000*l.*

A Shareholder: I suppose you will allot more shares if they are applied for?

The Chairman: Applications for shares are continually coming in. To-day we allotted some, and at every board meeting we have held we have allotted shares. (Hear, hear.) I consider that the steady application for shares which we have experieuced is a very hopeful sign of the public appreciation of the company. (Hear, hear.)

Another Shareholder: When will the next meeting be held?

The Chairman: The articles of association give us to June, 1890, but we shall doubtless make up the accounts to the 31st of December next, and as soon as we can make up the report and balance-sheet, we shall call you together, probably, in the spring of next year. In the meantime, however, the secretary will be happy to furnish any information to shareholders at the offices of the company.

A vote of thanks to the chairman concluded the proceedings.

EAST BLUE HILLS MINE.

ENCOURAGING STATEMENT BY CAPT. BISHOP—NO CALL NEEDED.

A MEETING of this company was held at the Offices in Gracechurch Buildings, Gracechurch Street, on Thursday—Mr. Brittain in the chair.

The notice calling the meeting was read by the SECRETARY (Mr. C. B. Parry).

The accounts showed that the labour costs were 697*l*., and the merchants' bills 198*l*. The sales of black tin realised 410*l*., and the sale that day (respecting which a telegram was received later in the meeting) realised 238*l*. 11s. 1d.

POSITION SUMMARISED.

The CHAIRMAN: You have the report in your hands. The accounts are imperfect, for the reason that the telegram of to-day's sale has not arrived. According to the one now in our hands, the liabilities over assets are 544*l*. 2s. 1d. That appears to be a large amount, but we shall be able presently to give a lower estimate by the sale of tin, which will probably reach 225*l*., that will leave us with a debit balance of about 300*l*. Considering the prospects of the mine which our good friend Capt. Bishop will be able to place before you presently of the further working, we may feel ourselves safe in his hands, with the probability that before the next meeting the debit balance will be reduced, if not entirely swept away. I should prefer you to hear Capt. Bishop, but I may add that our friend Mr. Wagstaff was recently on the mine and made a thorough inspection of it, and is so fully impressed with its value that I have no doubt he will make a few remarks as to his experience, which we shall all be very pleased to hear because I know he will greatly interest you.

VIEWS OF THE CONSULTING AGENT.

Capt. BISHOP, consulting agent to the company, said: I should like to make a few remarks on the Baldhu Mine. We are driving a level at the 30, and have made a cross-cut to the north 10 to 12 fms. to intersect the lode above the heave. The lode, when intersected in the shaft, was thrown up and then thrown north, and we have cut it upon the upheaval in the cross-cut. Consequently we have it, in all probability, stauding about 10 fms. high, and it would go on in our boundary for 50 fms. Thus we have two lodes in that same level. I think that is a promising and important point, inasmuch as if we had been able to raise so much from the other part, we shall multiply it by increasing the development to the north. The lode is very promising at that point, and for the moment we have valued it at 6*l*. per fm. I do think that is a hopeful point, because if the development of that part on the north proves as productive as the south, of course we have two strings to our bow. We have driven on that level, and, as far as we can see, it is of a very promising character; the lode is about 2 ft. wide, and the surroundings look very promising. I made an inspection of the property six months ago, and wrote a report advising you to drive a deep adit level to cut the lode. The shaft being down near the lode at about 150 fms. to the south (of where we drove the deep adit on the Pink lode) it has deen found regular and well-defined. At times it produces stones of mineral, but nothing to value, and, inasmuch as the Pink lode is one of the chief lodes, it is a hopeful point to pursue. There is a cross-cut further south, driven from the Pink lode towards the West Kitty lode. I am informed that that is very near the West Kitty lode. I have not seen it yet. because we are clearing out the level, and trying to get air there, but when we have seen it, it will become a question one day whether, if the other part turns out to your satisfaction and to mine, we may be inclined to put a shaft down between the lodes.

I THINK THE SETT IS PROMISING.

The operations are somewhat limited for the time, but in the future we may see our way to open it up a little more briskly. The sales of tin, though not high, are yet larger than they were formerly, simply for the reason that we are developing the western ground more vigorously than has hitherto beeu done. The ground is easily driven, and the mine can be cheaply worked. Hence a little improvement may bring you, I will not say, into a dividend-paying position, but to meet your demands, and from that point go on to better things. A little further improvement would make affairs wear quite another phase. I consider the property most hopeful, and am quite satisfied with present appearances. This, I repeat, is not an expensive miue to work, and the lodes you have in the sett are the chief lodes in the district. Altogether the position is extremely good. (Cheers.)

Mr. HODGKINSON: The points in operation are worth 40*l*., which is higher than they have ever been except once before.

GOOD TIN SALES.

Capt. BISHOP: You can easily see that the points cannot be valued without taking into consideration the tin sold in the time. We have no tin to any appreciable amount, except in the two stopes and the 30 driving on the Baldhu lode. Assuming we have sold 4 tons to-day (the telegram has not arrived) that will be 11 tons in the four months, and you will see that I have not over-rated the points. (Hear, hear.) The tin came entirely out of the bargains, which I value to-day at 10*l*. or 12*l*. per fm.

Mr. SIMMONS: Do you anticipate these points will last for some time to come?

Capt. BISHOP: The north cross-cut is additional to what we had before. That is quite a new piece of ground.

VIEWS OF A LARGE SHAREHOLDER WHO HAS INSPECTED THE MINE.

Mr. WAGSTAFF: I visited the mine with Capt. Bishop. I have visited East Blue Hills before, but this time I must say I was extremely pleased as far as the top workings were concerned. They showed a material improvement in every respect. Capt. Bishop's supervision has altered things at East Blue Hills altogether. With regard to the machinery he has completely overhauled it, and put it into a state of repair, but in certain respects it is rather defective. The machinery for working the stamps is not very good, but Capt. Bishop has had alterations and repairs made and I have no doubt it will answer for the time. The whole of the mine and its surroundings has improved considerably under the supervision of Capt. Bishop, so that there is a very different state of affairs from what existed under the late manager. (Cheers.)

The CHAIRMAN: Shall we be able to do without making a call at this meeting?

NO CALL.

Capt. BISHOP: Under all the circumstances I think we can do without a call. I am a cautious man, but I think I may go so far as to say that we shall do a little better next time.

The CHAIRMAN: The accounts show a balance of liabilities over assets of 540*l*., but the ore bill of 238*l*. (that is the result telegraphed of to-day's sale) will leave a debit of about 300*l*. We have such good prospects before us that you cannot do better than pass the accounts and look forward to a much more hopeful future. Some of our friends who have seen the mine had such a good opinion of it that they consider it will be one of the best mines that we have in connection with this office. I move the adoption of the accounts, together with the agents' report.

Mr. WAGSTAFF seconded the motion, which was carried.

Capt. BISHOP: Our increase of tin or otherwise will depend largely on the new lode we have cut. It has been cut, well-defined, and promising. I value it at 6*l*. per fm., and at any moment we may cut something on the Pink lode.

The report was unanimously adopted.

SATISFACTION WITH CAPT. BISHOP.

The CHAIRMAN: We have to thank Capt. Bishop for the able way in which he has conducted the company. He is making the mine totally uew, and we are very well satisfied and pleased with what he has done. I think it is only an act of courtesy on our part to thank him. I propose a vote of thauks to him.

Mr. WAGSTAFF: I shall have much pleasure in scconding it.

The motion was carried unanimously.

The CHAIRMAN: We desire that you may have as much success in mining in the future as you have had in the past.

Capt. BISHOP: I am very much obliged to you for your kind expression of thanks. I always try to do the best I can, and in the most energetic and economic manner possible. Six mouths ago, when Mr. Hodgkinson and some other gentlemen asked me to become your consulting agent, the lode was poor, but we have opened it to an extent that has given us nearly 20 tons of tin in the two accounts. The water charges are very light, the expenses low, and altogether you have a very promising property. Somehow I like the sett and I like the surroundings. I think we can manage with the present machinery for the time being.

The proceedings closed after Mr. Brittain had been thanked for his courteous conduct in the chair.

PRINCE ROYAL MINE.

DRAINING THE MINE—HOPEFUL OUTLOOK—A CALL OF 6D. PER SHARE.

A GENERAL MEETING of the adventurers in the Prince Royal Mine was held at the Offices in Gracechurch Buildings on Thursday, under the presidency of J. Brittain, Esq.

Mr. PARRY read the notice convening the meeting, and the minutes of the previous meeting, which were duly confirmed.

CAPTAIN BISHOP'S REPORT.

Captaiu Bishop's report was as follows:—

6th June.—Since the last meeting the adit level has been cleared and secured with adit shafts, &c. The engineers have put in the multiplying gear to the engine, which is working very satisfactorily. The mine is now drained to a depth of 5 fms. below the 20-fm. level, and it is to be hoped that within a fortnight from this time the mine will be drained to the bottom.—C. J. BISHOP.

RE-COMMENCING OPERATIONS.

The CHAIRMAN, in moving the adoption of the accounts, said that the mine had been in abeyance, and the works kept but slightly in repair from March last until the end of April, when operations were again resumed. The mine had been very considerably drained, and they were now about to re-start mining operations, and it would be necessary to provide a little capital. The present liabilities were 258*l*. 19s. 6d., against which there were arrears of call 176*l*., and other calls due on forfeited shares. He thought proceedings should be taken to recover these, because it was absolutely necessary that funds should be available for continuing the mine. At the same time he thought it advisable—and in this Capt. Bishop concurred—to make another call of 6d., which would wipe off the debit balance of 258*l*. 19s. 6d., and then any of the arrears of call that were recovered would go towards the working expenses for the next three months. Capt. Bishop had a very good opinion of the future of the property, and as soon as he was able to go down the mine he would furnish a detailed report.

Mr. WAGSTAFF seconded the motion.

AN EXPERT'S OPINION.

Capt. NANCE said he held a very strong opinion that this mine would turn out well, and in proof of his faith in it he was the holder of some 600 shares.

Capt. BISHOP said he had been informed that the chief part of the tin ground was in the bottom of the shaft for a length of 10 or 20 fms. The lode in the bottom of the shaft had been reported to be worth about 20*l*. per fm. When the mine was forked out he would make a special report, and, if circumstances warranted it, he would recommend that the shaft be sunk as rapidly as possible to ascertain what tin was there. This, he thought, should be done by contract.

The accounts were unanimously adopted.

Mr. SIMMONS proposed "That a call of 6d. be made, payable on the 6th July."

Capt. NANCE seconded the motion, which was carried.

CALLS IN ARREAR.

The CHAIRMAN moved "That immediate legal proceedings be taken to recover the arrears of calls.

Mr. SIMMONS secouded the motion, which was agreed to, and the meeting separated.

"LA VELERA," LIMITED.

AFTER A LONG DELAY THE COMPANY IS ABOUT TO MAKE RETURNS, AND THE SHAREHOLDERS ARE ADVISED NOT TO THROW AWAY THEIR SHARES—ENCOURAGING STATEMENTS BY AN EYE-WITNESS.

THE general meeting and the extraordinary general meeting of this company was held at the Cannon Street Hotel, on Tuesday.—James G. Bellamy, Esq. (chairman of the company), presided.

Mr. FOSTER BIGG (secretary), read the notice calling the meeting.

AN ANNIVERSARY.

The CHAIRMAN: In the first place, I may mention that this day, the 4th June, is the anniversary of the first meeting of the board of directors. I find on looking back at the attendance book that the directors met on the 4th June, 1886, and, therefore, we have been actually, to-day, three years at work on this property. It is not my intention to delay you for any great length of time, as I take it that most of you are men of business, and at this hour of the day time is of importance and value. I think the notice already sent out with the report has dealt somewhat fully with all matters connected with your property, and, therefore, it would be nearly reiteration on my part dealing with that subject, and particularly so as Mr. Albert Hess is here, and has just returned from the mine, so that he will be able to tell you what he has seen and known, which is far better than hearing from me what I believe and have heard. The directors have, in the first place, to apologise to you for the fact that this meeting is somewhat overdue. According to the articles, we should have called you together in March or April, but the directors thought it would be more satisfactory to you and to themselves if, before the meeting was called, Mr. Albert Hess, who procedeed to the mine, should have returned, as he would be able to tell you exactly what the state of the property is. I may say the principal reason for Mr. Albert Hess again kindly consenting to go out to the property was that your directors fondly hoped that before 1888 had finished the mine would be in full work.

JOINT ACTION.

We fully expected that, but certain delays took place on account of the want of proper water supply, and at the very time the directors were deliberating amongst themselves as to the advisability of sendiug someone to the property to report on the cause of delay, certain shareholders had also met and wrote to us that one of their number had most kindly consented to proceed to the mines and report for the general body of shareholders. We thought this a very good chance indeed, and suggested that as Mr. Albert Hess was going out they should go together. Unfortunately, sickness stepped in, and the hon. proprictor was unable to go, but notwithstanding this we immediately asked Mr. Albert Hess to proceed to the property, and he did so. What he has done and seen he himself, I have no doubt, will tell you as soon as I have finished. I am very pleased to say that the property is now ours. The final payment due at the latter end of April of 1,600*l.* was remitted by us, and, therefore, the property is fully paid for. As regards its value, I do not think there can be any doubt in the minds of the shareholders. It has been reported upon most fully by several able engineers. The property seems to increase in value the more it is investigated. I daresay certain shareholders occasionally receive circulars from outside brokers, saying that they have a buyer for a few shares at 14s. 9d. or 15s. 6½d., but the value of your shares, outside any speculative iuvestuent, is far over par, and that this will be proved to you I am as certain as that I am of standiug here, because our mining engineer,

MR. JOSEPH JEWELL, IS NOT A SANGUINE MAN,

but one who is most careful, and what he says he fully abides by. I have great pleasure in alluding to the last letter received from him, in which he says: "I am pleased to report that the construction of reservoirs is proceeding satisfactorily, aud my plans are so organised that everything will be in readiness to start crushing at the commencement of the raius." The commencement of the rains we know is in June. "I assure you I feel greatly encouraged, as I see no further set-back, and shall shortly see myself able to receive my 5 per cent., which will accrue from the profits." You know that he has accepted a moderate salary, hoping to recoup himself out of 5 per cent. of the net allowed on profits, according to his arrangements. "I shall then be compensated for the hardships in this outlandish country. All points throughout the mine are looking well—more especially the lode in No. 2 tunnel, which has greatly improved." Therefore I think we can take it that in a very short space of time, not to be reckoned by months but by weeks, you will see your mine fully at work, and very handsome returns beiug derived from it.

GOOD ADVICE.

Therefore I would particularly urge you not to sell your shares at anything like a sacrifice. You have had three years of patient waitiug, and therefore you should not hastily part with your property. As regards the debenture issue, it was made some time ago, and I am very pleased to tell you that only 4,000*l.* still remains to be placed, and although the time is now closed for applications, still I have no doubt that if any shareholder wished to put a little more money into the company he can do so, but we do not press it upon them at all. I have an apology to make, and that is our printers have disappointed us in regard to the accounts.

THE ACCOUNTS.

The orders were given to finish them for this meeting, and they were promised by half-past 10 this morning, but they have not arrived. We have proof copies, and I will just read through the chief item. The accounts are only audited up to the 31st of December. At that time the payments on account of the purchase of the mine were 48,000*l.* The purchase has been completed, aud the total amouut of 50,500*l.* has been paid, namely, 36,250*l.* in shares and 14,250*l.* in cash. The origiual price to be paid to the vendors was 75,000*l.*, but that was reduced to 50,500*l.*,

A CLEAR SAVING TO THE COMPANY OF 24,500*l.*

The bank balance on the 31st December was very small indeed. It was only 91*l.* 6*s.*, but if I take the accounts up to date I find that we have in hand at the bankers in Mexico on current account for paying for the piping and reservoirs a sufficient amount to pay all those charges, and so we stand on what is commonly called "velvet" at the present time. It is customary to ask shareholders to pass the accounts, but I do not see that I can do it at the present time.

Mr. BROWN (solicitor): You had better postpone it. A confirmatory meeting will be held in reference to the special resolution, and perhaps then the accounts will be taken on that date.

The CHAIRMAN: I will conclude by offering to answer any questions you may wish to address to me, and by proposing the adoption of the report, leaving the accounts until the next meeting. In the meantime care will be taken to circulate them among the shareholders. (Cheers.)

Mr. F. HESS (director) seconded the motion, which was carried.

VIEWS OF MR. ALBERT HESS.

Mr. ALBERT HESS: Gentlemen, you will see before you a very good plan of the mine, which was executed here. There are also sketches and details which have been sent home by Mr. Jewell. If you look at this map as well as at the report, you will see that a great deal of work has been done at the mine. Tunnels have been driven and a variety of other mining work—some of it old and some of it new. The new discovery was made on the same level as the A tunnel—118 to the north-west. It is a good piece of property, and we have great expectations concerning it. A winze is being sunk, and there is also a drive from the A tunnel so as to get a communication from the new discovery. In the No. 1 tunnel various cross-cuts have been driven to strike the new discovery vein at different intervals, and two of them are in the lowest level. A great deal of work has been done in the lower, though not in the upper part of the mine. We know that we shall strike the ore body. The machinery has been well erected, and from the test of the ore made we judged that it will work satisfactorily. A very small amount of work remains to be done, but it includes the furnace. We shall require a month to concentrate before we begin to smelt, because the smelting is greater than the concentrating power.

RETURNS SOON TO BE EXPECTED.

As regards the amount of work you can do, the plant is for 21 or 25 tons a day. Of course you will start with a smaller amount at first. probably about 10 tons, until you get into full working order, after which you will naturally go on increasing your output, your coucentration and your refining. The question of the water will be settled in a short time—in fact the pipes will shortly be on the spot, and there will be nothing to interfere with them.

I HAVE VISITED THE MINE THREE TIMES

during the last two years. Mr. Hawkins made an independent examination of it also, and I was there at the time. He is a man who stands very high in his profession in America, and, in fact, is one of the leading experts there. He was exceedingly pleased with our mine. He is very strict in taking samples. I was myself, but he even surpassed me. You will notice that some of the ore gives a little less than some of my samples, but he took the whole width of the vein, including, of course, all kinds of refuse with it. The samples sent to the Government Mint were assayed there, and they are above suspicion. There are coalfields within 80 miles of the mine, which have just been bought by a large Chicago syndicate, and it is the intention of these gentlemen to build a railway from Sonora up there. Your mines will then be brought within two days' ride of a railway station. The railway will make your property more valuable, because it will shorten by more than one-half your present district of the railway station. (Cheers.)

AN OLD WYNAAD FRIEND TURNS UP.

Mr. OLIVER PEGLER: We have listened to your opening remarks with pleasure; perhaps at a future time you will have to tell us more of a pleasing character. I have had experience in mining matters. I have never had the pleasure of meeting Mr. Hess, but I know him to be a gentleman of high reputation and integrity. I have listened with great pleasure to his remarks, and should like to ask a few questions. What is the share capital?

The CHAIRMAN: 100,000*l.*, of which 57,030*l.* has been issued, but it is nominally 100,000*l.* In addition to this we have 25,000*l.* of debentures.

Mr. PEGLER: Are the furnaces adapted for the consumption of charcoal?

Mr. HESS said yes, and went on to explain the precise inclination of the lode.

Mr. PEGLER: You have mentioned that we are near coalfields; is that in your mind a very important feature?

Mr. HESS: It is to a certain extent. The railway will of course cheapen carriage, and be of great assistance to the mine, though I do not attach any importance to its bringing us nearer to the coal.

A RETIRED EXPERT.

Mr. PEGLER: I have a great deal to do with miniug, though I have retired from the profession, but my experience has taught me that there is no class of mining more profitable than that of silver. I am not a large shareholder, but I have taken a few shares because of the reports I have heard, and if I can pick up a few of those alluded to by the chairman I shall be only too pleased to do so. I have followed the reports of the engineers and also what Mr. Hess has said, and everything convinces me of the great honesty of the mine. I am certain that promoters could have made a boom in the shares if they had so chosen, but they have not done so. They have tried to develop this mine upou its merits. I believe you have a magnificent deposit,

A ZONE OF SILVER,

and you are only just at the cap of it. If you penetrate deeper you will, in my opiuion, find that the lode increases in richness and in width, and you may be assured that the property is one of great value. The total capital of the company is 100,000*l.*, of which only a part has been issued, and you have 25,000*l.* of debentures. I am certain that you have a mine of great wealth that is developiug a lode 4 or 5 ft. in width, and giving 200 ozs. to the ton, though some of the assays are much higher. I leave you to judge from the chairman's figures what will be the yield per annum. My name is too valuable to be committed to exaggerated statements, but the reports say there is any amount of ore for years to come—iu other words, there are reserves. My own opinion is that if you work this mine vigorously, you will be able to get

100 ozs. to the ton. The small amount of capital that you have will be in your favour, and the fact that Mr. Jewell has taken his position at a low remuneration, with 5 per cent. out of profits, shows the faith he has in the property, and I am certain he is heartily with us in striving honestly to develop the mine. In conclusion, I advise the shareholders to pick up the shares cheaply if they can.

A FEW FIGURES.

The CHAIRMAN: As regards the figures alluded to, I have dotted down a few which may interest you. I take it that instead of crushing 25 tons we only crush 20 tons per day, and I take 300 days for the working year. That gives us 6,000 tons, and instead of taking 200 ozs. to the ton I merely take 150, and I find that gives us no less than 157,500*l*. From that I deduct 6*l*. per ton to cover the expenses (a liberal allowance) which gives us 121,500*l*. Divide that by half and you will have 60 per cent. for your money, and we shall be happy enough to get it. (Cheers and laughter.)

The report (but not the accounts) was then unanimously adopted.

Mr. E. D. SMITH proposed the re-election of the auditor, Mr. Doubleday.

Mr. GEARY seconded the motion, which was carried unanimously; as was also a subsequent resolution, fixing his remuneration at 10 guineas.

The CHAIRMAN said that at this meeting he would retire from office, but would be happy to serve again if the shareholders still had confidence in him. (Loud cheers.)

Mr. CUMMINS proposed, and Mr. J. D. FOX seconded, the re-election of the chairman, which was carried by acclamation.

DIRECTORS WORK FOR NOTHING.

The CHAIRMAN: I am very much obliged to you for your kindness. I have been working in this company for three years, during which time we have not received fees, and we do not wish for any until we have paid you a dividend. (Cheers.) During this period we have attended something like 200 board meetings (some of them lasting many hours), besides which we have attended other meetings outside those regularly called. For my own part, I can only say that I shall do what I have done in the past—give my utmost services for your benefit and my own. (Cheers.)

STAFF NOT FORGOTTEN.

Mr. PEGLER proposed a cordial vote of thanks to the staff in which he wished to include specially Mr. Jewell, his brother, and Capt. Breay. They had great hardships to put up with, as was evident from a phrase in Mr. Jewell's letter read to-day, that they were living in "an outlandish place." They were men of great ability, and it was significant that Mr. Jewell had made his remuneration partly dependent on results. They were working economically, and, in fact, the whole policy of the management at home and abroad was economy, in which respect they followed the pioneers of mining in the United States. If mining were carried out on these lines generally, there would be fewer fiascos than we now had.

Mr. GURLITT seconded the motion, which was carried.

A vote of thanks to the chairman for all he had done for the company brought to a close the proceedings.

BIRD'S SWAZILAND CONCESSION.

A COMPANY WITH A SMALL CAPITAL, AND A BIG PROPERTY—SHARES LARGELY OVER-SUBSCRIBED—SATISFACTORY POSITION.

THE statutory meeting was held on Wednesday at the Offices, 63, New Broad Street, E.C.—L. P. Allen, Esq. (chairman of the company) presided.

The SECRETARY (Mr. Frank Fuller) read the notice calling the meeting.

The CHAIRMAN: Gentlemen, this being only the statutory meeting, held in accordance with the requirements of the Act, we have nothing particular to lay before you, though I shall be very happy to give you all the information which we possess, and just detail what we have done since the company was incorporated. The nominal capital of the company is 30,000*l*., which we consider compares very favourably with the large capital of most other companies of this sort, and we allotted in shares for the property 20,000*l*.—

THE CAPITAL WAS LARGELY OVER-SUBSCRIBED

—giving us therefore 10,000*l*. of subscribed capital, out of which an amount of 2,500*l*. had to be paid in cash for the purchase of the property, leaving 7,500*l*. reserved for working capital. Of this only 840*l*. has been spent, so far, in buying the necessary pack animals and a complete assay outfit, &c., and paying all the expenses connected with sending out the manager. I may mention also that we have engaged as manager a very suitable man, with respect to whom we have received very favourable testimonials, and, as far as we can see, he is thoroughly suited for the work he is intended to perform.

MANAGER ON THE PROPERTY.

He sailed from here on March 15th, and announced his arrival at Durbau on April 13th; since then he has arrived on the property, and we, therefore, hope now he has quite settled down to his work. The company was registered on February 6th, and we went to allotment on February 13th. I think, therefore, you will say there has not been much time lost in engaging a manager and sending him out. (Hear, hear.) It is not always easy, when a property is so far distant, to get a man there under a considerable amount of time. After all the expenses have been paid

WE HAVE 6,660*l*. OF AVAILABLE WORKING CAPITAL,

which we trust will be ample to carry us on until we have something more to announce to you. We hear from various sources that the concession is considered very good out there, and that there have been several reefs known to be found on the property, some of which, I believe, were considered to contain gold, which, of course, is very reassuring. The title has been fully registered out there. Mr. Miller has been appointed secretary to the king, in place of Mr. Shepstone, and he registered the transfer out there with Umbandine, the king, and it has been sealed and passed through in the ordinary manner. Of course, what we have to do now is to wait until we get advices from our manager, which we are expecting to receive in due course. Naturally we all hope that he will find a payable reef on which we can commence operations. I ought to have mentioned that the working capital I spoke of, 6,000*l*. odd, is expected to last, at the present rate of expenditure, two or three years, and if we cannot find something in that time we shall all be very disappointed, of course. I think that is all I have to tell you, gentlemen, to-day. We have been very glad to have the opportunity of seeing some of the shareholders here, and if you like to ask any questions I shall be happy to answer them.

QUESTIONS.

Genl. KAYE: Has there been any survey?

The CHAIRMAN: A rough survey of boundaries. You see, it is an enormous property—about 45 miles—and it was important to get the boundaries properly defined.

In reply to further questions it was stated that the Umtillan River ran through the property. There was no doubt about the existence of gold on the property and in the river; that was an ascertained fact.

Major-Genl. A. C. Bruce, C.B. (director), said the company had the water right, which was a very important consideration.

Mr. GEORGE BROWN moved a vote of thanks to the chairman, and expressed satisfaction with the steps the board had taken in reference to the property.

The motion was unanimously carried.

The CHAIRMAN, in reply, said the directors were interested as much as the shareholders in the success of the property, and hoped they would obtain good results. The manager, he added, had with him a complete assay plant, and would immediately test any rock he found. Any information the directors received they intended to keep the shareholders advised of through the newspapers. (Applause.)

The meeting then closed.

WEST CARSIZE MINE.

A CALL OF 1s.—SHAREHOLDERS DECIDE TO GIVE THE MINE ANOTHER TRIAL.

A MEETING of the shareholders of this company was held at the Office, Gracechurch Buildings, Gracechurch Street, yesterday—Mr. John Brittain in the chair.

Mr. C. B. PARRY (secretary), read the notice convening the meeting, and also the minutes of the previous meeting.

AGENT'S REPORT.

The CHAIRMAN then read the agent's report as follows:—

6th June.—Since the last meeting of the adventurers on the 13th February, 1889, we have completed the sinking of the engine shaft to the 40-fm. level, cut plat, and secured it with timber; also cased and divided the shaft from the 30 to the 40-fm. level, and put everything in working order to this depth. The 40-fm. level is driven east of the engine shaft 10 fms. 1 ft.; the lode for the drivage has been about 1 ft. wide, at times producing a little tin, but not much to value. The 40-fm. level is driven west of shaft 8 fms. 3 ft.; lode at times producing a little tin. The 30-fm. level has been driven west on the old Carzise lode 24 fms. on a lode about 1 ft. 3 ins. wide, composed principally of quartz, with red and white prian, at times producing good stones of tin. The engine shaft is being sunk below the 40-fm. level about 3 fms. The lode has been split in branches, altogether about 3 ft. wide; in the last 2 ft. sinking the ground is getting harder, and has a much kindlier appearance for producing mineral. The branch or leaders on the north side or footwall has greatly increased in size, which is now 1 ft. 6 ins. wide, with a little tin, mundic, &c., sinking by six men, at 8*l*. 10s. per fm. I should strongly recommend this shaft be sunk at least to the 50-fm. level. This lode, since we left the slide, has been in a transition state, and no doubt in depth it will be equally rich, as on the top. The shaft on the old Tinners' workings, on the Old Carsize lode, has been cleared up 15 fms., and cannot go any deeper on account of water. The ground about the shaft left by the old men will produce tin, but not in paying quantities. In the eastern part of the mine we have cleared the adit cross-cut south of footway shaft 12 fms. 3 ft. to Old Carsize lode, and cleared east on the lode 12 fms., and drove the end 2 fms., which produced tin of a rich quality; worth 4*l*. 10s. per ton off stuff as broken. To the west of this end the lode is extensively worked and taken away to surface, a distance of 17 fms.; to the east of this there is a pair of tributers working, and getting good wages. Their tin-stuff is of a rich quality; worth 5*l*. per ton of stuff. In the past four months we have sunk and drove on the various lodes 60 fms. 4 ft. 2 ins.; and cleared shafts and levels 34 fms. 3 ft.; and sold tin, 23*l*. 3s. 10d. worth, and have about 20*l*. worth on the mine.—J. CURTIS.

SHALL THE MINE BE ABANDONED?

THE CHAIRMAN: Gentlemen, I think that is a very unsatisfactory report. If we can only produce 23*l*. 3s. 10d. worth of tin at a cost of 62*l*., the sooner we turn it up the better. I am not going to continue paying 40*l*. or 50*l*. every three months to get 22*l*. or 23*l*. worth of tin. Therefore, we shall have to decide to-day whether we go on with the mine or not.

Mr. SIMMONDS: I should like to know who is responsible for the statement in the prospectus on which this mine was started. The statement was that the shaft had been sunk a few fathoms, and out of this shaft 16 tons had been taken. I was induced to take up my shares on that assertion, and whoever made that statement should have something to say.

The CHAIRMAN: I came across a piece of paper the other day containing the statement you speak of, and I think, as you say, not only you, but most of us, were induced by that report to take up our shares.

Capt. CURTIS: So far as the adventure has gone I am greatly deceived myself. I am a holder of 180 shares. I would recommend taking the shaft down to 50 fms., and then if the lode does not improve we must then stop.

Capt. NANCE: I have been thinking a good deal about West Carsize. Our main points are at the bottom of the mine, and I wrote to Capt. Curtis and suggested that we should confine our operations to the bottom of this shaft, sink the shaft, and drive the 45-fm. level east. You have not discovered anything west.

THE ENGINE SHAFT TO BE SUNK TO 50-FM. LEVEL.

Capt. CURTIS: Before I received your letter I had a letter from Mr. Parry to stop all operations, except sinking the shaft. I recommended sinking the shaft to the 50, and if the lode does not improve throw up the sponge. We never had a lode so big as we have got it now in the bottom of the shaft.

Mr. PARRY: Mr. Hodgkinson, who is a large shareholder, left a proxy with me in favour of sinking the shaft down to the 50, and if there is no improvement, then to throw it up.

Mr. WAGSTAFF: I will be one to agree with Mr. Hodgkinson to sink the shaft, and do nothing but the shaft.

THE EXPENDITURE.

Mr. PARRY: What do you think would be the total monthly expenditure.

Capt. CURTIS: 50*l*. a month.

Mr. WAGSTAFF: And it would take three months.

Capt. CURTIS: Yes.

Mr. WAGSTAFF suggested that the work should be done by tributers.

Capt. CURTIS said he did not think men would take on the work.

Capt. NANTES: My view of the matter is this—the tributer gets two-thirds of what he produces and the company one-third, and certainly there is no objectiou to the tributers working on these conditions, or on any conditions, which would cause no loss to the company. Give them 20s. in the £ even for what they get. They might find a bonanza.

The CHAIRMAN: I think we had better limit you to this 50*l*. a-month, and if you can let it to tributers you better do so.

Capt. CURTIS: What I am to understand is our operations are to be confined to the sinking of the engine shaft.

The CHAIRMAN: Yes, and we shall expect that done in three months.

THE ACCOUNTS.

Well, now gentlemen, with regard to the accounts which are before you. You can see the state of affairs. We are left with a debt of 631*l*. 3s. 6d. I shall now submit "That these accounts be allowed and passed, printed, and circulated amongst the shareholders, together with the agent's report and proceedings of this meeting."

Mr. WAGSTAFF seconded the motion, which was carried unanimously.

The CHAIRMAN: As we have a debit balance we must provide for it being cleared off. I shall propose a call of the same amount as last time (1s.) That will give us 600*l*., and will be sufficient. I beg to propose a call of 1s., made payable at the bankers on 29th June.

Mr. SIMMONDS seconded the motion, which was carried.

ARREARS OF CALLS.

The CHAIRMAN: There is one more resolution—That immediate legal proceedings be taken to recover arrears of calls amountiug to 155*l*. 4s. If these arrears can be recovered it will go very materially to the cost of sinking the shaft. It is necessary these calls should be paid, because recently our bankers had not sufficient funds in hand to pay all the accounts that were presented to them, and we were placed in a very awkward positiou. Therefore I beg to propose this resolution.

Mr. SIMMONDS seconded the motion, which was carried.

The meeting terminated with the usual vote of thanks to the chairman.

NOUVEAU MONDE GOLD MINING CO., LIMITED.

WORK ACCOMPLISHED BY THE NEW MANAGER — INTERNAL DISSENSIONS—A LIVELY MEETING.

A MEETING of the shareholders in this company was held yesterday at Cannon Street Hotel, under the presidency of Alexander Brogden, Esq., J.P.

Mr. STEVENSON (secretary) read the notice convening the meeting

THE LEGALITY OF THE MEETING QUESTIONED.

Mr. RICHARD BAKER, the company's late secretary, asked where and when the notice appeared.

Mr. STEVENSON: In the papers on the 29th May.

Mr. BAKER, amidst considerable interruption, protested against the meeting being held, on the ground that it was illegal, the 10 clear days specified by the articles of association not having been given.

The CHAIRMAN said that on the very day that the accounts were received from the auditor the notice convening the meeting was inserted, but unfortunately the printing, &c., occupied a few days more than was anticipated, and consequently a little delay was occasioned in circulating the report and balance-sheet amongst the shareholders. It had been the desire of the board to hold the meeting as quickly as posible, but he was bound to say that the accounts were left by Mr. Baker in such a state that it took the auditors a very long time before they could get them into anything like proper shape. (Hear, hear.) Had the meeting not been called for to-day it must have been postponed until after the holidays, which would have been a very undesirable thing to do.

THE DIRECTORATE.

To begin with, he should tell them that the articles of association required that there should be four directors, and to a certain extent there had been some irregularity, as there were now only three. When Messrs. McMillan and Wallis retired from the board. the remainder of the board were anxious to conduct the affairs of the Company with the greatest economy, and they had been in negotiation with three or four influential people to join the directorate. Complications, however, that existed at the time prevented some of them from doing so; but negotiotions were still going on, and it was hoped that soon another gentleman would be elected to bring the number up to four. The directors had no personal feeling in the matter, but merely wished to act with a view to ecouomy and regularity.

ACCOUNTS.

As regarded the accounts, some of the items required a little explanation. They would naturally ask what was the amount of cash received. If they took the 34,806*l*. 15s. on the credit side of the account off the 45,671*l*. 10s. on the debit side of the account, that would leave a balance of 10,000*l*. odd, which was the amount of cash they had actually received. 5,000*l*. had been paid in cash to the vendor of the Tarryall Gold Placer, and the preliminary expenses and expenditure on works, &c., appeared in the balance-sheet. Unpaid calls amounted to 1,339*l*. 5s., the shares in respect of which had been forfeited, and there were 4,814 shares of the Nouveau Monde Company, the cash for which was never received from the persons to whom they were allotted, although their names were duly put down for them. Preliminary expenses, 1,688*l*., included the whole of the cost of advertising, brokerage, and everything connected with the bringing out of the company, and he thought they would all admit that that was not excessive. They had paid the Nouvean Monde Company én Commandite 15,000*l*. in shares to enable them to pay their debts, and they had still to receive from them 40,000 shares, to be exchanged for 20,000 in this company, and the 5,000*l*., which this company had to pay to the Nouvean Monde Comany én Commandite was repayable by them in consideration of their getting the 20,000 shares, so that the one item stood against the other.

CLAIM BY THE FRENCH COMPANY.

Speaking of the French Company, the board had had proposals for a settlement of the claim against the former syndidate, which, however, they did not deem adequate, but negotiations were still pending with regard to it. He might say that a judgment had been obtaiued for a considerable sum of money against certain parties, who were members of the syndicate. The question however, being *sub judice*, he would ask them not to press him for further details regarding the matter. Passing on to the Tarryall Creek Gold Property, he was glad to be able to say that they had finished preparatory work, and were now eugaged in hydraulicing the gravel. There had not been a clean up yet, but a telegram from Mr. Fortune, received at the end of May, stated that the gravel was being washed with great speed, and it was looking well. Mr. Fortune had been working well, and they had very satisfactory confirmation of that from Mr. Vernon Kennedy, who went over there because they were unfortunately thrown into serious doubts regarding the truthfulness of the information they had previously received. Mr. Kennedy gave a very good report, in which he stated that the chief aim of the present manager had been more with a view to future results than present gains—such as getting control over the water supply, which he had done in a most substantial manner. Mr. Kennedy also stated that there were two main ditches, each about 2½ miles in length; these had been cleaned up and widened, and were now 5½ ft. wide in the bottom, During the winter, Mr. Fortune had been doing prospecting work, sinking shafts, &c. The gravel from the bedrock would go over $2 per cubic yd., and from top to bottom would yield at least 85 cents. per cubic yd. They would see, therefore, that they had got

A REAL PROPERTY,

and it was now in working order. Some people had said that they had been too long over it. Mr. Fortune's engagement commenced in March of last year, and considering the amount of work accomplished since then he did not think they would be dissatisfied. Mr. Fortune was a man of ability and of good reputation, and if Mr. Baker, the late secretary, ever did the company any good, certainly he did it in finding them Mr. Fortune. An item of 2,000*l*. in the accounts for debeutures was explained by the fact that he (the chairman) had advanced money to secure the Tarryall Creek property for the company. (Cheers.) The other directors had also assisted the company in various ways, and no fees had been drawn for a very considerable time. They had been working hard to get everything put iuto perfect order, and they felt confident that there would be a result for the shareholders after the present season was over. (Cheers.) He moved the adoption of the report and accounts.

Mr. JOHN SHAW KENNEDY seconded the motion.

A LIVELY SCENE.

A SHAREHOLDER: For what reasou did the other two directors retire?

The CHAIRMAN: It was a question of internal dissension, and I would rather not go into it.

Mr. MCMILLAN: But I will go into it. (Laughter and cheers.) Mr. McMillan went on to say that he had never resigned his position as a director, and he described it as a piece of effrontery on the part of Mr. Brogden to say so. (Laughter.) It was an utter fabrication, and his name must have been forged. He had never resigned, but it suited Mr. Brogden, for purposes best known to himself, that he (the speaker) should cease to be a director. From first to last this property had been managed, if not entirely, almost so, by Mr. Brogden—(Oh!)—more for his own interest than that of the shareholders. (Interruption.) He maintained that no director should employ his time "jobbing" in the shares.

The CHAIRMAN: It is perfectly untrue. (Cheers.)

Mr. MCMILLAN (continuing) said he was not an opponent of the company—far from it. (Laughter.) The fact was that no dissensions would have occurred on this board if matters had been conducted in a proper manner. Mr. McMillan was proceeding to refer to the French shares to bear out this statement, when

The CHAIRMAN (interposing) said: This is a question that is *sub judice*, and I put it to the meeting whether it should be discussed here. ("Yes," "no," and interruption.)

A SHAREHOLDER: May I ask if all the gentlemen here are shareholders of the compauy. I see a person present who is

HISSING AND HOWLING,

and he is, I believe, the office clerk. (Laughter.)

The CHAIRMAN: He is the holder of a large number of shares.

Mr. MCMILLAN was making another attempt to speak on the subject of the French Company when

The CHAIRMAN said: I distinctly say you are out of order, and I order you to sit down. If you do not, I shall send for someone to take you out. ("Oh," and cheers.)

Considerable interruption followed, and it was put to the meeting and carried, that Mr. McMillan be not heard.

The CHAIRMAN said that he had not the slightest objection to Mr. McMillan saying anything that would not damage the company.

Mr. MCMILLAN: If I am not heard here, I will be heard elsewhere. (Laughter.)

A SHAREHOLDER: Is this gentleman a shareholder?

The CHAIRMAN: He is the holder of five shares.

Mr. MCMILLAN said he held 205 shares. He would have resigned in the ordinary course, as he did not agree with the way in which the affairs were being conducted. They found in the balance-sheet,

"Estate assets and rights of the Nouveau Monde Company én Commandite, 15,000*l.*," and the chairman had said that there was a prospective payment by the French Company of 40,000 shares, equivalent to 20,000 shares in this company, and for which the French Company were to receive 5,000*l.* The fact was the French Company did send in 40,000 shares, which turned out to be

BOGUS SHARES

manufactured for the purpose, and but for the action of himself and his colleagues those shares would have been accepted by the directors. He contended that that 15,000*l.* had been frittered away, the company having been managed in a most reckless manner, entirely at variance with the interests of the shareholders. He moved, as an amendment, "That the statement of accounts and report be not adopted."

Major De Winton seconded the amendment.

Mr. Bolton disagreed with Mr. McMillan, who, he said, had not the courage of his opinions, as he appeared to have diminished his holding from 205 to five shares. He thought they should be grateful to the chairman for having come forward and rescued the property from the hands of people who evidently thought it was good enough to secure for themselves. (Cheers.)

Mr. Baker (the late secretary) wanted to know what had become of the security given in America, and which were called notes. He understood that Mr. Brogden held them, and that he intended to stick to them.

Mr. Howard, who said he was perfectly well-known, remarked that the agreement with the French Company was very clear. The bargain was that this company—who represented they had shareholders in Paris holding 40,000 shares—should give 15,000 of their own shares, and 5,000*l.* in cash. He heard that these 40,000 shares were manufactured within 140 yds. of the place.

The Chairman: It is not true.

Mr. Howard insisted that that were manufactured in London; he would forfeit 200*l.* if this were not true. The shares were copied. A French advocate in London was consulted on the matter of the bogus shares, and he reported that the shares were unstamped, and this was a great irregularity, to say the least of it. His complaint was that they had given 20,000*l.* in shares and cash, and they had received no consideration. It was, too, a wrong thing to dabble in shares which were in his wife's name.

Mr. Bolton wanted to know who was guilty of a breach of confidence. (Uproar.)

The Chairman having appealed for order for Mr. Baker,

Mr. Baker proceeded, amid no little disturbance, to explain the causes of his resignation, in which he alleged want of management in almost every direction.

A Shareholder declared that the directors seemed to be making a good deal of benefit from the fees.

Questions were asked as to how the Chairman received his shares. Did he buy them?

The Chairman said he purchased his shares.

Mr. McMillan retorted that he had not paid for them up to the time he left the board.

The Chairman gave this a denial, and remarked that Mr. Howard did not pay for his shares.

Major Reed said the chairman did not purchase the notes, but he himself had been defrauded out of 2,500 shares, and as there would probably be voting, he asked the chairman not to accept the share voting.

The Chairman did not think he could he could allow this.

Major Reed proceeded amid uproar. He insisted that the company was a magnificent property, and it would have been wrecked but for the chairman putting his hands into his pockets.

Mr. Tuck suggested the striking out of the sum of 1,058*l.* as directors' fees.

The Chairman held that that could not be done, as the fees were fixed by the articles of association. Was Mr. Tuck a shareholder?

Mr. Tuck: I am, sir.

The Chairman: Your brother is.

A DISTURBANCE.

A disturbance took place at this particular part of the proceedings, which lasted for some minutes. Cries of "Chuck him out," "Kick him out," &c., were raised in every part of the room.

When order could be restored,

The Chairman said he had heard a great deal as to his managing this property in his own interests. That was not so. (Oh, oh, and cries of "Order.") It was first managed by Mr. McMillan and his colleague for Mr. Howard, who received 1,000*l.* which he ought not to have received. (Oh.) Because they would not work this mine in the interests of Mr. Howard, the late directors resigned. He believed, if he had not found the money, the mine would have been taken from the shareholders' property. Mr. Baker told him he was going to Scotland, but went instead to America. (Oh.) He held the "notes"—the securities to which Mr. Baker referred—in the interests of the shareholders. With regard to the French shares, they were now being stamped, and, more than that, they would receive advantage from the acquisition of the French claims. He would not prophesy the nature of the assets, except to say they would be amply repaid for their outlay.

QUESTIONS.

Mr. Condon was sorry he was not present when Mr. Baker dilated. (No loss.) Perhaps it was no loss. He gathered from Mr. Baker's report on the property that he was in favour of it.

Mr. Baker said he did not complain of the property; he attacked the chairman.

Mr. Condon inquired as to the 1,000*l.* received by Mr. Howard.

The Chairman explained that Mr. Howard paid 5*l.* for a 1,000*l.* consideration, and this, when presented by Mr. Howard, the company paid.

Mr. Condon: Did he understand that 2,000*l.* was advanced by the Chairman to save the property?

The Chairman: Yes; and the interest, 500*l.*

Mr. McMillan here rose, and said the chairman proposed 500*l.* be paid to Mr. Howard, and Mr. Shaw-Kennedy seconded. He opposed. This was a copy of the minutes.

The Chairman asserted that Mr. McMillan and Mr. Howard were in collusion. The 500*l.* was paid through Mr. Howard to the French vendor, who was to return it; but the 1,000*l.* was actually paid to Mr. Howard, and he retained that amount.

Mr. Condon asked what amount of cash would be required to carry on the mine now.

The Chairman said they had advanced sufficient cash for working expenses.

Mr. Condon asked if the syndicate in Paris would pay a certain sum to stay off proceedings in Paris.

The Chairman replied that he thought they would.

Mr. Condon suggested that any reasonable offer for the settlement of this matter ought to be accepted.

The Solicitor said $12,500 security was advanced by the chairman—(applause)—because difficulties had arisen, and the vendors would have taken the property otherwise. (Hear, hear.) The chairman did this to save the property to the company. (Applause.)

AMENDMENT LOST.

The Chairman then put the motion, when, with the exception of six or seven dissentients, it was carried, the amendment, of course, falling to the ground.

Mr. McMillan said he would demand a poll.

The Chairman: It is useless. We have sufficient votes to defy you.

This terminated the ordinary business.

The meeting was then made special for the purpose of changing the name of the company to that of the Tarryall Creek Gold Company, Limited.

This alteration having been agreed to,

A vote of thanks to the chairman closed the meeting.

THE NEW ZEALAND ANTIMONY CO., LIMITED.

3rd June.—I am directed to forward, for your information, the following extract from a letter (bearing date April 20th) received by the chairman from Sir William Fitzherbert, by the San Francisco Mail which arrived on Friday last:—"For the last two or three mails I have been expecting to be able to write and report to you on the subject of the cruding. Unexpected and vexatious delays have occurred, which have prevented me from being able to address you effectively on this most important undertaking. At last, however, I am informed that the furnaces are complete and the preliminary preparations, detailed in Mr. Fitzherbert's report of 14th March, carried out. Accordingly, Mr. Fitzherbert will proceed next week to the 'Inlet' to start and superintend the cruding in the new furnaces. You will see by the minutes of the local board that we decided to instruct Mr. Wearne to suspend dead work (for the present) and apply all the available mining labour to productive work, so as to get out, with all possible despatch, the 7,000 tons of ore, which Mr. Wearne stated was obtainable in No. 4 and No. 1 (slip); and to discharge such hands as were not required to carry out this object. Mr. Wearne does not like this step being taken, but I hope your board will approve of our judgment and conduct in this respect. 1st.—Expenditure in the meantime will be reduced. 2nd.—All energy will be concentrated so as to get out as quickly as possible the 7,000 tons reported by Mr. Wearne as producible from No. 4 and No. 1 (slip). 3rd.—So soon as the output from these points should proved to be in process of realisation, according to the same manager's estimate, the deadwork in driving for lodes in No. 2 and elsewhere could then at any time be resumed (without any damage to the works from the delay); *i.e.*, so soon as practical encouragement as to output and preparation for market by successful cruding shall have become apparent."

The managing director also writes under same date:—"You will be pleased to learn from the enclosed extract from a letter of Mr. Wearne's that the lode in No. 4 level is continuing to open up well as lhe driving proceeds. The lode in the slip tunnel, after attaining a width of 5 ft., has made a heave, but should be picked up again in a few days. When left it was of the same quality as last advised, being an unsuitable class of ore for dressing. I trust it can be cruded to better advantage." I have also to report that the March shipment of ore realised 481*l.* 6s. 10d. The wages for this month and shipping charges in respect of this parcel amounted together to 371*l.* 17s. 5d. There has been advised for April, per ss. Ionic, due on the 12th inst., 49 tons of ore, quality 50 per cent., and 10 tons of crude metal. You will be glad to learn that antimony is now quoted at about 56*l.* per ton.—W. B. Fabian, Secretary.

THE NEW GUSTON CO., LIMITED.

5th June.—Since the publication of the cablegram of the 31st May, the following additional particulars of May shipments have been received:—"Shipped cars, Nos. 89/97, value about $28,000 net, of which Nos. 83 and 85 each run 450 ozs. of silver per ton. The total shipments for May month consists of 29 cars, Nos. 69 to 97, or 290 tons, value about $37,000." Dividend: The directors have much pleasure in informing you that they have decided to pay an *interim* dividend for the current year of 2s. per share (free of income tax), payable on the 1st July next. The balance-sheet and accounts for the past year, together with the directors' report, are in course of preparation, and will be shortly issued.—B. McNeill, Secretary.

London Offices—14, GREAT ST. THOMAS APOSTLE.

IMPORTANT SALE.

CORRUGATED IRON SHEETS, IRON ROOFS, SHEDS, HOUSES, BUILDINGS, &c.

THOMAS WHITEHEAD & SON announce that they are instructed by Isaac Dixon and Co., Windsor Iron Works, Liverpool, to SELL by AUCTION, on TUESDAY 18th, WEDNESDAY 19th, and THURSDAY 20th June, at 11 o'clock prompt, at Acre Yard, Belvedere Road, next Westminster Bridge, S.E., about 1,200 TONS of their Well-known High-class Valuable IRON MANUFACTURES as follows:—About 30,000 corrugated iron sheets; 200 complete iron roofs and sheds; 100 iron buildings suitable for hay and corn sheds, agricultural, manufacturing, storage and general purposes, mission rooms; 12 miles wire fencing; 50,000 yards wire netting; 100 iron columns; several thousand feet iron ridging and gutters; 80 iron tanks; 10,000 yards roofing felt, and other goods.

Catalogues from Auctioneers, 67, Hanover Street, Liverpool, or Dixon's Windsor Iron Works, Liverpool.

In handy lots to suit various classes of buyers. To be followed by sales of similar goods at Manchester, Belfast and Dublin.

WANTED, SILVER-LEAD ORE DRESSER for Spain to take charge of dressing works. Knowledge of Spanish preferred, but not essential.

Apply by letter, with references as to ability and integrity, stating age, salary required, &c., to "K. K.," 37, Walbrook, E.C.

TO CONTRACTORS, COLLIERY OWNERS, &c.

VALUABLE COPPER MINES IN SOUTH NORWAY, AND TIMBER PLANTATIONS.

MESSRS. S. WALKER AND RUNTZ are instructed to SELL by AUCTION at the Mart, London, on Monday, June 24th, at TWO, in One Lot, the MINES, MINING RIGHTS and PROPERTIES of the Arendal Mining and Smelting Company, Limited, near the town of Arendal, on the south coast of Norway, comprising the Skytmyr, Boilestad, Sletne, and Maesel Mines, together with quays at Espeland and Lake Röre Vand, and other property north of the River Nid. Upon the property are valuable timber plantations, and the constant demand for Swedish and Norway fir offers an excellent opportuuity for a remunerative business being opened up with the timber trade. There is also a fine opening for the manufacture of wood pulp, for which there is a large and increasing demand. Particulars and Conditions of Sale, with Plan, may be obtained of Messrs. Monkhouse, Goddard and Co., Chartered Accountants, St. Nicholas Chambers, Newcastle-upon-Tyne and 28 and 29, St. Swithin's Lane, London, E.C.; Messrs. Gibson, Pybus and Pybus Solicitors, 42, Mosley Street, Newcastle-upon-Tyne; Messrs. Stibbard, Gibson and Co., Solicitors, 21, Leadenhall Street, London, E.C.; Messrs. Schweigaard and Christensen, Solicitors, Christiana, Norway; at the Auction Mart, London; and at the Auctioneers' Offices, 22, Moorgate Street, London, E.C.

PEARL LIFE ASSURANCE COMPANY, Limited. Chief Offices:—London Bridge, City, E.C. See Reports and Opinions of the Press as to the remarkable progress made by the Company. Wanted, additional representatives in all districts. To good business men liberal terms and certain success.

WATER-GAS PROVED A COMMERCIAL SUCCESS. A SAVING OF £10,000 PER ANNUM IN ONE WORKS ALONE.

THE BRITISH WATER-GAS SYNDICATE, LIMITED.

WATER-GAS.

The following extract from the *Times*, of January 2nd, 1889, relative to the manufacture and application of Water-gas, is reprinted for general information.

WATER-GAS.

"For many years past attempts have been made at intervals to produce what is known as water-gas—that is, gas resulting from the decomposition of water. Experimentally there have been several successes, but practically and commercially up to the present time, as far as we are aware, these have been only failures. These failures have mainly arisen from the difficulty experienced in separating the water-gas from the other products. This difficulty has now been overcome, not by one invention, but by the combination of the best features of several inventions having for their object the manufacture of water-gas. What is more, the patented inventions which have been combined in the new process are not those of one inventor or of one country, but represent several inventors and several nationalities—namely, England, Germany, America, and Sweden. The amalgamation of these various patents and the beneficial results which have accrued therefrom came about by reason of the exigencies of manufacture of corrugated boiler flues and press-flanged steel frame plates for railway rolling stock at the Leeds Forge Company's Works, Leeds. The metallurgical operations carried out there demanded fuel of a higher calorific intensity than could be obtained from either the generator gas of the Siemens' producer, or ordinary coal gas. Mr. Samson Fox, the managing director, therefore turned his attention to water-gas, and, having carefully considered the whole question, decided upon putting down a water-gas plant at the Leeds Forge. The works were begun on September 29th, 1887, and on March 29th, 1888, plant capable of producing 40,000 cubic ft. of water-gas per hour was started, and has since been in constant operation with perfect success, and without interruption. The gas produced gives every satisfaction, not only for metallurgical, but also for lighting purposes, the whole of the works being supplied with it.

"Water-gas is the result of a chemical re-action which takes place in passing steam through incandescent carbonaceous matter, and may be considered as the practical result on a wholesale scale of the ordinary laboratory experiment of decomposing water by passing steam through a highly-heated iron tube. In the water-gas apparatus the fuel, which at Leeds Forge is coke, is raised to a high temperature in a generator by the aid of an air blast. The blowing is continued for about 10 minutes, by which time the fuel has reached a dull red heat. During this period what is known as producer-gas is given off, and this is led away to a range of Lancashire boilers, where it is utilised in raising steam for the engines in the works. At the end of 10 minutes the valves are reversed, the air-blast being stopped, and the further exit of producer-gas to the boilers prevented. Steam is then admitted at the top of the generator for four minutes, and, passing down through the incandescent fuel, becomes decomposed, and a fixed gas results. This gas as formed passes away to a scrubber, where it is treated much in the same way as ordinary coal-gas. From the scrubber it passes to the gas-holder, where it is stored for use for metallurgical purposes in the works, such as heating and welding. For indoor illuminating purposes a portion of the gas is conducted from the gas-holder to the purifiers, where its purification is effected by means of oxide of iron. It will thus be seen that the process consists of alternately blowing the generator hot and making gas, and that a run of gas is made every 15 minutes, during which time the yield from each generator is about 17,500 cubic feet of producer-gas and 5,000 cubic feet of pure water-gas for heating and lighting purposes. The gas is also used most successfully for driving gas engines.

"The metallurgical purposes to which the water-gas is applied at the Leeds Forge are various. In the first place, it is used in the heating furnaces in the plate mill, where the steel ingots are rolled into plates for the manufacture of Fox's corrugated boiler flues. It is also used in welding these tubes and heating the plates for Mr. Fox's flanged frame-plates for railway rolling stock, and for his flanged boiler-fronts, besides which it is utilised in various other similar operations throughout the works. In the application of water-gas to the manufacture of Siemens' steel there is a marked improvement in the quality as well as the quantity of the product. With this gas 30 charges of steel per furnace per week can be turned out, as against 11 charges per furnace per week from furnaces of equal capacity using gas from Siemens' producers. Besides being used for metallurgical purposes, the offices and various parts of the works are lighted with water-gas, the burners employed being arranged on the Fahnejelm system. Burnt in the ordinary way, the water-gas gives a blue flame, but by suspending a comb composed of thin magnesia rods in the flame the filaments are quickly heated to a white heat, producing a bright glow light of high illuminating power, but which is neither unpleasant to the eye nor prejudicial to the sight. The heating power of water-gas was very great, as was demonstrated upon our recent visit to the Leeds Forge Works, where we inspected the method of its manufacture as well as that of its use in the various departments. To give one instance only, a piece of copper wire placed in an ordinary coal-gas flame was only made red hot. A similar piece of wire placed in a water-gas flame issuing from a similar burner was quickly and perfectly fused.

"An important consideration in the adoption of any new system is, of course, its cost; and in this respect water-gas comes out well. Its production per ton of fuel is about 30,000 cubic ft., and with fuel at 8s. per ton, labour at 3s. 6d. per man per day, and the production going on continuously, it is found that the gas costs slightly less than 4d. per 1,000 cubic ft. The experience of nine months' working at the Leeds Forge has led to the conclusion, based on carefully-ascertained data, that the saving effected on the whole works is about £10,000 per annum. Looking at the advantages of water-gas for illuminating purposes, it is to be observed that, besides giving an agreeable light, it does not develop any noxious fumes, nor does it produce smoke; health and cleanliness being thereby preserved, and paintings, furniture, and decorations remaining uninjured. For lighting mansions this would prove a boon, while the producer-gas can be utilised for heating purposes. Similarly, a mill-owner laying down a water-gas plant for lighting his factory will obtain gaseous fuel for steam-raising purposes practically for nothing. For small towns also the lighting could be carried out with water-gas, the producer-gas being used for steam-raising and manufacturing purposes generally. Although the installation of this water-gas plant at the Leeds Forge is the first in England, the system is being largely adopted in America and on the Continent, both at steel works and for illuminating purposes."

In addition to the above extract, the following papers have recently commented favourably on water-gas.

THE NO. 2 QUEEN GOLD MINING CO., LIMITED.

SHAREHOLDERS TAKE DRASTIC MEASURES—THEY GET RID OF THE OLD BOARD AND APPOINT AN ENTIRELY NEW ONE—ALL DEPENDS ON CUTTING THE VICTORY REEF—RE-CONSTRUCTION.

THE second annual general meeting was held at Winchester House, Old Broad Street, on Wednesday, "to consider, and, if approved, adopt the report and accounts, to elect directors, and for the purpose of transacting the ordinary business of the company."—Robert Milburn, Esq., chairman of the company, presided.

Mr. J. DURIE PATTULLO (secretary) read the notice calling the meeting, and the report of the directors was taken as read.

THE DERBY FETISH.

The CHAIRMAN: The directors must apologise for bringing you here on the Derby day, but they do not take much interest in racing, and, unfortunately, had fixed the day of the meeting before the fact of its being Derby day was called to their attention.

Mr. C. RIDLEY SMITH: Do you expect us to believe that? (Order.)

The CHAIRMAN: I expect one gentleman to take the word of another. (Loud cheers.) I think that the report taken in conjunction with the half-yearly report you received about two months ago, coming from Mr. Charleton, the company's manager at Charters Towers, will enable you to understand the position of the company both at home and in Queensland. When we first acquired this property we were led to believe that, although it would be from the proposed new shaft that we might expect to get the most remunerative returns, yet we had every reason to believe that we should get a considerable revenue from the existing workings. There can be no doubt that a large amount of gold had been taken from those workings, and that the original proprietors acquired a considerable amount of profit from them, but I think it is evident that at the time we took possession the reefs were poorer, and it would seem that the late manager hoped these reefs would make in richness again, because you will recollect the rosy accounts we received from time to time from the mine, and up to as late as last spring; but it became quickly evident to the directors there was little probability of the reef in the old workings (that is the old Queen ground) becoming of very much value, and therefore they took the earliest opportunity of issuing instructions to practically lease the workings in the No. 1 shaft, and devote all their energies to sinking the new shaft from which we expected to cut

THE VICTORY REEF.

This involved heavy expenditure, but this is a matter of ancient, though I am sorry to say unpleasant, history. We have gone over the old ground several times, and we are all very much disappointed that the old property has not turned out that which we had a right to expect, and what we understood to be the case. We have more particularly to consider now the question of the No. 2 shaft, and I wish to put before you the prospects we have of cutting the Victory reef, which I hope will soon take place. We have in Mr. Charleton (who took over the management about the middle of last year or later) a most excellent manager, not only a competent miner but a very straightforward and honest man, and I am sure you will all agree with me in saying that these are qualities which are especially valuable in a manager who is directing a property so far from the home office. That shaft is being sunk as fast as possible, and at the same time satisfactory progress has been made. Practical men are no doubt here, and they will agree that an average of over 50 ft. a month is a satisfactory rate at which to sink a large shaft. Our last advices have told us that Mr. Charleton expects to cut this reef at the end of July, or during August, and for that reason we have stated in our report that that is the time when the reef is likely to be struck. Of course the directors can scarcely be responsible for that. They will be rather inclined to think that it may be as late as September, knowing how anticipations have not been realised before. Of course we are in the hands of a practical man, and we can only tell you what he says. I may tell you in connection with that that you know we are going to cut the Victory reef, which has proved so profitable in the adjoining ground, and it will be satisfactory for you to know that the general character of the reef in that district is of a very permanent nature, and as they go deep the reef is so unlike the No. 2 workings that it continues of value in depth.

IMPORTANT BY LETTER.

I have here a letter which came on Monday from Mr. Miles, our local director, a man who is very well known and respected in Queensland:—"With regard to the prospects of No. 2 shaft cutting the Victory reef, we must state that we had a long conversation with the manager of the Victory yesterday, and he assures us that the mine never looked better than it does now." It is to that Victory reef that we are turning our best endeavours, and we shall by and by ask you to sanction an arrangement by which money can be obtained to enable us to develop it. Of course as we have stopped operations at the old shaft we have not crushed, but the total amount dealt with since the accounts were made up has been 306 tons. We have crushed since that time for the public, our charges for which have amounted to 1,042*l*.

Mr. HOLLOWAY: What is the produce of the 306 tons?

The CHAIRMAN: About 600*l*., but the average per ounce is about 3*l*. 5s.

Mr. ROSS ROBINSON: That is tributers' stone, is it not?

The CHAIRMAN: No; this is not the amount on tribute, excepting a small portion of 20 tons. It is a very common thing to say that when a mine meeting is being held there is generally a telegram giving favourable news, and I have a telegram to-day, but the truth is that the manager did not know we were going to have a meeting. It reads thus:—

"For the month of May crushed for the public 590 tons. We met with an unexpected formation at a depth of 710 ft. The formation is 4 ft. in width, and the quartz is 4 ins. Pieces of rock contain visible gold sufficient to warrant inspection later on."

That is probably Watkins Papuan. At any rate, we have gone through that, and we will reach the Victory reef a little lower down.

ACCOUNTS.

I shall now proceed to the accounts, and will turn first to the development of expenses account, knowing how the money has been expended. You will find that the mill expenses are 6,059*l*. The total gold on the other side is 10,502*l*. and the wages 5,956*l*. The wages have nothing to do with the sinking of the No. 2 shaft. The principal portion of the labour has been kept quite apart, so that is practically confined to the old workings. The mill expenses have been 6,000*l*. odd, and the wages nearly the same. The question of cartage is a small amount, and then there is that of stores, timber, charcoal, and other materials on the mine. Next, we have Queensland directors' fees 235*l*., which consists of 260*l*., the balance of Mr. Cavey's account. He received a certain fee per annum. The salaries (including Mr. Charleton's) are 456*l*. odd. In that amount are several little items that, perhaps, cannot be called salaries, such as rates and fees for surveys and plans, &c., but the majority is for the general manager, and also for our clerk. Cablegrams have absorbed a good deal, and though we have a code, 10s. a word runs into money, and in the alteration of the management, cables and replies were absolutely necessary. The Queensland auditor's fees call for no comment, and we had to pay 59*l*. for water damage. In the London expenditure there is the directors' remuneration. Last year we told you we should be content to take half fees, and you will see that we have fulfilled that promise. The other items are the same as hitherto, and, in fact, the balance-sheet, with these remarks, is pretty well explained to you, whilst the other side may be taken to explain itself. I now move, "That the report of the directors and statement of accounts be received and adopted."

Mr. WALLACE seconded the motion.

Mr. ROSS ROBINSON: How was it in sinking we were supposed to go through the Maud St. Leger to another reef?

The CHAIRMAN: We went through the same formation, thinking it may be worth while to prospect it by and by. It was not of any value, and therefore no notice was taken of it.

HOSTILE CRITIC.

Mr. C. R. SMITH: I rise to move "That this report be received, but not adopted," and I will go back to the formation of this company. A great many of the statements made in the original prospectus have not been fulfilled. You sent out shortly after the statutory meeting Mr. George Cavey to manage our affairs. I warned you at the time that it was openly spoken of in London that he had gone out in the interests of the vendors, and, unfortunately, that rumour (which was treated by you as you have treated all the suggestions that have ever come to you) has turned out to be too true. You sent out very expensive machinery to crush stone which, it afterwards appeared, did not exist. You employed this gentleman (whom you admitted to me you were very much dissatisfied with at an early stage of the proceedings), and I will only put it very mildly indeed, as I wish to use no strong language, that his management was, to say the least, unfortunate. They say he employed men at large wages for political purposes and for his own interest; but if I were to repeat all the things said about Mr. George Cavey I should render myself liable to an action for libel, which I do not intend to do.

MR. CAVEY'S MANAGEMENT.

I will only say that his management was exceedingly unfortunate, and I believe my brother shareholders will understand what I mean. At a late stage in the proceedings you sent out Mr. Charleton and everybody is glad you did so, and now after calling up the whole of the capital, you propose to raise further money to finish the sinking of the shaft. I have no doubt it is the correct thing to do, but the question is whether the gentlemen here have any confidence in the

present board. I confess I have not, and I think I am fully justified in saying so, if I only take the fixing of the meeting for a general holiday. (Laughter.) That, too, is very unfortunate. You called a meeting of the principal shareholders (of whom I am one) to arrange privately about the re-construction. When did you do that? You fixed it for a Stock Exchange settling day, when every business man in London is occupied. Looking at what has passed I think you should resign, and allow competent persons to be employed in your place. Nobody accuses you of personal miscouduct or dishonesty, but we are bound to say that this is the greatest swindle that was ever known. It would have been far better if you had recognised the fact long ago, called us together, confessed you had made a mistake, wound up the company and divided the balance. You proceeded to call up the whole of the capital instead, and it is just possible you may be saved by cutting the Victoria reef. I hope for your sakes and for ours that such will be the case, but I thiuk the whole thing is as bad as bad can be. I have to complain, and have done so to the chairman, of the misleading information I have had at the office, but in the meautime I have said quite enough, and I move my amendment.

A GOOD WORD FOR THE BOARD.

Mr. CHEMERY: I quite agree with what has been said by the last speaker. I think we have arrived at a period when any reflection on the board would be out of place. We have to look to the future. There are some large shareholders in this mine, and what I think should be done is to appoint some of them directors. I believe Mr. Sykes is here, who holds something like 4,000 shares. I should like to see him on the board. (Cheers.) There is also here a gentleman of great practical experience, Mr. Ross Robinson. He is a man who knows Charters Towers, and the miue thoroughly, aud I think it would be a good plan if we could get him ou the board. We want to have people who know something about the couutry and the mine, and who have a large stake. I do not wish to reflect on the board iu any way. I think, probably, they have been grossly deceived, but they have also been extravagant. The motto, henceforth, must be economy. We hear there is very little doubt about cutting the Victory reef, but I should not care to put any more money into this concern or vote for its re-construction unless we have new blood on the board.

A SUGGESTION.

A SHAREHOLDER: What will be done with the shares held abroad?

The CHAIRMAN: You will be able to discuss that question at the re-construction meeting. There is a misapprehension in the minds of several speakers. They have spoken about the directors. I hope that everyone of them will understand that there is not one of the board who wishes to remain in office. We place ourselves entirely at your disposal, and we will either remain or give place to others. You will find at the end of the report that two of the directors come up for re-election, but that is simply for the interregnum between now and the short period during which the No. 2 Queen will exist, with a view to re-construction. I decline to go into all the points raised by Mr. Ridley Smith.

I DO NOT CONSIDER THEM AT ALL FAIR,

and I do not think he was right in making those statements. I shall be extremely glad if any shareholders would take the trouble to come to the office, and see what that gentleman has written to me and the replies I have sent to him. We have been accused of extravagance, but from that general charge we appeal to the records of our office, for they will show that we have doue all we can to keep down expenses. You must recollect that Mr. Cavey was appointed originally according to the articles, and inasmuch as he was the principal proprietor, we naturally look to him to protect our interests.

A VOICE: He was one of the vendors.

The CHAIRMAN: We naturally thought that he was the proper man—at any rate, it was one of the stipulations of the company. We had no voice in it. He was there, aud so remained until we got rid of him. He is the largest shareholder in the company, and has not sold a single share.

A VOICE: There is no market for them.

The CHAIRMAN: I do not wish to go into any litigious matter, but I am sure that I have not been discourteous to any shareholder who has seen me. (Cheers.) Any shareholder who has asked a question has always had a proper reply. (Cheers.) I should like the correspondence to be seen by the shareholders.

Mr. RIDLEY SMITH: I understand it is the wish of my brother shareholders that I should withdraw my amendment, and I do so. At the same time it is their wish that there should be a change in the directors. I hope you are willing to meet the shareholders in that way, and matters may then proceed amicably.

The CHAIRMAN: We will certainly do so.

Mr. PRESTON: We paid 120,000*l*. to this property. 25,000*l*. was given in fully-paid shares, 95,000*l*. iu cash, but the vendor, Mr. Marsland, had the option of taking in lieu of cash further additional shares. What was the absolute settlement of the vendor, and does he still hold the shares given him as fully paid? We have had reports from different engineers, favourable reports—but I cannot say I believe them. I should like to see dividends instead.

The CHAIRMAN: The cash paid was 85,867*l*., and the shares 34,133*l*. He took over 8,000 shares more than he need have done. They are very nearly all held now.

The report was then unanimously adopted.

RETIRING DIRECTORS RE-ELECTED.

The CHAIRMAN: Two of the directors, Mr. McGavin and Mr. Wallace, retire from the board, and offer themselves for re-election during the interregnum. I shall propose the re-election of those two gentlemen.

Sir C. W. F. CRAUFORD seconded the motion.

The CHAIRMAN: We shall place ourselves entirely in your hands. We have no other wish than to serve the company.

Mr. CHEMERY: In place of the retiring directors I propose Mr. Sykes and Mr. Ross Robinson.

Mr. RIDLEY SMITH seconded the motion.

The CHAIRMAN: The directors are willing to do anything you wish, but it is a great pity during the short time of re-construction you do not elect these gentlemen, for I am certain you could not have better representatives. They, however, will not force themselves upon you, but fresh names must be put forward, only after proper notice.

Major COTTON quite agreed with the chairman that due notice should be giveu for the re-election of directors.

The SOLICITOR: If you decide upon re-construction, the shareholders who are nominated as directors will have their names put in, aud they will be directors.

A BIG HOLDING.

Mr. SYKES: I do not wish to be put in nomination certainly against Mr. Wallace and the other retiring director in the old company. All I wish is to have something to say in the re-construction of the company. It is quite true that I hold 4,000 shares, and that holding cost me something like 5,000*l*. I have never sold a share from the beginning.

VIEWS OF A PRACTICAL MAN.

Mr. ROSS ROBINSON: I have no particular desire to become a director of this company, unless the shareholders are of opinion that my practical knowledge of mining, and of this district in particular, should be of use. (Cheers.) If that is the opinion I shall be ready to serve. I am not a very large shareholder, but hold sufficient to qualify me. and I represent a large number who are considerable holders, so that I have a large interest in the mine. I have faith in its future prospects, and particularly in the Victory reef; and as one who has been acquainted with the district for a number of years, I feel that I have a right to speak on a matter of this sort, and especially as

I MADE A THOROUGH INSPECTION OF THE PROPERTY EIGHT OR NINE MONTHS AGO,

which inspection, and the report based upon it, have been borne out to the present time. When at Charters Towers eight or nine months ago, I was requested to inspect the mine, and was compelled to say that the workings of the present No. 2 Queen ought in a great measure to be discontinued, and that a greater amount of work ought to be done on tribute, so as to keep the mill going, and to keep down expenses. At the same time I gave it as my opinion that in course of time the Victory reef would be reached, and when that was done it was more than likely the company would be in a sound position. The Victory has been worked from that day to this, and I have had a telegram later than the report the chairman has read that the Victory is as good as it ever was. I really do think I might be of service on the board, because of my practical knowledge of mining and this particular property, and if the shareholders want me to serve them I am willing to do so.

The CHAIRMAN: I am requested to state that my two retiring colleagues do not seek re-election.

Mr. SYKES: I do not wish to displace Mr. Wallace. I hope Mr. Chemery will be on the new board, for he is a larger holder than I am.

TRIBUTE TO MR. WALLACE.

Mr. ROSS ROBINSON: I think Mr. Wallace should be on the board, for he would be able to render the company great service from his practical kuowledge in the matter of re-construction. I know Mr. Wallace is my superior on financial matters.

Mr. SYKES: I propose that the two retiring directors be re-elected.

The motion was carried.

The CHAIRMAN: That completes the business.

AN EXTRAORDINARY MEETING.

The SECRETARY read the notice, as follows:—1. That it is desirable to re-construct the company, and that with a view thereto the company be wound up voluntarily, and that Mr. James Durie Pattullo be and he is hereby appointed liquidator for the purpose of such winding-up. 2. That the said liquidator be and he is hereby authorised to consent to the registration of a new company, to be named "The Queen Gold Miuing Company, Limited," with a memorandum and articles of association, which have already been prepared with the privity and approval of the directors of this company. 3. That the draft agreement submitted to this meeting, and made between this company and its liquidator of the one part, and the Queen Gold Mining Company. Limited, of the other part, be and the same is hereby approved, and that the said liquidator be and he is hereby authorised pursuant to section 161 of the Companies Act, 1862, to enter into an agreement with such new company (when incorporated), in the terms of the said draft, with such (if any) modificatious as the said liquidator may approve, and to carry the same into effect. 4. That the remuneration of the liquidator be and is hereby fixed at 100 guineas.

FUTURE PLANS.

The CHAIRMAN: By circular sent you two months ago we told you that you would be called together to consider the financial position. We thought it better first to call a meeting of several of the largest shareholders (holding 500 or more) to consult with the directors. There were two schemes before us—one being the re-construction scheme, aud the other the raising of money by preference shares or debentures. We saw several difficulties in the way of the latter. It would cost a good deal, and would hamper the company with a prior tax on profits. Therefore, if we thought the re-construction should be carried out as suggested, it would be a fair way of meeting our difficulties. We have heard remarks about the vendors, but under this scheme the vendors will have to pay their quota just the same as any other shareholder. It was the unanimous feeling of the meeting that re-constructiou would be the better plan. The liability on the shares was fixed at 1s. 6d., and the understanding was that not more than 1s. should be called without the sanction of the shareholders. The 1s. ought to do a good deal more than cut the Victory reef, but it is necessary to have some margin. (Hear, hear.) The scheme has been embodied into an agreement, which will be read, and it will be for the shareholders to say whether they agree to it or not.

HARMONY.

Mr. CHEMERY: I quite agree with the chairman as to his mode of re-construction, and to the liability being so small. It practically amounts to only 1s. per share, because if we do not cut the Victory reef the mine is valueless. Therefore, it would be an absurdity to call upon the shareholders for the further liability. Let us go for the shilling, and if that does not prove the mine let us abandon it.

PRACTICAL QUESTIONS.

A SHAREHOLDER: By re-construction do we lose our legal position as against the vendors?

The CHAIRMAN: No, we cannot tell the exact amount of money that will be necessary. If we knew it we might take means of getting it in other directions, but we are going in a great measure according to the report of Mr. Charleton. We have consulted with the shareholders, and have come to the conclusion that this is the best method of raising what we want, and that it is cheaper than doing it by debentures. At the same time, if the opinion is in favour of the debentures, let us go on with that scheme.

A CONVERT TO RE-CONSTRUCTION.

Mr. ROBINSON: When I first heard of re-construction I was opposed to it, but, on mature consideration, think it is the best thing the directors could do. Although it has been stated that you expect to cut the Victory reef at a certain depth, such a calculation can only be approximate. You can only estimate the position of the reef so far as it had been worked, and if it should dip at a more acute angle you would have to sink a greater depth. Consequently it will not do to be short of funds.

Mr. SYKES: Are we certain to secure the adhesion and subscriptions of the vendors.

The CHAIRMAN: If they do not agree their shares will be dealt with for the benefit of the company. One of the vendors who holds 6,000 shares has expressed his consent to the scheme.

The SOLICITOR (who read the agreement) said: That if dissentients to the number of 20,000 shares objected, the liquidator had the option of abandoning this scheme. The assets of the old company came to the new company, and the shareholders who did not accept the scheme would have no interest in those assets.

A SHAREHOLDER thought that shares lapsing should be offered *pro rata* to the shareholders. He would support the re-construction.

LEGAL POSITION AGAINST VENDORS.

The CHAIRMAN: No doubt the shareholders will have the offer, but we do not think there will be many dissentients. In regard to the legal position as against the vendors, a company in liquidation will have even more power than out of it. Mr. Cavey has a representative here. I move the first resolution.

Sir C. W. F. CRAUFORD secouded the motion, which was carried.

The CHAIRMAN moved the second resolution, which was seconded by Sir C. W. CRAUFORD, and carried.

The CHAIRMAN moved the third resolution, which was seconded by Mr. CORY, and carried.

The fourth resolution was carried, the liquidator consenting to receive 75 guineas remuneration instead of 100 guineas.

An attack made by Mr. RIDLEY SMITH upon the secretary met with no support.

TRIBUTE TO MR. PATTULLO.

On this point the CHAIRMAN said: I am sure Mr. Ridley Smith would not wish to injure any one, and having had a good deal to do with Mr. Pattullo, I boldly assert in the presence of this meeting that he is entirely wrong. (Loud cheers.) A more courteous and able man for his position I have never met, and I am only very sorry indeed to hear any remark against him. (Cheers.)

After some conversation, it was proposed that the new board should be Messrs. Milburn, Sykes, Ross, Robinson, Chemery and Wallace, but the numbers for and against the latter being nearly equal he refused to be nominated, whereupon, Mr. Milburu, while thanking the shareholders for electiug him, said, in the circumstauces he must decliue to serve on the new board, as at present proposed to be constituted.

A vote of thanks to the chairman, proposed by Mr. SMITH, seconded by Mr. HOLLOWAY, was carried, special mention being made of the courteous manner in which he had conducted the business.

THE SOUTH VOGELSTRUIS GOLD CO., LIMITED.

SUDDEN DEATH OF SIR WM. ARBUTHNOT—THE SPEECH PREPARED BY THE DECEASED READ TO MEETING—HE TRACES THE COMPANY'S HISTORY AND GIVES ADVICE—VENDOR'S OFFER—LITIGATION *v.* COMPROMISE.

AN extraordinary general meeting of the members was held at Cannon Street Hotel on Wednesday, when Mr. Doughty Browne, a shareholder, it was stated, would, in accordance with a notice he had lodged with the company, move certain resolutions.—Percy Tarbutt, Esq., presided.

SUDDEN DEATH OF SIR WILLIAM ARBUTHNOT.

The CHAIRMAN: I regret very much to inform you that the chairmau of the company, Sir William Arbuthnot, died yesterday. We met him the day before yesterday, and fiually arranged the programme of to-day's meeting, but yesterday I deeply regret to say he died of heart complaint. I will have to do my best to-day in the chair at very short notice, only having heard of this sad event two hours ago. I will have to fulfil the duties which otherwise he would have fulfilled himself.

The SECRETARY (Mr. H. E. Rodwell) read the notice calling the meeting.

The CHAIRMAN: Gentlemen, Sir William had prepared his speech, and as I am totally unprepared to say anything at so short a notice, I will ask you to allow me to let the secretary read what the late chairman had put into writing.

THE VOICE OF A DEPARTED FRIEND.

The SECRETARY read the speech of the late chairman, as follows:—

Gentlemen, before proceeding to the business of this meetiug I desire to lay before you the following facts iu connection with this company. The company was registered on the 25th of January, 1889. The vendor, Mr, Brockman, had previously, on the 19th of January, entered into an agreement with the owners of the claims registered in Africa, who were. and are represented by Messrs. Druces and Attlee, the well-known firm of solicitors. The vendor entered into his agreement for sale with Frank Sedgwick Price as trustee for this company on the 24th of January. The company proceeded to allotment on the 30th January, and 53,627 shares were allotted. Of this number of shares a proportion of about 23,000 are held by persons who it now appears had previously entered into contract with the vendor to guarantee a minimum amount of the share capital, and for such guarantee were to receive remuneration. On the 30th January the board of directors adopted by deed the agreement made by the vendor with the trustee for the company, which they were required to do under articles of association. Under the terms of this last mentioned agreement set out in the prospectus, it was stipulated and agreed that the company should deposit with the Standard Bauk of South Africa 15,750*l*. part of the purchase consideration, in the joint names of the attorney for the claim-holders and the vendor. The company, however, did not so part with the money, but deposited it on due date in those names, with an undertaking of the vendor not to release the money to the attorney for the claim-holders, until the receipt of written instructions to that effect from the chairman of the company. This deposit was to be retained until the title had been examined by the vendor's agents in Africa, and fouud to be good and free from encumbrances when the money was to be released. All this was done prior to the first note of discontent raised by the shareholders. or rather a section of the shareholders. At the statutory meeting the shareholders present desired to carry certain resolutions, which, however, they could not carry at that meeting, and the board having previously learned that these shareholders were desirous of repudiating the contract, took the advice of Mr. Rigby, Q.C., as to the legal position of the company *vis-à-vis* the vendor, and Mr. Rigby's opinion was read to that meeting, and appeared *in extenso* iu the reports. The shareholders then requisitioned the board to call a meeting, which is the meeting now preseut.

SOLICITORS AT WORK.

In the interim a number of circulars have passed, and some of the facts which are now stated have been derived by the board from the circulars issued by Messrs. Morley and Sheriff, solicitors for Mr. Doughty Browne and others. Actions have been commenced by some of the shareholders to remove their names from the company's register, and a petition has been put on the file for the compulsory winding-up of the company by the Court, whilst the vendor has brought an action for specific performance of the company's contract to purchase his property.

VIEWS OF MR. JUSTICE STIRLING.

As regards the actions by the shareholders and the petition, I am advised that the company can and should resist them to the utmost for reasons I will presently mention, but, with regard to the action for specific performance by the vendor, that there is appareutly no valid defence, on this point I refer you to Mr. Rigby's, Q.C., opinion, which has been sent to you all. As to the petition, Mr. Justice Stirling, before whom the petition came last Saturday, said:—"Unless the petitioner can satisfy me that there is no substratum in this company, I shall dismiss his petition with costs. If there is no substratum, then I should desire to know the wishes of the shareholders before ordering a wiudiug-up." Now, gentlemeu, you have to decide to-day between embarking upon a sea of litigation, and the acceptance of an offer of compromise by the vendor, which, to my thinking, is well worth your most careful consideration. Let me first point out to you the result of your passing a resolution for winding up the compauy. First, you prevent your holdings in this company ever by any possibility becoming valuable. Secondly, you give to the petitioner the costs of a petition which ought never to have been presented, for if it is now, or ever becomes necessary to wind up this company, a voluntary winding-up is the least expensive and most expeditious eourse you can adopt. Thirdly, you do not relieve yourselves of the liability (if it be one, as counsel advises) of completing your purchase.

PROBABLE RESULT OF LITIGATION.

Lastly, assuming you cannot be compelled to complete this purchase by the time the action by the vendor is tried, a very large part of your capital will have disappeared in Court fees, the costs of the solicitors for the petitioner, and the costs of the accouutant who may be appoiuted official liquidator, but should you ultimately be compelled to complete this purchase, you will theu, in addition to the above expenses, have to provide the costs of the vendor's solicitors, in respect of his action for specific performance, and you will then have only a small amount remaining as working capital for your property which, being then in the hands of a liquidator, cannot be managed to the same advantage or as cheaply as you yourselves can manage it. The directors think the offer which the vendor has made for compromise is one which should be carefully considered by the shareholders before hastily determining upon any course of action.

VENDOR'S COMPROMISE.

His offer in plain language amounts to this:—I, the vendor, only require so much cash as I have actually to 'pay away—all the profit, which will be in shares, I am prepared shall stand on one side until the company has paid a 10 per cent. dividend. Does this look like want of faith in the property? Now, gentlemen, let us endeavour to calculate what cash the vendor has to pay away: he has first to pay 15,750*l*., the sum now on deposit due to the original claim-holders, he has then got to pay the underwriting commission, which he admits is 2s. 6d. a share, agreed upon with the several underwriters on the number of shares underwritten. This gives au amount of about 5,000*l*. Then there are the costs of the formation and promotion of the company, advertising, etc., which I presume may amount to about 3,000*l*. You must clearly understand that these figures are purely hypothetical, and are not within my own knowledge. Now if the underwriters will forego their respective commissions of 2s. 6d. per share, the vendor, as I understand his offer, will forego so much cash and the company will benefit by 9,000*l*. odd. The offer made by Mr. Jones is one which it might be well also to consider, provided the burning question of the dispute between the vendor and the company can be determined or suspended during the examination of the property as proposed by Mr. Jones. It suggests itself to me, and I think it must also suggest itself to you, that a large public company to be a success must, if possible, keep clear of litigation, and it

appears to me that you cannot do better at the present juncture than to adopt a course of action which will have this effect.

ADVICE.

In my capacity as chairman of this company I offer you advice, and it is this, to pass a resolution adjourning this meeting until the petition of Mr. Brown has been heard and adjudicated on by an impartial judge of the High Court of Justice. If it is granted then I strongly advise you authorising the liquidator to make the best terms he can with the vendor to settle his action, to complete the purchase, and to begin to test practically the capabilities of the property with the outlay of only a small sum of money. In conclusion, gentlemen, we are here to-day to carry out your wishes, whatever they may be. (Cheers.)

A SHAREHOLDER TAKES STRONG GROUND.

Mr. Lewis Levy: Gentlemen, in reply to the advice the chairman (I am sorry to have to refer to him under the circumstances) has generously given us, I may say that I was one of the first (I was the very first), from the information I received, to object to the carrying out of this contract, and to commence an action to prevent it. That action is held in abeyance. I have only 240 shares, but that is not a matter of consideration. My action was only left in abeyance because a larger and much more powerful body of shareholders had taken the matter in hand. My action was commenced on the 3rd of April, after I found that the circular embodying Mr. Anderson's report only confirmed what I had previously heard. The circular was issued on May 2nd, and the ordinary meeting was held on May 8th. I did not attend the ordinary meeting, because I thought matters were in such powerful hands, and because the large majority of shareholders, under respectable auspices, had taken this matter in hand, and hence I did not think it worth my while to attend. I will come at once to the salient points—that is the difference between the statements of the prospectus and Mr. Anderson's report. Those are the salient points, and I will strike them at once. The prospectus states that we were able to get 18 dwts. to the ton. I do not care about ambiguities of language. In a Court of Equity they would find that the prospectus led the shareholders to expect 18 dwts. to the ton. What does Mr. Anderson's report give us? It gives us from 2 to 5 dwts. The one is estimated at 57 per cent. profit, and the other is equal to less than nothing. (Cheers.) Gentlemen, that is a discrepancy—a very apparent discrepancy. Now, a discrepancy may mean misrepresentation, and a misrepresentation may mean a fraud, though I do not say this is a fraud. I think it is worth while to pursue an intermediary course, so that before anything is settled in this affair we may ask some independent expert, appointed by the shareholders, to see whether we have a property, or whether this is simply an attempt to swindle us. There is no medium.

INADEQUATE COMPROMISE.

We are either right or wrong. They talk of "compromise." Compromise! 15,000 shares—15,000 pieces of waste paper and so many acres of waste land, and for that we are giving the handling of so many thousands of pounds to be divided amongst a certain number of promoters. (Hear, hear.) I want to know more about these matters. I have several pertinent questions to ask. Whatever you may do gentlemen, I am not going to stand still. I have already given notice to the solicitors of the company to commence an action. I was only waiting for this meeting. I am going to ask pertinent questions. Who is the vendor? Who is Mr. Beccles? I do not think we ought to part with a shilling, or allow a shilling to be parted with, unless we are perfectly satisfied by independent experts that we have, at any rate, some equivalent. (Cheers.)

Mr. H. Doughty Browne: I rise to a point of order. I think in the ordinary way the resolution ought to be moved, and then any shareholder who likes may take part in the discussion.

The Chairman: I think Mr. Browne is perfectly right, only I wished to hear the shareholders first who desired to speak, so that there might be no question of our opposing them. (Hear, hear.)

Mr. Browne: Having had experience with the conduct of public meetings, the usual course when a special meeting of this kind is called, and when notice of certain resolutions is given, to ask the shareholder, who has given the notice, to propose the first resolution to begin with, and then the discussion follows. We will be glad to hear Mr. Levy later on, but it will be probably better to allow me now to move the resolution, of which I have given notice.

The Chairman: I am advised it is usual for the shareholder to move the resolution, and discussion can follow.

A RÉSUMÉ.

Mr. Browne: Gentlemen will recollect what took place at the meeting on the 8th of May, and how, being a statutory meeting, we could not pass a resolution, but only give an expression of opinion, because it is not competent to move a resolution at such a meeting. I am sorry I have to stand here in my present position. If the directors had seen their duty as I have seen it they would have done it for me. The circumstances are as follows:—The statutory meeting was held on May 8th, but previously there were rumours as to whether this property was what it was represented to be in the prospectus. Early in February Mr. Crews, representing the shareholders, went to the directors, and asked them to call a meeting to consider whether we had not better get a confirmatory report, so as to see we were getting value for our money. The directors, on that occasion, refused to call a meeting. We instructed solicitors to write to the board, and ask them to call a meeting. The directors refused to call a meeting unless there was a requisition signed by members of the company representing one-third of the shares. On March 11th we sent another requisition signed by shareholders holding 14,000 shares. The directors refused to convene a meeting, as the requisition was not sufficiently signed. Then our solicitors wrote to the board to say they would

APPLY FOR AN INJUNCTION TO RESTRAIN THEM FROM COMPLETING THE PURCHASE.

The directors replied that they would undertake not to do so until the statutory meeting. On May 8th we held the statutory meeting. You know what took place. You know the expression of opinion we gave on that occasion. Now, something occurred at that meeting, and I wish only to mention facts, without giving any expression of individual opinion. The chairman said that he and the other directors were the managing partners in this concern, and generally at statutory meetings managing partners told the shareholders what was the position of the company, what were its prospects, and also probably, most important of all, what financial arrangements they meant to make for the future. Nevertheless, at this meeting the chairman and the directors concealed the fact that they had made a call of 5s. What was the result of making that call? The result was that, owing to its being made payable within a week, a considerable number of the shareholders are disqualified from voting on the present occasion. On the same day a writ was issued by the vendor for performance of contract. At that meeting the opinion in favour of getting an independent report was almost overwhelming. I do not judge for the accuracy of the numbers, but it was estimated that there were 60 shareholders present, and out of that number the large majority voted in favour of the resolution and three against it. The directors then said that after that expression of opinion they could not call a meeting, but must have a requisition. At last we had sent in a requisition, and we are here on June 6th, after a further delay of a month, before we can really get to business, and now I come to the point of the meeting to-day. The late chairman's speech has been read to you to-day.

A WORD OF SYMPATHY.

I should like on my own behalf, and that of the other shareholders, to express our deep regret at the sad news which the chairman has given us. It is a very frightful thing that he should have written that speech to deliver to us at this meeting, and that before the meeting was held he should have passed away. (Hear, hear.) I am sure the shareholders will agree with me in offering our sympathy to the board in the exceptional condition in which they are placed. (Hear, hear.) But I have now to discuss that speech as if the late Sir William Arbuthnot were occupying the chair. I have listened to it very attentively, because, like most men of business,

I DO NOT LIKE LEGAL PROCEEDINGS.

If I saw any fair basis of compromise or of satisfactory settlement I should be the last man to advocate litigation in any shape or form. But it appears to me that the so-called compromise is no compromise at all. All this merely represents an alteration in the character of the payment that the vendor is to receive as to a portion of his purchase-money. Shares are given up, but the payment of 25,000*l.* remains out of the total sum of 53,000*l.* paid into the pockets of the company. 25,000*l.* is parted with as purchase-money, and when we are told of the dangers and expenses that we are likely to be put to by law costs and expenses of liquidators, I have no doubt they will amount to a considerably larger sum that we shall desire to pay, but it will take a long time for them to get up to 25,000*l.*; and what, practically, the late chairman advocates is that you should part with your money first, and then ascertain afterwards whether you have anything to represent it or not. I do not think that that is a course which will find favour with you. We have had a doubt passed on the value of this property. The delay of independently testing its value does not rest with the shareholders, but with the board, but still, at the same time, we advocate that course. Now, I have taken the advice of the solicitors on this question, and am informed that the best and the most inexpensive course for us to pursue would be to pass on this occasion a resolution for voluntarily winding up. I also notice in the chairman's speech that this is a course which, under certain circumstances, he advises. It is certainly the most inexpensive course we can pursue. If we do that, a voluntary liquidator, whose expenses will be comparatively trifling, will be able to deal with this question and ascertain what we are getting for our money, and whether we have or have not a good or bad defence to this action.

MR. BROWNE AN UNDERWRITER.

I must say there has been doubt thrown upon the *bonâ fides* of myself and others, because I was one of those who undertook for a sum of money to subscribe for a certain number of shares in the event of their not being taken by public subscription. I cannot see that that alters the condition at all. As a matter of fact, I am in the position of a man who had the recommendation of this property given to him, and who applied as one of the public for 200 shares, and had them allotted to him. I was also one of those who undertook to take shares, not taken by the public, to the number of 2,000. I had 1,600 shares allotted under that contract, and I hold 1,800 shares, but fail to see how my position differs from that of any other shareholder, because I am the proprietor of 200 shares, for which I will have to pay 1*l.* each, and 1,600, for which I will have to pay 17s. 6d. I am unable to see that my position differs from that of anybody else. I will tell you this also, that the resolution to-day that would please me better than any other would be to send out an independent expert to South Africa, and find if we have really the property for which we have subscribed. That would please me far better than anything else, but I appeal to you as men of business, with the experience you have had of similar concerns, whether it is not wiser to decline to part with your cash until you know what you are going to get, and not be frightened out of that position because you are threatened with litigation; whether that is not, after all, a better course than to part with your money, and then try and get it back afterwards. With these remarks I will move the alternative resolution, "That the company be wound up voluntarily under the provisions of the Companies Acts of 1862 and 1867."

Mr. Lewis Levy: I beg to second the motion.

On a show of hands, the Chairman declared it to be carried.

RESOLUTIONS.

Mr. Browne: I am informed by the solicitor that I should move the third resolution. The object of it is to keep this petition alive until some settlement be made. I am not great in legal forms, but I trust you will take it from me that it is a resolution we ought to pass: "That the directors be and they are hereby requested to consent, on behalf of the company, to the petition for winding up the company, presented by Mr. Henry Doughty Browne, and now pending."

Mr. Lewis Levy: I beg to second the motion.

The Chairman: It is not quite clear that two resolutions can be put to this meeting, as, according to the notice, they are alternative. But still I will put this one, as Mr. Browne has asked me.

Mr. Browne's Solicitor: Mr. Buckley, Q.C., has advised that all the resolutions can be put and carried.

The Chairman put the motion, which was carried.

A SHAREHOLDER: Is there any chance of a further call?

The CHAIRMAN: That will be a matter for the liquidator.

Mr. BROWNE: Under the circumstances I think I will put the third resolution. It may be useful to put the first resolution, of which I have given notice:—"That the directors be, and they are hereby requested to abstain from completing the purchase of the property agreed to be sold to the company until a report upon the same has been made by an independent expert, approved of by the shareholders, and has been considered by the shareholders in general meeting, and until the shareholders in general meeting shall consent to the purchase being completed."

Mr. FRANCIS (the company's solicitor): In accordance with instruction given by the shareholders at the last meeting we have, of course, been resisting this action of the vendor on behalf of the company, and have gained time for delivery of statement of defence.

A SHAREHOLDER seconded the motion, which was carried, and the proceedings closed with a vote of thanks to Mr. Tarbutt for presidiug.

THE MINING EXCHANGE, LIMITED.

THE EFFORTS OF THE COMMITTEE MEET WITH SUPPORT—MR. THOMAS THOMPSON CONFIDENT AS TO THE FUTURE OF THE EXCHANGE—CAREFUL SELECTION OF NEW MEMBERS.

AN ordinary general meeting of the company was held at the Offices, No. 9, Old Broad Street, on Monday, for the purpose of receiving a statement from the directors.—Thomas Thompson, Esq. (chairman of the company), presided.

Mr. T. W. MARTIN (secretary), read the notice calling the meeting.

NEW MEMBERS FLOCKING IN.

The CHAIRMAN: Gentlemen, as doubtless you are aware, this is only a statutory meeting—one which is held in accordance with the Act of Parliament, and I have therefore practically no business to place before you. You will doubtless remember the remarks I made on the occasion of our opening ceremony. I dwelt then very particularly on our position and also on our prospects, and stated that, after reducing our subscriptions to 12 guineas per annum, we thought we saw our way to paying all our expenses. I am now speaking for myself, and not for the members of the committee, but from what I have seen of our position, our accounts, and what we are doing generally, I cannot help coming to this conclusion, namely, that we shall not only be able to pay our way, but that we shall be able to do something very considerably better. We have a large number of applications for our rules and bye-laws, and a number of gentlemen state that they intend to come in. Under these circumstances I think it will only be another month or two before we shall have a very large addition to the number of our members. I do not know that I have anything more to say now, but if you like to ask questions as to our business, and the position of the company, I shall be only too pleased to answer them. You will understand that afterwards we have an extraordinary general meeting, and when I have dealt with anything you may like to ask me, I will then speak about the special resolutions which I shall have to place before you at the extraordinary meeting, and so save your time. (Hear, hear, and Cheers.)

A FORECAST.

Mr. PETER WATSON: As the chairman has stated, this is simply a formal meeting, held in accordance with the Act of Parliament, and there are no accounts to pass. I think I may nevertheless state that we have commenced under very favourable auspices, and I hope and trust, and I fully believe, that this Mining Exchange will be entirely successful. I certainly think with the increased number of members that we look for, the day is not far distant when we shall require greatly increased accommodation.

A MISQUOTED TEXT.

At any rate, suffieient for the day is the good thereof—not the evil. (A laugh.) I think so far we have very comfortable quarters, but in another 12 months I trust we shall be compelled to take a much more commodious building. (Hear, hear.)

Mr. NICHOLLS: I should like to ask the number of members we have at present.

PRESENT NUMBER OF MEMBERS.

The CHAIRMAN: The number is 52. We have besides these a large number of clerks, authorised and unauthorised. I cannot tell you the exact number, but it is from 15 to 20, and we are recciving applications for clerks almost every day. We have received a great number of applications for our rules and bye-laws, and letters to the effect that gentlemen are wishful of joining our Exchange. I will only repeat what I said at the opening ceremony, that the directors and committee of the Mining Exchange are becoming very careful indeed about the character of the gentlemen whom they elect. They have had a great number of applications under consideration, and

THEY HAVE ALREADY REJECTED FIVE,

so that you will see they are looking after your interests both as regards the Mining Exchange and the company to the very best of their ability. I think we may now consider our ordinary meeting coucluded, but there is a matter which I will take this opportunity of bringing before you. It was intended under the rules that whenever we wanted to make any alteration or addition to the rules that we should do so at a special meeting. I am sorry to say that by an oversight I cannot place any resolutions before you with regard to the rules to-day, but I may tell you that on going through them very carefully we have found it necessary, at all events desirable, to make sundry alterations in those passed at the first informal meeting. Those alterations I think I may say were almost entirely of a verbal character, with the exception of No. 4, which is to the following effect:—"An applicant for membership must find security for his transactions to the amount of 300*l*. . . . This rule shall not, however, apply to the first 50 subscribers."

SUGGESTED INCREASE OF MEMBERS.

I daresay you will remember it was understood that we should have only 40 members at the beginning, but we found it necessary to raise it to 50. That has been done, and we now find it necessary to go yet a step further. There was a general concensus of opinion that 50 members, coming in on the original terms, would not be too many, and we elected close upon that number; but I think I must state that it was the opinion of the committee and myself that the 50 members should refer rather to 50 firms than to 50 individuals, and now that we find sometimes in the same firm as many as three partners, we discover that the number of 50 is hardly sufficient, and we propose to ask you at the special meeting, shortly to be called for the purpose, to make a few verbal alterations in the rules, and particularly in that rule which refers to 40 members, and that we should make it 55. That will be a matter for the consideration of the members, and if the gentlemen present like to discuss the subject now we shall be glad to hear any remarks that they may make in regard to it.

Mr. NICHOLLS: How are the shares dealt with now in the case of firms?

The CHAIRMAN: Where there are two or three members in one firm they take their 50 shares between them.

Mr. NICHOLLS suggested, as a recommendation to the committee, that the number of members should be raised to 60 instead of 55.

The CHAIRMAN: So far as the committee are concerned, they are desirous only to meet the wishes of the members, and if it be their wish that the number of members should be increased to 60 the committee will carry it out.

Mr. FERRIS seconded the motiou.

The CHAIRMAN: We caunot adjudicate upon these new rules to-day, because they will have to come before a special meeting, and I will, therefore, put the resolution to the meeting in this way, "That the committee be recommended to increase the number of members to be admitted under rule 4 to 60."

The motion was carried unanimously.

RE-ELECTION OF DIRECTORS.

Mr. J. H. A. SMITH: The very pleasant task devolves upon me of proposing the re-election of the directors. Under table A all your directors go out of office at this meeting, and for the moment you are left without any. I shall have great pleasure in proposing "That Mr. Thomas Thompson, Mr. W. H. Bumpus, Mr. Samuel James, Mr. Peter Watson, and Mr. J. H. Crofts, be, and are hereby elected directors by the request of the company. (Cheers.)

Mr. TALLENTIRE: I second the motion. I think the directors have done their duty in a most efficient manner, and we can scarcely trust our interests to better men. (Cheers.)

The motion was carried unanimously.

The CHAIRMAN: I have to thank you very much for re-eleeting us as directors. I will point out that we did not think it necessary to come forward for re-election to-day. It is only a question whether this is a first ordinary meeting of the company or not, but it has been pointed out to us that it might be more safe if we be re-eleeted to-day, in order that all our transactions may be perfectly legal. The directors, who are *ipso facto* the committee, will thus remain in office for another 12 months.

EXTRAORDINARY MEETING.

OBJECT OF THE MEETING.

Mr. T. W. MARTIN here read the notice of the extraordinary general meeting, which was called for the purpose of considering the subjoined resolution:—

"That the regulations contained in table A of the Companies' Act, 1862, shall not apply to the company, but instead thercof the regulations contained in the printed document submitted to the meeting, and for the purpose of identification subscribed by the chairman thereof, be, and the same are hereby approved, and that the said regulations be, and they are hereby adopted, as the regulations of the company, to the exclusion of all the existing regulations thereof."

The CHAIRMAN: I now declare this meeting extraordinary, for the purpose of considering the articles of association which we propose to put before you. You will, doubtless, remember that our company, when started, was formed somewhat hurriedly, and we had only time to register our memorandum of association. We, therefore, have at the present time to work under table A. Table A is very inconvenient for any company to work under, but I need not point out in what way that is so, because it will be apparent to all of you who know anything about companies. We have placed ourselves in the hands of our able solicitors, who have drawn out articles of association for us, and these have been posted in the Exchange for the last 10 days. Whether anybody has taken the trouble to read them or not I do not know, but all I will say is that the committee have done so, and they can recommend these articles to you, and I think I may state on their behalf that they are nothing more than what are usually employed in all companies of a similar class.

A NECESSARY ARTICLE OF ASSOCIATION.

There is only one article which differs materially from those of other companies, and that one I will read.

26. "Shares may be sold only to persons who are members of the Mining Exchange, and in the event (1) of a holder ceasing to be a member of the Exchange, and (2) of his death, his shares shall, without any further consent by, or the concurrence of the holder so ceasing to be a member, or, in the case of his death, of his legal representatives, be offered for sale by the directors, who shall offer them to the existing members of the company, either by auction or otherwise, as the directors may think best. The proceeds of such sale shall in the first case be applied by the directors, so far as such proceeds will extend, in satisfying the debts and liabilities of such member to any member or members of the Exchange to whom he may be indebted, or if be not indebted such proceeds shall be paid to the holder so ceasing to be a member, and, in the second case, to the legal personal representative of the deceased member. Any certificate for shares so sold shall be returned to the compauy on demand, aud in the event of refusal the

directors may by resolution cancel the same and issue a new certificate. The directors may enter the name of the purchaser of such shares upon the register of members in respect thereof, and a certificate in writing, signed by two directors and the secretary, and the receipt of the company for the price of such shares shall constitute a good title thereto; subject hereto, shares shall be transferable only by instrument in writing signed by the transferor and transferee and duly entered in the register of transfers."

That appears a long article, but it has been framed with a view of carrying out several of our rules, and they are generally to the effect that only members shall be shareholders. The solicitors have thought it requisite for our purposes to insert it, and I think you will agree that it is a very proper rule indeed for an Exchange like ours. I move the resolution.

Mr. Peter Watson: I second it. The committee have had a great many meetings, and have gone through all these articles under

THE ABLE ADVICE OF MESSRS. SNELL, SON AND GREENIP.

We desire to have everything legally and properly carried out, and under their advice we are endeavouring to place this institution on a satisfactory basis not only towards the members, but towards the public at large. I think that will be the way to gain confidence. I hope, and believe, the public at large will be able to come and deal with the members of this institution as freely as they may feel inclined to do elsewhere. I am quite satisfied, knowing as I do a great many of the members of this institution, and being associated with the mining market and mines at large for very many years, that the members will act fairly, considerately, and honestly in every way to the public, for it is only by these means I assure them that they will have the esteem and confidence. With these remarks I beg to second the resolution.

The motion was carried unanimously.

On the suggestion of Mr. Vickers, the proceedings closed with a cordial vote of thanks to Mr. Thomas Thompson for the ability with which he had presided over the meeting.

BLUE SPUR AND GABRIEL'S GULLY CONSOLIDATED GOLD CO., LIMITED.

DISCORD BETWEEN THE LONDON BOARD AND THE LOCAL DIRECTORS — NO INFORMATION FROM LOCAL DIRECTORS — LETTERS UNANSWERED—TELEGRAMS IGNORED—PROPERTY OF MUCH VALUE.

An extraordinary general meeting of the company was held at the City Terminus Hotel, on Tuesday, for the purpose of considering, and, if deemed advisable, passing, either with or without modification or amendment, the subjoined resolutions, viz.:—

RESOLUTIONS.

(1.) "That the directors be, and they are hereby, authorised to abandon the options given to the company for the purchase of the mining rights of the following companies or claims, namely:—'Blue Duck,' 'Fidelity,' 'North of Ireland,' and 'Morrisons.'" (2.) "That it is expedient that the offices of the local directors be abolished, and accordingly that Mr. James Clark Brown and Mr. David McIntosh be, and they are hereby, removed pursuant to powers conferred by article 88, from their respective positions as local directors of the company."

Sir Walter Buller, chairman of the company, presided.

Mr. W. B. Fabian (secretary) read the notice calling the meeting.

OPTIONS ABANDONED AND PURCHASES MADE.

The Chairman: I think the notice sufficiently discloses the object of the meeting. You may remember that at our statutory meeting in May last I explained that, besides making certain purchases, we had secured options of mines. On these we have paid 10 per cent. deposit, and we had a right to complete, or to abandon, within a certain time. The directors propose that in certain cases the purchases shall be completed, and that in certain others (as per resolution) they shall be abandoned. It is necessary that some decision should be come to now, because, under our agreement with Mr. Brown, in all cases where the option is abandoned the company is entitled to recover the 10 per cent. deposit paid in cash, and as security for that agreement, Mr. Brown has left in our hands (unissued) 5,000 shares, to which he is entitled. The directors have given the matter careful attention, and chiefly on the advice of their inspector, Mr. Howard Jackson, they recommend to you that in these cases the purchases should be abandoned under the option—"Blue Duck," "Fidelity," "North of Ireland," and "Morrisons" claims. Mr. Jackson says: "In my opinion, the value of the amalgamated companies would in no way depreciate if these options were abandoned, as none of them could be worked without the water of the amalgamated company, and no effort should be left unmade to secure all the water which can possibly be brought on to the works." The other resolution is one for the removal from the office of local director of Mr. James Clark Brown and Mr. David McIntosh. The director ask for this resolution under sec. 88 of the articles, which provides that a director may be removed by a special resolution from office at any time within the period of his office. I do not wish to go into the reasons which had determined the board to do this.

A JARRING NOTE.

We find ourselves out of harmony with the local board, who so far from being a help to us are obstructive. We simply cannot be held responsible for the management of the mine and its proper development unless the control is centred in us. At the instance of some very large shareholders, the board some months ago appointed an Inspector, for the simple reason that for 12 months we could not get any information. Letters were left unanswered and telegrams ignored. We appointed an inspector, a gentleman known to myself, and one in whom the board had full confidence, with instructions to visit the mines and inspect the works at all times, and to report to the board in London by letter weekly, by cable monthly, and by this means to let us know what was going on. The managing director seems very much to object to such an appointment, and is entirely at loggerheads with the inspector. The inspector cannot get access to the books, and appears to have difficulty in getting access to the mines, and he is not allowed funds to send cables as instructed by the London office. He did send two or three cables, but as he had to pay for them out of his own pocket you will not be surprised to hear that he very soon discontinued doing so.

NO INFORMATION.

Meanwhile we are not getting the required information. It will be for you to say whether the course recommended by the directors shall be adopted or not. If the resolution be passed it will have to be confirmed at a subsequent meeting. If you elect to retain Mr. Brown and his colleague we shall retire, for we cannot be responsible for the control of the mines if we have no power, and if we are to be saddled with local colleagues with whom we are not in harmony. (Cheers.) It is a difficult and delicate position—and I wish to state absolutely that this is the position the directors take up.

DIRECTORS WILL RESIGN IF LOCAL BOARD BE CONTINUED.

Sir John Stokes (director): Before you proceed to discuss these resolutions let me say I entirely endorse all Sir Walter Buller has said to you as to the impossibility we were under from May last year until we sent out our inspector of learning anything that was going on. We had two delusive telegrams sent us in May as to what had been done in a fortnight's work, which raised our hopes, and enabled us to raise those of the shareholders. But we never could get from that day forward a word of what they were doing—

THEY SIMPLY LEFT US IN THE LURCH.

As a director, I concur in what Sir Walter said, that if Mr. Brown and his colleague are left in office at the mines I can have nothing further to do with them. We are quite willing to continue the trouble and difficulties we have had to contend with in managing the business for you; but without control it is impossible for us to do anything, and, therefore, I only recommend to you the resolution that has been proposed.

Mr. Gisborne (director) said he coincided with all that had been said by the two last speakers. In matters of administration, where there was responsibility there must also be power, but in regard to the local board of direction, the home board found their action paralysed.

Sir John Stokes: I should like to add that the result of the appointment of our inspector has been to confirm us in the opinion that the property is valuable, which is a matter of importance.

CLAUSE 88.

The Chairman: I ought to state how the company came to be saddled with Mr. Brown. Mr. Brown had an agreement with the promoters securing him in the position of managing director for three years at a fixed salary, which was part of the bargain. The company was floated subject to that agreement; but, as we are advised by our solicitors, clause 88 meets the case. Mr. Brown may think he can ride over us for three years, and that there is no power to the contrary, but we ask you to exercise the power given by this article.

Mr. Haughton agreed in the policy of the directors in regard to the purchase of some of the mines and the abandonment of the options of the others. The properties must ultimately all fall to the company, because it possessed the water rights, and was secure of the return of the deposit money by still having Mr. Brown's shares. He moved the first resolution as read.

Mr. Bigland seconded the motion, and asked how they stood with regard to the water rights?

The Chairman: We do not give them up.

The resolution was carried unanimously.

Mr. Haughton proposed the second resolution as read, and said: In any company it is necessary to have undivided authority. If there are two heads the business is bound to come to grief. Our position is that we have two heads, and the question is which head is to be got rid of. Is Mr. Brown to be allowed to dictate to the company and ignore the London office, or are we going to take advantage of our articles of association and remove him and his colleagues altogether—leaving the sole business in the hands of the present directors? It is a question of whom we have the most confidence in. Mr. Brown and his colleague seem to refuse to give us any information, and even at the present time they have sent no audited accounts and no vouchers, whereby they can show a balance-sheet so as to bring it before the general meeting. Under these circumstances I certainly think we should abolish the local directors.

AN ERROR CORRECTED.

The Chairman: I would state that since the issue of the circular the accounts and vouchers have been received, and they all seem to be in order. After issuing the circular I telegraphed to Mr. Brown to let me know whether he had posted the accounts, and I received the reply that they were coming by the San Francisco mail, and they accordingly reached me on Saturday last.

Mr. Beckworth: May I ask you, on behalf of Mr. Brown, as regards the 5,000 shares not yet allotted, and the money paid by the company for the options—how do we stand now in regard to those shares? Will the balance of those shares be delivered to him after this meeting?

The Chairman: That is a matter for our solicitor, Mr. Greenip, to consider, and advise the board upon. If the shares were readily saleable at par I should have another reply, but it is too notorious that they are worth very little in the market. We have 5,000 shares to which Mr. Brown is entitled on the settlement of this question, and it will be for the solicitor to advise us, as to the treatment of these shares.

Mr. Beckworth: What amount of cash has been paid?

The Chairman: For the "Blue Duck," 200*l.*; "Fidelity," 400*l.*; "North of Ireland," 700*l.*; and "Morrisons," 174*l.*

Mr. Beckworth: 1,474*l.* in all, and I presume the balance will be arranged.

The Chairman: That will be an administrative question on which the board will act after taking legal advice.

Mr. Greenip (Snell, Son, and Greenip): I may as well answer the question at once, by saying that 1,474 shares would not be the equivalent of 1,474*l.* in cash.

Mr. Hume Webster: I second the resolution. I do not think the company has a chance until it is completely under the power of the directors in London.

PROBABLE ACTION OF MR. BROWN.

A Shareholder pointed out that by passing this resolution the company was inviting litigation from Mr. Brown.

The Chairman contended that Mr. Brown was removable under clause 88, and that they must not grasp the nettle in a half-hearted

way. Either they must assert themselves or Mr. Brown would. His own view was that Mr. Brown would fight, but whether they had much to fear from an impecunious plaintiff he left the meeting to judge. There were grounds of misconduct which might also be alleged, but into which he must decline to go. He would rather remove him without alleging any such grounds.

A SHAREHOLDER pointed out that Mr. Rawlins had stated in his report "that justice has been done to the property during the 12 months."

The CHAIRMAN: I do not wish to go behind the main question, and at this moment Mr. Brown is my colleague; as such he is entitled to a certain amouut of consideration—especially as he is absent; but I do not choose to be his colleague any longer. If charges are to be brought against Mr. Brown, I would rather someone else brought them.

The resolution was carried unanimously.

A SHAREHOLDER: How is it proposed to carry it into effect?

FUTURE ARRANGEMENTS.

The CHAIRMAN: We have appointed an inspector, in whom we have absolute confidence. That appointment was, I understand, distasteful to Mr. Brown, and I believe in a lesser degree to his colleague. Our solicitor, Sir Robert Stout, has, I believe, every confidence in the man we have chosen, and we propose to appoint him general manager, assuming that this resolution be confirmed at a meeting that will take place in about three weeks. On the 18th of this month Mr. Howard Jackson will receive the power of attorney authorising him to assume supreme control of the mines. That power revokes an existing power in favour of Mr. Brown and Sir Robert Stout. We should have been glad to join Sir Robert Stout, but there was not time for reference. Mr. Brown will probably be absent attending to his parliamentary duties, but he will be advised of our action.

BETTER RELATIONSHIPS WITH THE BANK.

Mr. HUME WEBSTER: This will not affect your arrangements with the bank.

The CHAIRMAN: Not in the least. Sir Robert Stout has made a most satisfactory arrangement. We have had a remittauce from the bank, and are in a very much better position than we were before.

Mr. HUME WEBSTER proposed a vote of thanks to the chairman, and said that the best proof of the value of the property was the fact that the bank had taken a mortgage on it. It was very unusual for banks to lend money on mining properties.

Mr. HAUGHTON seconded the motion, which was carried unanimously, and the meeting closed.

LATEST REPORT.

15th April.—Acting under instructions of Mr. J. C. Brown, M.H.R., managing director in Otago, New Zealand, of your company, I visited and examined your property, and I have to report as follows:—The Blue Spur gold deposit consists of a vast bed several hundred feet in thickness that at one time formed the bottom of a lake or river, and is mainly composed of angular fragments of quartz and slate, with water-worn gravel, cemented together in some places with iron, but mainly with alum. On the southern side a valley has been eroded, which was fed with the washings from the deposit, and the lighter portions being carried away with water the gold remained, and formed a very rich deposit that was worked in the early days and known as Gabriel's Gully. When the richest portions of this ground had been worked out the source from which it was derived was attacked, and for many years has produced large quantities of gold. Being held by mining companies in small uneven sized areas, and the workiugs very deep, the lines of the boundaries became uncertain and difficult to define, and led to lawsuits for the recovery of gold said to have fallen on the wrong side of an imaginary line. Work was, however, carried on for a number of years, always resulting in good yields, till the valley before mentioned as Gabriel's Gully, became completely blocked with immense beds of half broken *debris*, the result of the workings on the various claims running their tailings into it. A company was then formed known as the Tailiugs Company, who introduced the old system of elevating tailings in California on an improved plan, which acted very well indeed, and although the immense bed of tailings had already been worked or erushed by the Spur Companies, this Tailings Company made a considerable profit out of the re-washing. In order to allow of this being done a tail-race was brought up through the drift, and the material was simply turned over in a few hundred feet, the gold extracted, and the tailings left, the water running off in the 4-ft. tail-race down the gully. In the meantime the Extended Company, who held a block immediately above the Tailings Company, having run off all their top wash down to a certain level, had to resort to the same means of elevating introduced by the Tailings Company, but were very cramped for room, and the only chauce for getting their tailiugs away was by bringing up a deep tail-race on the rock on the same level as the Tailings Company. On the rough sketch I have enclosed it will be seen that in order to attack the cement deposit which commences at A a tail-race would have to be carried up the gully in tailings, and this is now being done with the result that up to this date the new company has only been working old worked ground, and has, I am informed, been able to pay expenses, which speaks well for their future, as in a short time a deep face of virgin ground will be opened from which large quantities of material have been lifted and crushed by rollers, stampers, &c., and have yielded highly payable returns. The time and money involved in this preliminary work was evidently not calculated on in basing an estimate of output, and hence the delays in getting results commensurate with the outlay involved in the purchases. Two euts are being rapidly advanced in the direction of the virgin ground, and both are now in fairly (one very fairly) payable material. It may be questioned if the means proposed to be adopted for the reduction of the cement will suffice to crush it, the old companies being compelled to use rollers and stamps. The advantages that a new company have, are:—1st. That having a very high face, about 70 to 80 ft., the material will break in falling. 2nd. The introduction of the elevator has at the same time provided a splendid means for reducing as the material is carried up a nearly perpendicular pipe with great velocity against an iron shield at the top and completely shattered. 3rd. That the open faces ready for washing have been rendered very friable by exposure and, if any difficulty occurs, small charges of dynamite will shatter large blocks by being simply exploded on the upper surface. 4th. That the decreased quantity of material put through will be more than compensated for by the great yield of gold. 5th. The large supply of water available. In conclusion I may state that although there might have beeu differences of opinion in regard to the most expeditious means to be employed to open the elaim, no other, with a view to future economy, could have been carried out, and on the whole I feel that justice has been done to the property; the only thing I noticed during the visit being that the gold saving boxes are set with too great an angle, as they have a very short run, and the fine gold, I fear, is being lost. The advantage gained, however, is that the boxes clear themselves much faster, and more material is passed through. For general work this matter will require attention. The nozzles were not large enough to keep the elevators fully employed. I have below shown on a rough sketch a section of the ground. (Sketch of mine which may be seen at the office.) I have every confidence in the future of this eompany, as the lower beds of cement are richer than the higher ones already worked, and I feel quite satisfied that the future yield will be much richer. I understand that your water rights are equal to 2,400 ins., which used with ordinary experience should wash from 5 tons to 6 tons per minute, including lifting tailings and water from nozzles. This large body of water has never hitherto been brought to bear on any face at the Blue Spur like your company will have, and when it is known that this material actually paid something more than the cost of quarrying, truckiug and crushing, some idea may be gained of its richness, and the probable return when treated with the means now provided. I may state, in conclusion, that I have known this deposit for over 20 years, and that I visited the place three years ago, and also to-day, and I have every confidence in the future workings proving highly remunerative.—C. C. RAWLINS, M.E., F.G.S., Manager of the Island Block Gold Mining Co., Limited.

SMELTING CO. OF MEXICO, LIMITED.

THE COMPANY TO GO INTO VOLUNTARY LIQUIDATION—£8,000 IN HAND FOR DISTRIBUTION AMONG THE SHAREHOLDERS.

THE ordinary general meeting of this eompany was held on Monday at Winchester House, under the presidency of Mr. Sopwith.

The SECRETARY read the notice convening the meeting.

ACTION OF THE COMMITTEE.

The CHAIRMAN: It will be remembered that at the general meeting of the company held on the 16th day of October last, the shareholders were made fully acquainted with the conditions of the company's affairs, and the accounts, now presented and audited by the company's auditors, fully disclose the results of the company's operations during the brief period of its existence. I do not propose to take up your time by enlarging upon the accounts, but rather leave that subject for the criticisms of the shareholders, when I will reply to such enquiries as may be made. At the last meeting the shareholders, at the invitation of the board, appointed three gentlemen to act as a committee of consultation, to advise with the directors in regard to a negotiation then pending, having for its object the sale of the company's business and effects to an American smelting company. The three gentlemen so named—Messrs. J. W. Johns, J. H. Collins, and Mr. Bowes-Scott—took advantage of the terms of the resolution passed at the meeting, which enabled them to increase their number to five, and they accordingly obtained the consent of Mr. Robert McIlwraith, absent, and Mr. C. W. Western—to act with them. The directors beg to thank these gentlemen for the attention they have bestowed upon the matter, and for their counsel in deliberation; many meetings were held, and it was hoped that the project for sale alluded to would have been carried through, but, unfortunately, conditions were imposed which the company could not possibly agree to, and which I will endeavour to explain to you. The proposition made to the company was based upon the assumption that the financial position would enable us to dispose of some 20,000*l.* cash for investment iu the American company, this being made a condition of the purchase, the American company would then have further paid us 7,000*l.* for the immovable plant, &c., and have takeu over the coke and other stores at a fair valuation. The American company was a sound one, paying its shareholders 10 per cent. dividends, and they would have paid us in shares of their company, which shares would be convertible into cash to any shareholder preferring to receive cash. The financial condition of the company, however, did not admit of our accepting the proposal.

COUNTER PROPOSAL.

We did not see our way to finding more than 7,000*l.*, aud therefore we made a counter proposal. The American company have a representative, who is also one of the most influential of the shareholders, in London, and several meetings were held, at which both he and the committee of shareholders were present. The negotiation was a protracted one, and to assist the business the directors undertook to augment the sum available up to the amount of 10,000*l.*, intending themselves to take any additional amount between them in the American company over and above the sum available in cash in the coffers of the company. It was hoped that this would lead to business, inasmuch as the London representative referred to strongly recommended his colleagues to agree to it. However, they insisted upon the 2,000*l.* as a minimum, and it was thought to be unreasonable to expect the shareholders to be willing to put more money in the business, and in addition it transpired at the last moment that the American company would require us to pay a premium of 12 per cent. for their shares, and consequently the negotiation was eventually broken off. Another advantage to this company at the time the negotiation was pending consisted in the fact that this eompany had a large outstanding liability to Messrs. Fraser and Chalmers for plant ordered from Chicago, and it was part of the arrangement that they took over this liability. Finding it impossible to come to terms, the directors, with the concurrence of the committee, directed their attention to the realisation of the stores out in Mexico, especially such as would deteriorate by keeping; and to the reducing so far as possible the current expenses of the company, as also to the settlement of certain contracts that had been entered into by the company at the time when the directors were advised that the business was being conducted at

a large profit. The board have succeeded in their efforts, so that the company is now free from any liabilities of an important character; and we have an available balance of some 8,000*l.* cash in hand, for distribution among the shareholders (subject to current disbursements) in the event of the shareholders electiug to wind up voluntarily, or to assist in carrying out a scheme of re-construction should the meeting so determine. There is also the plant, &c., in Mexico to be disposed of.

MR. COLLINS' ADVICE.

Mr. J. H. Collins, one of the committee named by the shareholders, has consistently advocated a scheme for re-construction of the company. The board is much indebted to Mr. Collins for the very considerable time and thought he has given to the matter, and the board much regret that they have not felt able to join in his recommendations, and in his views they were supported by the other members of the committee. The secretary will read a summary of the special report prepared by Mr. Collins, and if it be the wish of the meeting I will call upon the secretary to read also the very full and special report therein referred to. In justice to Mr. Collins, the board would wish the meeting to know the contents of the entire report, as it deals not only with his recommendations for re-construction, but it is the result of his careful examination and criticism upon the past operations and management, and the board think that his views on this subject should also be made known. You will observe that Mr. Collins' proposal involved raising an additional sum of 35,000*l.*, or a minimum of 30,000*l.*, and the board are bound to confess that their past experience would deter them from putting the proposal forward as one which they could recommend or become responsible for; neither do they believe that the attempt to raise 30,000*l.*, or 35,000*l.*, could reasonably be expected to succeed, especially as the directors themselves would be unwilliug to put their own money into the business agaiu. The board wish to say that there is much in Mr. Collins' report in which they fully concur, but they differ from him in expectation of what would be the result from a re-construction of the company as proposed.

A DEFINITE PROPOSAL.

The proposal is, however, before the meeting, and, in event of its acceptance, the board will render all assistance that lay in their power to carry out the wishes of the meeting, although they would not be willing to remain directors of such company when formed. The board wish now to lay before the shareholders a proposal of a defiuite character, made by a gentleman of some considerable position in Mexico. A syndicate of gentlemen in Chihuahua appears to have been formed with the view to taking a lease of the smelting works for a period of five years upon the following terms: The syndicate propose to form a capital of some $100,000, to lease the works from us for five years; their original proposal did not carry with it the payment of any fixed sum to this company, but this company was to receive 20 per cent. of the profits made, aud to be exempt from sharing in any loss that might take place. The board thought this proposal too indefinite to be considered seriously as it then stood, and wrote in reply, suggesting the payment of a minimum fixed sum of 500*l.* per annum, and a cablegram has been received in reply, to the effect that they will doubtless agree, stating that there will be a meeting of the syndicate shortly, and it is very probable they will agree to pay a minimum of 500*l.* per annum. The secretary will read you the correspondence on this subject, if it be your wish to be made more acquainted with the subject in detail.

A RESOLUTION.

It rests with the meeting now to decide what course shall be adopted under the present circumstances, and in default of any other course beiug determined on by the meeting, the proposal will be submitted: —"That the company be wound up voluntarily under the provisions of the Companies Acts, 1862 and 1867." The meeting must weigh the prospects as to what sum may be realised for the works in Chihuahua if it becomes known that they must be sold. The committee, with certain of its members, hold the opinion that the company would do well to retain the works for a time. It is a growing conviction that the movement afoot in America for putting a duty upon all lead ore coming into America from Mexico is becomiug so strong that it will iuevitably be carried; in that case there cannot be a doubt that smelting in Mexico will become not only possible, but unquestionably very profitable, when the works would at once become much more valuable and readily saleable, or a scheme of re-coustruction could then be proposed, with every prospect of success. In case of voluntary liquidation there would, of course, be available for distribution the 8,000*l.* more or less now in the bank. I wish to do an act of justice to Mr. Rathbone, who is not present. Mr. Rathbone came to London for the purpose of being present to meet the shareholders, and, unfortunately, the protracted character of the negotiations already referred to delayed the holding of the meeting. Meanwhile, Mr. Rathbone's financial position rendered it necessary that he should be doing something for a livelihood, and he was therefore compelled to leave England very summarily for South Africa to accept some employment there. Mr. Rathbone wished to assure the members by his attendance personally that, while regretting deeply that he had been the means, unwittingly, of entailing losses upon his friends and others, he had made no profit himself by the transaction, and the directors are satisfied that he speaks truly. I beg to move:—"That the accounts and report of the directors for the year ending 31st December, 1888, be adopted."

Sir Wm. Cunninghame seconded the motion, which, after a brief discussion, was carried *nem. con.*

The Chairman proposed "That the company be wound up voluntarily, under the provisions of the Companies' Acts, 1862 and 1867.

Mr. Munro seconded the motion, which was agreed to. Mr. Foster, the secretary, being appointed liquidator,

The proceedings then terminated.

The first tin mine in the United States is located in San Bernardino, County California, and another has been recently reported in the same locality. Neither has yet been worked, although the development of the first is about to be undertaken. The tin is found in numerous lodes, some of them disclosing a high percentage of ore.

NOTICE.—The List of Subscribers will Close on TUESDAY, June 11th.

SAN SALVADOR SPANISH IRON ORE COMPANY, LIMITED.

(REGISTERED UNDER THE COMPANIES ACTS.)

The Property to be acquired by the Company is estimated by Mr. Jeremiah Head, M.I.C.E., of Middlesbrough, to contain upwards of 5,000,000 tons of "Rubio" Iron Ore, showing, by the analysis of Messrs. Pattinson and Stead, of Middlesbrough, 59.50 per cent. of iron.

CAPITAL - - £60,000.

Divided into 35,000 PREFERENCE SHARES of £1 each, entitling the holders to a Preferential Dividend of 20 per cent. per annum, out of the profits available for Dividend in each year, with participation in further profits; and 25,000 ORDINARY SHARES of £1 each, which will entitle the holders to a Dividend of 10 per cent. per annum, after the Dividend of 20 per cent. has been paid on the Preference Shares. The 20 per cent. Preference Shares are now offered for Subscription, upon the following terms:—Deposit on Application, 1s. per Share; Payment on Allotment, 2s. per Share; One Month after Allotment, 3s. per Share; Two Months after Allotment, 4s. per Share. The Balance of 10s. per Share will be called for in Two Instalments of 5s. each, at intervals of not less than Two Months.

REGISTERED OFFICES (*pro tem.*)
80, CORNHILL, LONDON.

ABRIDGED PROSPECTUS.

This Company has been formed to purchase a lease or leases of, and to work, certain deposits of rich hæmatite iron ore, subject to a royalty of one peseta per ton, situated within 2 miles from the Port of San Salvador, within the Port and Bay of Santander, covering about 1,740,000 square metres, equal to about 500 English acres. The concessions have been examined and reported on by Mr. Jeremiah Head, M. Inst. of C.E., of Middlesborough, and 26, Lombard Street, London, and Mr. F. Kensington, C.E., of 2, Copthall Buildings, London, gentlemen of established reputation and considerable experience of the iron deposits of this district and the methods of working the neighbouring properties.

The following extracts from the "*Gaceta de los Caminos de Hierro*," of December 9th, 1 88, and the "*Revista Minera*," of January 24th, 1889, give the particulars of the shipment of iron ores from Spanish ports, for the past 11 years.

	Tons.		Tons.
1878	1,000,774	1884	2,448,941
1879	861,610	1885	2,726,762
1880	1,908,579	1886	2,515,128
1881	2,099,362	1887	3,422,966
1882	2,971,221	1888	3,591,637
1883	2,667,163		

The property which this Company intends to aequire contains an enormous supply of the finest hæmatite ore, several units richer in metallic iron than the ordinary Bilbao "Ruhio" ore, for which there is a large demand at all the chief centres of iron manufacture in England, Belgium, Germany and America.

The estimated quantity of *marketable iron ore* contained in the property is, according to the reports furnished to the directors, believed to be, at the lowest estimate, 5,000,000 tons, this would suffice for an annual output of 150,000 tons for 33 years. Mr. Head, in the report previously mentioned, says:—"Mr. Kensington's estimate of at least 5,000,000 tons, represents an assumed average depth of about 6 metres. My impression is that a much greater average depth may fairly he assumed, and that the quantity obtainable is far more than the above figures represent."

Calculating the net profits on the sale of 150,000 tons per annum at only 2s. per ton, the result is an annual income of £15,000.

The very profitable character of an investment of this description is thus summarised by Mr. Head, in the conclusion of his report:—"1st. That from the several concessions not less than 5,000,000 tons of iron ore corresponding to analysis No. 1 may be obtained. 2nd. That the quality (after washing) as indicated by that analysis of the samples I brought away is such as to yield more iron and less aggregate impurities than is usual in Spanish Rubio ore. 3rd. That at present values a profit of 2s. per ton should he realised, a profit which, if maintained over the whole estimated quantity, would represent a total of over £500,000. 4th. That regarded as a commercial venture the opening out and working of these mines by your company ought, with good management, to prove a very prosperous undertaking."

The reports of Mr. Jeremiah Head, M.I.C.E., and Mr. F. Kensington, C.E., together with the analysis and all other documents, are open to inspection at the offices of the Company. Copies of the reports can he had on application.

All applications for the preference shares must be sent to the bankers, Messrs. Martin and Co., 68, Lombard Street, London, E.C., accompanied by a deposit of 1s. per share on the number of shares applied for.

If no allotment is made, all deposits will be returned in full, without deduction.

MINING MACHINERY

Of Latest Approved Designs as developed in American Practice.

The ultimate success of the African Goldfields must depend on large economical Mills, crushing the maximum quantity of ore with the minimum outlay for fuel and labour.

As an illustration of what can be done with superior machinery reference is made to the Montana Company's Mill. This consists of three rock-breakers, 60 stamps and 24 Frue Vanner concentrators. It crushes daily 120 tons of hard quartz, burning six cords wood (3 tons coal) per 24 hours, and employs 15 men in the 24 hours. The engine has been run four months at a stretch without once stopping.

The following extract from the "Engineering and Mining Journal" shows the difference between Fraser and Chalmers' Mills, and those of less experienced firms:—

"STAMPS AND STAMPS.—The El Callao Company has two mills of 60 stamps each; the new one supplied by Fraser and Chalmers representing the best modern designs and workmanship. Both mills are run under one management, and the old mill has been much improved on its original condition.

"Old Mill crushed 31,770 tons in 48½ weeks, cost 24.60 fcs. per ton.

"New Mill crushed 29,000 ,, 25 ,, ,, 8.60 fcs. per ton.

"New Mill will probably crush 60,000 tons in 51 weeks. The rock is a very hard quartz."

The cost of freight and erection is nearly as high for a poor mill as a good mill. The difference in first cost between ordinary mills and the best mills can be made up in the extra saving on a month's run. The large masses of low-grade ore in Africa cannot be worked to a profit with expensive fuel and labour except by improved mills. The days of small mills and rich rock are numbered, as proved by experience in all other goldfields.

THE INGERSOLL DUPLEX HAND-POWER

ROCK DRILL.

A SAVING OF 300 PER CENT. OVER ORDINARY HAND-LABOUR.

Send for full description, testimonials, &c., to

WELLINGTON & CO. (Successors to CLARK & WELLINGTON),

MANUFACTURERS, 73A, QUEEN VICTORIA STREET, LONDON.

It is perfectly automatic, and bores holes from ½ to 2½ inches diameter at the rate of 1 to 2 inches per minute in hard rock. It will work equally well in any direction or on any uneven surface. No skilled labour required to run it. No expensive repairs. Made in two sizes, and can be worked by electric motor if desired. Hundreds of these Machines are at work in all parts of the world in Mines, Quarries, and for all kinds of rock excavating. It is the only *effective* and *durable* hand-power Rock-drill ever made.

On MONDAY and TUESDAY, June 17th and 18th, 1889, at 12 o'clock noon each day.

MR. W. T. DAVEY, Auctioneer, Redruth, has been favoured with instructions from the liquidators to SELL by PUBLIC AUCTION (in lots to suit the convenience of purchasers), on MONDAY and TUESDAY, June 17th and 18th, 1889, at 12 o'clock noon, punctually, at the Tolgullow United Mines, about 1 mile from Scorrier Station on the West Cornwall Railway, the following first-class ENGINES, PITWORK, and MINING MATERIALS thereon, namely, at Magor's: 1 high-class 70-in. cylinder pumping engine (stroke 10 ft. by 9), with first piece of main rod; 3 excellent boilers about 36 tons, with fittings complete; 1 excellent donkey engine; 1 excellent iron balance bob complete; 1 60-ft. shears with shieves and brasses; 1 pair 14-in. cylinder, 2 ft. 6 in. stroke, horizontal slide-valve high-pressure coupled engines, No. 1,103, date 1886, by Sandycroft Foundry Co.; 1 pair 14-in. air compressors, 2 ft. 6 in. stroke, attached to back of steam cylinders, complete with air receiver; 1 20-in. cylinder double-acting winding engine, 6 ft. stroke, with 2 fly-wheels and cage; 1 good 11-ton boiler with fittings complete; steam capstan, about 300 fms. nearly new steel wire rope; 1 34-in. cylinder stamping engine, with 2 large fly-wheels and shafting; 2 first-class 11-ton boilers with fittings complete; 5 good stamps axles with 60 heads and frames complete; 2 stamps axles for 16 heads each; about 25 fms. 20-in. pitwork, 35 fms. 18-in. ditto, 40 fms. 12-in. ditto, and 53 fms. 10-in. ditto, 6 15-in. pitch pine rods, 3 14-in. ditto, and 2 12-in. ditto, 1 10-in. balance rod complete; several pairs faggotted strapping plates, 5 shaft tackles with shieves, 4 "climax patent" rock drills with fittings complete, 1 4-in. 9-ft. drop screw, 1 3½-in. 6-ft. ditto, and 1 2-in. 3-ft. ditto, dry tube, about 200 fms. iron stave ladders, wheel and hand barrows, launders; considerable quantity of very useful TIMBER; about 15 tons of tram-road iron, tram wagons, shaft rolls, old cast and wrought iron, smiths' and miners' tools in variety, 2 nearly new 42-in. smiths' bellows. A good double-power winch, 3 single ditto, lifting jack, &c. Also a large quantity of other articles in general use in mines.

The pumping engine is considered by competent judges to be one of the finest and best finished engines in Cornwall, and the whole of the other machinery and materials will be found in perfect order, and of the best possible description.

Refreshments as usual at 11.30 a.m.

Intending purchasers may inspect the machinery and materials any time previous to the days of sale.

Order of sale: First day, Monday, at 12 a.m., at Magor's (Unity Wood part), engines, pitwork, rods, strapping plates, rock-drills, smiths' tools, brass, &c. Second day, Tuesday, at 12 a.m., at Trefusis and West Poldice proper, small pitwork, railroad iron, ladders, poppet heads, shaft rolls, dry tube, timber, &c.

Further particulars may be obtained on application to John Garland and William Mitchell, Esqs., Liquidators, 6, Queen Street Place, London; Capt. John Gilbert, Mellanear Mine, Hayle; and catalogues may be had from the Auctioneer.

Dated, May 30th, 1889.

THE ABOVE ADVERTISEMENT WILL NOT BE REPEATED.

ADVERTISER, who wishes to obtain Experience in Construction and Working, desires EMPLOYMENT at a Metal, Gold, or Coal Mine. Will place at disposal practical skill and knowledge in consideration of obtaining such experience. No salary required. Has served three and a half years in engineer's workshops. Has a knowledge of mechanical drawing and other engineering subjects. Also had experience as bookkeeper, and shorthand clerk. Good character. Further particulars if required.—Address, Box 26, MINING WORLD Offices, Old Broad Street, London.

ESTABLISHED 1851.

ABRIDGED PROSPECTUS.

THIS Company has been formed for the purpose of amalgamating the businesses of Messrs. C. T. and Joseph Eastman and Messrs. John Bell and Sons, Limited, two prominent firms engaged in the exportation and distribution of American and other meats. Both firms have been engaged for many years past in different branches of the trade, which has now reached such a magnitude that it is considered desirable to amalgamate them under one management, so that the consumers in England will deal direct with the purchasers from the producers.

Mr. T. C. Eastman, who was the pioneer of the American trade, began the exporting of fresh meats in refrigerators to Great Britain in 1875.

Messrs. Eastman stand first among the shippers of meat from America, and the process of refrigeration used enables them to ship the meat to Great Britain, and have it distributed to the retail dealers, or placed on Smithfield Market, in perfect condition.

During the year 1888, Joseph Eastman shipped to Great Britain over 75,000 carcases of meat, and since the inauguration of the trade in 1875, Messrs. T. C. and Joseph Eastman have shipped the enormous quantity of over 500,000,000 pounds weight of dressed meat and over 185,000 live cattle.

The following steamers have refrigerating chambers carrying meat for the Messrs. Eastman, and have an aggregate capacity of over 50,000 quarters of beef.

White Star Line.—"Germanic," "Britannic," "Celtic," "Adriatic," and "Republic." *Guion Line.*—"Nevada," "Wisconsin," "Arizona," "Wyoming," and "Alaska." *Inman and International Line.*—"City of Paris," "City of New York," "City of Chester," "City of Chicago," "City of Berlin," and "City of Richmond." *Anchor Line.*—"City of Rome," "Circassa," "Devonia," "Anchoria," "Ethiopia," and "Furnessia," *National Line.*—"The Queen," Erin," "Eugland," "Egypt," "France," "Italy," "Helvetia," "Denmark," "Spain," "Greece," and "Canada."

These steamers give from five to six arrivals of fresh meat each week.

The business of Messrs. John Bell and Sons was established in 1827. The magnitude of this business may be seen by the turnover in the year 1888—viz, 1,506,674*l.* 18s. 3d.—while the turnover from 1878 to 1888, both inclusive, exceeded 17,000,000*l.* sterling.

Besides selling all Messrs. Eastman's shipments, Messrs. Bell have a very large trade in other meats, including Australian, New Zealand, and River Plate mutton. This firm has the largest trade in dressed meat in Great Britain.

The Board of Trade returns show the immense development in this country of the importation of mutton from Australia, New Zealand, and the River Plate.

Ten years ago Messrs. Eastman requested Messrs. Bell to endeavour to get into direct touch with the consumer, and with this object in view, they have been gradually securing suitable premises in populous districts, and have opened retail meat shops, tied to them for all their supplies. This has enabled them to do a profitable business, whilst selling to the consumer at lower rates than if the meat had passed through the hands of a middleman.

This branch of the business has been established with singular success, and is being steadily extended as suitable premises can be obtained.

Messrs. Bell and Sons have about 330 of these shops, the sales at which last year exceeded £800,000.

The directors have every confidence that the amalgamation of the two businesses under one management will add very materially to the prosperity of both concerns, and Mr. James John Thomson, who has been connected with the English business since its commencement (and who, with Messrs. Henry and James Bell have been sole directors of Messrs. John Bell and Sons, Limited), has arranged to act as managing director for a term of three years.

The Company will take over, as included in the purchase price, the whole of the stock-in-trade of Messrs. John Bell and Sons, Limited, as at 1st January, 1889, together with 20,000*l.* of cash and bills in hand Messrs. John Bell and Sons, Limited, retaining the assets comprised, under the heading book debts, and discharging the liabilities of nearly even amount.

The directors consider that the working capital which the Company will have, will be ample to meet the growing extension of the business. This will consist of £51,400, the difference between the purchase price and the share capital ; the whole of the stock-in-trade of Messrs. John Bell and Sons, Limited, and the £20,000 of cash and bills above referred to, and the large profits which have accumulated in both businesses from 1st January, 1889.

This being a trading Company it is not desirable to indicate the numerous sources of profit, but Messrs. Price, Waterhouse and Co. have made a thorough examination of the books of account of Messrs. Eastman, and Messrs. Turquand, Youngs and Co. have made a thorough examination of the books of Messrs. John Bell and Sons, Limited, from the date of its formation into a private limited Company—viz., 1st January, 1888, to 31st March, 1889—and their reports show that the profits of the two firms for the 15 months amounted to £173,729 16s. 4d., or at the rate of £138,983 19s. 1d. per annum, to which should be added £6,000 (less taxes), the rentals of the Glasgow property.

Taking the above report as a basis of calculation for future profits, the figures will stand as follows :—

To pay 4 per cent. on the £182,474 mortgage will require per annum	£7,299
To pay 8 per cent. on £400,000 preference shares will require per annum	£32,000
To pay 16 per cent. on £500,000 ordinary shares will require per annum	£80,000
	£119,299

leaving a margin of over £25,000.

Prospectus and forms of application can be obtained at the offices of the Company, or at the offices of the bankers, brokers, and Solicitors.

NEW RHYL, LIMITED.

(AN EXTENSION OF RHYL'S SEA FRONT).

Incorporated under the Companies Acts, whereby the Liability of each Shareholder is limited to the amount of his Shares.

174 ACRES OF FREEHOLD LAND, WITH AN UNUSUALLY EXTENSIVE SEA FRONTAGE OF 1¾ MILES.

With a beautiful Beach of the far-famed "Rhyl Sands" running the whole extent.

The Estate runs up to, and commands the Sea for 1¾ Miles, and has only the small average depth of 100 yards. There is therefore no outlying back land, as is usual with an extensive frontage of this kind. The Estate includes a strip of land about the centre, connecting it with the London and Holyhead Railway, which will form one street, from the Sea to the Railway, and give Two Building Frontages, for Shops and other Buildings.

The late Right Hon. John Bright, M.P., speaking in this district at Llandudno says:—"When I look at the position of your town, and its beautiful bay; when I look round and see the beauties of your locality; when I remember how near you are to all the finest scenery of this glorious North Wales; and when I observe and enjoy the purity of your climate, which in winter, I believe, is not surpassed by that of any other place in the United Kingdom; and when I remember all the courtesy and all the kind attention with which I have been met, I am free to say that I have great faith in your future, and I hope and believe that your growth and your prosperity will be continual and will be lasting."

SHARE CAPITAL - £70,000 IN 7,000 SHARES OF £10 EACH,

The whole of which is now offered for Public Subscription. Payable 5s. per Share on Application, 35s. on Allotment, £2 in one month, £3 in two months, and £3 in three months after allotment. Interest will be allowed at the rate of 4 per cent. per annum to Shareholders who pay up their calls in advance.

In addition to the above shares, £20,000 OF SIX PER CENT. FIRST MORTGAGE DEBENTURES, part of an issue of £35,000, redeemable at par on the 31st December, 1897 (or earlier at the option of the Company, by payment of 5 per cent. premium). To be secured by a deed of Trust of all the Company's real Estate, and as a first charge by a floating charge on the Debentures upon all the Company's property. A Draft of this Trust deed (which gives the Company power to sell its lands upon the terms of applying half the proceeds in redemption of the Debentures) can be seen at the office of the Solicitor of the Company, Payable, £5 per cent. on Application; £25 per cent. on Allotment; £70 per cent. on July 17th, 1889. The Debentures will be issued in any multiple of £10. Interest will run from the date of payment of each instalment, up to the 1st day of January next, and afterwards will be payable half-yearly, on the 1st day of July and the 1st day of January, in each year.

The Directors and their friends have agreed to take the whole of these £20,000 Debentures, but they will first be offered for public subscription, and applicants for Shares will, if they so desire, have a *pro ratâ* allotment of Debentures of this issue, the intention being that Shareholders should have a preference in taking up the Debentures.

PROSPECTUS.

This Company is formed for the purpose of extending the fashionable seaside place, Rhyl, along the coast towards the east, all extension towards the west being prevented by the River Clwyd, which is the boundary of the present town on that side.

Rhyl is the nearest, and has for many years past been recognised as one of the leading popular seaside resorts of visitors from Lancashire, Warwickshire, Staffordshire, and Cheshire—four densely-populated counties.

The growth of Rhyl has been most remarkable, and the demand for accommodation arising from the ever-increasing stream of visitors far exceeds the present capabilities of the town, and every new house erected with a view of the sea is quickly taken up. The comparatively small sea frontage compels the greater number of visitors to put up with accommodation without sea views.

The railway journey from Liverpool occupies at present two hours, but on the opening of the new railway crossing the River Dee about August next the run will be reduced to about one hour, thus bringing Rhyl within such easy distance of Liverpool as to justify the expectation that not only will the number of visitors from Liverpool be greatly increased, but that there will grow up a resident population in New Rhyl of persons actually engaged in business in Liverpool.

Rhyl is noted for the remarkable purity and bracing character of its air, for its sands, its excellent sea bathing, the dryness of its climate, and small rainfall.

The Company's scheme is to acquire the long belt of land consisting of about 174 acres immediately adjoining the present town of Rhyl, and extending about 1¾ miles along the sea shore, to extend the Marine Parade along this sea frontage with a fine carriage drive, and lay out and prepare the land for the erection of residences, hotels, and shops.

The development of the scheme will be greatly aided by the erection of the new pier of 800 yds. in length, and 20 ft. wide, with a pier head of 63 ft. by 48 ft.

The pier will be built at the expense of a company already incorporated, and with the capital subscribed for the purpose, and called "The New Rhyl Pier Company, Limited," who have entered into an agreement with this Company to apply for powers to construct the pier, and to erect it forthwith, this Company giving them building sites of about 11 acres of land as a special consideration to erect the pier immediately. The old pier is about a mile and a quarter distant, and at low water the tide recedes some quarter of a mile beyond its extreme limit (*vide* ordnance map).

Liverpool Shipping Companies, when the pier is built, will, it is believed, readily establish a regular service of steamers, daily each way, between Rhyl and Liverpool, the distance being 24 miles, and the time occupied about one and a-half or two hours.

The Company will, in due course, let and sell the lands for building puposes, keeping such control over the buildings erected as shall ensure that the elevation and disposition of the houses shall be tasteful and appropriate.

It is considered that the site of the new scheme is more pleasantly situate, and is generally superior to that of the present town, being closer to the sea at almost every state of the tide, and being immediately opposite to the very best part of the far famed Rhyl Sands.

A most carefully considered drainage scheme has been prepared, and has just received the sanction of the Board of Trade, and will be carried out by the Company. Gas and water will be obtained from Rhyl, and also water from the Prestatyn Waterworks, whose supply is of the purest quality.

The directors wish to call attention to the fact that Mr. Hiley, the Secretary of the Cadogan and Hans Place Estate, Limited, will be manager of this estate, and his experience gained while bringing that important Company to a most successful issue, will enable him to render special services to this Company.

It is anticipated that the whole estate will be covered and realised within a space of seven years. As the land is sold by the Company the proceeds, to the extent of one-half, will be applicable in repayment of debentures. The other half will be at the company's disposal, and the directors anticipate that it will be available for dividend, or for reducing the paid-up capital.

From the report on the estate of the surveyors, Messrs. Owen Williams and Sutcliffe, of Liverpool, who originated and laid out Llandudno, the following figures are taken.

To be received from the sale of the building land			£252,893 12 0
Less road making and asphalting	£45,413 15 0		
Sewering and outfall Sewer	1,700 0 0		
Sewers in road, &c.	10,500 0 0		
		57,613 15 0	
Nett proceeds ...			£195,279 17 0

Taking these figures as a basis, the value of the shares, say seven years hence (and after deducting the amount estimated as payable for interest, dividend, and working expenses during the time, and making allowance for land to be given to the pier company) should be about £25 per share.

It is at present intended to issue £20,000 only of the debenture capital, the whole of which will be spent on the development of the estate, and not paid as part of the purchase-money.

The Company propose to accept shares of the Company, in lieu of cash, when tendered in payment for land, thus giving shareholders the opportunity of purchasing sites on the estate, in exchange for their shares. The Company have taken power to apply for the necessary powers to carry this out, and when such are obtained it will prove an attractive and novel feature of the scheme. The bonus created on completion of the estate will be divisible among those shareholders who have not taken advantage of these powers.

The shareholders will be the owners of an extensive and compact freehold estate, being practically all frontage, and forming an important and much needed extension of a well-established and populous seaside resort.

The vendor has fixed the purchase price at £53,000, payable in shares, debentures or cash, or partly in each, at the option of the directors, thus leaving, with the £20,000 debenture subscription above referred to, £37,000 for working capital out of the present issue. The directors have therefore made ample provision at present for developing the estate. Beyond this there remains £15,000 of debentures unissued for further development of the property.

The following contracts have been entered into, viz.:—A contract dated the 14th day of June, 1889, made between Sidney Walter Humphrey (the vendor), of the one part, and the Company of the other part, and a contract dated 14th June, 1889, made between the New Rhyl Pier Company of the one part, and the Company of the other part.

All costs, charges, and expenses incidental to the formation of the Company up to the first allotment of shares will be borne by the vendor. In relation to these expenses and to the subscription of a portion of the capital, certain arrangements have been entered into with various persons, which may constitute contracts within the meaning of the 38th section of the Companies' Act, 1867. Applicants for shares must be deemed to waive the insertion of dates and names of the parties to any such arrangements, and to accept the above statements as a sufficient compliance with the section 38 of the Companies Act, 1867, or otherwise.

Applications for shares and debentures should be made on the forms accompanying the prospectus, and sent with the deposit direct to the Company's bankers. In any case where no allotment is made the deposit will be returned in full, and where the number of shares or debentures allotted is less than the number applied for, the surplus will be credited in reduction of the further amount payable upon allotment.

Copies of the memorandum and articles of association, the above-mentioned contracts, and the surveyor's and architect's reports, can be inspected at the offices of the solicitor to the Company.

Prospectuses and forms of application can be obtained from the bankers, solicitor, or at the offices of the Company.

15th June, 1889.

QUINLAND—LONDON.

THE MINING MARKET.

CITY, FRIDAY EVENING.

BROKERS IDLE—STRANGE DEPRESSION OF PRICES—BUYERS SHOULD INSIST ON DELIVERY—UPWARD MOVE IN HOME SHARES.

BROKERS have been standing idly in the market-place this week because no man hath hired them. They have regarded each other with rueful looks, and the general opinion is that current expenses have not been cleared by the amount of business that has been done. The weather has been an unfailing, though scarcely an original topic of conversation, and how the Whitsuntide holidays were passed has been as much descanted upon in the Mining Exchange as the rise or fall of prices. There has been literally and truly an absence of business, which is not wholly to be accounted for by the topics to which we have adverted. An utter deadness seems to have come over the mining market, though from whence it springs and to what it ultimately tends no one can tell. It is impossible to think that present quotations represent the intrinsic merits of most of the properties now appearing in our lists. Some that are declaring dividends are ridiculously low, and others that are on the point of doing so are scarcely accepted as a gift. Gympie Great Eastern, for example, is paying handsome dividends, and yet the price is round about 10s.; Nundydroog is on the point of recovering the lode, but shares can be picked up not far removed from par; New California has been earning substantial profits, and yet the shares are only at 9s. New Emma is paying working expenses, but the shares are quoted below 5s. Talking of this company, we are able to deny emphatically, and on official authority, that there will be any call this year. The rumour on the market to a contrary effect has been circulated by persons short of shares. We advise every purchaser of stock in this mine, in California and in Gympie Great Eastern, to insist upon immediate delivery, for by so doing the market will be strengthened, and quotations brought to a reasonable point.

The Indian market during the week has moved but little. The prospectus of the Champion Reef Company has been issued with a capital of 200,000*l*. We gave the full details last week. There has been a demand for Colar Centrals, the report of the directors just issued being read favourably.

South Africans have been down, and the market is extremely dull. The total output for the Witwatersrandt districts for May was 36,525 ozs., towards which De Villiers (Robinson) contributed 7,096 ozs., Simmer and Jack, 879 ozs., and other companies in the proportion shown in our African news. The poor return of Salisbury is attributed to the absence of an adequate supply of water, and we are led to expect that this will continue for two or three months more. The diamond market has shown unsteadiness.

The general foreign market has been uneventful, except that there has been a demand for Californias on the issue of the director's report.

Copper shares have been unsteady, and there has been no feature worthy of note in Queenslands.

Vigour has been thrown into the home market by a big rise of about 4*l*. in Carn Brea, and of about 30s. in Cook's Kitchen. The general opinion is that tin mines are on the upward move.

The settlement, which was a light one, passed off satisfactorily.

AFRICANS.

The market for African shares opened firm on Tuesday, notwithstanding the holidays, but prices have given way all round since Wednesday, as will be seen by the following making up quotations :—Bantjes, 1½; City and Suburban, 9½; Crown Reef, 6; Crœsus, 1⅞; De Villiers (Robinson), divided 3⅞; Ferreiras, 13¼; Goldfields of South Africa, 2⅞; Heriot, 3½; Jubilee, 4½; Jumpers, 12½; Langlaagte, 4; Langlaagte Central, 1 7/16; Modderfontein, ¾; Salisbury, 12¾; Thomas Reef, ⅝; Van Ryn, ⅞; Wemmer, 5¼; Wolhuter, 3 5/16. The following have fallen :—Pigg's Peak, 1/16; Sheba, 1/16; Thomas, ½; Thomas, pref., ½; Johannesburg Waterworks, 1/16; Moodie's, 10s. paid, 1/16; Aurora, ¼; Bankets, ⅜; Bantjes, ⅛; Bothas, ⅛; City and Suburban, ⅝; Crown Reef, ¼; Crœsus, ¼; Dornkop, 1/16; De Villiers, ⅛; Durban Roodepoort, ; Evelyns, ¼; Goldfields of South Africa, ⅛; Goldfields of South Africa, new, 3/16; Heriot, ¼; Henry Nourse, ¾; Jumpers, ⅜; Kleinfontein, ⅛; Langlaagtes, ¼; Main Reef United Roodepoort, ⅛; Modderfontein, ⅛; New Grahamstown, 1/16; Randfontein, ⅛; Salisbury, ⅛; Simmer and Jack, ⅜; Spes Bona, 1/16; Stanhope, ½; United Langlaagte, ⅛; Van Ryn, 1/16; Vogelstruis, ½; Wemmers, ⅝; and Wolhuters, ⅜; the only rises to note has been in Main Reef of 3/16; Geldenhus, ; and Blaubank, 1s.

Diamonds.

These shares have again fallen in price from a want of buying support; there are no substantial buyers for the moment. The following were the making up prices on Wednesday last of a few of the shares chiefly dealt in:—Anglo-African, 4⅞; Bultfontein, 3⅝; De Beers, 15¾; Gordon, ⅞; Griqualand West, 6; London and South African Exploration, 17¼; Reads Drift, 2; New Jagersfontein, 12¼. A fall has taken place in De Beers of 3/16; Gordon, 1s.; Griqualand West, ⅛; New Jagersfontein, ⅜; South African (Pullinger), 1s.; United Jagersfontein, 1s.; and Burmah Ruby Mines, 1/16. The only improvement being in Bultfontein and London and South African, of ⅛ each.

Anglo African	4¾	—	5
Bultfontein, New Shares	3½	—	3¾
Central Dorsfontein	8	—	10
De Beers Consolidated	15⅝	—	15¾

London and Orange Free State Explor. ...	3¾	—	4¼
London and South African Exploration ...	17¼	—	17½
Read's Drift Land Co.	1¾	—	2
Burma Ruby Mines	1 5/16	—	1 1/16pm

Copper.

Extreme dulness was the feature of the copper market, and all round quotations have receded, although they to-day do not close at their worst. Rio Tinto is an exception, for it has improved 3/16.

The following were some of the making up prices of Wednesday:—Capes, 2⅞; Masons, 6⅜; Panulcillo, 13/16; Quebrada, ⅞; Rio Tinto, 11¼; Tharsis, 3½.

The only changes of note on the week are in Capes, which have fallen ¼, Copiapo, Libiola and Rio Tinto, ⅛.

Indians.

Business in Indian shares has been easy this week, but prices remain very firm, and stock is somewhat scarce. It would require but very little buying to put Mysore, Colar Central, and Goldfields considerably better. The following show a fall on the week:—Goldfields of Mysore, 1s.; Mysore Gold, 3/16; Mysore Reefs, 6d.; Nundydroog, 1/16; Ooregum, 1/16, and Ooregum Pref., ⅛. No improvement to note.

Foreign Shares.

Considering that the week opened with a holiday, and, furthermore, the other three days have been occupied with the settlement, prices generally have been very firm. In many cases the jobbers have been found short of stock. We can only again advise our readers to take up what they purchase, and so help their own markets. The principal dealings have been in Day Dawn, Denvers, New California, Palmarejo, Tetuans, Victory, and Yuruari; while Gold Hills, La Trinidad, and Mount Morgan Extended are almost unsaleable. A fall has taken place in Colons of 3d.; Frontino, 6d.; Garfield, 6d.; Jay Hawk, 6d.; Kapanga, 6d.; La Trinidad, 1s.; Montana, ⅛; New Emma, 3d.; New Organos, 3d.; Sam Christian, 1s.; Tetuans. 6d. The following have risen:—Carlisle of 3d.; Orita, 1s.; and West Argentine, 3d. No other changes of note.

Australians.

The dealings in Australian shares this week have been almost *nil*, with the exception of British Broken Hill. A fall is shown in Cumberland of 2s.; Day Dawn, 1s.; Day Dawn, "P.C." 6d.; Etheridge, 3d.; Mosman, 6d.; Mount Morgan, 6d.; No. 2 Queen, 3d.; the only rise being in British Broken Hill of ¼.

The following list shows the principal changes which have taken place:—

	Last Week.		This Week.	
Carn Brea	31	31½	35½	6·

LATEST FROM THE MINES.

Indian Mines.

Indian Gold Mines of Glasgow.—Telegram:—"Have started new stamps; everything is going well."

Colonial Mines.

Day Dawn Block and Wyndham.—A cablegram from the general managers at Charters Towers gives the result of the crushing for the fortnight ending 8th inst.:—"1,350 tons crushed; yield of gold, 791 ozs.; approximate value, 2,740*l*.; fortnight's expenses, 2,310*l*."

Day Dawn P.C.—A cablegram just received from the manager at Charters Towers, gives the result of this company's crushing for the fortnight ending 8th June, viz.:—"1,046 tons; 1,394 ozs." (Estimated value, 4,739*l*.)

Midas.—Cable from the mine:—"Yield for week, 166 ozs. (664*l*.)."

Mount Leyshon.—Cablegram received from the manager on the 8th inst.:—"350 tons crushed; 189 ozs. gold; 20-stamp mill running five days and a-half."

Foreign Mines.

Cortez.—A cablegram from Mr. Welsh, the superintendent at the mines, shows the results for the month of May:—"Production, 40,600 ozs.; expenses, $15,500."

Garfield.—A cablegram from Mr. Hooper, the superintendent, shows the results for the month of May:—"Production, $6,400; revenue expenses, $7,300; capital and development expenditure, $1,700; tons crushed, 260; five stamps working 24 days."

Ouro Preto.—A telegram advises the May returns as follows :—"2,525 tons of ore produced 8,623 oits. of gold." (1,030 ozs.)

Pinos Altos.—The out-turn for May was $44,000.

Pittsburgh Consolidated.—Capt. C. W. Seccombe, the manager of the above mines, for the week ending 24th May, reports : Number of tons mined, 350 ; average mine assay, $14.56 ; number of mills working, 4 ; number of tons milled, 350 ; average mill assay, $16.50 ; yield in bullion, 326.98 ozs. ; estimated value, $4,610.15.

Rio Tinto.—The company announce payment of the drawn bonds of their Five per Cent. issue of 1884, and coupons on their Five per Cent. issues of 1880 and 1884, due 1st prox. They invite holders to present coupons and drawn bonds at once.

Santa Barbara.—A cable message from Rio de Janeiro advises the amount of produce obtained for the month of May as being 4,252 oits. of gold. The value of this produce would amount, at 8s. 6d. per oitava, to 1,807*l.* 2s. sterling.

United Mexican.—Telegram received 14th June: "San Cayetano property : Gross returns week ending June 8th, $5,650 ; expenses week ending June 1st, $5,500 ; loss week ending June 1st, $400. El Cubo property : Gross expenses, including capital expenditure, week ending June 1st, $2,820. Cubo mill works well since June 5th."

Woodward and Walker's.—At an extraordinary meeting of this company, held on Thursday, the resolutions passed on 28th May, winding-up the company with a view to re-construction, were confirmed.

Home Mines.

East Pool.—A dividend of 5s. per share was declared out of a profit of 1,607*l.*

Gunnislake Clitters.—At an adjourned meeting of adventurers, held at the purser's office, Tavistock, it was decided to wind-up the present concern, and a meeting will be held on the 25th inst. to confirm this resolution.

South Frances.—A call of 10s. per share was made on Thursday to cover a debit balance of 2,120*l.* 13s. 10d. on 16 weeks.

Ticketing for Tin Ores.

A tin ticketing took place at Redruth on Wednesday last, when 185 tons were offered.

COMMERCIAL NOTES.

Railways.

The traffic receipts of the undermentioned railways for the past week show the following changes when compared with those of the corresponding period of last year : — Increases : — Caledonian, 3,064*l.* ; Eastern and Midlands, 221*l.* ; Great Northern, 8,036*l.* ; Great Western, 22,200*l.* ; Hull and Barnsley, 137*l.* ; London and North-Western, 40,626*l.* ; London and South-Western, 14,680*l* ; London, Chatham, and Dover, 7,060*l.* ; Manchester and Sheffield, 3,817*l.* ; Metropolitan, 148*l.* ; Midland, 23,282*l.* ; North British, 3,638*l.* ; North-Eastern, 13,795*l.* ; and North Staffordshire, 1,007*l.*

From May 17th to 24th the estimated earnings of the Ohio and Mississippi Railway were $76,038, against $76,125 (actual receipts last year). The New York, Ontario, and Western Railway earnings for the first week in June amounted to $36,867, or $3,455 more than in 1888. For the first week in June the gross receipts of the Cincinnati, Washington, and Baltimore Railway were $37,800, compared with $38,600 last year. For the first week in June the gross receipts of the Mexican Central Railway were $140,657, compared with $103,078 last year.

Dividends declared and announced for week ending June 15th.

California Gold Mines.—Amador Gold Mine.—Deeds were placed on record this week transferring this company's property to the Amador Gold Mine, Limited, an English corporation, with headquaters in London. We are informed that there will be no change iu the management. The sale having been consummated, we expect to see the stamps in motion at an early date, and also that in the near future this property will take its place among the steady bullion producers of the county. Of course, nothing can be definitely said on this point until the mill has actually spoken. The promoters of the Amador Gold Mine have plodded on. They have spent in underground development and surface improvements between $250,000 and $300,000, and have now brought the property to the point where the actual extraction of gold from its native quartz is in order. The general opinion is that it will prove a paying mine. It is on the mother lode ; there are several ore shoots of great extent already exposed ; it may not all be of paying grade ; it would be something remarkable if it were, altogether out of keeping with the general run of even the best mines on the main lode ; but it would be equally out of joint with the general character of mining along this wonderful quartz belt, if among the masses of quartz which nature has stored up there should not be found sufficient of a paying standard to make this new candidate for gold-producing honours profitable for many years to come. Such we sincerely believe the new English owners will find it to be.—From the *Amador Ledger* of May 25th, 1889.

BRITISH MINING INTELLIGENCE.

BERTHA CONSOLS (12th June).—The lode in the 53-fm. level east of engine shaft has a very promising appearance, producing good arsenical ores, peach and tin of good quality. Glasson's rise in back of the 40 at the new engine shaft produces 8 tons of arsenical mundie and some good copper per fm. The stopes in back of this level produce from 8 to 10 tons per fm. Cook's late stopes below the 30 east of cross-course will produce over 10 tons of mineral per fm. There is no change in the large lode west of junction, the stopes are producing fairly well of mixed ores.—T. GREGORY.

D'ERESBY.—The cutting of ground round the western side of the Gor's shaft, laying a tramway and other preliminary work, have now beeu completed, and when the lift from No. 8 to No. 9 level is fixed the sinking of the shaft will be continued without interruption. The shaft is now down nearly 2 fms. below the No. 9 level, and the part of the lode in the shaft is prodncing good saving work for the dressing-floors with indications of improving in depth. Other points are unchanged.

DEVON UNITED (13th June).—Willesford's shaft: During the past month the 132 has been driven east 1 fm. 4 ft. 6 in., the lode proving 2 ft. wide, composed of capel and quartz, with peach and small quantities ot copper mnndie ores. The 132 west has been driven 3 fms. 3 ft., the lode proving from 3 to 4 ft. wide, very promising, and yielding for a short distance 2 tons of copper ore and arsenical mundie per fm. At present it yields saving work, and judging from its general promising appearance, an early improvement may be expected. The winze in the bottom of the 120 west has been sunk 2 fms. 3 ft., making it 10 fms. 3 ft. 6 ius. below the level, the lode proving from 2 to 2½ ft. wide, very promising, and yielding for the last 9 ft. sunk 3 tons of copper ore per fm. for length of winze, 9 ft. At present sinking is being carried on on the north side of the productive part of the lode for more speedy progress, and which it is intended to remain standing until a sufficient depth for the 132-fm. level is reached. The plat at the 132-fm. level referred to in former reports is completed.—1. RICHARDS.

EAST GRASSINGTON (12th June).—The following report has been received from the manager:—Hammond shaft: The lode in the 47-fm. level west is 2 ft. wide, and worth 12 ewt. of lead ore per fm. A stope in back of the level is worth 9 cwt. of lead ore per fm. The 47-fm. level east has been extended from shaft 30 fms. 2 ft. in a wide sparry lode, worth 15 cwt. of lead ore per fm. Iu the drivage west of No. 2 snmp below Amy's workings the lode is 2½ ft. wide, and worth 25 cwt. of blue and grey lead ores per fm. The lode in the same level east is 2 ft. wide, and worth 20 cwt. of lead ore per fm. The 37-fm. level east has been extended 4 fms. upon the heave, and is within 5 fms. of reaching the main lode. A stope in back of the level is worth 12 cwt. of lead ore per fm. Harris main E shaft: The cross-cut north to intersect the lode at the 47 is in 28 ft. 6 ins. The end is letting water freely, and we are continually meeting with branches of spar highly charged with mineral, which are encouraging indications of a rieh lode in advance. The cross-cut north at the 37 is in 19 ft. Excellent progress is being made in opening out the water level east. We are getting on well with harvesting smelting fuel. Dressing and smelting operations pnshed forward with energy. We are daily carting ore to the mill, and commence smelting ore on Monday next.

GAWTON (11th June).—The lode in the rise going up in the back of the 105 east is earried 4 ft. wide, and yielding 10 tons of mundic per fm. The lode in the 95 east is 6 ft. wide, composed of spar, sulphur and arsenical mundic, yielding 11 tons per fm. The winze sinking below the 82-fm. level east is yielding 11 tons of mundic per fm. All other bargains are without change.—G. ROWE.

GLYNDWR LEAD.—The engine shaft has been secured and retimbered where necessary for 25 yds. from surface. The timbering of the shaft as they go down appears to be very good, with the exception of a few breaks which can easily be restored. The small winding engine is doing its work very well. The cutting of foundations for the pumping engine is being pushed on, and will soon be completed, when the building of the house will be commenced. Reports from various qnarter continue to confirm the statements received from working miners of the enormous productiveness of the great limestone flat measures here, whieh will be fully developed when the necessary machinery is erected, whieh will be the work of a few months only, and if the manager's expectations be realised, large profits may be expected soon after.

GREAT FORTUNE.—Fair progress has been made in clearing and draining to the 10-fm. level, and it is expected in about a fortnight that level will be reached. Preparations are being made for sinking and stoping below the adit level on the Conqueror braneches on the incline tram. Ladders and other appliances are being got ready for the engine, copper ore, and Blne Barrow shafts, which will comrand three different points and sets of branches. The stope in the bottom of the adit level on the Conqueror branches, and also two tribute pitches in the bottom on the copper ore branches are improving in the sinkiug, which promise well for the 10-fm. level. The various points are valued in the aggregate at about 40*l*. per fm.

MID-DEVON (8th June).—Snrfaec: The pnmping machinery is being worked slowly, 3¼ revolutions per minute, whieh gradually draius the water in A shaft. A shaft: At 1 p.m. this day the water was 48 ft. below the 80. C shaft: The 50 east No. 3 stope worked on by six men; thc deposit and branehing of ore arc still tending north and east. The section of the lode now worked on is about 12 ft. wide (north to south), with good deposits of ore standing on either side; present yield quite equal to 6 tons per cnbic fm. The strata retains its favourable properties, and indicates a continuous yield for some distance. We have sent forward to Plymouth 111 tons copper ore, whieh was sampled yesterday, computed for the sale 104 tons. Wc have 10 tons remaining on dressing-floors prepared for market.—J. NEIL.

PRINCE OF WALES.—The sinking of thc engine shaft below thc 155-fm. level is proceeding satisfaetorily. The lode is valued at 16*l*. per fm. for the length of shaft. All other points are without change.

PRINCE ROYAL.—The water is now down 5 ft. below the back of the 30-fm. level, so that the bottom of the mine will now soon be drained.

ROMAN GRAVELS (14th June).—The water is to-day about 6 fms. below the 110-fm. level, and we hope to reach the 125 on Saturday next. We have now resumed working the following points:—The 110-fm. level north of old engine shaft, where the lode is about 3 ft. wide, and worth 1½ tons of lead ore per fm. This drivage has been in the east lode for several fathoms just passed through, and we purpose shortly to cross-cnt west to intersect the Roman lode. The 110 south of main shaft on hanging wall, part of Roman lode: The vein here is at present small, but is producing good stones of lead ore. The forebreast is not yet far enough south to cateh the dip of the bunch which we are now stoping immediately above. The three stopes in back of the level, just over the forebreast, are together producing 4½ tons per fm. There are two stopes at work in back of this level, at a point, say, 60 fms. from main shaft, each worth about 1 ton per fm. The three stopes in back of the 125 soutb, one north and one south of Lewis' winze, and one south of Edwards' winze, worth respectively 2 tons, 1 ton, and 1 ton per fm. As soon as the 125 is reaehed, we shall commence to take out the old drawing left from the 110 down, and then make the necessary preparations for the sinking of the shaft. The work here will be pushed with all possible speed.—A WATERS and SON.

RUSSELL UNITED (12th June).—The 80-fm. level has been driven west during the past fortnight 2 fms. 2 ft. 6 ins., and is again getting clear of the influence of the crossing referred to in my last, while the lode is taking a more regular conrse, the leading part being 2 ft. wide, producing good quality stamping work. In the rise now 6½ fms. above the back the lode is 4 ft. wide, worth 5*l*. per fm. We have commenced a cross-cut towards the south lode about 22 fms. west of the main cross-cut from shaft.—W. GEORGE.

SOUTH CONDURROW (12th June).—It was our usual monthly setting on Saturday last, and a general holiday on Monday. There is very little alteration to notice in the mine since our report of last week.—W. RICH.

SOUTH DARREN (13th June).—The stope in the 142 west is worth 2 tons of silver lead ore per fm. The stripping further east is worth 10 cwt. of silver lead ore per fm. The stope in this level east is worth 15 cwt. of silver lead ore per fm. The drivage east on the lode in the 130 west is worth 10 cwt. of silver lead ore per fm. The lode in the 110 end east has improved, worth 12 cwt. of silver lead ore per fm. The cross-cut in the 100 west is in a strong lode, streaked with lead. The lode has been proved 16 ft. wide, 6 ft. of which was very good. The forebreast is not now of much value, but the drivage should be continued through the lode. The winze in the 90 west is without ore.—J. MITCHELL.

WEARDALE (8th June).—Water supply scaree. Ore raised for week, 83 tons; ore dressed for week, 72 tons; ore, fume and slag smelted for week, 143 tons, producing 79 tons of pig lead.

WHEAL METAL AND FLOW.—The metal lode in the 35-fm. level contiuues to present a promising appearanee, containing iron, mundic, capels, prian, and a little tin, and from the look of the surrounding country rock the agents are expecting an early improvement. The lode in the winze is 1½ ft. wide, still in the spar, and the water is very quiek.

WHEAL UNY.—Hinds' engine shaft is now nearly 9 fms. below the 214-fm. level. The lode presents a very promising appearance; good progress is being made in sinking, and the agents are in daily expectation of an important and valuable improvement in the produce. In the 193-fm. level west of incline shaft the lode is reported to be large and of a beautiful character. That level is just getting under where they had a good lode in the level above. It is now valued at 12*l*. per fm. A large piece of tin ground is being opened at this level, which with a little better produce will give increased returns. The 193-fm. level east of Hinds' shaft is also getting under ground that was productive in the level above. The lode is reported to be 8 ft. wide, worth 10*l*. per fm.; and here also an important improvement is daily expeeted. The aggregate value of the five levels now being driven is reported to be 44*l*. per fm.

FOREIGN MINING INTELLIGENCE.

ALMADA AND TIRITO (19th May).—Have driven station at bottom of the Balvanera shaft, 4 ft. 5.10; size of station 10 ft. by 6 ft. Air pipes and everything necessary in shape to commence work with machine drills the coming week. Drivage in 50-fm. level 14 ft. 7.10; ground shows no metal; drifting now about 20 degs. west of north. Drivage in 31-fm. level in metal, 4 ft. 8.10. Face of metal 5 ft. wide, with indieations of strong ore body ahead. Drivage in 12-fm. level 2 ft. 7.10.; ground showiug but little metal, and very hard. Have abandoned work on it for the present. Have placed timbers in various parts of mine where actually needed. Placed rails in tramway to the breast of 50-fm. level. Main shaft ladder-ways in good order. —H. C. CLOUD.

ANGLO-MEXICAN.—The superintendent, in his report for the week ending 27th April, says: There is no change of importance since last report. San Gerado shaft below 572 ft. level has been sunk 9 ft. In the bottom there is still a small streak of fairly good ore. East drift from San Gerardo winze has been advanced 5 ft. We are following what we take to be both foot and hauging walls, distance apart 5 ft., all of which is ore, although here and there we find spots and bunches of waste rock. In the drift west from San Antonio winze we are making rapid progress. The face shows several feet of good ore. We are leaving ore on the footwall, and shall probably find more on the hanging-wall side, the indications for doing so are favonrable.

ASIA MINOR (25th May).—58 men driving, 186 men stoping; value of stopes, 13 tons, 2 cwt.; 10 men rising, 4 men sinking, 4 men cross-cutting, 151 trammers, labourers, &c. The end west from No. 4 stope is worth for silver lead ore 1 ton per fm. The lode in the end of Petri main level west is from 4 to 5 ft. wide, which is producing good stones of lead ore. Great importance is attached to any discovery which may be made here, as this level is being driven in entirely unexplored ground in the interior of the mountain. Numher of men employed at the dressing floors, 75. Production to 31st May, 4,571 tons crushed; yielded 609½ tons rich silver lead ore. Corresponding period last year, 4,617 tons crushed; yielded 581¼ tons.

BALAGHAT MYSORE.—Report for fortnight ending 25th May states as follows:—North engine shaft: This shaft has been sunk 2 ft. 3 ins., or 8 ft. below thc 410-ft. level. The lode is at present poor. The 410-ft. level north is now 103 ft. 6 ins. from the shaft. The lode is presenting a more kindly appearanee than hitherto. The 330-ft. level north has been extended 14 ft., or 495 ft. from the shaft. The quartz this week only assays about 1 oz. of gold per ton. The No. 1 winze in the bottom of this level has been sunk 5 ft. 6 ins., or 41 ft. 6 ins. below the level. The quartz is about 1 ft. wide, and assays 1 oz. 17 dwts. 21 grs. of gold per ton. The drive south from the No. 3

winze at the 270-ft. level north has been communicated with the back of the 330-ft. level. This has cousiderably improved our ventilation, and also laid open for immediate working a good section of paying ground. The No. 2 cross-cut west is now extended 45 ft. from the shaft. The No. 2 cross-cut east has been driven 1 ft., or 79 ft. from the level. The ground in both these cross-cuts is very hard for driving. The 270-ft. level south has only been driven 9 ft. 6 ins., or 220 ft. 6 ins. from the shaft; the lode presents a kindly appearance. The 165-ft. level north has been driven 3 ft. 6 ins., or 491 ft. 6 ins. from the shaft, the quartz showing only a trace of gold in the assay. The stopes in the bottom of this level produces quartz of an average width of 1 ft., and assays 1 oz. 9 dwts. 9 grs. of gold per ton. Surface: The new boiler for the compressor is being fixed and got ready for working. All other work is progressing satisfactorily. (Office note: The gold produced at the mine during month of April has been sold for 519*l.* 8s. 8d.)—Capt. PRYOR.

BRATSBERG (3rd June).—Report for week ending June 1st.—Hoffman Mine: Some very nice batches of ore are being met with at No. 2 adit level, yielding fully ½ ton per fm. The rise in the back of this level is worth 1½ ton per fm. No. 3 adit level is looking very fine, and producing 2 tons per fm. No. 4 level is unchanged, which remark also applies to the other points of operation in this mine. Johannes Mine: Howard lode is yielding fully 1 ton per fm.; it is highly encouraging, the result of operations here. Næsmark Mine: The fixing of the water dam, taking up top water, rearranging pump, and air-pipes is about finished, as is nearly the whole of the work necessary previous to resuming the sinking of Barker's shaft. Surface work and remarks: Nothing new to report under this head.—J. D. HOLMAN.

CHONTALES.—The directors have received advices from their manager *via* Corinto and New York, dated 3rd May, who reports:—During the past month the Consuelito main level was driven 8 varas, and rise put up 5 varas. The work was hindered partly by the Easter holidays and also by the ground getting again very hard for progress, and by which the lode is squeezed to a mere division in the rock. To-day the ground is again easier, which, I hope, will continue to enable us to make better progress in the present month. The cost at the mines for the month of April was 131*l.*

CORTEZ (25th May).—During the week ending this date work at the mines has been as follows:—Boss tunnel: Advanced 34 ft. Main tunnel: East drift advanced 2 ft. Centre: Stoped 2½ tons; ore averaging 60 ozs. silver per ton. Middle tunnel, West Drift: Stoped 43 tons ore, carrying 50 ozs. silver per ton. North-east upraise: Stoped 75 tons of ore, carrying 60 ozs. per ton. North-west upraise: Stoped 68 tons of ore carrying 140 ozs. per ton. East drift advanced 7 ft. Development tunnel: Advanced 31 ft. Ore hauled to mill, 175 tons. Ore worked at mill, 145 tons; averaging 70 ozs. We were compelled to close down No. 1 furnace to do some much-needed repairs, which is the reason that more ore was not worked. We have ready for shipment 15 bars of bullion which contain about 15,500.00 ozs. fine silver.—WELSH.

DEVALA-MOYAR (24th May).—We have resumed driving the west drive with a rock-drill; the lode is looking well, and has improved since we started. I am laying the pipes in the east drive to continue this also by machinery; the lode in the end is 2 ft., with a good footwall, and has also greatly improved. Both these drives are opening fresh ground. The winze from the 48 will reach the deep tunnel level in a few days. This and No. 2 winze are being worked by hand labour. We are getting fair shows of gold from both winzes.—R. B. JOHNSTON.

DENVER (31st May).—The generally good condition of the underground workings, reported in my last, continues. 200 level west—Drift: This point shows considerable improvement. The end has been advanced 12 ft. during the week, and is yielding milling ore for a width of 2 ft., assays from which gave a result of 14 dwts. gold and 6 ozs. silver per ton. Stopes: The lode in the fore end of the stopes consists of 2 ft. of good ore, and maintains a steady improvement. The first block of ground, mined in order to obtain better facilities for working the vein at this point, returned 3 ozs. 15 dwts. gold for 16 tons milled, but a later shipment from these stopes gave a yield of 10 ozs. 8 dwts. for 20 tons milled. 1,050 level: The drifts east and west of the cross-cut have been advanced about 5 ft. each way during the week. The east drift shows no material change, but the drift west has met with a split in the lode. The wedge of rock causing this is some 1¾ ft. wide, and is bounded on either side by a good vein of similar composition to that before described, making the end 5 ft. wide in all. The test lot (21 tons) from these points returned a yield of 8 ozs. 15 dwts., and a further shipment of 20 tons gave 7 ozs. 3 dwts. on the plates. We are keeping 10 stamps well supplied with good ore from these workings, having shipped 145 tons to the mill since the 9th inst., of which 118 tons have yielded us 46 ozs. of gold, besides a considerable quantity of concentrates.—F. RICKARD.

EAST AREVALO (18th May).—I beg to inform you that during the past week we have driven the No. 3 level east 3 ft.; the ground is hard for driving, and the lode is showing mineral the full size of the level, but except some streaks it is low-grade, I enclose assay certificate, the 50 mark or 400-oz. ore is a small branch. I am having a parcel of ore got ready for sale, because of the hardness of the lode, and the great heat, I cannot raise as much ore as I could wish, as soon as we make a connection with the fourth level this will be overcome, and we shall make better progress in driving in the third level. We had to repair the drum counected with the water-wheel; it is old, and we shall soon require a new water-wheel and hoisting drum. On this account the water got into the bottom levels, and prevented us from making the much desired progress in the raise.—Capt. PRIDEAUX.

GOLD FIELDS OF MYSORE (25th May).—The end of the west cross-cut at 165ft. Bridge shaft has been advanced 1 ft.; total distance, 34½ ft. The end is in country, and has now been stopped. A level south from this cross-cut has been started, and 2 ft. have been driven, and there is a lode of low-grade quartz about 15 ins. wide in the end. The west cross-cut from the north level at 105 ft. has been advanced 2¼ ft.; total, 5 ft. The end is in country. The south level at 105 ft. has been driven 5 ft.; total, 86 ft. The lode of quartz is wider than the level, but of low grade. The new shaft south of middle shaft has been sunk 3¼ ft.; total depth, 120¾ ft. The bottom is in country. The sinking of middle shaft has been resumed this week, and 1 ft. has been sunk; total depth, 199½ ft. There are about 2 ft. of lode in the bottom. Driving south at 175 ft. an advance of 2¼ ft. has been made; total, 95¾ ft. There is 2 ft. of lode in the end worth by assay 2 dwts. per ton. The north level at 175 ft. has been driven 4 ft.; total, length, 100¾ ft, We are carrying 4 ft. of lode in the end worth by assay 18 dwts. per ton. This end has improved very much. The north level at 108 ft. has been driven 4¾ ft.; total, 165 ft. There are 4 ft. of lode in the end worth by assay 4 dwts. The sinking of the winze below the south level at 108 ft. has been resumed, and 3¼ ft. have been sunk; total depth, 18¾ ft. A sample from 9 ins. of the lode in the bottom assayed 15 dwts. per ton. Champion lode: The sinking of Coromandel shaft has been resumed, and 1½ ft. have been sunk; total depth, 189 ft. The bottom is in country driving north from the west cross-cut at 150 ft. An advance of 11 ft. has been made; total length, 97½ ft. There are a few stringers of low grade quartz in the end. Prospect shaft has been sunk 3¼ ft.; total depth, 224 ft. The bottom is in country. The north level at 200 ft. has been driven 6¼ ft. in old workings; total, 31¼ ft. The old workings are evidently going further north, and also down below this level. The west cross-cut at 40 ft. from the prospecting shaft, near Balaghat, has been driven 7¼ ft.; total, 80¼ ft.; the end is in country.—J. SAMBORNE.

The superintendent further writes:—Mining: I am very glad to be able to report a discovery we have made in Coromandel shaft. Last week, in cutting a hitch for timber on the east side of the north level, at 150 ft., about 50 ft. from the shaft, we cut some quartz, a few stones of which showed visible gold, so I started a cross-cut to the east at this point, and a few feet in have cut what is apparently a lode of quartz running parallel to the stringers we have been driving on. At present we have about 2 ft. of quartz in the bottom of the cross-cut, with still more quartz in the end. Yesterday we took two samples, and the best sample from furthest in panned about 1 oz., and several stones showed visible gold.

HAMBLEY FREEHOLD (25th May).—The tunnel has been extended a distance of 140 ft. towards the vein, and I hope the vein will be intersected in extending the tunnel a further 100 ft. The prospectors are still at work, and we have discovered what appears to me to be spurs and segments broken away from the main vein. We have not yet been able to discover a definite vein *in situ*. but around those spurs the surface pans remarkably well, and in one instance we discovered a vein 2 ft. wide, which panned very good in free gold, but on extending our operations on this vein a few feet down it mysteriously disappeared. The strata on your property is broken and tilted in every direction, which makes the work of prospecting tedious and difficult. In the neighbourhood of this outcrop the surface invariably pans gold freely, but up to date we have been unable to locate any permanent ledge. I hope, however, the No. 6 vein will be met with in the tunnel sufficiently encouraging to justify our commencing real operations thereon. This vein has the strongest outcrop of any, and is traceable on surface for some distance.

INDIAN CONSOLIDATED (17th May).—Colar section: No. 5 shaft: This shaft has been sunk 5 ft. 6 ins., or 71 ft. 4 ins. below the 360-ft. level. There is no lode to value in the bottom of the shaft. The 360-ft. level driving south of shaft has been extended 6 ins. or 57 ft. 2 ins. from shaft; no lode to value in the drive. The 360-ft. level driving north of shaft by coolies has been extended 1 ft., and by drill 5 ft., or 69 ft. 10 ins. from shaft; lode in drive 2 ft. 6 ins. wide, assaying 6 dwts. 8 grs. per ton stone. The 300 ft. level south of shaft has been extended 2 ft. 4 ins. The vein is larger, being now 1 ft. wide, and showing a little free gold, assaying 10 dwts. per ton stone. The 300 north has been extended 1 ft.; nothing to value in the end. The stope in the bottom of the 300 south continues in a small lode from 6 ins. to 1 ft. 6 ins. wide, assay value 7 dwts. 4 grs. per ton stone. The stope in the bottom of the 300 north continues in a lode 2 ft. wide, assaying 6 dwts. 4 grs. per ton stone. The stope in back of the 300 south has been without change; lode from 9 ins. to 1 ft. wide; assay value, 5 dwts. 8 grs. per ton stone. The 230-ft. level south of shaft has been extended 1 ft. 6 ins.; lode still of mixed character, but improving as we advance; assay 2 dwts. per ton stone. The 230-ft. level north of shaft has been extended 1 ft. 5 ins.; no lode in the end. The stope in the bottom of the 156 north drive continues in a lode 2 ft. wide, low-grade stone, assaying 5 dwts. 3 grs. per ton stone. Davey's shaft: The cross-cut driving east of the 170-ft. level has advanced 2 ft. 6 ins., or 56 ft. from level; ground hard. The 170-ft. level driving south on east lode has advanced 14 ft. 6 ins., or 32 ft. 6 ins. from cross-cut. We have 1 ft. of quartz in forebreast, showing per assay a trace of gold. New south shaft: This shaft has been sunk 1 ft., or 147 ft. from surface; no change in the rock. Air shaft: This shaft is now cleared to the bottom, and cut down ready to receive timber, which will be got on with as quickly as possible. Have put nine coolies to clear the 70-ft. cross-cut to communicate with No. 2 shaft. Have fixed new bullock whim, and work generally is in a forward state. Trial shaft: This shaft has been sunk 2 ft., or 144 ft. from surface; lode 1 ft. wide, which pans a little gold.—T. R. DAVEY.

JOSEPHINE.—Extract from superinteudent's report for week ending May 18th:—The 400-ft. level has been driven east 15 ft.; total distance east of shaft, 330 ft. Considerable water has come into the drift, which is curious, as the 300 drift is so much further east. and both this drift and the two winzes are quite dry. The 400 stopes west, although the ledge is small, are yielding some very fair quartz. The vein in the 300 west stopes continues very large and troublesome; the quartz is from 2 to 4 ft. wide. Raise No. 5 from the 300 has reached and conuected with the 220 about 12 ft. from the breast, and as soon as properly timbered will be continued on above the 220. The mill will be cleaned up to-day.

— Extract from superinteudent's report for week ending May 25th:—The 400-ft. level has been extended east 20 ft.; total distance, 350 ft. east of shaft. The 400-ft. level has been exteuded west 13 ft.; total distance, 183 ft. west of shaft. There is 20 ins. of quartz in the breast. The 400-ft. stopes both east and west look fair. The 300 west stopes show considerable quartz, but the ground is bad for working and requires great care in timbering. Raise No. 5 from the 226 has gone up 20 ft. We have some small stringers and bunches of quartz, but I do not expect to get any quartz body for another 30 ft. at least. 20 stamps are running steadily; the weather is very hot, but the water has not slacked up any.

MONTE DEL ORO.—The following are the results received to-day of assays made in London of nine samples taken from different parts of the mine, viz.:—No. 1, sample from the south end, 6 dwts. 13 grs. gold per ton. No. 2, sample from 186-ft. level north of west cross-cut, traces gold per ton. No. 3, sample from No. 6 shaft, 5 dwts. 5 grs. gold per ton. No. 4, sample from intermediate level, 11 dwts. 18 grs.

gold per ton. No. 5, sample from north of No. 5 shaft, 1 oz. 2 dwts. 3 grs. gold per ton. No. 6, sample from south end, 3 dwts. 22 grs. gold per ton. No. 7, sample from No. 6 shaft, 3 dwts. 22 grs. gold per ton. No. 8, sample from intermediate level, none. No. 9, sample from north of 5 shaft, 2 ozs. 7 dwts. 1 gr. gold per ton.

NEW EBERHARDT (25th May).—The mine manager reports as follows :—Mine : Number of tons of high grade ore assorted and put on the ore dump for the week, 20 tons ; assay value $56 per ton. Number of tons of ore of a lower grade assorted and put on the ore dump, 10 tons ; assay value $34.57 per ton. Total number tons of ore extracted and put on ore dump for the week, 30 tons. The general appearance of our mine is much the same as reported for many weeks past ; our daily output is about 4½ tons of good milling ore. Could we only keep up this output, I think we can safely say we can pay all our expenses from the proceeds of the mine. Mill : Our mill is running steadily. The general average of pulp assays from battery samples for the past eight days has been $49.77 per ton. I am very much pleased with the running of our mill, and I could not ask for better work than is being done by it. The men also, both at the mill and mine, are all labouring with a will and doing faithful work. Bullion shipment : Herewith enclosed please find shipping receipt for two bars shipped on the 23rd inst. Total, 3,049.13 ozs ; standard value, $1412.23.

NEW LA PLATA.—The results for May month as cabled by the manager, are as follows :—"Slag dump and mine royalties, $1,545 ; profit to La Plata Company, $600." N.B.—Including rental of smelting works the total profit at Leadville is about 245*l*.

NINE REEFS (18th May).—I beg to inform you that in consequence of the approaching monsoon the mail-day has been altered to Saturdays instead of Tuesdays, as heretofore. I now submit to you the assays of vein matter from a portion of the works reported on Tuesday last, viz :—No. 1 stope, 18 dwts. 20 grs. gold per ton ; No. 3 stope, 8 dwts. 3 grs. gold per ton ; No. 5 stope, 7 dwts. 12 grs. gold per ton ; No. 6 stope, 1st part, 1 oz. 1 dwt. gold per ton ; No. 6 stope, 2nd part, 16 dwts. gold per ton ; Battery, 10 dwts. 4 grs.; Battery, 3 dwts. 17 grs. We are pressing Hodgson's shaft and new shaft.—Capt. BENNETTS.

NO. 2 QUEEN GOLD.—Report from the mine dated Charters Towers, April 24th :—No. 1 shaft : The tributers continue stoping over No. 1 level south on the formation ; they have only broken about 8 tons of stone for the fortnight. No. 2 shaft : I am glad to report that the contractors are making good sinking ; the shaft is now down to 649 ft. The winding engine has arrived, and no time will be lost in getting it to work, which I look forward to further considerably facilitating our progress. Mill : We have crushed the last of our No. 1 stone (96 tons) for a yield of 76 ozs., and have put through the following crushings for various companies :—Sweedenborg, 114 tons 15 cwt. ; Lal Lal, 11 tons 16 cwt. ; Luxons, 7 tons 16 cwt. The Phœbe are now crushing a lot of some 200 tons or over, and several other parties are booked. The reservoir has been re-filled by an abundant fall of rain.—A. G. CHARLETON.

NUNDYDROOG (25th May).—Mining operations : The 370 north end at Webb's shaft has been driven 75 ft., and the cross-cut west has been driven 56 ft. ; they have not been measured for my report to-day. The rock in the cross-cut is light in colour, but there is no signs of the vein. In the north end there is a good footwall, and it seems to be inclining more to the north-west. There is a band of vein matter 2 ft. wide of schist and small strings, but of no present value. The quartz separated from the schist assays 1 dwt. 6 grs. per ton. The new shaft near the north boundary : The engineer is still engaged erecting the engine, and the carpenters in setting up the poppet heads. No sinking was done, nor will there be until after the engine is got to work. Webb's shaft is down 427 ft. ; Taylor's shaft, 381 ft. There is a slight improvement for sinking in the former ; in the latter there is no change ; both are barren. The stope in the bottom of the 370 south of Webb's shaft is in a lode 3 ft. wide, assaying 3 ozs. 10 dwts. 18 grs. per ton. In the following places the reef is 1 ft. 8 ins. wide :—Intermediate level assaying 1 oz. 18 dwts. The stope in the bottom of 230, assaying 1 oz. 11 dwts. 12 grs. Middle level, assaying 4 ozs. 8 dwts. 6 grs. The 230 north of Webb's shaft, assaying 8 dwts. 18 grs. The stope in the bottom of the 166, assaying 1 oz. 12 dwts. 18 grs. of gold per ton. Assay of weekly samples from the mill : Rough quartz, 2 ozs. 19 dwts. 12 grs. Smalls, 1 oz. 0 dwts. 16 grs.—B. D. PLUMMER.

OSCAR (6th June).—Lode No. 3 : There is less quartz and more country rock this week, still the men have advanced at the rate of 1 ft. per day. Daw's lode : Shaft and bottom level show no alteration. The 370 north has considerably improved. There is a foot of quartz, which is highly mixed with pyrites. The same level south shows no alteration. The same remark also applies to the 230-ft. level.—J. DAW, Jun.

OURO PRETO (16th May).—Passagem Mine : Mine operations : The 315 and 265 ends south-west continue in poor ground, but the two bottom ends are in lode of good quality, containing more tourmaline ore than is usually seen in the upper lode. A sink is going down on the lower lode at the 215, and is turning out rich ore, though until we come to stope this not much will go to the stamps for the present month. The ore in No. 2 shaft is holding down, and the 315 end north-east going towards it is full size in quartz. The stopes on the whole all through the mine are looking well.

PESTARENA UNITED (3rd June).—Caunter lode at Pestarena : The 90 end east is yielding 3 tons of ore per fm., at 1 oz. per ton, and the 100 east 8 tons, at 1 oz. The 110 west has apparently reached the limits of the ore shoot, and is suspended. The 110 east yields 4 tons per fm., at 15 dwts. The 110 west from cross-cut has a massive lode of white quartz 1½ metres wide, but carries no pyrites. On the No. 1 lode ends are being driven south at the 70, 130 and 150 levels, and north at the 150 and 160, but they are not producing sufficient ore to value at the moment. An intermediate drive over the 130 is worth 5 tons per fm., at 15 dwts. All the machinery above and below ground is working well, and the mine is thoroughly drained. Val Toppa : Exploratory works are being continued, but are opening very little ore ground. A drive north on flat lode over No. 2 level is giving 10 tons per fm., at 4 dwts.

— (12th June).—A cross-cut east at intermediate level under Zero has entered a body of pyrites at distance of 1 metre, and it is considered that the main part of the ore is yet before the end. A mill trial of the ore as it came from the cross-cut gave 11 dwts. 20 grs. per ton.

POTOSI (16th May).—New lode : No. 3 tunnel, upon being extended another 5½ ft. since last writing, was holed to the drive put out towards it from the eastern side of the hill. Just at the point where this communication was effected the ground is very hard, and the lode attenuates to a few inches in thickness. No. 2 new lode : The deep tunnel has been driven north hereon since my last 23 ft. The appearance is most encouraging for a thickness of 4 ft., which is the most we have yet attempted to see, and this shows colours. Potosi Viejo—Zeiler's shaft : Since my last we have resumed the driving of the bottom level west of shaft, and have extended same another 6½ ft. in a lode of fairly good quartz. The lode in the winze sinking below this level is now 3 ft. wide, of very good quality, and the ground is hard for breaking. Socorro lode : The deep tunnel has been driven south 27½ ft. since my last, and the lode is 2½ ft. wide, of good quality quartz. We have just commenced to sink a winze below this level in a lode of the same size and value as that in the end last referred to.—PRYOR.

RUBY AND DUNDERBERG CONSOLIDATED.—Report upon the mines for the week ending May 12th :—Dunderberg : Amount of ore shipped during the week by tributers, 45 tons of high-grade ore ; there is no change of moment in the mine. Eagles' drift : We have advanced 8 ft. during the week, making a total of 219 ft. raised. We have 18 tributers and six contractors at work in the mine. Lord Byron : We have shipped 11 tons from here during the week, and have about 50 tons more ready for shipment. We have 12 tributers at work here.

— Report upon mines for the week ending May 19th :—Dunderberg : 13 tons of ore shipped by tributers during the past week from this mine ; no change since last report. Eagle's Drift : The ground in the upraise has been very hard during the week, and we have only advanced 6 ft. ; total raised, 225 ft. ; we have six contractors and 17 tributers at work. Lord Byron : We have shipped 46 tons by the tributers during the week, and have somewhat about 50 to 60 tons broken ready for shipment ; this mine is looking a trifle better ; we have 12 tributers at work here. Bullwhacker : No change at this mine ; we have a good-sized body of low-grade ore which contains a lot of lead : we have three tributers at work here.

— Telegram received 12th June, from Eureka :—"52 tons tribute ore shipped and smelted, producing to company $630."

SOUTH-EAST MYSORE (18th May).—I beg to inform you that in consequence of the approaching monsoon, the day for mailing letters for Europe has been changed from Tuesdays to Saturdays ; the usual weekly report of the South-East Mysore Mine will, therefore, not be sent earlier than Saturday next. In the meantime you will be pleased to learn that the sinking of Rogers' shaft progresses very favourably, the vein increasing in width and general appearance. In the 120-ft. level north of Thomas's shaft we have uncovered a good-looking vein of quartz, of about 3 ft. wide. The vein in the south end of Rogers's shaft has increased to a width of from 4 ft. 6 ins. to 5 ft.—F. BENNETTS.

VICTORIA (LONDON) (25th April).—The following is the return of quartz raised and crushed at the South Clunes United Company's Mines for the four weeks ending the 18th April :—Total quartz crushed, 2,474 tons ; total gold obtained, 818 ozs. 14 dwts. ; average per ton, 6 dwts. 14¾ grs. The above return shows an increase in the quantity of quartz raised on the company's account, and a considerable reduction in that raised on behalf of the tributers. The total average yield is much the same as that for the last month. Receipts, 2,834*l*. 3s. 6d ; expenditure, 2,812*l*. 17s. 11d. ; balance, creditor, 21*l*. 5s. 7d. The balance is very small, but the expenditure in progressive work and completion of machinery at No. 4 shaft has been considerable. That incurred in underground work amounted to 501*l*. 2s. 3d., and at the No. 4 shaft 361*l*. 4s. 3d. ; total amount, 862*l*. 6s. 6d.

VICTORY.—Reports from the Victory Mine, under date May 15th, state that the mill was started, but was only able to run 20 hours owing to failure of water supply. All were under the impression that the rainy season had set in, but it had not commenced in earnest.

THE YURUARI CO., LIMITED.

THE assistant-secretary advises receipt of mid-monthly mail from the mines, dated Chile, 16th May. In it the superintendent states :—Good progress is being made driving drifts No. 8, 9 and 10 west, Cenicero shaft, and 4 and 5 east, water shaft, but further sinking of the shaft has been discontinued for the present, as contractors have been unable to supply firewood, the droughts have created difficulty of transport. We intend starting two rock-drills without delay, one in No. 8 rise to hole the old Potosi shaft at another point, and the other in No. 8 drift west. As soon as this connection is made with the Potosi shaft, there will be a large amount of stoping ground opened up, and insufficient ventilation, which has been so great a difficulty to us, will be at an end. I expect that the quartz in this ground will give good results. The No. 4 drift, water shaft, still looks most promising, and the driving is being pushed forward vigorously. Capt. Rogers reports that the drifts Nos. 8, 9 and 10 west, Cenicero, still continue to look promising. The agents at Bolivar report, under date 22nd May, that rains have now set in, as stated in telegram already published, so that the results of crushing should be shortly received.

IRON AND STEEL HOUSES AND ROOFS.

MESSRS. ISAAC DIXON AND CO., of the Windsor Iron Works, Liverpool, have issued an abridged catalogue of their galvanised corrugated iron roofs for all purposes, which include iron buildings, galvanised corrugated iron and steel sheets, and other metals for roofing purposes, wire fencing, fencing strand, fencing wire, wrought iron hurdles, gates, and other manufactures. The catalogue is most interesting, even though greatly abridged. We have more than once pointed out how suitable these structures are for new localities in which mining is being carried on, and how, for the protection of miners and machinery, iron roofings have been found of admirable service. Sometimes at mines costly brick buildings are put up, only to be found useless afterwards, when development work has shown the futility of operations. If iron buildings, such as Messrs. Isaac Dixon and Co. supply, were put up in their place, much time and money might be saved. Mining directors should at least get a copy of the Messrs. Dixon's full catalogue, which contains a vast amount of information and many original designs. The roofings are also suitable for every conceivable purpose for which cheap and adequate covering is required.

AFRICA.

LATEST FROM THE GOLD AND DIAMOND MINES.

SHEBA.—The following telegram from the mine gives result for the month of May.—"670 tons of ore crushed at the mill ; yield, 1,703 ozs. of gold."

GORDON DIAMOND. — Return of work done at mine for week ending 8th June :—Loads blue hauled, 4,200 ; loads blue washed, 4,600 ; value of diamonds produced, 1,700*l.*

SIMMER AND JACK.—A cablegram from the secretary states :—"Obtained 879 ozs. of gold during May month. Next half-yearly meeting of shareholders will be held 15th July."

WOLSINGHAM.—Robert Whyte and Co. advise the receipt ex Drummond Castle, at Cape, of one box native gold, weighing 375 ozs. for account of the Wolsingham Gold Mining Company.

SOUTH AFRICAN.—The following particulars of work relate to the week ending May 11th :—Blue ground hauled, 5,990 loads : blue ground washed, 4,752 loads ; diamonds obtained, 1,517 carats ; estimated value, 1,675*l.*

WEST BATTERY REEF.—The manager telegraphed that assays have been made by the reduction offices from No. 2 shaft, 2 ozs. 2 dwts. per ton ; No. 5 shaft, 2 ozs. 10 dwts. 15 grs. per ton. Samples were taken from across reef at the lowest depth.

TRANSVAAL EXPLORATION AND LAND.—Cablegram : "Mined during month 525 tons ; crushed 250 tons, yielding 500 ozs. (11 days work double shifts). Treatment of tailings in the pans yielded 100 ozs. Pan residues 50 ozs. ; additional total for May, 650 ozs.

MOODIE'S.—The following are the returns from the company'a property for May, as cabled by their secretary in Pietermaritzburg :—"Claims rented or leased, 575 ; claims rented or leased which are producing returns, 9 ; 1,250 tons crushed by claimholders yielded 539 ozs."

NEW AKANKOO.—The manager telegraphs :—"Result of May crushing, 102 ozs., low grade ; 15 heads at work." This is from the old heap extracted five years ago, and lying in the way of extension of mill. The manager writes further : "In the 100-ft. level north the reef is nearly 5 ft. wide, with heavy gold all through, and in the south 2 ft. of the same quality ; 30 ft. and 60-ft. levels are also both very good indeed."

WITWATERSRANDT.—Mr. C. Hancock, the manager at the mine, writing under date 17th May, says :—The mine is now in perfect working order, and there will be no fear of work being stopped again, the pump is also working well and is keeping the mine clear of water. He further says :—In the main shaft we have already reached the sandstone, which in this part of the country always overlaps the reef, and is the country rock.

BATTERY REEF.—Advices have been received from the managing director that the assayer and amalgamator sent out from England has arrived on the mines. The assays made by him of the reef on the adit level give 2 ozs. 5 dwts. per ton, and from the 170-ft. level 3 ozs. 7 dwts. The reef on the eastern portion of the property has widened out to nearly 5 ft., and looks well. Subsequent advices received by cablegram state that the battery has commenced crushing.

WEMMER.—The company has received a cablegram giving the result of working and returns for the month of May :—"Raised 1,321 tons ; crushed, 1,390 tons ; yield of gold, 481 ozs. ; 20 stamps working for 535 hours only, 181 ft. driven ; 57 ft. of passes ; shaft sunk 8 ft. The reason of low crushing is a change from under to over hand stoping. Better results are expected." One box native gold, weighing 423 ozs. has been received by the London agency.

DOUGLAS DEVELOPING SYNDICATE.—Johannesburg, 17th May:—Shaft C, 6 ft. ; total depth, 54 ft. At 52 ft. we struck a dark red banket reef, which we are not yet through. From pannings this gives about ½ oz. prospect. I do not take this to be the Burger reef, as I think we have still 30 ft. to sink before striking. Shaft D, 5 ft. ; total depth, 52 ft. We are going through dark blue quartzite, occasionally discoloured by peroxide of iron. There is a large flow of water in this shaft.

FORBES REEF.—A telegram from the mines states that "the yield of gold for the month of May is 580 ozs." The progress of the work during the month of April is as follows :—Main reef, east end, advanced 24 ft. Main reef, west end, advanced 79½ ft. The position of the ends of the drives of outside reefs are as follows :— Haslemere drive, 287 ft. from face of hill. Oban drive, 168 ft. from face of hill. Waverley drive, 225 ft. from face of hill. Avalanche new drive, 56 ft. from face of hill. Primrose drive, 158½ ft. from face of hill. Ivanhoe drive, 116 ft. from face of hill. Art Union drive, 104 ft. from face of hill. A drive from trial shaft eastwards on Avalanche is driven 40 ft.

SALISBURY.—We are requested to state for the information of shareholders in the Salisbury Gold Mining Company resident in Europe, that the falling-off in the crushings in the last two months is due entirely, as the manager reports, to the great difficulty he has experienced in obtaining a constant supply of suitable water for the 20 stamp battery. The same difficulty may be encountered during the present, and possibly next month, but a new water-right has been purchased on the farm, Klipriversberg, upon which the new 50-stamp battery is now being erected. This water-right is unsurpassed by by any water-right on the fields, and will be amply sufficient for all the requirements of the company.

SOUTH STANDARD.—Report from the manager, dated Johannesburg, 17th May :—The main shaft is progressing satisfactorily, though the necessity of timbering retards the sinking. 5 ft. 6 in. was sunk during the week, making a total of depth of 63 ft. 6 in. The formation is still sandstone, necessitating blasting, but the flow of water causes slips and compels us to close timber. There is a small leader about 3 ins. thick, and dipping about 80 degrees, running diagonally across the shaft ; this carries gold and appears to be increasing in thickness. At the 100-ft. level I shall know more of its value. The main shaft is located to cut the battery reef about 150 ft. from surface. I however propose to cause drive at 100 ft. ; this would give about 70 ft. stoping, leaving the tops 30 ft. intact.

OTTO KOPJE.—Manager's report.—"At the 800-ft. level the work upon this property is being actively pursued by relays of workmen by day and by night. The 'blue' is of the finest description, and the mine being now completed, there is nothing to impede the development." Report of Capt. Hambley, Government Inspector of Mines, Kimberley, South Africa.—"The shaft is sunk in the south-west side or end of the mine. This, according to experience taught by established mines, is not the most favourable or productive position for the shaft. Notwithstanding, however, the position of your shaft, all the ground that has been taken out by sinking will average in full over 6s. per load of 16 cubic ft. This, to my mind, speaks well for the class of ground that may be looked for and expected at the north-east part of this mine."

SILVER WOLVERINE.—Report from the consulting engineer, Mr. Walpole Roland, C. and M.E., Port Arthur, May 22nd :—Since date of my last report referring to the rich strike of native and black silver in No. 1 shaft, at a depth of 82 ft. and 90 ft., I have been unable to resume operations in this shaft owing to water. I have now, however, effected a purchase of a hoist from the Beaver Mining Company that will fully answer our purpose. Immediately No. 1 shaft is made ready for further sinking, and the 100-ft. level attained, we commence drifting from that point towards No. 2, between which points I anticipate cutting a rich deposit of black and native silver. In sinking No. 2 shaft at a point 300 ft. eastward of No. 1, after excavating some 13 ft. of boulder drift and gravelly clay loam, they struck the vein. At this point the vein measures 4 ft. 4 ins. in width, and carries the usual rich black blendes, fluorite and calcite, together with black silver and iron pyrites, notwithstanding the fact that it is yet in the trap overflow. In conclusion, I may observe that the outlook at the Silver Wolverine is most promising.

TRANSVAAL GOLD EXPLORATION AND LAND.—The following particulars are from manager's advices of 13th May :—Bullion : A shipment of five bars, melted gold, weighing 409 ozs., value 1,540*l.*, has been made through the Standard Bank. Mines :—Theta vein : Weight extracted during week, 80 tons, assaying 6 ozs. 13 dwts. gold per ton. This is an improvement on the previous week's assay. Beta vein : Extracted during week 10 tons, assaying 1 oz. per ton. A paddock was being stripped, but had not reached the vein. Columbian Hill : In one of the drives at this place the vein has been found to carry payable gold. At the point indicated it was 4 ft. wide, and showed a pan or milling value of 12 dwts. per ton. At other places it still continues poor. Jubilee Hill : Another vein has been found here about 2½ ft. wide, and assaying 1 oz. 12 dwts. per ton. It was not sufficiently opened out to judge of its value, but from indications, the manager hopes it will prove a valuable find. Brown's Hill Mill :—Battery : The battery was at work 105 hours, and crushed 98 tons of Theta ore, assaying 2 ozs. 7 dwts. per ton. Clean up of plates yielded 263 ozs. of amalgam. Pans : The pans were at work 26 hours, and treated 7 tons of mixed blanketings, assaying 6 ozs. 13 dwts. gold per ton.

JUMPERS.—Copy of cablegram from Johannesburg, 13th June :—"Results for May : Quartz won, 2,437 tons ; quartz crushed (30 stamps), 1,825 tons ; obtaining gold, 1,685 ozs. ; profit on month's operations, 3,014*l.* ; expended upon permanent works, construction of buildings, &c., 3,849*l.* New battery, making altogether 100 stamps, will be completed and ready for crushing towards the end of June." Summary of operations and result of same for the month of April :—Quartz won, 1,700 tons ; quartz milled (30 stamps), 1,495 tons ; yielding gold, 1,455 ozs. 1 dwt. ; taken at 3*l.* 10s. per oz., 5,092*l.* 13s. 6d. Cost of winning same, mining and milling, also legal, office, and all other expenses of every nature, together with 102*l.* 10s. for quartz won, prosecuting permanent works, and 102*l.*, being 2s. 6d. per ton for every ton of quartz stoped, credited permanent works redemption account, 2,659*l.* 18s. 8d. ; profit on month's operations, 2,432*l.* 14s. 10d. Expended upon permanent works, construction of buildings, &c., during month, from capital account (apart from transport and material, such as new battery engine account, which alone amounts to a large sum), 3,717*l.* 11s. 11d. Driven during month : Main reef, 61 ft. ; north reef, 103 ft. ; total, 164 ft. Sunk winzes : 59½ ft. ; cross-cuts from main to north reef, 1st level, 33½ ft. ; cross-cuts from east to strike main reef shaft, 2nd level, 8½ ft. ; East Main Shaft : Dividings, runners, and ladder-way completed to second level, also steam-pump fixed at this level and at work. On both east and west blocks stull and other timbering being pushed forward. Reef in the winze being sunk from 1st to 2nd level maintains its average thickness and richness, and is thoroughly free milling ore ; this winze is now 125 ft. from the surface. All work generally making favourable progress. Battery : The 70 stamps are in position, and their erection completed, except in a few details. Bed for engine is built, and the erection of boilers well in hand. But for the vexatious delay in receiving portions of the machinery from Kimberley, the erection of the same would be much further advanced than it is. The want of one or two pieces belonging to the engine has completely stopped work with it, and we have had to get one piece cast in Johannesberg, or allow the delay to continue. These delays are solely owing to the block at the railway at Kimberley, which is far from creditable to those responsible for the proper management of the Cape Government Railways. The despised ox-waggon has proved a reliable means of transport in comparison with the railway referred to. In spite of these difficulties we expect to be able to start the new battery (bringing the mill up to 100 heads) during June.

VOGELSTRUIS (17th May).—South reef : In the stopes above Maddock's winze the reef is very much tangled with the country rock. It is, however, producing milling ore—the best we have. The appearance would imply we are on the top of better ore ground. At Rosewarne's winze a rise is being put on the reef to determine its practical value. It is only small, but such reef as is obtained is selected. No. 2 shaft : The south reef in the drift faces is smaller than it was in the 75 ft., driven previous to the suspension of work at this shaft. Now that the machinery is at work we shall push these drivings, to prove the practical value of the reef. In the winzes 150 ft. east and west of No. 2 shaft, good progress is being made in their sinking ; and by the time the drifts are forth we are hoping these will be down to the plane of the 66 ft. level. Main reef : A gang of boys with miners are engaged at No. 2 winze, stoping out what we call the foot-wall reef. The reef all along about this winze has a very fine appearance. The ore by pan and assay shows up what should be good milling ore. Drainage

level: The drift has reached 170 ft. west of No. 7 winze. We thus have 430 ft. more to drive to connect us with the cross-cut being driven out from No. 2 shaft to main reef. As soon as this connection is made it will drain No. 2 shaft at its 66 ft. (vertical) level, which is very heavily watered. Out of No. 7 winze a cross-cut is being driven out south to prove the value of the south reef intermediate ground, and at this point. It is now about 110 ft., with 40 to 50 more to drive to intercept the south reef line. Battery: Water for milling purposes is rather scarce. We are, however, working 20 heads. The marked difference between assay tests and mill returns of the ore is most serious. Every part about the battery seems to be working efficiently, and yet the gold returns are most disappointing. Our south reef is only narrow, and can only afford a small quantity of ore, but from main reef, though we knew it to be low-grade, we had hoped the ore would mill something approximating working expenses. The ore already milled has been the mixture taken from all parts of the mine. We purpose now, however, milling lots of 100 tons from the various working places, and be guided accordingly, but workings are too shallow to expect marked improvement. There is not perhaps a cubic fathom of our main reef but will give a show of gold; our difficulty is inability to get down below the drainage level. At no point on the main reef have we milled ore which has been mined below a depth of 50 ft.; in fact, its clayey and gossany character has perhaps much to do with its low milling qualities, and as I have repeatedly advised you, as soon as our drainage level reaches No. 2 shaft so as to give it adit drainage, we shall immediately commence sinking with our 6-in. lift of pumps. Trespass on Mynpacht: By your cablegram of enquiry the persistent attempts to jump the western portion of our property would seem to have reached London. I wired you on Monday last as follows:—"The title to the property is perfect. Government authorise us to prosecute jumpers." There was never any real doubt about our Mynpacht boundaries (all beacons being erected in accordance with actual survey), the trespassers had, however, obtained licenses to locate claims, by declaring it to be a strip of unoccupied Government land, and for which, I believe they were offered a large sum of money, having such licenses to show. Owing to the rumour of a piece of main reef being unoccupied, several parties pegged it off, and latterly move with the appearance of sinister motive or annoyance, than real occupation, but we deemed it best to obtain direct instructions from the Government to deal summarily with any further trespassers.

REPORT OF MEETING.

THE TAMARUGAL NITRATE CO., LIMITED.

A GOOD BEGINNING—PROFIT OF £58,000 IN FIVE MONTHS.

THE first ordinary general meeting of this company was held at Winchester House, on Tuesday.—Frank H. Evans, Esq., M.P., chairman of the company, presided.

Mr. RICHARD KIDNER (secretary) read the notice calling the meeting.

The CHAIRMAN: Gentlemen, you are aware that this is only a statutory meeting of the company, held in accordance with the Joint Stock Companies Acts. Being assembled only four months after the company was formed, we have no accounts to present to you, and in fact have not any from the coast—we could not have had any in this time. The property which we have taken over is extensive, and the capital is so large, that naturally you would like to have all the information the board possessed even without the accounts. You must take what I say roughly as far as figures are concerned, because though obtained by cable I am going to give you the results of five months' work as nearly as I can without that strict examination which would make them absolutely reliable in all their details. I have no doubt the figures I shall give you may be relied upon. We have taken over as the property of the company two estates, one called La Palma and the other La Patria.

FIVE MONTHS' PRODUCTION.

The total production of these two oficinas for five months amounts to 634,000 quintals, and the cost of production in the case of La Palma, which is the larger of the two, is 5s. 0½d., and of La Patria 5s. 2½d., per quintal. The estimate in the prospectus was 5s. This shows an increased cost in one case of a halfpenny and in the other of 2½d. I will deal with that matter directly, in the profit and loss account. We have arranged with Messrs. Anthony Gibbs and Company to be the agents of this company on the coast, and have made a favourable arrangement under which they assume the agency for several years. In the prespectus sent out the estimate, if I recollect, was 150,000 quintals per month. The total production is 634,000, which is barely 130,000 a month. The production for May exceeds 130,000. As I pointed out, the cost is a little more than was stated in the prospectus, and I will deal with those two points first.

LABOUR QUESTION RIGHTED.

The production in the early part of the year was affected by the scarcity of labour on the coast owing to the high price of copper and the Panama Canal creating a great demand for labour. It was hard to get labour, and production fell off considerably in the earlier months. Since then copper has fallen, and the development of the copper mining industry has fallen with it, and the Panama works have been stopped so that the labour difficulty is evidently being overcome, as we find that the production in May is considerably in excess of the average production of the first four months of the year. The cost has been affected by the high rate of exchange.

RATE OF EXCHANGE.

The exchange that ruled in the early part of the year was as high as 29½d., but it is now 26d. Whereas the average price for four months was 5s. 2d., the price for May was under 5s., and as the rate of exchange is likely to keep low I think you may take it that the cost of production for June and July will be under 5s. The price of nitrate on the coast at the present time is from $2 60c. to $2 65c., which is practically the same price as existed last year at this date. I will deal with the question of the profit to the producer in a moment. We have sold all the production possible until the end of July, and possibly all we produce until the middle of August, and that will leave four or five months of this year to come into the account, but the produce for the first five months will be more than maintained up to the end of the period by the sales we have made to the end of July or the middle of August, and after August we enter upon a season of the year which, I daresay most of you know, is generally the time which is best for the sales of nitrate, and it is fair to assume that the price we shall obtain during the balance of the year will, at any rate, be equal to that which we have received for its eight preceding months. The nett results for the five months ending the 31st of May from sales made, taking the total cost of production, and the iodine sold, have realised a profit of 56,000*l.* (Cheers.) In addition to that we have still a small quantity of iodine on hand, out of which we expect to make 2,000*l.* or 3,000*l.* more. That will make

A TOTAL OF OVER 58,000*l.*,

or nearly 59,000*l.*, or equal to a profit on our capital of 650,000*l.* of 9 per cent. for five months' working. (Cheers.) I should like to add a word or two about the nitrate business generally. A good many remarks have been made as to nitrate business, and the lower prices that have prevailed have been taken to be the measure of the fall in nitrate properties. That is not so at all. The present prices ruling on the coast are equal to the prices that were ruling last year. The very high prices that existed since that time in this country do not produce a profit to the produeer of nitrate. It was a profit that passed to the dealers, and the profits made by the companies are not based upon the prices of this country, but on the prices on the coast, which were at this time equivalent to the prices now being paid this year. Neither does it affect this company so far as regards the estimate of profit. I think you will all agree that the profit which I have told you we have made is, at any rate, equal to that which was promised in the prospectus, but the low prices do not affect us adversely, because that estimate was based upon a price of about 9*l.* per ton for August delivery, and we have been offered 1s. or 2s. over 9*l.* per ton for our produce, but have not taken that price as we expect to do better. I do not know that there is anything further I have to tell you. My statement is very short, but in the absence of figures I have been obliged to make it so. If any gentleman wishes to know anything further, and he will only mention what it is, I shall be happy to throw any light upon it I can. (Cheers.)

TITLES ALL RIGHT.

Mr. WILSON: Are the titles to the properties all as correct as you would like them to be? Do the properties now really belong to this company, and can you tell me how long they have been worked?

The CHAIRMAN: The titles are all in order. We have full possession of the properties, and they have been working for about four years.

A SHAREHOLDER: Do you contemplate giving a dividend at the end of six months?

The CHAIRMAN: We propose to pay a dividend as soon as we have funds available. (Laughter.) We are receiving them now on account. We have received about 25,000*l.* already. (Cheers.)

Mr. SEABER: I beg to propose a vote of thanks to the chairman, whose statement, I think, has been most satisfactory. We have been only in existence five months, and to hear such a statement as has been made to-day is very gratifying to me, and I am thoroughly satisfied with it.

A SHAREHOLDER seconded the motion, which was carried.

The CHAIRMAN returned thanks, and the meeting closed.

THE FRONTINO AND BOLIVIA (SOUTH AMERICAN) GOLD MINING CO., LIMITED.

DIRECTORS' REPORT.

11th June.—The directors beg leave to submit to the shareholders their fourth report since the re-construction of the company, together with the accounts duly audited, for half-year ending 31st December, 1888. The number of shares issued by the company to the 30th June, 1888, the date up to which the accounts last tendered extended, was 125,218. Under the circumstances mentioned in the last report, 2,020 shares were afterwards allotted to one of the three shareholders who dissented from the liquidation, in respect of his holding of 1,010 original 2*l.* shares, thereby bringing the number of shares issued to 127,238, as mentioned in the last directors' report. The returns from the company's mines during the half-year ending 31st December, 1888, have been as follows:—

Tons of mineral.	Produce of gold dust from mineral.	Average produce.	Weight and value of sulphurets.
7,352	4,630 ozs.	$12\frac{7}{10}$ dwts.	$5\frac{1}{4}$ Tons. £1,016 8 9

The returns from the tributers' mines for the same period have been 2,264 ozs. of gold dust. Compared with the returns of the previous six months, the above table shows a decrease of 227 tons crushed, and a decrease of 1,427 ozs. of gold dust produced, and a decrease in the yield per ton of 3 4-10 dwts. Also a decrease of 1¼ tons in the quantity of sulphurets produced, but an increase of 81*l.* 7s. 6d. in value. The return of gold dust derived from the mines leased to tributers shows a decrease of 791 ozs. of gold dust. The amount realised for the total produce of the six months was 16,736*l.* 3s. 8d., as against 22,877*l.* 16s. 2d. for the previous six months, being a decrease of 6,141 12s. 6d. The average produce per month was 2,789*l.* 7s. 3d. against 3,812*l.* 15s. 5d. in the preceding six months. The reduction in the amount of gold dust obtained is attributable to a reduced yield per ton from all the mines except Ceeilia, and which reduction of yield was largest in the cases of Cordoba and Rosario. During the three months of the current half-year, of which advices have been received, the number of tons crushed has been 1,947, the number of ounces of gold dust has been 1,641, and the average yield per ton has been 16 dwts. and a fraction. The returns from the tributers during such three months have been 653 ounces of gold dust. The total value of the gold dust

and sulphurets during sueh three months was 5,150*l*. 13s. 8d. These returns show considerable reductions in the number of tons crushed and of ounces of gold dust produced, but an increase in the average yield produced from the company's mines. The eause of these reductions was the occurrence of the regular dry season, which, coming after a prolonged period of unusually dry weather, resulted in a drought of perhaps unprecedented severity, so that some of the mills were altogether stopped working for want of water. It is satisfactory to announce that Mr. Hodge's letter of the 8th April, referred to in the last monthly eircular, and whieh spoke of showers and indieations of the probable approaching break-up of the drought, has been followed by a letter, dated 24th April, reporting further showers, and a hope of their eontinuance, and stating that the rains had already made a difference in the returns. Mr. Hodges half-yearly report to the 31st December has arrived, of whieh the material portions are annexed. The chief points of interest in the mines which have presented themselves since the writing of the half-yearly report are then indicated. The profit and loss account now submitted shows a profit of 1,708*l*. 19s. 6d., after charging 741*l*. 4s. 4d. for depreciation of plant, &c. After writing off from the balance to credit at June, 1888, the dividend paid in December, and adding the profit to December, there remains a balance to credit of 5,015*l*. 0s. 5d., subject to a further sum of 300*l*. for reserve fund, as mentioned in last report, to be set aside, but which sum has not yet been invested. Having regard to the eash balauces in Colombia, aud to the exeess of expenditure over returns, amounting to the estimated sum of 1,751*l*. 0s. 9d., for the first three months of the current half-year, the directors regret that they are unable to recommend the declaration of a dividend. This company, being the owner of 10,000 1*l*. fully-paid shares in the Antioquia (Frontina) Company, Limited, being part of the consideration for the sale to that eompany in 1874 of the Frontino Mine, and being the holder of debentures of that company for 1,500*l*., with an arrear of interest thereon, and also a creditor of that eompany for the sum of 5,133*l*., has recently received proposals from the Antioquia Company to convert such debenture debt and interest into 2,228 1*l*. 10 per cent. preference shares, and to compromise such cash claim of 5,133*l*. for 3,000 like preference shares. As this operation will enable the Antioquia Company to develop the Frontino Mine out of profits now being temporarily made, aud which development will, in all probability, render the Frontino Mine permanently profitable, and impart a substantial value to this company's iuterest in the property, these proposals have been accepted, and the Antioquia Company are now taking steps to obtain the assent of all their debeuture-holders to the plan. The directors hope in their next report to be able to announce the completion of this operation, and ere long to attach a value to this company's interest in the Antioquia Company in the balance-sheet.—J. Jameson Truran, Secretary.

THE MONEY MARKET.

City, Friday Evening.

As expected no change has been made in the Bank rate this week, although the conditions of the market shows signs of material alteration, and that the tide has turued in respect of the bullion movements. The influx on the *Gazette* week was 432,000*l*. aud 300,000*l*. has goue in to the Bank since, a considerable proportion of the influx being from South America, the revived operations in gold at Buenos Ayres haviug resulted in a further advance of the premium to 62¾ per cent. The Bank return shows that the circulation of coin in consequence of the holidays and tourist requirements in connection with the Paris Exhibition have absorbed all but 248,000*l*. of the influx from abroad, but the note circulation has contracted, and, coupled with the reduction of 550,000*l*. under the public and private deposits, has improved the reserve by over 400,000*l*., to 14,512,000*l*., as against 13,455,000*l*. last year, or 42⅝ per cent. of the liabilities, being 2 per cent. better than last week. The private securities are slightly larger, but the Government Securities have declined a million, due to the non removal of Treasury Bills taken by the Bank. Discount has been easier at 1⅜, ½ per cent., but money has been better supported at 1 and 1¼ per cent. by the Stock Exchange settlement.

Money has been in stronger demand, owing to the conclusion of the settlement and disbursements on accouut of a call on Local Loans Stock, and this disturbanee, coupled with a fall in the Paris exchange, has steadied the discount market. Three months' bills have closed firm, at 1⅜, ½ per cent., and short loans have commanded on an average 1½.

Bar gold, worth 49,000*l*., was bought by the Bank to-day. Bar silver was steady, aud Rupee Paper nominal.

Business at the Stock Exchange during the past week has not been at all brisk, partly owing to the holidays, and partly due to the attention of dealers and others being engaged in the arrangement of the fortnightly settlement. The rates for "carrying over" speculative bargains until the 28th inst., ranged from 1 to 3 on Foreign Government Bonds, and from 2½ to 3½ per cent. on Ameriean Railway Securities. Prices were well maintained until Thursday, when a sharp relapse set in due to some very adverse rumours respecting the expected action of Russia in Servian affairs. A very uneasy feeling prevails at both the "Nerve Centres" Berlin and Vienna, and the bourses were reported as very flat, but the "political" authorities still assert there is no danger of the peace being broken at least this year. The Funds have given way to a slight extent, and India Government Securities also exhibit a trifling reduction. Colonial Inscribed Stocks only exhibit nominal alterations. The most active descriptions in the Foreigu Government section show the greatest decline, Greek and Hungarian issues being as much as 1 to 1½ lower on the week, and several others ½ to 1 per cent. South American Currency Loans were also flat, as the gold premium at Buenos Ayres has advanced to 62.75 per cent. Home Railways were also dragged down by the heaviness in the preceding market, and anticipations of unfavourable holiday traffics. South-Eastern Deferred fell 2, Chatham Preference 1¾, and other active descriptions ½ to 1. Sheffield issues, however, were firm on the opening of their new line, and Hull and Barnsley rose on the removal of five of the directors. American Railway issues have been rather erratic. Denver Preference, Lake Shore, and Reading issues have improved about 1; while the Pacific issues have declined about 1, and several other descriptions ¼ to ¾. Grand Trunk Stocks show a trifling decline, but the traffic return was satisfactory. Miseellaneous Securities have followed in the wake of the other markets; but the changes here have not been so important beyond the decline in Water Gas, Leeds Forge, Bell's Asbestos, and Guinness Brewery issues.

The Stock Markets to-day have again shown weakness, but towards the elose dealers appear to have recovered from yesterday's scare, and although operators for the fall tried to revive the uneasy feeling they were not successful. The Funds, however, were easier, New Consols closing at 98 7/16, 5/16 for money, but the Two-and-a-Half per Cent. and Local Loans Stoek were ⅛ easier at 95⅝, 95⅞ and 108⅛, 108⅜ respeetively. The latest priees in the Foreign Government section were about the best of the day, but were still ¼ to ½ per eent. below yesterday's levels. Egyptian Unified touched 90½ and Greek 92½, but both recovered, and Portuguese and Spanish Bonds were exceptionally higher on the day. The fluctuatious in Brighton "A" have again been the feature in the Home Railway Market, the stock at one time selling at 153, subsequently being "bid for" at 154, and finally closing at 153⅜, or a rise of ¼ on the day. The defeat of the Hull Board has had a marked effect upon Hull and Barnsley Railway Stock, which rose to 36, but finally left off at 35⅛, or a rise of 1½, or over 2½ per cent. above the "making-up" price. South-Western and Great Northern "A" receded ½; Metropolitan District, ¼; and one or two others, ⅛. The Scotch lines still keeping very firm. American Railroad Securities opened irregular, became weak, and finally closed at their worst; Mexican Central Income Bonds heading the downward movement with a fall of 1½, while other leadiug descriptions mark a fall of ½ to ¾. Grand Trunk stocks were also a shade easier, but the fluctuations in Mexican (Vera Cruz) Railway issues have been very wild, the Ordinary radiating between 47¼ and 49; First Preference between 124¾ and 126, and the Second between 82 and 85, the final prices showing a gain upon the day. Very trifling alterations occurred iu the Miscellaneous section, and were about evenly distributed.

Annexed are the final quotations to-day:—Consols Aceount, 98⅛, 98¼xd; Egyptian Preference, 103⅜, 103⅞; Egyptian Unified, 90⅞, 91: Freneh Four-and-a-Half per Cents., 103½, 104; Hungarian, 86 1/16, 86 5/16; Italian, 96⅜, 96⅝; Mexican 94¾, 95¼; Peru Five per Cents., 15 3/16, 15 5/16; Peru Six per Cents., 17, 17¼; Russian, 1873, 100¾, 101; Portuguese, 67⅜, 68; Spanish, 75 1/16, 75⅛; Turkish, 1871, 93, 93½; Turkish Defence, 99¾, 100¼; Caledonian Railway, 119⅝, 119⅞; Great Eastern, 76¼, 76½; Great Western, 159⅜, 159⅝; Brighton "A," 153¾, 154; North-Western, 183⅜, 183⅝; Metropolitan, 89½, 90; Metropolitan District, 35, 35½; Midland, 143¾, 144; North British, 58½, 58⅜; North-Eastern, 175⅛, 173⅜; South-Eastern "A," 114⅜, 114⅝; Hull and Barnsley, 35½, 36; Grand Trunk, 10 3/16, 10 5/16; Ditto First Preference, 68¼, 68½; Ditto Second, 47, 48¼; Ditto Third, 25½, 25¾; Canadian Pacific, 57¼, 57¾; Denver Preference, 49¾, 50¼; Erie, 28¾, 29; Milwaukee, 74⅜, 75; Lake Shore, 108⅜, 108⅝; Louisville, 72⅜, 72⅝; Atlantic First, 32⅝, 32⅞; Ontario, 17¾, 18; Ohio, 23½, 24; Norfolk and Western, 53½, 53¾; Reading, 24 5/16, 24 7/16; Reading Bonds, 84¾, 85¼; Union Pacifie, 63⅞, 64⅛; Wabash Preference. 30⅜, 30⅝; Ottoman Bank, 11¼, 11⅜; Anglo-Telegraph, 53½, 54; United Telephone, 14⅞, 15⅛xd; Hudson's Bay, 20⅞, 21⅛; Suez Canal. 93, 93½; Guinness 31½, 31¾; Allsopp's 8⅞, 9⅛; Bryant and May, 13⅜, 13⅝; Nitrate Railways, 22¼, 22½; Salt Union, 13¼, 13½; Suez Canal, 93, 93½; Bell's Asbestos, 17, 17¼.

THE NEW ORIENTAL BANK CORPORATION, LIMITED.

FIFTH ANNUAL REPORT OF THE BOARD OF DIRECTORS.

In submitting to the sharcholders tbe fifth annual balance-sheet and statement of profit and loss for the year ended 31st March, 1889, the directors have pleasure in being able again to show a satisfactory result of the bank's operations. After payment of working expenses, interest, income-tax, rebate, exehange on foreign assets, and making full provision for bad and doubtful debts, the nett profit (including 18,707*l*. 12s. 4d. brought forward) amounts to 57,471*l*. 16s. 11d. An interim dividend of 6s. per share, being at the rate of 6 per cent. per annum, for the half-year ended 30th September, 1888, was paid, free of income-tax, in January last, and the board now recommend a further dividend of 6s. per share, being at the rate of 6 per cent. per annum, also free of ineome-tax, for the half-year ended 31st March last, the same to be paid on the 16th July.—R. T. Rhode, Inspector.

The following figures show the steady increase in the business, here aud abroad, since the eommenccment of the bank:—

			Dividend paid.
30th September, 1884...	Banking Assets	£102,000	
31st October ,, ...	,,	742,000	
30th November, ,, ...	,,	1,086,000	
31st December, ,, ...	,,	1,480,000	
31st January, 1885...	,,	1,796,000	
28th February, ,, ...	,,	1,992,000	
31st March, ,, ...	,,	2,383,000	5 per cent. per ann.
30th September, ,, ...	,,	3,846,000	,,
31st March, 1886...	,,	4,963,000	,,
30th September, ,, ...	,,	5,483,000	,,
31st Mareh, 1887...	,,	6,231,000	6 per ceut. per ann.
30th September, ,, ...	,,	7,102,000	,,
31st March, 1888...	,,	8,177,000	,,
30th September, ,, ...	,,	8,526,000	,,
31st March, 1889...	,,	9,493,000	,,

The Brighton Railway traffic return for the past week shows an increase of 19,149*l*.; the South-Eastern an increase of 6,594*l*.

The net earniugs of the Denver and Rio Grande Railroad Company for April were $187.900, as against $142.193 in 1888.

The approximate gross earnings of the Mexican National Railroad for the first week in June were 66,485 Mexican dols.

THOMAS THOMPSON,

STOCK AND SHARE DEALER,

8½, ANGEL COURT, LONDON, E.C.

Telegraphic Address:—"NOSMOTH," LONDON.
Telephone No. 509.

Bankers:—THE CITY BANK, LIMITED, and THE ROYAL EXCHANGE BANK, LIMITED.

Mr. THOMPSON transacts business in all classes of Securities, Bonds (Foreign and Colonial), Banks, Railways, Insurance, Telegraph, Tramway, Gas, Water, Mining, and all Miscellaneous Shares. Shares sold at special prices for Forward Delivery (One, Two, or Three Months) on Deposit of 20 per cent.

Orders by Letter or Telegram promptly attended to.

NOTICE TO READERS.

Replies to Annual Subscribers will be sent by wire or letter, as may be necessary.

Non-Subscribers must send fee of 5s. 0d., in order to have their enquiries answered in "Mining World," or by wire or letter, as requested.

B. R. T. (Berks).—Hold.
Investor (B. A.)—Sell 2 and 3, and hold 1 and 4.
S. B. Smithson.—Take your profit without delay.
T. B. (Southsea).—The company was promoted by Mr. Hartmont of Lombard Street, to whom you had better complain. We fear it will be a total loss.
Foster (Cheltenham).—Certainly not. Sell at once.
M. T. (Ramsgate).—Yes, we are members of the Mining Exchange. The person you name is considered a respectable man to do business with.
Scot (Inverness).—No; there will be no call this year in New Emma, but in both the others there will be 6d. or 1s. called up almost directly.
T. Waine (Dundee).—Wait for a while. It is quite possible things will improve.
T. Train.—Under the circumstances we advise sale of the first named. Will write by letter about others.
Timid (Durham).—A little patience is all that you require. You will then see how a profit is made.
P. S. (Manchester.)—Have nothing to do with the party mentioned. We believe he trades under several *aliases*.
J. Taras (Brighton).—Buy them, and see that they are delivered 10 days after pay-day is allowed.
Knowledge (M. P.)—Dispose of your interest in Nos. 3, 4, and 6. Wait until you see a profit on 1 and 5, which we think is near at hand. Others unsaleable.
B. A. T.—We are afraid you must take up the shares. The broker can sell out for a name, and so cause a loss.
S. M. R. (Rainham).—We are informed that sufficient capital will be found to work the mines. This will be done by private persons, as far as we know.
La Velera.—We advise you to sell your shares if you get a chance, but there is no market.

The Mining World.

LONDON: SATURDAY, 15TH JUNE, 1889.

The "Mining World" is not the property of a Mining Speculator nor under the control of any clique.

TIN SHARES.

A reference to our usual comparative list of prices for the past two or three weeks will show that a considerable advance has been taking place in the shares of the leading Cornish tin mines. In some the rise has not been material, but in most instances it has, as will be seen from the following short table, showing the prices a little over a month ago in contrast with yesterday's closing quotations:—

	May 10th.			June 14th.		Rise.
Carn Brea	22	22¼	...	35¾	36¼	13⅝
Cook's Kitchen	15¼	15¾	...	19½	20	4¼
Dolcoath	99	100	...	100	101	1
South Condurrow	7¼	7½	...	7¾	8¼	⅝
South Crofty	7	7½	...	7½	8	½
Tincroft	11¾	12¼	...	15½	16	3¾
West Frances	7¾	8¼	...	9¼	9⅞	1½
West Kitty	7⅜	7⅝	...	8⅜	8⅝	1
West Seton	4⅝	4⅞	...	5	5½	½
Wheal Grenville	10	10½	...	12½	13	2½
Wheal Agar	10	10½	...	14	14½	4

The advance thus shown is mainly due to the improvement in the statistical position of the metal market, and to the renewed confidence in the future of the Cornish industry which that improvement has brought about. At the beginning of the current month the total visible supply of tin in Europe and America amounted to 14,727 tons, in contrast with 20,423 tons at the corresponding date a year ago when, it will be remembered, the market was in a state of collapse owing to the break up of the French speculation in tin at the beginning of May. The price of tin had been run up by leaps and bounds from 104*l.* to 170*l.* in the preceding half year or so, and when the syndicate ceased to buy, the rocket-like ascent was followed by a rapid decline until 75*l.* per ton was reached. At the lower range, however, the accumulated stocks were quickly disposed of, while production became lesseued, so that in the 12 months ended with May we fiud that while the total supply was 39,835 tons, against 44,329 tons, the consumption increased from 32,503 tons to 43,831 tons. As a further indication of the improved statistical position we may mention that the amouut of foreign tin in London and Holland and afloat for those destinations was 11,067 tons at the beginning of the present month, as against 12,092 tons a month previously, and 18,543 tons a year ago. In these circumstauces it is not surprising that the prices of tin have steadily improved, and that the market is firm at about 91*l.* per ton for Straits tin aud 95*l.* for English. Prices such as these are eminently satisfactory. They are good enough for the Cornish mines which are at all advantageously situated, while they are not so high as to induce foreign producers to increase their shipments as they did while the boom lasted. It is to be hoped, therefore, that the present quotations will be maintained, for they are fair both to the mining companies and to the consumers of the metal.

THE ROBINSON MINE.

In view of the commanding position which the Robinson Miue occupies among the gold-producing properties of the Witwatersrandt district, it may be of interest to describe briefly what the mine is, and what it has done. The property is about 220 acres in extent, and operations have been going on upon it for about two years, or rather more. At first the ore was extracted by means of open trenches, and, until recently, the whole of the crushing was done by a 10-stamp mill. The present company paid 45,000*l.* for the mine and such machinery as was on it, 5,000*l.* being reserved as working capital. The results obtained even by the primitive means employed were so good, however, that considerable profits were made, and out of these the development work was prosecuted in a vigorous and systematic manner. Fourteen or fifteen shafts have been sunk to a greater or lesser depth, and levels have been driven to a considerable length. By these means large bodies of ore have been discovered, and at the meeting in February the chairman stated that the ore bodies laid open are sufficient to keep the mills going "for some years to come." The underground works were at that time said to have a total frontage of a mile and a half in length. The main reef is reported to be 10 ft. wide, and there are several smaller reefs, ranging from 1 ft. to 3½ ft. wide, all more or less auriferous, and improving in quality as depth is attained.

The gold produced last year amounted to 26,195 ozs., of the gross value of 91,098*l.*, and out of this sum 67,007*l.* was net profit. The yield of the ore ranged from 1¼ oz. to 7 ozs. to the ton; the average for the 12 months being just 4 ozs. In the current year this rate has, we understand, been exceeded, the average going to 5 ozs. to the ton and over. The report for April, which has been published this

week, shows that the new 40-stamp mill had been got to work, so that the increase shown in the crushing for May is likely to be at least maintained. The following are the results obtained month by month since the beginning of last year :—

	1888. ozs.	1889. ozs.
January	572 ...	2,550
February	722 ...	3,400
March	827 ...	3,360
April	738 ...	3,965
May	1,656 ...	7,200
June	1,757 ...	—
July	2,747 ...	—
August	2,454 ...	—
September	3,296 ...	—
October	3,551 ...	—
November	3,917 ...	—
December	4,043 ...	—
	26,195	20,475

From this it will be seen that the results of the first five months of the current year are not far short of the complete output last year, and probably the first half of this year will show a larger aggregate production than the whole of 1888. Of course, it may be said that prosperity such as this does not prove the mine to be of great permanent value ; but all indications seem to justify the chairman's statement that the reefs improve in depth, and there is every reason to believe that the company has a brilliant future before it. It is, therefore, a pity that, as we pointed out a fortnight ago, the capital has been watered to such an extent—from 50,000*l.* to 2,750,000*l.* in fact—that the existing shares are quoted at a discount of over 20 per cent. But even at the present price the property represents a market value of nearly two and a quarter millions sterling, so that to earn 10 per cent. on the present market value of the capital, the company will have to earn nearly four times as much in the way of net profit as it earned last year, and, after all, 10 per cent. is not an excessive yield to look for from an enterprise of the kind. Whether or not such a profit will be obtained remains to be seen.

PALMAREJO MINING CO.

We are given to understand that this company will, at an early date, attract wide attention. On completion of the works in progress the shareholders will possess a modern 50-stamp mill, erected at a cost of upwards of 40,000*l.*, and a mineral railway specially constructed to carry the ores and traversing the company's estate. The management is to be highly congratulated on the position in which the company is placed as the prospects could not be more encouraging, and the funds in hand although they look too large, must be regarded as a wise precaution. This corporation is the pioueer in an enormous and marvellously rich district, 60 square miles of which is its own property, and the Mexican Government, which has already done so much for the credit and permanent benefit of its Republic, will probably be sensible of the great good to be derived from eucouraging such an industry as the Palmarejo Mine, and affording it liberal facilities in carrying out its objects, which would do so much to stimulate the flow of European capital—all that is needed to devclop the mineral wealth of the country. The general meeting of the company takes placc on the 18th, and will be specially interesting in consequence of thc chairman having so recently returned from his visit to Palmarejo.

THE TRANSVAAL GOLDFIELDS.

(From our Correspondent.)

The Causes of the Collapse.

The present depressed state of our gold share market may be attributed to various causes. First, there cannot be a doubt that during the months of December, January and February, not only did the spirit of speculation run absolutely mad, but we now know that knavery and swindling were carried on to an enormous extent. Perhaps I should be more strictly correct if I defined knavery and swindling to be confined withiu the limits of the Witwatersrandt Goldfields proper, whilst reckless speculation ran mad over the whole of South Africa. In fact, those who have overstepped the mark are now beginning to be found out, and already we hear the mutterings of the storm in the fact that three days ago it came to light that a clerk in thc employ of the Union Boating Company (Port Elizabeth) has defrauded that company and the banks to the tune of 20,000*l.*, the result of his reckless share speculations. And he appears to have got clear away. Secondly, the banks at Johannesburg, after encouraging the formation of the deep level companies, about which there exists a furious controversy, and after giving countenance to the abominable practice of time bargains, have suddenly withheld credit which they had so generously afforded during the last four or five months ; and the consequence has been that there is much weeping, and wailing, and gnashing of teeth. Thirdly, directors, investors, and speculators look forward with feelings of anxiety to the next three months, knowing, as they do, that the native labour cannot be relied upon. On this subject I am more and more convinced that as soon as English capitalists have realised the fact that these goldfields will form an industry which the present generation will never see the end of, they will take some decisive steps to secure a regular output of stone all the year round, instead of having to look forward to a cessation of the work during the winter months. And, fourthly, whatever may be asserted to the contrary, there can be no doubt that the gold output for March only reaching 28,000 ozs. was a real disappointment. On this subject, a writer, who has exceptionally good opportunities, makes the following observations :—"The reasons for the falling off are various ; the two most important are the exceptionally dry season, which is true, and the scarcity of native labour. A great many companies have already lost as many as half of their boys. There really is no reason for the closing down of batteries—firstly, because managers, as a rule, are not without the experience of last year and the year before that ; and, secondly, because hundreds of boys are not required to run a mill. Two mill-men and half-a-dozen, or, at most, a dozen boys for day and night shifts, would run most of the mills at the Randt." Be it here remarked that this writer altogether misses the chief point on the subject of the failure of native labour. The natives do not, as a rule, object to work at the mills during the winter months. What they object to is working either on the surface or in mines or tunnels during the cold weather, and so far as I can ascertain, only two or three companies have had sufficient foresight to meet this difficulty by a sufficient amount of labour during the summer months to provide sufficient stone to put through the mills during the winter. The writer then goes on to remark :—"The truth must be told. Directors, managers, and officials of companies have employed their time in the Exchange and Share Market instead of attending to the interests of their shareholders and the companies they represent. The water difficulty could not have been foreseen, but possibly provided against to some extent ; but there is no excuse for not opening out their mines so as to feed their batteries. Again, it is no secret that a great many managers have been picking the plums out of the pudding, as in the case of the Moss Rose aod others—selecting the quartz from rich leaders instead of taking it fairly from the main reef and leader stuff together. The result is that their successors will have to provide capital to put their mine in order if satisfactory dividends are to be paid. An instance is known where one manager was dismissed from the company's service because he thought it dishonest, as most people do, to give false returns in this way and he refused to carry out the directors' instructions. Nothing but Government legislation and supervision can prevent such proceedings. Apart from the fraud of manipulating the ore for share rigging purposes, this mode of working a mine is highly dangerous to the miners and natives alike, as these men never know at what time they may be buried alive. The absence of 15 of the best companies from the March return of output upsets any forecast founded on probabilities or reasonable expectations. It must not be forgotten, moreover, that some companies, whose returns are distinctly unfavourable, keep their returns back, and they are not sent to the banks until the Chamber of Mines report is declared. Others again, having struck something good iutentionally close dowu their mills in order to "bear" the stock, and to buy in for a higher market when these matters are circulated through the Exchange in confidential whispers ; and so it is that so many too confiding parties are plundered."

Political.

Your readers will remember that I have frequently insisted that all who are interesting themselves in the progress of South African gold miues should keep a sharp eye on the intricate political questions with which they are inseparably connected. It may be that I hold extreme views on these questions. Those views I have presented to your readers on several occasions, and propose to do so again whenever I feel it incumbent on me to do so. Just at this moment I prefer to quote a writer in the *Diggers' News*, and I do so for the purpose of showing that my views are in a measure supported. The writer remarks :—"From various sources, and in many different ways, intelligence has been received that a section of the Boers (in the Transvaal) are in a state of unrest. At one time the iutelligence takes the form of a rumour to the effect that a raid is to be made on Khama to revenge the death of Grobelaar. At another it is Swaziland which is to be invaded, and King Umbandine made a vassal of this Republic. It is said that secret meetings are frequent amongst a certain section of Boers, and that the object of these is to gain over the weak and the wavering in order that if there should be a raid, either on Khama or the Swazies, it may not fail for want of numbers. These rumours are somewhat disquieting, inasmuch as from their frequency there must be fire behind the smoke. The intelligence, too, is not brought to us and others by 'rabid Englishmen,' or by those who may not know the signs of the times. It is brought by men who know the nature of the Boers, who are familiar with their doings, and who know what their tactics were before on like occasions. There can be no doubt of the fact that overtures have been made in an unofficial manner to the Swazie King, and that in the present state of disunion in his camp he may haply do that which would play into the hands of those whose friendship is but another name for cruelty and annihilation. The bulk of the better class of Boers are not included in the list of those who are said to wish to try their hands with their new rifles. They desire peace and progress, and would be found as much opposed as the European populatiou of this Republic to any

violent attempt to punish Khama, or to wrest Swazie territory from Umbandine and his people. In this fact lies the best guarantee for the failure of any such attempts. England could not overlook any such attempt, and there can be no doubt that if such a fatality should occur, any action she would take would meet with the support and approval of the best men of this Republic, be they Transvaal born or European." I have quoted this article because of the moderate view it takes of the position. Since it was written (a week ago) it is not too much to say that the rumours alluded to have, to some extent, been confirmed. The fact is that there is a very strong party of ignorant Boers in the Transvaal whose ideas of *meum* and *tuum* with regard to land held by any native tribes is of the loosest description, and whilst Paul Kruger diplomatically avows that whatever they do, in the way of annexation, is done without the sanction or encouragement of his Government, it is universally known that it is done with its knowledge, and that, moreover, not the slightest attempt is made to restrain them. It is just possible that the prompt measures taken by the Imperial Government, and the augmentation of the Bechuanaland police force, may have a pacific tendency, but I confess I have my doubts. There are hundreds of Boers in the Transvaal, who, having rescued that territory from the Imperial Government in 1881, fondly hoped that they would remain for generations in peaceful possession, and without the pale of hated civilisation. Now they find that civilisation has swept over the land in a form they little anticipated, and as time goes on they become convinced that these auriferous discoveries will speedily attract thousands of people from all parts of the world. Anything in the shape of progress and the arts of refinement are positively hateful to the average Boers ; and as soon as he finds that he is being surrounded by them he makes tracks. North of the Transvaal are millions of acres of pastoral lands dear to the eye of the Transvaal Boers. Thither he will go to a dead certainty, wholly ignorant of the fact that those lands are also largely auriferous, and there he will pitch his tent, unless he is restrained by a British Imperial force. What the result will be we must leave time to tell.

A LUCKLESS COMPANY.—DURHAM "ALLAN REEF."

THE shareholders in Durham Allan Reef Gold Mining Co., Limited, did not meet yesterday in high spirits, and they parted without the directors having said much to cheer them. The concern has lost its right hand man in the person of Mr. Wm. Gundry, but for the prestige of whose name, as a highly respected member of the Stock Exchange, we venture to think the capital would not have been subscribed. Mr. Gundry's departure was a sore blow to the shareholders who joined the company at the invocation of his name, because they felt sure that in him the company would at least possess one practical man who knew what he was about. We do not see that this gentleman could have adopted any other course than he did. Questioned by one of the shareholders as to the progress of the works, he bluntly answered that he had nothing to do with the the company, for he could not approve of directors drawing two guineas each per meeting, while the shareholders were reaping from their investment nothing but a crop of disappointment. Mr. Gundry very properly retired, and the circumstance that he and so many others are landed with the shares is eloquently explained by the fact that there is no market for them. The chairman deserves credit for the candour of his statements, but every one of them bore the stamp of failure. Where anything has been found in the reefs it has cut out rapidly, or been too poor to work. Whenever the board have rejoiced the chairman ruefully admitted that their jubilation was premature. Of the three blocks into which the property is divided not one has so far proved worth a tithe of the money expended upon it, and the position is vaguely described as "one of great possibilities and no certainties." There is great difficulty even in securing labour, and much more difficult in retaining it when it has been found. Altogether the song of the chairman was pitched in the minor key, and led to the shrill notes in which the displeasure of the shareholders were subsequently made known.

The adverse criticism was led off by Mr. Addison, who pointed out that with a working capital of only 13,000*l.* the directors have taken 600*l.* in fees. The directors themselves seemed rather to blush for the whole affair, for they omitted the common practice of putting their names to the head of their report. A shareholder asked for an explanation of this omission, but none was forthcoming. The meeting was decidedly unpleasant for the shareholders, and could scarcely have been agreeable to the directors.

The consideration money for this property was 35,000*l.*, and particular stress was laid on "the permanency of the reefs," but nothing was more clear in the chairman's statement than that there is no permanency in them at all. The shareholders must smile the smile of the captive Greek as they read in the original prospectus a reference to a probable return of 3 ozs. to the ton, or "10,800 ozs. of gold per annum, worth 40,000*l.*, which, less expenses, would be equal to a dividend of 50 per cent. per annum." Judging from yesterday's meeting, dividends are so well out of sight that Sam Weller's opera glass of double extra magnifying power cannot detect them in a future that is decidedly both dim and distant.

BALAGHAT-MYSORE—CIVIL WAR.

THE deputation of shareholders appointed to wait upon the board has blossomed into a committee, and circulars have been issued on the one side and on the other, which, to our deep regret, show that this promising enterprise is in a state of civil war. We advise the shareholders, as they value their cash, to promptly cause hostilities to cease. At the meeting complaint was made of the tardiness of the board, but the members of the deputation now complain of their promptitude. The deputation went holiday-making, and the board did not see why the affairs of the company should remain in abeyance until they chose to come back. Two of the deputation take up their parable in the names of the whole four, and make statements which a reference to the full report of the proceedings at the meeting last month will not bear out. We do not think the votes of the shareholders on that occasion were intended to signify a want of confidence in the management. Having adjusted the matter of the fees there was no other indictment against the board. The immediate effect of the fighting that has taken place is the resignation of Mr. John Darlington, who, in his letter to the directors, makes the following appropriate remarks:—"From the day I became associated with you to the present time I have had but one purpose, viz., to assist by my counsel and advice in developing your property in a miner-like, economical and expeditious manner. With the able assistance of the agents at the mines this has been accomplished, and a prospect established of achieving successful results for the shareholders." With the full concurrence of the local staff, and acting under the able advice of Mr. Darlington, certain operations are now being carried on, which give every promise of early success. But the steady policy pursued by the board would be changed by individuals, who are rightly described by Mr. Darlington as "having no experience and no technical knowledge of mining." For example, at the meeting Genl. Sankey, whose name is appended to the circular of the deputation, was all for sinking a new shaft ; but possibly he forgot to acquaint himself with the cost and the utility of such a work. To the absence of this shaft Genl. Sankey attributed the misfortunes of the mine, but Genl. Walker laid them at the door of defective machinery. There is not a scrap of evidence to show that the local management dissent from the policy of the home administration ; but, on the contrary, there is much to prove that they are in harmony with it, and that the board have kept them thoroughly well supplied with all that is needed for effective working. If the Balaghat board be changed on such premises as the deputation allege there is not a mining board in London that might not be removed from office to-morrow. Already 10,000*l.* worth of gold has been recovered from a property, which so far has been remarkable for the narrowness rather than the width of its veins. Until these open out a board of angels cannot pay dividends. It seems clear that if the shareholders wish to throw the affairs of the company into disorder they will listen to the syren voices of the deputation, but, on the other hand, if they wish the policy of steady development, on a reasonable and well considered plan, to be continued, they will at once forward their proxies to the directors.

NEW CALIFORNIA, LIMITED.

THE most encouraging report which has yet emanated from the offices of this company is that which was forwarded to the shareholders in the course of the present week in anticipation of the annual meeting next Wednesday. The mortgage loan has been repaid, and other small claims liquidated. Down to August last the mine did not look well, but that month was signalised by the discovery of a valuable ore body in the 1,800-ft. level, which, up to the present time, has proved continuous for a distance of nearly 600 ft., yielding on an average some ¾ oz. of gold per ton of quartz, with at times a considerable percentage of rich smelting ore, yielding from 2 to 7 ozs. of gold per ton. The continuance of this ore body has been found in the 1,900 level. Two important claims which adjoin the present sett have been purchased, thus largely extending the company's area. The profit for January was 718*l.*; for February, 980*l.*; for March, 1,240*l.*; and for April, 1,300*l.* The directors anticipate that under this improved state of affairs they will shortly be able to resume the payment of dividends, and Mr. Rickard is to be credited with having at last scored what appears to be a decided mining success.

NEW EMMA.—A BASELESS RUMOUR.

IN addition to the news we publish in our Supplement about New Emma, we are authorised to state that the rumour circulated on the market this week—that there will be a call this year—is utterly false. Mr. Snell, the chairman, stated at the last general meeting that there would be no call this year, and the secretary has this week confirmed the statement. The mine is now paying its expenses, and the funds in hand are ample for all requirements. A further report from Mr. O. A. Palmer, who has again inspected the mine, is looked for, and, when it arrives, will be published *verbatim* in our columns. Its general tenour is known to be favourable.

NEW SPITZKOP—MR. HEANAN'S REPORT.

THE directors of New Spitzkop, Limited, have issued the full text of Mr. Heanau's report, which turns out to be an even more encouraging document than we were led to believe from what that gentleman said at the recent meeting. Mr. Heanan gives in detail the reasons which led him to express the opiuion at the meeting, that by an expenditure of 23,000*l.* he can ensure a nett annual return of 20,000*l.* In cases like these re-construction is usually resorted to, and we are not certain that it would not have been a better policy. But as it is, the directors offer 25,000*l.* in prefcrence shares primarily to the shareholders, but failing applications from them, they will proceed to dispose of them to persons outside the company.

COLAR CENTRAL.—CHANGE OF POLICY.

THE report issued by the directors of the Colar Central Gold Company, Limited, calls attention to the state of affairs as it existed at the meeting held some six months ago, since which time there have been none of those discoveries of rich ore, the expectation of which led to the formation of the company. At the same time, though, the directors do not pronounce the prospects of the enterprise as hopeless; the change of policy they aunounce will, we have no doubt, meet with the approval of the shareholders. The management will suspend work in the present sett for the time being, except the sinking of the No. 4 shaft, and will transfer the rock-boring plant to the new property, the nature of which will be divined from the meeting we reported of the Eastern Mysore Company, two or three months ago. The Eastern Mysore block to be acquired by the Colar Central Company immediately adjoins the Mysore Mine on the east, and is a little to the north of its own sett. Mr. Oakley is in charge, and his reports are so decidedly encouraging that the prospect of what the directors term "quick success" is very much stronger than in the sett originally acquired. The terms of the proposed purchase (which have been agreed to so far as the Eastern Mysore Gold Company's shareholders are concerned) are:—500*l.* in cash, and 56,350 fully-paid shares of this company. Of these last, 6,350 are available from forfeited shares. To complete the purchase it will be necessary to increase the company's capital by an issue of 50,000*l.* new fully-paid shares of 1*l.* each, and a special general meeting has been called for Friday next to submit the whole proposal to the shareholders. Its adoption in its entirety is so manifestly in their interest that no difficulty need be apprehended in obtaining their assent. Since the issue of the report the shares of the company have been in demand at improved prices.

BRIGHTER DAYS FOR MOUNT MORGAN EXTENDED.

THE spectacle of a good man struggling with difficulties is said to be a sight for the gods, and that sight has been presented individually, as well as collectively, by the directors of Mount Morgan Extended Company. Like man himself, this concern was born to trouble, as the sparks fly upwards. It was launched just at the period when the unwise telegram from the Premier of Queensland came, which cast a general, and, in many cases, a wholly undeserved slur upon mining in that colony, which it has never yet thrown off. At a very early stage the company nearly fell into the hands of professional wreckers, and was only saved from them by the energetic action of Mr. Henry Wilson (the chairman), Mr. Jenkins, and one or two other gentlemen. A large proportion of the capital was eaten up in useless expense, which the directors, old and new, were powerless to prevent, and when started upon its reorganised basis it turned out that only one-half of the anticipated capital was forthcoming. Later on an issue of debentures was attempted, and before a sum of 7,000*l.* or 8,000*l.* could be scraped together, Mr. Wilson and Mr. Jenkins had to go about from door to door, like Stock Exchange hawkers, persuading everyone whom they could to help to rescue the company from the rocks. Later still the melody of impecuniosity assumed a more acute stage, and as a last resource the directors wisely resolved upon re-construction. We shall show presently in our opinion why it has every prospect of success, but in the mean time we may say that the shares will be of the denomination of 5s., that they will be issued with 1s. credited as paid, leaving a liability of 4s. That all of them will be taken up we entertain not the slightest doubt. 28,000*l.* will thus be in the hands of the board, and with it they will have a chance of doing something for the shareholders, which the state of the exchequer has denied to them before. The Mount Morgan Extended Company has a property which is of the most promising kind. During its existence, and almost wholly under the administration of the present board, an immense amount of development work has been done. About 40,000 tons of low-grade ore are exposed, which nevertheless can be profitably dealt with by present appliances, commencing at the rate of 70 tons a week, and going up to 300 or 400 tons in the same period, as the machinery is increased. In addition to this there is the rich ore going up to 5 ozs. or 6 ozs. to the ton. The company is now about to make its first crushing, and to stop it at this stage would be equivalent to building a ship, and just when on the point of launching it to make a hole of the requisite size to sink it. There is every encouragement to go forward. There are the reports of such experts as Mr. Norman Taylor, Mr. C. C. Rawlings, and Mr. Westley Hill, of the famous Mount Morgan Mine, which are most favourable.

The local directors are the Hon. Hume Black and Mr. Ballard. The latter gentleman takes the most active part in the management, and in him the directors have the fullest confidence, which they do not hesitate, upon all suitable occasions, to express. The reports of this gentleman show him to be a man of mettle, and to be deeply impressed with the value of the mine. He has been much restricted for want of funds, but now he will be able to advance matters in a manner he has all along pointed out to be desirable. In 12 months' time we shall be extremely disappointed if the directors do not give a very good account of their stewardship, and if the shares are not at a substantial price in the market. All this time we have assumed that the re-construction scheme will be a success, for we cannot imagine any shareholders so unwise as to refuse to join it.

VISO TIN, LIMITED.

THE directors of this company are to be commended for the persistence with which by personal inspection, by themselves and by experts of repute, they have followed up the encouraging reports of their manager. All authorities agree that the company ought to lay open, explore, and work some of the numerous tin lodes which traverse the property. Unfortunately they have never had sufficient capital to do justice to the property, but they are about to submit a plan to the shareholders by which money can be raised and tin in paying quantities can be put upon the market. On Saturday next a meeting to consider the proposals of the directors will be held at the Great Eastern Hotel.

NEW RHYL, LIMITED.

VISITORS to North Wales, who have been privileged to linger for awhile at the little town of Rhyl, must agree that there are few seaside resorts that can boast so many advantages. Its sands are far-famed, its sea-bathing excellent, and the bracing character of its air is unsurpassed by any other place on our coasts. In addition to this, it is within easy access of Lancashire, Yorkshire, Staffordshire and Cheshire — four densely populated counties, and is in close proximity to some of the most picturesque scenery of North Wales. The rapid growth of the town in recent years has led to a scheme being set on foot with a view to its extension for about 1¾ miles along the seashore. The present small sea frontage compels a great many of the visitors to take up quarters where a sea view is not obtainable. The railway journey from Liverpool occupies at present two hours, but this will be reduced to about one hour upon the opening, next August, of the new railway crossing the River Dee; and this will, naturally be an inducement to many business men engaged in Liverpool to reside there. It is proposed also to erect a pier—an accessory which is now deemed indispensable to a seaside resort—which will enable the Liverpool shipping companies to run a regular service of steamers across, the distance being 24 miles. The company, which has been formed under the above title, consists of a capital of 70,000*l.*, in 7,000 shares of 10*l.* each, which are now offered for public subscription, as well as 20,000*l.* 6 per cent. first mortgage debentures. We may mention that the estate includes a strip of land connecting it with the London and Holyhead Railway, which will form one street from the sea to the railway, and give two building frontages for shops and other buildings. The price to be paid to the vendor for the 174 acres of freehold land acquired has been fixed at 53,000*l.*, payable as the directors may choose. The working capital, therefore, will be 37,000*l.*, and in addition to this there will remain 15,000*l.* of debentures unissued for further development of the property. The scheme seems worthy the attention of investors, and, with good management, we see no reason why a satisfactory return to the shareholders should not be forthcoming. The list of applications close on or before Wednesday next for London, and the following day for the country.

THE INDIANAPOLIS CABINET CO., LIMITED.

THIS company has been formed for the purpose of acquiring and developing the business of the Indianapolis Cabinet Company for the manufacture of desks, cabinets, &c. The business was established in 1870, and was formed into a company in 1880, and is now carrying on business on an extensive scale. It is stated that the daily output from the factory is 50 desks, and the demand has increased so rapidly that the resources of the existing company have been unable to cope with it. Nineteen patents for improvement in the manufacture of desks have been secured, and will be transferred to this company. The capital of the company is 100,000*l.*, in 10,000 8 per cent. cumulative preference shares, and 10,000 ordinary shares of 5*l.* each; and 50,000*l.* in 6 per cent. debentures of 100*l.* each. The price to be paid for the goodwill, patent rights, freehold property, machinery, &c., is 85,000*l.*, 40,000*l.* of which is payable in cash, and 45,000*l.* in shares or cash, at the option of the directors. The lists will open on Monday, 17th June, and close on or before Thursday, 20th June.

The traffic receipts of the following tramway companies for the past week show the subjoined comparative results:—Increases:—London Street, 483*l.*; Provincial, 143*l.*; London, 870*l.*; North Metropolitan, 1,485*l.*; Belfast, 287*l.*; Southampton, 49*l.*; London Southern, 32*l.*; Sheffield, 129*l.*; Hull, 14*l.*; Calcutta, 146*l.*; South London, 171*l.*; Bristol, 202*l.*; French, 12*l.*; Imperial, 54*l.*; Sunderland, 80*l.*; Swansea, 50*l.*; German, 320*l.*; Gothenburg, 80*l.* Decreases: Glasgow, 348*l.*; and Bordeaux, 62*l.*

REPORTS OF MEETINGS.

THE MESQUITAL DEL ORO MINING CO., LIMITED.

THE POSITION GREATLY IMPROVED—CRUSHING FOR MAY, £2,000—SOME PLAIN SPEAKING BY DIRECTORS AND SHAREHOLDERS.

THE annual general meeting was held in Winchester House, on Thursday, for the purpose of receiving the directors' report and accounts to the 31st December, 1888—the chairman of the company, P. Penn Gaskell, Esq., presided.

Mr. RALPH S. ARCHBOLD (secretary) read the notice calling the meeting, and the report of the directors was taken as read.

MAY RUN, 2,000*l*.

The CHAIRMAN: Gentlemen, we so recently held a meeting in this room, and presented you with so extensive a report from Mr. Holberton, that it leaves me very little to say, except what has occurred since then. We received a telegram to-day giving us the result of the May crushing, but as we say in the report, it is no criterion for three reasons:—First of all, the new plates never amalgamate until they have been used for a month or so, and, secondly, we hear from Mr. Crowe, who had just come over, that the old dump has been brought down to the floor for the purpose of passing it through the mill, with poor ore first, because the plates will not amalgamate well when they are new, and, thirdly, we find by the telegram that it has been a very short month—in fact, calculating it by hours, there is represented only 19 days' working.

TELEGRAM.

"40 stamps running 462 hours; quantity of ore crushed, 1,069 tons; bullion produced, 572 ozs. No amalgamator and short water. Mines looking well—137 west."

He adds "137 west" to his telegram, because he shows that we have good ore in that working, and because it was not looking so well by his last written report. I think we can congratulate ourselves on one thing, which certainly to my mind was always doubtful, and that is the water supply. If we can run 40 stamps in May, which is the last month of the dry season, it certainly shows that we need not fear about water. The rainy season will burst upon us almost immediately, and if we can do that in the dry season, it is beyond what I originally expected. It may be that the short number of hours run during the month was due to the want of water, but we cannot tell. We have simply what I have read to you in the telegram, but I think it very satisfactory as a telegram, and calculating the run to produce that amount of bullion it would be (taking the gold at 3*l*. 10s. per oz., and generally it is worth 3*l*. 12s.) 2,000*l*. for the month. (Cheers.) That leaves a considerable profit. When we considered that was the result of only 19 days' running, I think we ought to feel very pleased. The tons crushed during the year were 4,443, and the average would bring it to about 11½ dwts. We know, of course, some of the runs have come up to an ounce, and that a great deal of gold is being lost. That is with the old mill to which I am referring entirely. I think the new mill will make a great difference, and if it does not we must fall back upon science, and see what that can do for us in treating our tailings. There is no doubt we can save, and ought to save, much of the gold that is being lost, for experiments in New York have resulted in an extraction up to 85 per cent., and I do not see why we should not have the same. We are just starting with our heavy work, and in a short time shall produce better results. I have another telegram in relation to the 20 new stamps from Zacatecas. We were anxious to get up the stamps before the rainy season began, and we have received from Mr. Petit this telegram:—"25 tons machinery have gone; the remainder will go as soon as they arrive." I fancy that 25 tons of machinery will cover nearly all. In the profit and loss account the directors have debited capital with 5,000*l*. That is scarcely fair to the mine after you deduct the cost of administration on the spot, and the daily wages. Of stoping, we are doing very little, but everything else is fairly developed. This is only a matter of account, and it will be all the same in the end, so that we have made, in round figures, 5,000*l*., and carried that to capital account. We produced 10,341*l*. 6s. 7d. with the old stamps. I believe the additional 20 stamps will reach there, but at any rate we have been doing about 60 tons per day—it actually comes out 62. I do not say that we cannot get those stamps down before the rainy season, but probably there might be some delay. With 30 stamps going, and having the plates in good condition, I think

WE CAN DO SOMETHING WHICH WILL SATISFY EVERYBODY.

We have been very fortunate with the new amalgamator. He was seven years in the Homestake Mine, which pays large dividends out of $4 ore, but in order to make it pay they have to bring their working expenses down to a small point. When he deals with our ores, I think you may look for a decided improvement. I must explain the item of travelling expenses. It includes the escort of gold and cash to the mine, and mine charges. We have to send soldiers to escort the bullion. There is no coin, except silver dollars, and it is necessary to have this guarded going up as well as the bullion coming down, but if I read to you what this item of the expenses of export escort of gold means, you will find that a large amount of it comes under the head of duty paid to the Government on what is called Mint charges, amounting to 194*l*. 5s. 1d., and the cost of the soldiers' escort, 56*l*. 1s. 3d. The travelling expenses of the staff came to 252*l*. 12s. 11d. We have a large number of Englishmen out there, and there is one in the room who has served us for three years. All these expenses have to be paid for as well as the horses, mules, &c., and you can plainly see that that expense, including Mint charges, is not of great consequence. London travelling expenses include the charges of the men we have sent out lately to replace those who have left, and to increase our staff on the spot. We contract with them to pay so much in wages and their expenses out and back, provided they remain three years. Sundry expenses amount to 180*l*. I now move "That the directors' report and accounts be received and adopted.

Mr. WHITTALL (director) seconded the motion.

SHAREHOLDERS CRITICISE.

Mr. AUSTIN: Why are the deferred shares not paid upon? There can be no difficulty in recovering the money when you can sell them. I think it is a pity the directors have quoted Mr. Holberton, because his report was that we had opened 18,511 tons, of an average value of 1.40 ozs. to the ton. That average value is very delusive, because the telegram shows that during last month the average has been half an ounce. I think the directors cannot be too careful in measuring their words, and that in this case they have adopted a very unfortunate expression which I wonder they should agree to use. It is evident that we are in a transition state, but it is satisfactory that we should have nearly doubled our produce for the last month. (Cheers.) It is to be hoped that when the new stamps get to work, and when the San Miguel tunnel is opened, we shall be assisted very much. We should like to know how far that has been extended.

THE DEBENTURES.

I think the weakness of our position is in the large amount of our debentures. We might have an accident or an earthquake at any time, and these debentures would menace us. The mine would become the property of the debenture-holders, and why should not we issue shares instead of debentures, for the directors have power to do so in the articles, though I am told there is some arrangement with the vendors which makes it difficult for us to do it. I hope something will be done to deal with the debentures.

BLESSED BY NATURE, BUT NOT BY DIVIDENDS.

Mr. BOYLE: I certainly hoped that I might have been able to congratulate you to-day upon your report, but in spite of the inevitable telegram that always arrives in the nick of time, I think we are a long way removed from congratulation. Year after year you have called us together, and you tell us that we hold one of the finest mining properties in the world, that labour is cheap, that timber is plentiful, and that water is abundant—in fact, if we are to believe all the reports presented to us, nature seems to have concentrated in that one little spot all the necessaries for a great and successful mining adventure, and yet year after year we separate without any reward for our patience and enterprise. A great many shareholders think there must be something radically wrong. It cannot be the fault of the mine, because we extract gold from it, but

I THINK THAT IT IS THE MANAGEMENT THAT IS WRONG.

There are eight directors sitting round that table reading letters that come from the mine, but unless they have the ability and determination to take advantage of the knowledge those letters convey, they are no more managing the affairs of the mine than a sailor is who has his hand on the spoke-wheel of one of Her Majesty's ships. (Laughter.) I shall be told that I know nothing about mining, and may just as well take a back place, but if this is the way mines are managed by persons who do understand them, all I can say is I am glad I do not. All mines are more or less a speculation, but we have heard of mines floated with large capitals, and when directors have come to manage them they have found it impossible to pay dividends. We have heard of other mines started without sufficient capital, but does this mine come under either of these categories? Not at all; you have everything you require. There are no great engineering difficulties in extracting the ore, and the directors have never been stranded in the use of money; but how is it we do not produce gold? (A Voice: "We do.") We have been working four years at this mine, and the result is exactly the same. I have no doubt it is very important that we should have gentlemen who understand mining, but I think it far more important we should have a really good man at the base of operations. The directors are thousands of miles away from the mine, and it seems to me that the most important thing is that we should have a man on the spot who thoroughly understands his business. Have you such a man, and have the directors confidence in him?

CONFIDENCE IN THE MANAGER.

The CHAIRMAN: As far as I am personally concerned, I have absolute confidence in Mr. Holberton, but I will not answer for the board. I know him, I have been at the mine, and I have seen him at work. He is a perfect glutton for work. I know him to be a thoroughly educated man as a mechanical and civil engineer, and, personally, I have every confidence in him, and the board support him too. (Cheers.)

Mr. BOYLE: I will take your answer that you are satisfied with him, and I am going to show you how much confidence you place in him. About a year and a half ago you visited the mine, and in conjunction with this gentleman, in whom you have such great confidence, you selected the mill site.

ALLEGED FRUITLESS OUTLAY.

Not satisfied with that, the rest of the board, at an expense of 1,000*l*., sent out their consulting engineer, Mr. Harvey, to arrange also about this mill site. I say that was a most disgraceful expenditure. Surely the man at the mine was capable of arranging such a matter as that, and supposing, instead of paying one man 1,000*l*. for going out, we divided that money into three, and added 300*l*. a year to the salary of the men you have out there, he would have done everything for you, and at no greater expense to the company. I am not at all satisfied with this item of expenditure. I have nothing to say to directors' fees (1,000*l*.), to which, no doubt, they are legally entitled, and which no one begrudges them. As was truly remarked elsewhere, they do not come into the City to play at marbles. But what is the meaning of these words, "Not paid?" The reports for previous years had the same words—1,500*l*. not paid, 1,000*l*. not unpaid, and 1,000*l*., again, not paid. Why put in these words? When I see the number of people who are managing this company I think it exceedingly cheap to get all that talent, and as it is going to be paid for I do not see why it should be termed "Not paid." Then I think the charges for secretary and clerks too high, and would like to know whether that is arranged by contract. If we go on employing people at the rate we have done we shall very soon all be generals and no privates, like the Portuguese army. Then there has been a lavish expenditure on assaying samples. What is the use of these assays? I think they should be paid out of the directors' fees.

(Laughter.) Then the consulting engineer has a consulting fee of 200*l*., which, I hope, will not be paid. I do not see the good of having a consultiug engineer, if, whenever he is consulted and sent to the mine, he is to get a thousand pounds, or something like it. The first report of Mr. Harvey was a tremendous damper to us. To me it did not convey very much. It was a mass of scientific terms and false prophecies. The scientific terms I could not understand, and the false propheeies I could disprove by Mr. Holberton's reports. He told us the ore was only worth $10, but we have proved it is a great deal better than that by actual stamping, and what is the value of an opinion like that? We have to pay Mr. Harvey a thousand pounds for going out to inspect and report upon the miue, and of what value is his report. I think the time has come wheu there ought to be a great ehange made in such items as this. I have detained you a considerable time—(hear, hear)—and I do not think I have any right to try to oeeupy your attention any longer. (Hear, hear.) I do not think I shall move the rejection of the report on this occasion, though I shall do it on the next if matters be not improved.

CHAIRMAN'S REPLY.

The CHAIRMAN: In the first place, there is no contract with the secretary, but I shall have more to say about that later on. Mr. Austin has asked about the unpaid calls. Since the report was presented, with the exception of a very small amount, the sums due have all been paid. The owner of the unpaid shares is abroad, but the money is good. With regard to the 1.40 ozs. to the ton, that eomes from samples from all parts of the mine. We have at times ruu up to nearly an ounce in the mill, knowing that we were losing 45 or 50 per cent. in the old mill. There is always a wide differenee between samples and erushing. In 2,000 lbs. weight you have probably only 1 oz. of gold finely powdered. You may get a sample that will give you accurate knowledge, or you may get one that will mislead you. I base my faith on milling. (Cheers.) The San Miguel tunnel has only 450 ft. to run, but we are working with air compressors, and they ought to do 30 ft. per week if the roek only holds hard enough. But there is no eeonomy in using rock-drills where the roek is soft. I think the San Miguel tunnel will be in before September, and that will make a great difference. We have to haul up all our ore, and draw 60 to 80 tons of water out of the Brioncs shaft per day. The ore has to be packed in leather sacks and placed on the baeks of mules. The owner of the mules gets 30c. per ton, but the chief cost is in the leather bags which wear out. We have only this short distance to run before we get the Miguel tunnel into the Briones shaft. Then the ore will be dropped down winzes and loaded in the trucks and run straight to the mill. (Cheers.) The tramway is laid, and the moment we communicate the tunnel with the bottom of the Briones shaft, all the hoisting and packing of the ore will be obviated, and

THE EXPENSES ENORMOUSLY DECREASED.

Our mine cost is $3.50 for wages and $2.50 for material. If you deduet $1.25 for deadwork, when we have finished this important piece of work on capital account we will mine very eheaply in comparison with any other mine that I kuow of. We could not help ourselves with debentures. When we bought the mine,

THE OWNERS WANTED AN IMMENSE FIGURE FOR IT.

I think we were about a year arranging terms with them. They wanted a large cash priee, and we only would give in cash what they laid out in the mill. The result was that we gave them one-half of our capital in deferred shares, and the preferred shares represented the working capital. We were told by experts that 25,000*l*. would be enough, but we had 50,000*l*., and as things have turned out it is very fortunate we had. (Hear, hear.) We have taken counsel's opinion, and we cannot issue more shares. Of the debentures, I am not at all afraid, because from the way the mine looks the debenture-holders are never going to seize our property. (Cheers.) The entrance to the mine is perfectly safe. The San Miguel tunnel will be in shortly, and if anything should happen to the Briones shaft we have put down another shaft from the outside of the valley, so that in the event of anything happening to the two shafts we shall still have another access to the mine. The additional office expense has been caused by the directors taking au extra room, for reasons of which they must be the best jndges. (Hear, hear.)

FULL DETAILS FROM THE MINE.

I have never known a company so well furnished with reports to the minutest detail as those we have from Mr. Holberton, and from Mr. Crowe, who takes charge of our finances. These accounts come every week, and the directors wished to have copies made. We meet every Thursday, and this extra expense has been incurred entirely at the wish of the directors.

GRACEFUL TRIBUTE TO MR. ARCHBOLD.

As far as Mr. Archbold is eoneerned, it does not rest with me to say a word. He is too well known to need any praise from me. I have found him such an efficient aid that I would contract myself without hesitatiou to do any business with his assistance in the way of running a mine, because he has a wide experience, knows exactly what ought to be done, and is altogether a man who cannot be spared. (Loud eheers.) I speak of him in high terms, because I have a deep sense of the services he has rendered. The board is no doubt a large one, but each member takes a very strong interest in the company. Mr. Harvey was sent to Mexico while I was away, because the board thought he should be on the spot to superintend so important a matter as the erection of the new mill. The board have the management of your mine, and it was for them to say whether they would incur such an expenditure or not. (Hear, hear.)

A WORD FOR MR. HARVEY.

Mr. ROBARTS (director): Mr. Harvey has written to me to say that he has an attack of lumbago, and cannot attend to-day. I joined the board last year after his fee for visiting the property was decided upon. I did not know him before I joined the board, but my feeling now is that we have in him a most valuable servant. Without his aid our engineering would be worse done than it is at present. The thousand pounds he received for going out he replaced in the company by taking debentures, and as for his retaining fee of 200*l*., he wishes the directors to understand that it will not be drawn until a dividend is paid. Mr. Boyle has called in question the matter of assays, but it is quite a new thing that work done for the benefit of the company should be paid for out of the fees of the directors. (Laughter.)

SHOULD DIRECTORS PAY FOR SAMPLING THE COMPANY'S ORE?

Mr. BOYLE: Mr. Archbold has always been very courteous to me when I have called to make enquiries, but I think the expenses should be kept down. The chairman did not seem to think that Harvey should be paid 1,000*l*., and I am with him there. I have no objection to samples being assayed, but as they are quite useless to us they should be paid for out of the fees of the direetors. (Laughter.)

A SHAREHOLDER: Mr. Harvey, in 1886, told us that the two 5-stamp batteries we then had were not adapted for gold but only for silver ores; and you said in your first speeeh that we might have to refer to a scientific process to treat the tailings. Now it would be very unfortunate if that were to go forth to the public. Where are the five stamps bought by Mr. Harvey in Denver? You ought to have 20 stamps, but I can only aecount for 10. I thiuk you ought to withdraw that remark, or modify it with respect to the tailiugs. Capt. Pill said in a letter to me, "Mr. Harvey stopped the old mill, but I entirely repudiate that good results were not obtainable from the old mill, and this stoppage was a great blunder." The whole of the directors have always expressed themselves as exercising great caution, but what we want is that they should exercise common sense as well.

The CHAIRMAN; We originally had 10 stamps, and Mr. Harvey ordered a Colorado battery of five stamps, and we had another five stamps from Lugos. The old mill was worn out so completely that we had great difficulty in keeping it goiug, and did so by taking parts of the Denver stamps to supplement it, aud we are now running with 10 stamps.

The SHAREHOLDER: Where are the five stamps?

The CHAIRMAN: We have made use of certain parts. There are 10 stamps working made up of parts of the Denver and Lugos batteries, and portions of the old mill that we bought originally with the property. Certain parts wear out and have to be replaced. We must rely entirely upon our new mill, and we are having duplicate parts made.

A SHAREHOLDER: Are the five stamps which Mr. Harvey bought at Denver intaet?

The CHAIRMAN: They are working in the old mill, and form a part of the 10 stamps.

Mr. CROWE, who has just returned from the mine, said the Denver battery was not working. It had worked for about 10 months, but the old Californian battery did better. He was not prepared to say that the Denver stamps were a failure.

The report was unanimously adopted.

RE-ELECTION OF DIRECTORS AND AUDITORS.

The CHAIRMAN proposed the re-election of Mr. D. H. Barry as a director.

Mr. AUSTIN seconded the motion and said Mr. Barry's relatives were deeply interested in this mine, and had been very successful in similar enterprises.

The motion was carried unanimously.

SAD REFLECTION ON SHAREHOLDERS' GRATITUDE.

Mr. BARRY in returning thanks for his re-eleetion, said: I have a very big stake in this eompany, and if it goes wrong it will be a very serious matter to me, and you may bet your bottom dollar that I will do my best for your interest, and for my own. I do not profess to know much about mining, but I have aceess to the best advice. As to the directors' fees—all the money we have had out of the company we have put into it in debentures. (Cheers.) And I must say when we meet the shareholders we get rather more kicks than halfpence. (Laughter.)

Mr. WHITTALL proposed the re-election of the chairman.

Mr. SWEETLAND seconded the motion, whieh was carried.

The CHAIRMAN proposed the re-election of Mr. N. F. Robarts, which was seconded by Mr. T. K. WEIR, and carried unanimously.

The auditors, Messrs. Cooper Bros. and Co. were also re-eleeted.

THE CHAIRMAN AND DIRECTORS HIT HARD, BUT THANKED.

A SHAREHOLDER, in cordial terms, proposed a vote of thanks to the ehairman and directors. He said there had been hard hitting, but those who hit the hardest must be credited with the desire of protecting the interests of the shareholders.

Mr. BOYLE said as perhaps the hardest hitter of all he would second the resolution with cordiality. The ehairman did his best, and, after all, he was the only director who had visited the mine. On the next occasion he sincerely hoped they would all receive a dividend which would make them happy. (Laughter.)

The CHAIRMAN, in returning thanks, said: I like Mr. Boyle's hard hitting because I have looked upon him as a pillar of support to the eompany. I like to see a shareholder who takes an independent tone, and who is not afraid to express the feelings that are in his mind. It does the directors good. (Cheers.)

The proceedings then closed.

THE GRAVEL GOLD MINES OF COLOMBIA, LIMITED.

GRATIFYING STATEMENT—RAPID PROGRESS.

THE adjourned statutory meeting of the above company was held at the Terminus Hotel, City, on Thursday last—Mr. I. T. P. Pechey presiding.

Mr. SYDNEY A. COBBETT (secretary) read the notice convening the meeting, after which

The CHAIRMAN said: Gentlemen, the notice which the secretary has just read may, perhaps, require one word of explanatiou. You are all aware, I am sure, that the Joint Stock Companies Act provides that the directors of a new company shall call the shareholders together within four months of its incorporation, in order that they may give an account of their stewardships, but you may not, perhaps, all know that this company was registered on the 20th of April, 1888, just at the time a very severe depression set in in mining matters, and that it was thought by the directors desirable to defer the issue of the prospectus until such times as matters took a turn for the better, so that the statutory meeting, which was held on the 8th of August was attended

only by the signatories of the articles of association, and it was left to the directors to call the shareholders together at this adjourned statutory meeting. We are very glad to meet the shareholders, but as the company has been so recently formed we have no report or accounts to present to you, but we wish to put you in possession of all the information in our power as to what we have done in carrying out the work of the company (hear, hear) ; and let me say here, as we stand on the threshold of our enterprise, that it will be our aim, as it is our duty, always, as the Americans say, to post you well up with all that goes on (hear, hear)—and all that we are doing. One proprietor has suggested that we should have half-yearly meetings, but I do not think (and my co-directors are of the same opinion) that it will be worth while to go to the expense and trouble of doing that, while we are getting the property into working order. (Hear, hear.) It will be very easy, and not a costly matter, for the secretary to send you on a post card from time to time any special item of importance, as we receive information from the mines as to what is going on. Of course, any more lengthy reports will be published in the financial and mining journals. I think we can very fairly congratulate ourselves upon the success with which this company has been floated. The prospectus was advertised on the 16th of February last, and during the few days that it was open 68,082 shares were applied for by 537 shareholders. I am very glad to think that the gentlemen who applied for shares were not mere premium hunters. They were those who, like the directors, have put the money into the concern believing it to be a genuine enterprise, and as

FREE FROM RISK OR SPECULATION

as a mining property can possibly be. (Applause.) Out of that 68,082*l*. as much as 50,000*l*. has been set aside for working capital, the balance going towards the purchase, the remainder of which, in accordance with the contract, is made up of fully-paid shares. In my opinion that is just as it should be. I think that the vendors of mining property, which must, under the most advantageous circumstances, be more or less of a speculative character, ought to take the larger proportion of the purchase-money in fully-paid shares. (Hear, hear.) Their interests thus became identical with those of the shareholders, who provide the working capital for putting the mine in proper working order, and make it, if possible, a profitable concern. This remark will apply, I think to every mining property ever floated in the City of London. The question may be asked why we did not hold this meeting a little earlier. That admits of a very simple answer. The directors wanted to meet the shareholders to-day, as I am happy to say we are doing, with my friend Mr. Welton, on whose report, in conjunction with that of Mr. Oakes, the engineer of the Colombian Hydraulic Company, this company's property was purchased. We were also anxious to be able to tell you that

THE PROPERTY HAS BEEN TRANSFERRED

in the Government books on the other side into the name of the company. That, gentlemen, has been done so far as the three properties —Rica, Maravilla, and Hoyo-Negro—are concerned. We have received certificates showing that the properties have been transferred to the company, and that they now stand in the company's name in the Government books in Colombia. We have received a telegram, however, stating that there is some little hitch with regard to the Reforma papers. The telegram we have received simply says, "Papers not in order," but I do not suppose that is a thing that will cause five minutes' delay, and as soon as we receive the papers they will be put in order as quickly as possible. The Reforma property is at the extreme end of the mine and will doubtless be transferred into the name of the company without delay. As soon as we receive that notice we shall apply for a Stock Exchange quotation and settling day. We shall get a settling day at once, I know, but whether we shall obtain a quotation or not I do not know, as that depends very much upon the application for shares ; but, at all events, we shall get it if we possibly can. It may be as well, as there are gentlemen here unacquainted with

THE WORKING OF HYDRAULIC MINES,

for me to give some information upon the hydraulic principle, but so much information has been given in the prospectus with regard to our properties that I do not think it will be necessary for me to go into many details connected with the properties themselves, but it may be as well to state briefly what are the three conditions necessary for the successful working of a hydraulic mine, and show how far those conditions have been fulfilled in the properties we have purchased. (Hear, hear.) First of all, we want a very large supply of auriferous gravel of sufficient thickness to enable it to be crushed profitably by the hydraulic process ; secondly, we want a sufficient outlet for the tailings, as they are called ; and, last of all, we require (what the gravel and outlet would be useless without) a very large supply of water, and that water must be in such a position that it can be brought in at a height of at least 200 ft. or 300 ft. above the bottom of the gravel bed, in order to obtain sufficient pressure and power to work. These three conditions, then, do exist on the properties we have acquired. (Hear, hear.) First, as to the gravel, I do not know whether you have noticed that we have in our possession two separate mines. There is the Maravilla group of mines, containing, as I understand,

AN INEXHAUSTIBLE SUPPLY OF RICH GRAVEL,

and there is a ridge some eight miles in length, and from 100 ft. to 200 ft. in thickness, which comprises the Rica, Hoyo-Negro, and the Reforma properties, forming altogether, as I said before, an inexhaustible supply of gravel. We think it would be best in the interests of the company, in the first instance, to limit our work to developing these three mines—(hear, hear)—and with that view we propose to bring on a stream of water of not less than 4,000 ins. to 4,500 ins. from the River Guali, in order to attack that very large body of gravel under the most advantageous circumstances. Mr. Welton has made a very elaborate survey of the water supply, and has reported very fully upon it. We find from his report that the length of what he calls the Guali ditch is to be from first to last, 22,369 miles. At a distance of about 9 miles we tap a stream called San José, and that stream runs in all seasons of the year about 1,000 ins. of water, and at a distance of 4 miles further we tap another stream called the Agua de Dios, so you see, gentlemen, we shall not have to wait to get this 22 miles of ditch wholly constructed before we can commence making

PROFITABLE RETURNS.

(Hear, hear.) As soon as we get 1,000 ins. of water in from San José, so soon ought we to commence the payment of dividends. The outlet of these properties is a magnificent one. From the gravel bed down to the river Guali there is a drop of nearly 1,000 ft., so that we never need be alarmed as to the outlet—for tailings, &c. The shareholders will naturally want to know how soon we may expect to get this water on. Under ordinary circumstances, we should have been compelled to have to wait until we get the information of the transference of the property before doing anything towards developing the property of the company ; but I am happy to tell you that one gentleman connected with the vendor was so sure of the value of the property, that immediately the company was subscribed here, and the shares were on the eve of allotment, he, at his own risk, telegraphed credit of 3,000*l*. for the immediate commencement of work. He ordered also all the necessary stores for the commencement of work on the ditch. I think we owe a great debt of gratitude to this gentleman—(hear, hear)—whose name I am not at liberty to give, for had it not been for his action we should now be only just sending out the money for the commencement of operations. The tools have all been shipped, and I have no doubt many of them, if not all, are by this time at the mines, and the work is going on. Mr. Welton has given us an exhaustive report with regard to the ditch, but, unfortunately, through his long stay in Mexico, he has almost entirely lost the use of his voice, otherwise he would be glad to address you. After carefully considering the matter the directors have decided to place the construction of the ditch in his hands. I have had the pleasure of that gentleman's acquaintance for the last 35 years, and I know of no man in whose hands I would rather place work of this description. Next month Mr. Welton will leave this country for the mines, and he undertakes to have the first head of water into the mine within 12 months of his arrival in Colombia. The work is still going on whilst he is here, as he has left an efficient engineer (Mr. Griffith) to proceed with the work. Mr. Griffith wrote, under date of April 29th last, as follows :—"Since my letter of the 20th ult. we have had a great deal of rain at night, but I am glad to say the rain has cleared off during the day. Last week, up to Saturday, we had cut down and excavated 3,750 ft., making a total from the start of 8,303 ft., and at the time of writing I should say we have completed about 2 miles. The ground we passed through last week was difficult, and there were a good many large stones and loose rocks." This progress Mr. Welton considered was very satisfactory, and on his return he would put as many men on as he could obtain. We have quite a large engineering work before us that will cost us 40,000*l*. You will, therefore, see, gentlemen, why we made the working capital 50,000*l*. We knew perfectly well the work we had before us, and we think that if we get this work done for 40,000*l*. we shall come off very cheaply indeed. (Hear, hear.) By the prospectus you will see that the shares were payable, 2s. 6d. on application, 2s. 6d. on allotment, and the balance in instalments—not calls ; they are not calls—of 5s. at intervals of two, four and six months respectively from the date of allotment. I may tell you that the board will want the third instalment of 5s. due on July 1st, but the last one will not be wanted for at least 12 months to come. (Hear, hear.) You will naturally ask,

WHAT RESULTS DO WE EXPECT

to obtain with this first 1,000 ins. of water, which will be brought on the three properties? I have gone carefully into the results that have been obtained by the Colombian and Orita Companies, which are working very successfully, and I find that the yield per inch of water per hour runs for the last six months at the Malpaso Mine has been 1.87 c. Then if I look at the work done at the Rica Mine, I find the yield per inch per hour is 3.66 c.—(hear, hear)—nearly double that of the Colombian Hydraulic Company. There is one thing in our favour and that is that the mine we are going to attack is on a slate bedrock, while the rock that underlies the gravel deposit of the Malpaso Mine is granite, and there are also in that mine large boulders often met with that give them a great deal of trouble. In our own mine the bedrock is changed to slate, and, as you are doubtless aware, in slate rock no boulders are found. At the rate of $3.66 per inch per hour, I find that, working for 500 hours a month on 1,000 ins. of water, we ought to get a gross return of $18,300 per month. (Applause.) (A VOICE : That is 20 per cent. upon the capital of the company). We might take a large discount from that and still make a large profit. (Hear, hear.) My feeling is that it might be to the interest of the company to eventually form a subsidiary company to work the Maravilla property, but that is a matter that is entirely for the future. We must remember that our undertaking is

NOT AN UNTRIED EXPERIMENT.

The Orita and the Colombian Companies are both paying good dividends, and their gravel is apparently not so rich as that which this company is about to work. The country we are working into has been long known as a wonderfully rich country. I find, on looking up the records, that King Ferdinand of Spain named it the "Golden Castile," and nearly all the gold of old Spain was derived from the mines of Colombia. (Applause.) I think that the policy your directors have adopted will commend itself to your judgment, and that you will give it your cordial support. I am sure that, if you will wait until we can bring the water to bear upon our mines, judging by their capabilities and the results obtained by the Orita and Colombian Companies, your patience will be rewarded by a great and lasting success. All we ask of you is that you will give us, in the meantime, your loyal support. (Applause.)

After several questions, having no direct bearing upon the remarks of the chairman, had been asked and answered, a vote of thanks was given to the chairman for his address, and also to the board of directors.

LATEST REPORT.

Mr. W. St. D. Griffith reports under date Rica, April 29th :—Since my letter of the 20th ultimo we have had a great deal of rain at night, but I am glad to say the rain has cleared off during the day. Last week, up to Saturday, we had cut down and excavated 3,750 ft., making a total from the start of 8,303 ft., and at my time of writing I should say we had completed about 2 miles. The ground we had passed

through last week was difficult to excavate in places, and there were a good many large stones and loose rocks. I should have forwarded you by this mail a detailed account of my expenditure and the cost of the work, but Mr. Navarro tells me the rule here is to pay the men on the first of the month and not at the end of four weeks, and as this letter has to go away before the 1st May, I must send it next time.

THE DURHAM "ALLAN REEF" GOLD MINING CO., LIMITED.

A DISAPPOINTING CO.—THE ONLY PRACTICAL MAN ON THE BOARD RESIGNS—DIRECTORS AND THEIR FEES.

THE first annual general meeting of this company was held at Cannon Street Hotel, yesterday, to consider and receive the report of the directors, with balance-sheet, elect an auditor, and transact any other business of the company—Mr. Alexander Davidson presided.

Mr. F. PARKYN (a director) in the absence of the secretary read the notice of meeting.

BAD MINING OUTLOOK.

The CHAIRMAN moved the adoption of the report, aud said: This report now before you gives a full and detailed account of the workings on the various parts of the property. The first block of claims, and the largest, is the Durham, after which the company is named. At the time we took it over very little work had been doue. It had been opened but little, but being iu the line of the Union Company's claims (where they had shortly before discovered a good reef of considerable size which had the effect of sending the shares of that company up to 12*l*.) it was thought reasonable that we, in our property should come upon the same reef. Whatever may be in store for us in the future, we have not come upon that reef yet, although we have been following up other gold-bearing reefs, which, however, have proved limited in extent, and of low-grade ore. We have been driving a little to cut the reefs at a lower level. We have a threefold purpose in carrying this out, first, that of cutting any reefs that may ruu through the property; next, of providing a cheap and convenient means of exit for any ore found iu the mine; and, thirdly, of establishing a perfectly efficient means of draining all the water in the mine. It is to be regretted that the driving of this tunnel has been through very hard rock, so that the progress has beeu slow; but every effort has been made to proseeute the work, aud we hope that our industry may bear good fruit iu the future. The next largest block is Robertsou's and Bassett's, where the ground has been a good deal easier to work, and where a large amount of sinking and driving has been carried out. Very rich ore has been found from time to time in the veins worked upon, and the reports which have come from the manager as to these findings, as well as very high assays taken from time to time, have more than once induced somewhat premature rejoiciug on the part of your anxiously watching board.

THEY GET FEES.

The board have a large interest in the company, although it does not require that to ensure their atteution to their duties. Every such finding has as yet turned out small in extent, and not persistent in character. As au illustration, I may read you an extraet from a reeent letter froui the manager. He says, referring to one of the parts of the reef on this section of the property, that "on taking down the leader which had been allowed to stand for convenience, we found that we had driven through a rich patch earrying visible gold. It is from 4 to 5 ft. long, and 5½ ins. wide in the back of the level, but smaller towards the bottom. The average assay gave 32 ozs. 16 dwts. The portiou of the reef containing visible gold is at the baek of the level." We refrained froui publishing that, and it is well we did, for the very next letter showed that the leader is 2 ins. wide, assaying 1 oz. 1 dwt. 9•grs., showing clearly how great a change occurs in this reef within a few feet. The third block is the Little Ben, lying towards the south and here we have had our expectatiou raised at various times

ONLY TO COME TO DISAPPOINTMENT LATER ON.

The width of the reef is pretty eonsiderable, and if it had only been of richer character throughout, it would have turned out well. As it is, it is of very low-grade ore, and is therefore disappointing, although at one time Mr. Johns found it so good that it was running over 1 oz. to the ton, and he wrote home anticipating that he would be able to keep 5 stamps crushing on this part of the property.

POSSIBILITIES BUT NO CERTAINTIES.

Thc property is full of possibilities, but as yet no certainties have been obtained. With regard to the accounts, I will point out that this being the stage of development and no returns coming in, the expeuditure has been put against capital. The bills payable consist of bills drawn by our general manager at 30 days' sight upon us. On the other side, the Transvaal expenditure is for a period of about eight months, and the London expenditure 12 months. The expenses are therefore, somewhat heavier than they would otherwise have been. The directors have voluntarily agreed to draw half the fees to whieh they are entitled by the articles of association—(laughter)—so as to help to harbour the resources of the company, aud make them endure as long as possible. (Renewed laughter.) The arrangement with Mr. Clemes is a considerable economy without making auy sacrifice of efficiency. A good deal of the cash in hand and at the bank has been drawn upon siuce the aecounts have been made up. While endeavouring to be as economieal as possible, the board do not spare any means of obtaining the best skilled advice as to laying out and working the property and obtaining the most speedy and direct information from the other side as to all that is going ou. For this reasou the board have availed themselves of Mr. Todd's services, who has returned to Africa that he may send periodical reports and advices, and also the services of Mr. Boucher. Under the advice of the solicitors the board took steps at an early stage to have the company registered in the Transvaal, but there has been great delay on the other side principally owing to official red-tapeism at head-quarters. By the last mail we have a letter from the agent, stating that he hopes to complete the business at an early date.

LABOUR HARD TO GET AND HARD TO RETAIN.

I ought to have alluded to the difficulty of labour. The natives are difficult to get, and difficult to retain when you have got them, and so our operations have been retarded for want of labour. I believe this is a difficulty that will disappear as time goes on, and that by and bye things will settle down to a more regular form of working. white men have also become scarce, but so far we have retained the miners we have sent out though we have had to increase their wages lately.

Sir W. ONSLOW secouded the motion.

THE BOARD'S BEST MAN RESIGNS.

Mr. ADDISON: There seems to be a very curious and significant omission in this report—the directors do not put their names on the top. Now, why is that? (Hear, hear.) I took shares in this company on the faith of the name of Mr. William Gundry, whom I look upon to be a great authority in mining. I went to him wheu I received this report and said I was very curious to know why the directors had not, as is the invariable eustom, put their names at the head of this document. He said, "Why, I have nothing to do with it now. I resigned a long time ago." I said, "How is that." He said

"THE DIRECTORS WOULD TAKE TWO GUINEAS EACH FOR EVERY MEETING.

I thought that too much, and consequently I resigned." (Cheers.) I have seen many reports iu my time, but never recollect one coming out without the names of the directors at the top of it. (Cheers.) I think it very siguificant that these names should have been omitted when the solitary director who is generally known to the shareholders has ceased to be a member of the board. (Cheers.) Hearing that he had resigned because the directors were drawing too much money, I looked to see what they had received and found it close upon 600*l*.

PLAIN TALK WITH DIRECTORS.

It will thus be seen that with a working capital of about 13,000*l*. they have not forgotten themselves. What they have drawn, I think, is far too much for a company like this to have to pay. (Cheers.) The chairman remarked that they had taken half what they were entitled to, and therefore it seems that they are entitled to 1,200*l*. fees per annum on a working capital of 13,000*l*. It is no wonder that I say this is too much. That is my opiuion, and it is the opiuion of several shareholders with whom I have conversed. (Cheers.)

Mr. DAVIES: I also took my shares on the faith of the name of Mr. Gundry, and I am very sorry to see that he has left the ship. I should have been glad to have seen him at the board to-day, and I should like to know whether it is true that he left the company because he thought the directors were taking too much money.

A SHAREHOLDER: Is not the stationery account too much—101*l*.?

MR. GUNDRY DEFINITELY RESIGNS.

The CHAIRMAN: Mr. Gundry wrote to the board suggesting his retirement, but did not mention the matter of fees. He attributed it to the faet that he was a stockbroker, and had not time to attend to the meetings, and also to the faet that he expected to be hushed down considerably during six mouths. We asked him to reconsider his decision, as we should be sorry to lose his services; but he again wrote that he must tender his resignation. We have not accepted it as yet, and we are not obliged to accept it—(laughter)—and so he is still a director of this company. (Renewed laughter.) At the same time, I think we must look to losing him as a direetor, but I hope we shall not lose his support as a member of the company, and he is a larger shareholder now than he was originally. With regard to the fees, they are 600*l*., aud the directors have had a great deal to do. The stationery account has been swollen by the large number of books, &e., we have sent to Afriea, the carriage of which was 30*l*. Then there were the books in London, the eommon seal, the engraved plate for the certificates, and the telegraphie code books.

The report was then adopted.

Mr. J. B. Laurie was re-elected auditor at a remuneration of 12 guineas on the motion of Mr. DUNCAN, seconded by Mr. MACKAY.

The CHAIRMAN suggested that a new director should be appointed by the present meeting, but uo notice was taken of the matter.

Mr. DAVIES proposed a vote of thanks to the chairmau.

Mr. STRICTLAND, in seeouding the motion, said he did not think the fees of the directors should be halved. (Laughter, and cries of "Yes.")

The meeting then closed.

SOUTH FRANCES.

A CALL OF 10s. PER SHARE.

A SIXTEEN-WEEKLY MEETING of the adventurers in South Frauces Mine was held in the Account-House ou Thursday—Mr. Cornelius Bawden, purser, presiding.

Mr. J. C. Daubuz and Mr. A. Lanyon were present among a large number of shareholders.

The accounts showed the labour costs to have been 4,041*l*. 12s. 10d.; merchants' bills, 2,752*l*. 4s. 10d.; rates, 45*l*. 6s. 7d.; total debits, 6,853*l*. 5s. 11d. Tin had been sold to the amount of 84 tons, 16 ewt., at an average priee of 51*l*. 7s. 6d. per ton, for 4,350*l*. 6s. 6d.; total credits, 4,485*l*. 3s. 5d., leaving a loss of 2,368*l*. 2s. 6d., and a balance against the mine of 2,120*l*. 13s. 10d.

The CHAIRMAN said everybody expected something like this, knowing that the water was in. The mine was now drained, however, and they hoped this would be the last time they would have to come before them with so heavy an adverse balancc.

Capt. HOOPER observed with regard to the statement in the report that they were making preparations to fix a lift at the bottom level, that it would take some time to do this, as before they could put in the lift they had to take down a certain amount of lode. It was a profitable piece, and they intended to take it away.

Mr. JOHN MAYNE proposed that a call of 10s. per share be made, which would cover the balance against them.

Mr. R. S. TEAGUE seconded, aud the motion was agreed to.

The meeting theu concluded.

COLORADO GOLD, SILVER AND LEAD RECOVERY SYNDICATE.

EXTRACTS FROM REPORTS.

Received from the Company's Manager at Leadville, Colorado, on the 31st May, 1889.

I was at the La Plata mill this morning, and ascertained that it will be completed and ready to put our pulp over the tables on the 18th inst. Concentrator: Revised price list of machine of which I sent you a cut in my previous letter. The price on board of cars at Boston is $3,000.00; freight and setting up of same, about $850.00; 10 tables, $80.00 a set, and placed in position, $800.00; five sizing machines, $65.00 a piece, $325.00; pulleys and belting, $925.00; 10,000 ft. of lumber, $200.00; nails and hardware, $225.00; tar paper, $40.00; labour, setting up machinery, and re-modelling building, $1,500.00; total, $7,865.00; or about £1,650. With this plant we can treat about 70 tons of slag every 24 hours, making five tons of concentrates, or 14 tons of slag to one ton of concentrates. For the concentrates we realise about $65.00 per ton, smelter returns:—Five tons concentrates, at $65.00 per ton, gross per day, $325,00. Help required in mill per day:—One foreman, $4.00; two engineers, at $3.50, $7.00; five labourers, at $3.00, $15.00; three tons coals, at $5.50 per ton, $16.50; oil and repairs, $7.50; eight men on dump, loading slag on cars, $2.50, $20.00; one-third royalty, $108.00; total expenses per day, $178.00; leaving a net profit per day of, $147.00, of, 30*l*. 6s. 3d.; or per month of 26 working days, a profit of $3,822.00 (nearly 800*l*.), and per annum, 9,600*l*. The foregoiug figures are high as to expenses and low as to profits, in order to be sure of the result as to placing it upon a paying basis, but I am giving facts without regard to the result, and I shall make no assertions which cannot be verified at any time. The shareholders should not be discouraged because they are out a few dollars, and must not forget that we can reimburse them for every cent so expended, and pay them a large profit per annum if they put up the necessary means to put matters in shape to make the enterprise productive. You will see by the smelter returns that the value of the matte is about the same as it has been, but we do not get as much out of the dump for the reason that most of the slag is fine, and the matte and bullion is scattered through it in small particles. This we will remedy by concentration. The mill in which we expected to put the pulp over the tables has not been completed. I saw Mr. Litchfield Saturday last at the mill, when he informed me that it would be completed on the following Tuesday evening, and start upon our slag on the following (Weduesday) morning. Monday came, and we had a heavy snowstorm, stopping work on the mill, and it has been storming every day since and still at it. On last Saturday we shipped three cars of matte, one car of ore, and 17 cars of bullion, as you will observe by the returns from the smelter, which will be sent you in my next, together with the April accounts. I have concentrated the pulp in a pan up to as high as 72 ozs. silver and 51 per cent. lead to the ton. This is a positive proof that it will concentrate; but I will make sure by putting several tons over what is known as the Gilpin bumpers (tables), which have done the best work at the least cost. Your prospects are very promising, and if you will or can go into the matters as laid before you, large returns are sure to result. The best thing that can be done is to have the shareholders come here and see for themselves, and they are sure to be well pleased and satisfied.

THE NEW CALIFORNIA, LIMITED.

REPORT OF THE DIRECTORS.

8th June.—The directors submit balance-sheet for the year 1888. The balance of 3,000*l*. of the original mortgage loan, with the premium of 400*l*. payable thereon, has been paid during the past year, out of the call on shares, as also a balance of 600*l*. due to the vendor of the Badger State Mine. It will be remembered that in the earlier portion of the year and down to the month of August, the mine manager reported very disappointing results; but in that month a new and valuable ore body was discovered in the 1,800 level, which up to the present time has proved continuous for a distance of nearly 600 ft., yielding on an average some ¾ oz. of gold per ton of quartz, with at times a considerable percentage of rich smelting ore, yielding from 2 to 7 ozs. of gold per ton. The 1,900 level, to intercept and prove this valuable ore body, was commenced in the month of September last, and the latest advices from the mine manager would seem to confirm his oft-expressed opinion, that the ore body is not only existent at this point, but will, probably, as depth is attained, lead to greater riches than those developed in the 1,800 level. Your directors therefore look forward with increasing interest to the development of the mines at the 1,900 level, as probably assuring the continuation of the same ore body for a far greater depth than at present anticipated—sufficient, it may be, without fresh discoveries, in other portions of the company's properties, to secure the future prosperity of the company. The latest advices from the mines are enclosed herewith. The manager, in August last, having urged the importance of providing a fund of not less than 5,000*l*. for the more thorough aud systematic development of the mines, and for the purchase of adjacent mining claims, the directors authorised an issue of 10,000*l*. of 10 per ceut. first mortgage debentures for this purpose. The directors have now the pleasure to advise that arrangements have been concluded for the purchase by the company, on most advantageous terms, of the two important adjoining mining claims, Governor Adams and Rhode Island, thus largely increasing the mining area of the company. The following satisfactory monthly returus since the closing of the accounts in December have been received:—January: The output for the month was 792.90 tons of ore, yielding 489.80 ozs. of gold; value, 1,735*l*. The mining costs proper were 1,017*l*., leaving a profit of 718*l*. (453*l*. was expended in development and exploration). February: Output 1,030.37 tons, yielding 620.10 ozs.; value, 2,097*l*. The mining costs were 1,117*l*., showing a mining profit of 980*l*. (324*l*. was devoted to development and exploration). March: Output 830 tons, 685 ozs.; value, 2,370*l*.; mining costs, 1,130*l*.; mining profit, 1,240*l*. (Expended on development and exploration, 300*l*.) April: The manager telegraphed 15th May as follows:—"April output, 615 tons; yield, 710 ozs.; value, 2,500*l*.; mining costs, 1,200*l*. Expenditure on mine development and exploration, 200*l*. I will remit next mail $10,000 on account of profit up to the present." (The mining profit thus was 1,300*l*. for the month of April. A continuance of such favourable returns should permit of your directors resuming the payment of dividends at an early date.—W. H. ROWE, Secretary.

MOUNT SHAMROCK.

SPECIAL REPORT.

17th April.—My co-directors, Mr. Simpson and myself, visited the mine a fortnight since. We thoroughly examined the underground and surface workiugs. At the mine we found a large body of rock with numerous veins of mineral running through it. The veins are from one to about six inches thick, and from prospects tried by pestle aud mortar, then treated with acid, we obtained extraordinary prosects. From the mauner iu which the veins run through the rock most of it has to be put through the battery. So far we have not seen any hanging-wall, but have instructed the manager to cross-cut to prove the width of mineralized rock. The depth at present is about 200 feet from the surface, and looks as well in the bottom as it has ever doue since we have been working the refractory ore. Our returns are not satisfactory from the mill compared to the prospects obtained, which is easily accounted for by the great loss from the battery, as is showu by the returns from the tailings sent to Sandhurst some time since for chlorination, which gave about 1¼ oz. of gold to the ton, the gold being worth 4*l*. per oz. Finding we were losiug such a large quantity of gold we have taken steps to prevent it by erectiug concentrating machinery to concentrate the crushed material coming from the battery. Four Brown and Stanfield concentrators were ordered from John Walker and Co., of Maryborough; these have been put up, and are working splendid, Capt. Higgins, our manager, being a first-class man at this kind of work. To give you proof of the working of the pans we brought three samples of crushed ore to Gympie for test; two of the samples were concentrates from the pans, the other sample after leaving the pan. Sample No. 3 gave: Gold, 8 ozs.; silver, 1 oz. 2 dwts. 21 grs.; bismuth, 6.80 per cent. Sample, No. 4 gave: Gold, 8 ozs. 3 dwts. 8 grs.; silver, 1 oz. 12 dwts. 16 grs.; bismuth. 7.42 per cent. Samples No. 4 tailings, after concentration gold, silver, and bismuth, traces only. I enclose assay notes. There was a No. 1 sample, but there was a doubt as to where it came from, being sent down in the coach with samples, so we did not have it tested. This is the reason we had two tests from the concentrates to settle the doubt. the result is nearly the same. We have sent 2 tons to Sandhurst and 2 tons to Cassell's at Ravenswood. We have sent to Rockhampton for the plans of a chlorination plant to treat about 40 tons per week; we have also to put up a furnace for roasting the ore. To get this plant and erect a furnace we have sent to you for 2,000*l*. It will take nearly all that sum; but money has run short, as we have purchased a portable engine, bought and erected the concentrating machinery and erected two Berdan pans. This, with a severe drought which prevented crushing for many weeks, has brought our balance very low. We expect the gold from the boxes and tables to keep us going, but we cannot erect the necessary plant to obtain the gold from the concentrates and the heap of tailings on the flat, about 7,000 tons, without the necessary funds to do so, you will, therefore, I hope, have the money forwarded. Mr. Simpson and myself proceed to Rockhampton next week to arrange about the plant. There was very little water in the dam at the mine wheu we were there, but a shaft is being put down close to the creek, and drives put into the bed rock of the creek to tap the water. The boiler and pump that was down, the creek has been removed to this shaft, where we expect to cut a good supply of water; but I do not think we shall require this water as we are now having heavy rain, which appears as likely to last, the rain being general all over the district. The railway to Clifton will be open in about a month; this is about 35 miles from the mine. The next section will be let as soon as Parliament meets; in a few months this will be within six miles of Mount Shamrock, and lessen the cost of working the mine. A whim has been erected on the mine, which will do double the work of the present whip.—W. SMYTH.

— 17th April.—I hereby certify that the samples marked No. 2, 3 and 4, received from the mine per Wm. Smyth, Esq., M.L.A., and F. G. Simpson, Esq., yielded the following results:—

	Fine gold per ton.			Fine silver.		
	ozs.	dwts.	grs.	ozs.	dwts.	grs.
Sample No. 3—concentrations	8	0	1	1	2	20
	Bismuth, 6.80 per cent.					
Sample No. 4—concentrations	8	3	8	1	12	16
	Bismuth, 7.42 per cent.					
Sample No. 2—tailings after concentrations, gold ... ... } traces.						
„ „ silver... ... }						
„ „ bismuth ... }						

DAVID E. REID.

— April 11th.—We have treated the parcels of ore sent to us by the Mount Shamrock Gold Company with the following results, viz.:—M.S. 1: Heavy mineral ore picked out of main body of stuff, 35 bags, weighing 1 ton 15 cwt. 3 qrs., yielded 5 ozs. 14 dwts. 23 grs. gold, or equal to 3 ozs. 4 dwts. 8 grs. per ton; it also contained a trace of silver. The tailings left from this assayed equal 3 dwts. 12 grs. gold per ton. M.S.E. 2: Ore from winze about 20 ft. below main workings, 35 bags, weighing 1 ton, 16 cwt. 2 qrs., gave a trace only of gold and silver. M.S.F. 3: Concentrations, 40 bags, weighing 2 tons 2 cwts., yielded 10 ozs. 16 dwts. 7 grs. of gold, or equal to 5 ozs. 3 dwts. per tons. It contained 1 oz. 12 dwts. silver per ton. The tailiugs from this lot gave by assay a loss of 3 dwts. 23 grs. per ton. M.S.T. 4: 40 bags, weighing 2 tons 1 cwt., yielded 12 ozs. 9 dwts. 7 grs. of gold, or equal to 6 ozs. 1 dwt. 12 grs. per ton. It contained a trace of silver and ¼ per ceut. of Bismuth. The tailings were assayed, giving equal to 4 dwts. per ton. Ore from next wall or side of workings taken 4 ft. wide. We trust this will be satisfactory to your directors. I will forward you cheque for balance, after deducting charges, but I thought better to send you this report as quickly as possible to let your directors know.—S. H. McGOWAN.

SAN SALVADOR SPANISH IRON ORE COMPANY, LIMITED.—The letters of allotment and regret to the English shareholders were issued on Thursday night; those to the Spanish shareholders were sent yesterday.

HARTBEES UNION CRUSHING AND GOLD MINING CO., LIMITED.

CIRCULAR TO THE SHAREHOLDERS.

THE London agent of this company is Mr. Walter Bramall, of 5, Copthall Buildings, E.C. In a circular to the shareholders the directors in Kimberley say :—In issuing the new working capital of the company, the directors take the opportunity to acquaint you with a summary or statement of the property possessed by your company, and the position that has been attained in the development of the same, in order that the extent and special value of your property may be better known. Locality: The property of the Hartbees Union Crushing and Gold Mining Company is situated on the farm Rietkuil, in the Klerksdorp Goldfields of the Tranvaal. Mining claims: The company possesses 199 mining claims, in blocks upon all the best reefs yet opeued on the farm, carefully selected, after months of examination, out of the original holding of 431 claims taken over from the original grantees into the "Hartbees Union;" and the opinion is confidently exprcssed by the Selection Committee, after personal inspectiou, that reefs of the Klerksdorp fields series are in every claim retained, and now held by the company. It is especially noted that the company possesses the block called Owners' Claims, which answers to the Mijnpacht reserve on other farms. Water rights: The company had the first choice of water right on the farm, and has already selected the two best water rights on the two streams which flow through Rietkuil, besides having rights to water for several amalgamated blocks. Battery: The battery is a 30-stamp Sandycroft, driven by a 30-h.p. compound condensing Fowler's engine (having a reserve of power capable of driving more stamps). The battery and its concomitants are enclosed in substantial and roomy buildings, and the whole is in working order. Machinery, stands, and compounds: The company secured 36 plots or stands, as it was deemed advisable to have ample space for the above purposes, so that in the event of floating off developed blocks of claims into new companies, there need be no difficulty about sites for the necessary machinery. Mine work and exploration: All the prelimiuary work of prospecting has been done, and already permanent shafts have been commenced in two of the blocks,viz.: In the Owners' block, about 200 yards above the battery; and in the block immediately adjoining the rich reef of the Worcester Hope Company, to cut the said reef in our ground. It is in contemplation to commence a main shaft in the block near the Rietkuil Kopje Company's property, to pick up the extension of their reef. Working capital: The company is in possession of an ample working capital; as the calls due ou the new issue and the amount to be received for the shares offered by public tender, will furnish an available balance of probably over 30,000*l*., and in addition thereto the company will hold the reserve of 10,000*l*. preference shares intact. London registration: The directors contemplate opening an office in London, to facilitate the transfer of the shares of the company in Europe. Your directors remind you that the company was formed expressly as a parent company with the iutention of forming other companies out of blocks of claims from the present large holding, which is sufficient indeed for many large companies; and, in conclusion, your directors have to report that an application has already been received for the purchase of a block of 25 or 30, with a water-right, and that such application is under consideration.—G. BUCHER, Secretary.

PROGRESS OF THE WORKS.—EXTRACTS FROM MINE MANAGER'S REPORTS.

2nd May.—The property is situate on the well-known gold-bearing farm Rietkuil, and is one of the most comprehensive in the district, comprising as it does 200 claims, pegged out in blocks of various sizes, on all the most valuable reefs ou the farm. The claims are distributed as follows:—In block A, 86; in block B, 91; in block C, 22; and in block D, one. On those in block A there are three distinct reefs, averaging from 2½ ft. to 3 ft. in thickness, and traversing in an unbroken line the entire length of the claims. They all pan well, one in particular gives unusually good results, and when thoroughly opened up will easily keep 50 stamps going. These reefs, unlike all others in the district, staud nearly vertical, and can therefore be mined at about half the cost of the ordinary horizontal reefs. In block B the reefs are numerous and varied; a number have already been partially opened up by small prospecting shafts and costerimous trenches. The most valuable are perhaps the large 8 ft. reef close to the battery, and a leader, or rather series of leaders, some distance from it. The former, taking into consideration its size and close proximity to the battery, should pay well at from 6 dwts. to 8 dwts. to the ton, and the latter should prove a valuable auxiliary to it. In block 6 the claims are pegged out in two sections, containing eight and 14 claims respectively. The former immediately adjoins the Worcester Hope Gold Mining Company's ground, and the latter that of the Rietkuil Kopje Gold Mining Company, and as both sections contain portions of all the reefs owned by the two aforesaid companies, this value is unquestionable. The single claim in block D being too small to work by itself can doubtless be disposed of at a good figure to the owners of the adjoining claims. The battery, a 30-stamp Sandycroft, with a Fowler's patent improved compound condensing engine, after having the necessary alterations and additions, such as stone-breaker, automatic feeders, &c., will crush easily 1,500 tons of ore per month, which, taken at only ½ oz. per ton, gives about 2,800*l*., and, after deducting 15s. per ton to cover all mining and milling expenses, leaves about 22,000*l*. per anuum profit. The gold in all the reefs is for the most part coarse and free from all coating or alloy; no difficulty need therefore be anticipated in amalgamation. From the claims to the battery there is a gentle depression, and when a tramway is laid down ore can be delivered at the mill at a cost of about 25s. per 100 tons. In conclusion, taking into consideration the size of the property, the number of reefs, the many facilities for economical working, and all other natural advantages, I have no hesitation in saying that I consider this property second to none, and superior to most in the Schoon-spriut Goldfields. Again, the parent company, after reserving sufficient ground for its own use, could, without crippling itself, re-float at least three-fourths of the property into subsidiary companies, thereby increasing the value of the present shares three or four-fold. We commenced work three weeks ago, and have now got fairly under way. Trial shafts are being sunk an average depth of 10 ft. on all the best reefs, preparatory to laying out plans for extensive working. Workman's and Kaffir houses are being erected, and work in all the different departmcnts is being pushed on with the utmost vigour and euergy.

— May 8th.—I am very pleased to inform you that in course of sinking one of our shafts in block B we have come across a reef which pans at least 1 oz. to the ton. We cannot yet form an opinion as to its thickness, but from general appearances I should say that it will be a good working size. Work at all the other reefs proceeding rapidly, and everything at present looking well.

THE TOLIMA MINING CO., LIMITED.

DIRECTORS' REPORT.

13th June.—In the balance-sheet the result of the company's operations during the year ending 31st December, 1888, is given. You will, on perusing the superintendent's report, note with satisfaction that the anticipations entertained at the period of the issue of the last report have been fulfilled, rich bodies of ore having been found in the western section of the mine, extending with more or less continuity from the sole of the 20-fm. sinks down to and below the 60-fm. level. The cost of winning these deposits has, however, been considerable, owing to the amount of dead work which it was necessary to execute to reach them, but the results obtained have fully justified the expenditure, mineral in considerable quantities (varying in value from 130 ozs. to 450 ozs. per ton) having been extracted, and reserves opened out in the western section alone which are calculated at 403 tons of export mineral, to which 100 tons in the 80 east being added, give an estimated total value of 30,000*l*. The appearances in the lowest excavations in the engine shaft and the 90-fm. level east deserve attention, indicating, as they do, further satisfactory discoveries. The superintendent has been directed to give an estimate of the cost which the development of this mine will involve, and your directors propose, on its receipt, to take such steps regarding it as may, in their opinion, best conduce to the interests of this company. The issue of debentures to the amount of 2,530*l*., under the powers vested in your directors, permitted the execution of the exploratory works so strongly recommended by the superintendent, and also enabled the company to tide over the difficulties incidental to the low returus which prevailed up to July of the past year. The royalties from the Organos Mine, which, as you are aware, are especially assigned to the debenture-holders, have proved more than sufficient to meet the interest of the issue, and would, in all probability, have rapidly effected the redemption of the loan, were not funds for this purpose about to be provided by the sale of the Alto Gold Gravel Washings, which has beeu recently effected for the sum of 6,000*l*., as sanctioned at the last annual meeting of this company. Iu conclusion, the directors believe that they are fully justified in cougratulating the proprietors upon the present position and future prospects of this company.—W. W. HOLMES, Secretary.

Certificates of the Preferred and Deferred shares of the Industrial and General Trust are now ready for delivery at the offices of the company, Winchester House, Old Broad Street, E.C., in exchange for the letters of allotment and the banker's receipts.

The London Joint Stock Bank's branch establishment, at 114, Lcadenhall Street, has commenced business under the management of Mr. W. W. Maycock.

The Anglo-American Land Mortgage and Agency Co., notify that their debenture interest coupons, due July 1st, will be paid by the Clydesdale Bank, Lombard Street.

The Foreign and Colonial Debenture Corporation give notice that allotment letters and bankers' receipts can now be exchanged for share certificates.

Notice has been given that the transfer books for the Four-and-a-Half per Cent. Debenture Stock of the Salt Union will be closed from the 17th to 29th June, both inclusive, prior to the payment of the half-yearly interest, due July 1st.

Messrs. Baring Brothers and Co. announce that they are prepared to deliver scrip certificates of the City of Monte-Video Six per Cent. Loan in exchange for letters of allotment.

IMPORTANT SALE.

CORRUGATED IRON SHEETS, IRON ROOFS, SHEDS, HOUSES, BUILDINGS, &c.

THOMAS WHITEHEAD & SON announce that they are instructed by Isaac Dixon and Co., Windsor Iron Works, Liverpool, to SELL by AUCTION, on TUESDAY 18th, WEDNESDAY 19th, and THURSDAY 20th June, at 11 o'clock prompt, at Acre Yard, Belvedere Road, next Westminster Bridge, S.E., about 1,200 TONS of their Well-known High-class Valuable IRON MANUFACTURES as follows:—About 30,000 corrugated iron sheets; 200 complete iron roofs and sheds; 100 iron buildings suitable for hay and corn sheds, agricultural, manufacturing, storage and general purposes, mission rooms; 12 miles wire fencing; 50,000 yards wire netting; 100 iron columns; several thousand feet iron ridging and gutters; 80 iron tanks; 10,000 yards roofing felt, and other goods.

Catalogues from Auctioneers, 67, Hanover Street, Liverpool, or Dixon's Windsor Iron Works, Liverpool.

In handy lots to suit various classes of buyers. To be followed by sales of similar goods at Manchester, Belfast and Dublin.

WATER-GAS PROVED A COMMERCIAL SUCCESS. A SAVING OF £10,000 PER ANNUM IN ONE WORKS ALONE.

THE BRITISH WATER-GAS SYNDICATE, LIMITED.

WATER-GAS.

The following extract from the *Times*, of January 2nd, 1889, relative to the manufacture and application of Water-gas, is reprinted for general information.

WATER-GAS.

"For many years past attempts have been made at intervals to produce what is known as water-gas—that is, gas resulting from the decomposition of water. Experimentally there have been several successes, but practically and commercially up to the present time, as far as we are aware, these have been only failures. These failures have mainly arisen from the difficulty experienced in separating the water-gas from the other products. This difficulty has now been overcome, not by one invention, but by the combination of the best features of several inventions having for their object the manufacture of water-gas. What is more, the patented inventions which have been combined in the new process are not those of one inventor or of one country, but represent several inventors and several nationalities—namely, England, Germany, America, and Sweden. The amalgamation of these various patents and the beneficial results which have accrued therefrom came about by reason of the exigencies of manufacture of corrugated boiler flues and press-flanged steel frame plates for railway rolling stock at the Leeds Forge Company's Works, Leeds. The metallurgical operations carried out there demanded fuel of a higher calorific intensity than could be obtained from either the generator gas of the Siemens' producer, or ordinary coal gas. Mr. Samson Fox, the managing director, therefore turned his attention to water-gas, and, having carefully considered the whole question, decided upon putting down a water-gas plant at the Leeds Forge. The works were begun on September 29th, 1887, and on March 29th, 1888, plant capable of producing 40,000 cubic ft. of water-gas per hour was started, and has since been in constant operation with perfect success, and without interruption. The gas produced gives every satisfaction, not only for metallurgical, but also for lighting purposes, the whole of the works being supplied with it.

"Water-gas is the result of a chemical re-action which takes place in passing steam through incandescent carbonaceous matter, and may be considered as the practical result on a wholesale scale of the ordinary laboratory experiment of decomposing water by passing steam through a highly-heated iron tube. In the water-gas apparatus the fuel, which at Leeds Forge is coke, is raised to a high temperature in a generator by the aid of an air blast. The blowing is continued for about 10 minutes, by which time the fuel has reached a dull red heat. During this period what is known as producer-gas is given off, and this is led away to a range of Lancashire boilers, where it is utilised in raising steam for the engines in the works. At the end of 10 minutes the valves are reversed, the air-blast being stopped, and the further exit of producer-gas to the boilers prevented. Steam is then admitted at the top of the generator for four minutes, and, passing down through the incandescent fuel, becomes decomposed, and a fixed gas results. This gas as formed passes away to a scrubber, where it is treated much in the same way as ordinary coal-gas. From the scrubber it passes to the gas-holder, where it is stored for use for metallurgical purposes in the works, such as heating and welding. For indoor illuminating purposes a portion of the gas is conducted from the gas-holder to the purifiers, where its purification is effected by means of oxide of iron. It will thus be seen that the process consists of alternately blowing the generator hot and making gas, and that a run of gas is made every 15 minutes, during which time the yield from each generator is about 17,500 cubic feet of producer-gas and 5,000 cubic feet of pure water-gas for heating and lighting purposes. The gas is also used most successfully for driving gas engines.

"The metallurgical purposes to which the water-gas is applied at the Leeds Forge are various. In the first place, it is used in the heating furnaces in the plate mill, where the steel ingots are rolled into plates for the manufacture of Fox's corrugated boiler flues. It is also used in welding these tubes and heating the plates for Mr. Fox's flanged frame-plates for railway rolling stock, and for his flanged boiler-fronts, besides which it is utilised in various other similar operations throughout the works. In the application of water-gas to the manufacture of Siemens' steel there is a marked improvement in the quality as well as the quantity of the product. With this gas 30 charges of steel per furnace per week can be turned out, as against 11 charges per furnace per week from furnaces of equal capacity using gas from Siemens' producers. Besides being used for metallurgical purposes, the offices and various parts of the works are lighted with water-gas, the burners employed being arranged on the Fahnejelm system. Burnt in the ordinary way, the water-gas gives a blue flame, but by suspending a comb composed of thin magnesia rods in the flame the filaments are quickly heated to a white heat, producing a bright glow light of high illuminating power, but which is neither unpleasant to the eye nor prejudicial to the sight. The heating power of water-gas was very great, as was demonstrated upon our recent visit to the Leeds Forge Works, where we inspected the method of its manufacture as well as that of its use in the various departments. To give one instance only, a piece of copper wire placed in an ordinary coal-gas flame was only made red hot. A similar piece of wire placed in a water-gas flame issuing from a similar burner was quickly and perfectly fused.

"An important consideration in the adoption of any new system is, of course, its cost; and in this respect water-gas comes out well. Its production per ton of fuel is about 30,000 cubic ft., and with fuel at 8s. per ton, labour at 3s. 6d. per man per day, and the production going on continuously, it is found that the gas costs slightly less than 4d. per 1,000 cubic ft. The experience of nine months' working at the Leeds Forge has led to the conclusion, based on carefully-ascertained data, that the saving effected on the whole works is about £10,000 per annum. Looking at the advantages of water-gas for illuminating purposes, it is to be observed that, besides giving an agreeable light, it does not develop any noxious fumes, nor does it produce smoke; health and cleanliness being thereby preserved, and paintings, furniture, and decorations remaining uninjured. For lighting mansions this would prove a boon, while the producer-gas can be utilised for heating purposes. Similarly, a mill-owner laying down a water-gas plant for lighting his factory will obtain gaseous fuel for steam-raising purposes practically for nothing. For small towns also the lighting could be carried out with water-gas, the producer-gas being used for steam-raising and manufacturing purposes generally. Although the installation of this water-gas plant at the Leeds Forge is the first in England, the system is being largely adopted in America and on the Continent, both at steel works and for illuminating purposes."

In addition to the above extract, the following papers have recently commented favourably on water-gas.

VALUABLE COPPER MINES IN SOUTH NORWAY, AND TIMBER PLANTATIONS.

MESSRS. S. WALKER AND RUNTZ are instructed to SELL by AUCTION at the Mart, London, on Monday, June 24th, at TWO, in One Lot, the MINES, MINING RIGHTS and PROPERTIES of the Arendal Mining and Smelting Company, Limited, near the town of Arendal, on the south coast of Norway, comprising the Skytmyr, Boilestad, Sletne, and Maesel Mines, together with quays at Espeland and Lake Röre Vand, and other property north of the River Nid. Upon the property are valuable timber plantations, and the constant demand for Swedish and Norway fir offers an excellent opportunity for a remunerative business being opened up with the timber trade. There is also a fine opening for the manufacture of wood pulp, for which there is a large and increasing demand. Particulars and Conditions of Sale, with Plan, may be obtained of Messrs. Monkhouse, Goddard and Co., Chartered Accountants, St. Nicholas Chambers, Newcastle-upon-Tyne, and 28 and 29, St. Swithin's Lane, London, E.C.; Messrs. Gibson, Pybus and Pybus, Solicitors, 42, Mosley Street, Newcastle-upon-Tyne; Messrs. Stibbard, Gibson and Co., Solicitors, 21, Leadenhall Street, London, E.C.; Messrs. Schweigaard and Christensen, Solicitors, Christiana, Norway; at the Auction Mart, London; and at the Auctioneers' Offices, 22, Moorgate Street, London, E.C.

DUNCAN'S TRAMWAY MANUAL FOR 1889.
(TWELFTH EDITION.)

Now Ready, Price 5s., Post Free,

This Book contains every needful information relating to all the Tramway Companies in the kingdom, as well as those abroad the capital of which is held in this country. It is the acknowledged authority on all matters relating to Tramways.

It gives an Analysis of the Accounts of each Company for the two past half-years, and the Traffic Tables of all the larger Companies.

It shows the exact financial position of each Company, and gives the names of those connected with its administration and management.

Mr. Duncan has endeavoured to make it a safe guide to Tramway investors, as it deals solely with actual facts, from which the intelligent Shareholder can, at a glance, form his own opinion.

It is an invaluable Book of Reference, and both large and small investors may save themselves from serious loss by having it at hand to consult.

EDITED BY MR. W. W. DUNCAN, TELEGRAPH STREET, LONDON, E.C.

MINING MACHINERY

Of Latest Approved Designs as developed in American Practice.

The ultimate success of the African Goldfields must depend on large economical Mills, crushing the maximum quantity of ore with the minimum outlay for fuel and labour.

As an illustration of what can be done with superior machinery reference is made to the Montana Company's Mill. This consists of three rock-breakers, 60 stamps and 24 Frue Vanner concentrators. It crushes daily 120 tons of hard quartz, burning six cords wood (3 tons coal) per 24 hours, and employs 15 men in the 24 hours. The engine has been run four months at a stretch without once stopping.

The following extract from the "Engineering and Mining Journal" shows the difference between Fraser and Chalmers' Mills, and those of less experienced firms:—

"STAMPS AND STAMPS.—The El Callao Company has two mills of 60 stamps each; the new one supplied by Fraser and Chalmers representing the best modern designs and workmanship. Both mills are run under one management, and the old mill has been much improved on its original condition.

"Old Mill crushed 31,770 tons in 48½ weeks, cost 24.60 fcs. per ton.
"New Mill crushed 29,000 " 25 " " 8.60 fcs. per ton.

"New Mill will probably crush 60,000 tons in 51 weeks. The rock is a very hard quartz."

The cost of freight and erection is nearly as high for a poor mill as a good mill. The difference in first cost between ordinary mills and the best mills can be made up in the extra saving on a month's run. The large masses of low-grade ore in Africa cannot be worked to a profit with expensive fuel and labour except by improved mills. The days of small mills and rich rock are numbered, as proved by experience in all other goldfields.

THE INGERSOLL DUPLEX HAND-POWER

ROCK DRILL.

A SAVING OF 300 PER CENT. OVER ORDINARY HAND-LABOUR.

Send for full description, testimonials, &c., to

WELLINGTON & CO. (Successors to CLARK & WELLINGTON),

MANUFACTURERS, 73A, QUEEN VICTORIA STREET, LONDON.

It is perfectly automatic, and bores holes from ½ to 2½ inches diameter at the rate of 1 to 2 inches per minute in hard rock. It will work equally well in any direction or on any uneven surface. No skilled labour required to run it. No expensive repairs. Made in two sizes, and can be worked by electric motor if desired. Hundreds of these Machines are at work in all parts of the world in Mines, Quarries, and for all kinds of rock excavating. It is the only *effective* and *durable* hand-power Rock-drill ever made.

REPORTS OF MEETINGS.

THE MOUNT MORGAN EXTENDED GOLD MINING CO., LIMITED.

SHAREHOLDERS AGREE TO RE-CONSTRUCT—THE MINE ABOUT TO COMMENCE CRUSHING—40,000 TONS OF ORE IN SIGHT—CONFIDENCE IN THE MANAGEMENT AT HOME AND ABROAD.

THE first ordinary general meeting of the above company was held at the City Terminus Hotel, on Weduesday, for the purpose of receiving the directors' report and statement of accounts, the re-election of directors and auditors, and for general business — Henry Wilson, Esq., chairman of the company, presided.

Mr. G. L. S. MAGGIOLONI (secretary) read the notice calling the meeting.

CONCISE STATEMENT OF THE POSITION.

The CHAIRMAN said: You will observe, gentlemen, that the report aud statement of accounts with which we have to deal is comprised in the period embraced between the 5th of September, 1887, and the 31st December, 1888, a period of 15 months and 25 days, or, in other words, a year and a quarter, less five days. The first resolution, therefore, which it is our duty to propose to you is, "That the report as circulated, and the statement of accounts, as duly audited, be received and adopted." In asking your approval of that resolution it is not our intention to offer you a discursive address from the chair, and because we do not consider that to be an appropriate prelude to the calm and serious investigation of the business we have met to consider. We propose to place before you a few facts as succinctly as possible on which to form your judgment as to whether we have been just and diligent stewards of the interests committed to our charge. The broad and really important question seems to us to be, How have you spent our money, and what have you to show for it? We hope to be able to show you that the money has been well and judiciously spent. The programme of development and exploration was, as stated in the report, determined after careful consideration, and in conjunction with the opinions and approval of practical men—men whose opinions were stamped with the hall mark of experience. (Cheers.)

LOCAL MANAGEMENT.

It will be readily admitted, I think, that of all the duties to be discharged in connection with the management of a property of this description the most important, undoubtedly, are those devolving on the local management. That local management, as you doubtless are already aware, is represented by the Hon. Hume Black, Member of the Legislative Assembly of Queensland, a gentleman of high social standing, renowned for his administrative ability, a staunch supporter of mining interest, and a thorough believer in Mount Morgan Exteuded. Mr. Robert Ballard, C. and M.E., is, as you also doubtless know, his colleague. Anything that I could here say of that gentleman's professional abilities, and his qualifications to discharge the duties devolving on him, would fall far short of what he is entitled to at our hands. His graphic account of Mount Morgan, as a mining district, and the 38 interesting and lucid reports which he has already sent you of your property, are alone sufficient to stamp him as a man of marvellous resource and of the highest order of attainments. Capt. Aldridge is, as you know, responsible for the work above and underground, and of him Mr. Ballard speaks in the highest possible manuer. That gentleman is the material of which the local management is composed; and in such machinery we may, I think, repose the fullest confidence. No. 35 is a particularly interesting report, and I would advise some of you gentlemen who have leisure and inclination, and who take an interest in the progress of the work, to come to the office and study these in conjunction with the maps. You will find Mr. Jenkins, or myself, there every morning. (Cheers.)

PROGRAMME OF DEVELOPMENT.

To carry out the policy of exploration and development referred to we expected to have had at our disposal a working capital of some 15,000*l*., and the source from which that was to be obtained was the liquidation of Mount Morgan West. That policy was steadily and energetically pursued for a period of seven or eight months'; not with ever-varying success, but with encouraging indications from every point which development had reached. Our resources, although husbanded in every possible manner, began to fail in the month of June, 1888, and we were consequently compelled to reduce to less than one-half our monthly remittances to the local committee. This was a period of serious anxiety to your directors; the supply of machinery suitable to the requirements of the mine had been contracted for, some 70 men were employed, occupied in the construction of roads, the excavations for dam, bye-wash, and storm bye-wash, making of incline road and tramway, preparation for mill site hewen out of solid rock, and for the preparations generally for the reception and erection of the machinery. Works of such magnitude could not possibly be carried on at a less expenditure than 500*l*. to 600*l*. per month, irrespective of the heavy payments for machinery. It was at this juncture that your directors, fearing the complete suspension of operations at the mine, called the shareholders together with a view to devise a plan by which the financial position of the company might be strengthened, and the result of that conference was the issue of the debentures. (Hear, hear.)

DIFFICULTIES OF DEBENTURE ISSUE.

Notwithstanding the tempting terms on which the debentures were issued, and the nature of the security offered, the applications were disappointing. A pledge was given to the shareholders present at a meeting held at the Cannon Street Hotel on August the 16th, that we should not proceed to allotment unless a minimum of 7,500 was applied for: the shareholders still remained coy, but your directors determined that the issue should not fail. Mr. Jenkins and I resorted to a house to house visitation of the principal shareholders within our reach (rather a humiliating position in which to find directors). Even then our energies were but poorly rewarded, and the result was that to make up the deficit your directors were obliged to put their hands somewhat deeply into their own pockets. The sum realised by the issue amounted to 5,080*l*., and immediately on finding that the issue was secured we at once telegraphed to Mr. Ballard to complete provision and purchase of machinery, and to proceed, with the utmost expedition, the completion of all works. But although our instructions were promptly obeyed, serious interruption had already taken place, with the consequent partial dislocation of our plans. From this point the remarks I have to make would be more appropriate at the special meeting which is to follow this; suffice it to say then that by this time we believe all those difficulties have been overcome, that the machinery has been erected, and that, in all probability, the first produce of the mine is going through the mill. Here it may be well to remind you that, whereas your property originally consisted of but 14 acres, it now consists of 35, two additioual blocks, one of 10 and one of 11, having been acquired by the tact and perseverance of Mr. Ballard.

CAREFUL EXPENDITURE.

The balance-sheet will, I think, explain itself pretty clearly, though no doubt some of you gentlemen on that side of the table will exercise your privilege, and put such questions as you may think proper, with a view to elucidating any points which seem obscure. On all such questions we shall be pleased to give you the fullest information in our power. For every shilling spent in Queensland we have proper vouchers sent us, and to none of those could we take exception. In the new departure which we propose making an all round reduction must be made. An enormous amount of deadwork, unremunerative and very costly, has been done within the period of this report. That portion of his scheme, Mr. Ballard assures us, will admit of easy extension without much additional expenditure, and it is in contemplation to extend it, for his object evidently is to deal with a large output of low-grade ore, and thereby make up by quantity what he lacks in quality. His estimate is that with his present appliances he will be able to treat 100 tons a week. I venture to doubt that, seeing that at present he is provided with only two Watson and Denny's pulverising and amalgamating machines; these, however, can be easily supplemented at a cost of about 155*l*. each. His object is to treat 300 or 400 tons a week, for there is scarcely a yard of the ground that is not more or less auriferous and that will not pay to put through the mill. Seeing that he estimates 4 dwts.—a pennyweight being worth, say 4s.—as the cost of mining and milling, anything over that being profit, and a profit we are sure to get, inasmuch as several portions of the lodes and veins already exposed yield several ounces on assay. (Cheers.)

CONFIDENCE IN MR. BALLARD.

What your views may be, gentlemen, as to the value of the property you possess, I do not know. I dare say they are somewhat conflicting: ours are not. No one who has carefully studied the 38 reports that have been sent you can doubt. No one who has taken the trouble to make himself familiar with the history of that mountain since its first discovery, as we have done, can for one moment imagine that all its golden treasure is deposited in the cap, or geyser, of the senior claim. There is overwhelming testimony to the contrary. Remember that we are still in our infancy, for the first two years is but a brief period in the history of any mine, and we are but 20 months old, during which not more than seven or eight months' mining, in the literal sense of that term, has been done. Considering the almost total suspension of work which at one time took place, and to which I have already referred, we consider that Mr. Robert Ballard has accomplished as much as any man could have done, and certainly more than most. In him, in every sense, we have absolute confidence, and his confidence in the value of Mount Morgan Extended is sufficiently exemplified in the fact that hitherto he has only drawn as remuneration the paltry sum of 100*l*. a year, being content, as he says, to wait for further remuneration until he can dig it out of the ground.

WORKS IN PROGRESS.

There are at present six tunnels in progress, and I scarcely think I need refer to those in detail, for they are fully treated in the various reports. There is the shaft in Osborne's knob, which, as Mr. Ballard phrases it, he intends to make the main chimney of the mine. There is also Classon's shaft, from the bottom of which there is a drive north-west by west, half west, which gives good indications of meeting with the lode in No. 1 tunnel 100 ft. from its mouth, and may establish the existence of a payable lode 310 ft. in length. This shaft is 40 ft. south of tunnel No. 2, and 310 ft. south of tunnel No. 1. This is a very promising hæmatite reef. Then there is the shaft sunk between the leaching and pulverising platforms, in which he expects to find the continuation of the Immanuel reef discovered in the well at a depth of 56 ft., assays of the stone of which gave 1 oz. 15 dwts. 5 grs. It was the outcrop of this lode he discovered when excavating the bye-wash. These are the principal points of development, from all of which it is expected good ore will be forthcoming for the mill.

HOW THE MONEY HAS BEEN SPENT.

That, gentlemen, is the way your money has been spent, and those important and extensive works, and this equipment of machinery, are what we have to show for it. In everything we have done we have exercised an independent and conscientious judgment in your interest. We have applied to this enterprise the same economical principles as those by which practical and experienced men in other undertakings have been guided. I will now ask my colleague, Mr. Jenkins, to second the resolution, and I have no doubt but that he will be able to give you still further information upon some points that I have omitted. As it is with men, so it is with men: We know what we are, but we do not know what we may be. (Loud cheers.)

40,000 TONS OF ORE EXPOSED.

Mr. JENKINS (director): It is my pleasure to second the resolution which the chairman has put to you, and in doing so I do not think that many remarks from me are required after the able way in which he has put the matter before you. I would only ask your careful attention to the report which Mr. Ballard has sent, dealing with the question of the poor ore, which he proposes primarily to treat, because in that way he wishes to raise the money by which he can prospect and carry out development work by means of purchasing the machinery with which it will be necessary to treat it. I will refer you to Mr. Ballard's report, in which he states that he has exposed ore to the extent of 40,000 tons. Those 40,000 tons, he said, can be realised at a gross cost of 12s. per ton: therefore, practically looking at the fact that from 26 assays taken from the exposed ground, which we know everything about, and which proved an average of 4½ dwts., there should be a surplusage of 1½ dwts., or practically 12,000*l.* profit, after dealing with this quarry. There is no mining here, it is simply a breaking down of the side of the hill, and carrying it away by means of a wire tramway. We know him to be a practical man, and believe he can produce for us a profit, which profit will not, necessarily at first, go towards paying dividends to the shareholders of the company, but will go towards the supplementing of the machinery already acquired; for the purpose of treating the ores which are known to exist in the tunnels Nos. 1 and 2, and other portions of the property. Mr. Ballard says: "I have arranged my programme, and it will be a matter of moderate cost to increase our strength to 300 or 400 tons a week." He wishes to treat 300 to 400 tons a week, instead of a paltry 100 tons, as put broadly, and which I am afraid, from my practical knowledge, we may more safely take at about 60 to 70 tons a week. However, that is easily supplemented. We have all looked upon it that this little plant now used is simply to treat and deal with the ore which we have before us at the quarry. If that ore contains, as we have every reason to believe it does, richer deposits in conjunction with the poorer ones, so much the better, but our calculations in regard to it are based upon the 4½ dwts. However, we have found in the tunnels ore which will assay 1 oz. 16 dwts. 8 grs. of gold, and the 26 assays on which Mr. Ballard has based his calculation show 4½ dwts. of gold and 4 dwts. 12 grs. of silver. With regard to

CLASSON'S SHAFT,

that is the lowest point on which we are working. It is below Nos. 1 and 2 tunnels, and the connection has been made. Mr. Ballard says from here rich assays were obtained (writing in February), and that richer ores, he believes, will be found in working this part of the mine. He says: "Everything tends to lead me to the hope that below the water level richer stone will be found in various portions of levels." Then Mr. Ballard, in order to show the interest he takes in our property, and of course that cannot be measured from receipt of 100*l.* a year—what does he say with regard to the mill? He says: "As soon as I start the mill I shall spend most of my time at the mines, and camp upon the ground until I have made it a success." Those are the words of a man of professional experience, who has held a Government appointment. He is living with the hope of getting something more out of the mine than 100*l.* a year. I have always been ready at any time, by personal interview or correspondence, to meet shareholders and explain matters touching the mine. The reports as received have been published. A poor company (we have been poor from the beginning) with 1,200 shareholders cannot print each report, for the cost would be about 10*l.*, but we have done the next best thing—we have sent them to the mining and other papers, though, naturally, we have to limit their length, as the papers cannot and will not publish long reports. The reports themselves have, however, been at the office, and the chairman and I have also been there ready to give any explanation, and we shall continue to offer you these services. The most serious portion of to-day's business falls upon the meeting that follows this, and, therefore, I will conclude by simply seconding the motion.

A DESPONDING SHAREHOLDER.

Genl. GORDON: The shareholders should consider whether it is worth while going on with this property. We had an affidavit in April, 1887, sworn to by Mr. Claud Vautin, that the mine was not worth a 50*l.* note, but afterwards we had a more favourable report from him, but I would rather accept that gentleman's affidavit than his later report. The manager quotes the experience of Port Phillip—a mine which did pay formerly, but does not pay now. Poor ores will not pay under any circumstances. (No, no.) We find the ore assays 4½ dwts., and every engineer knows you cannot get more than 3½ dwts., and that if it costs 12s. a ton you will not have more than 1s. 6d. over.

Mr. JENKINS: Our calculations show considerably more.

Genl. GORDON: If we have this large capital we shall be liable to charges under the Stamp Act, and I question whether 3s. will be sufficient. I do not think it is any use going on with the mine. (Cries of "Yes.")

Mr. L. S. LONG: The cost of the property is 130,000*l.*, and I see we paid away only a portion of that and the balance of 67,000*l.* was left. How was that spent?

Mr. JENKINS: The cost of the property was the issue of the shares, which had been issued to the shareholders.

Mr. LONG: I understand. Did you say anything over 3 dwts. would pay?

Mr. JENKINS: Mr. Ballard says so.

Mr. LONG: How many stamps have we going?

MACHINIC RESOURCES.

The CHAIRMAN: We have Denny and Watson's pulverisers and pans, which are calculated to deal with 100 tons a week.

A SHAREHOLDER: Are the works stopped now?

The CHAIRMAN: Certainly not; they are in steady progress. (Cheers.)

VIEWS OF A PRACTICAL MAN.

Mr. PETER WATSON: This concern has come to a sad end for the second time. What the third time will produce no one can tell, but I am of opinion that the shareholders must not be altogether downhearted with regard to the past. I have watched this company's career with care, and have seen a great deal in connection with gold mining and mining generally abroad. I think with practical management and with a little fresh blood in the direction a better state of affairs can be produced. The chairman foreshadowed that he would be happy and willing to meet the suggestions of the shareholders, and I think if one or two more practical men were introduced to the board it would be well. It would be far more advisable to make these shares into 4s. each, credited with 1s. as paid, instead of 1*l.* shares 3s. paid, and credited with 17s. It will save a considerable amount in the stamp duty if you do. Other companies have started in that form, and why should not you? That would bring you something like 21,000*l.*, but I think the chairman should tell us how we stand at the present time. The accounts show 2,600*l.* up to the end of last year, which is a long way from the present time. What will be our probable liabilities to the end of June? I have heard about this mine privately, and it does not follow that because you have 2 or 3 dwts. now you are not going to get more, and after all 2 or 3 dwts. show that there is gold.

I THINK THAT THIS PROPERTY OUGHT TO GO ON,

and that the shareholders should rally round the directors. I will be happy to take my proportion, but I do not want any possible liability of 17s. If Messrs. Snell, Son and Greenip are the solicitors (and I see Mr. Greenip is present), and will consider the position, and advise the shareholders upon it, I shall be content; but I very much prefer that these should be 5s. shares, that 1s. should be credited upon them, that 4s. should remain to be called, and that the board should have at their disposal an available balance of 28,000*l.* I think the directors would have acted wisely had they called this meeting three or four months ago, but I know they delayed it because they were hoping to have good news to tell us.

Mr. W. BUTTLE: We seem to be drifting into matters which will come before the extraordinary meeting. I quite agree with what Mr. Peter Watson has said, for I can see no object in having a large nominal capital. Personally I have

NO FAULT TO FIND WITH THE DIRECTORS,

but there cannot be much to do except at mail times. (Laughter.) I think the expense might be reduced, and even limited, to 600*l.* a year. I must do the directors the justice of saying that they have done their best, that they have given the shareholders every information, and I have no fault to find with them. (Cheers.)

The CHAIRMAN: With reference to Genl. Gordon's remarks that we have heard the property was not worth a 50*l.* note, we have the opinion of Mr. Wesley Hall, of Mount Morgan Mine, of Mr. Norman Taylor, and Mr. C. C. Rawlings—men who are not officially associated with the property in any way, and their opinion, undoubtedly, justifies us in proceeding.

MOUNT MORGAN LODE.

They all testify to one thing—that the lode of Mount Morgan proper runs from the north-west to the south-east right through this property. As regards the board, my colleague, Mr. Jenkins, stated to you the result of 20 or 30 different assays, but he might have said we know that there is plenty of ore standing in No. 1 level that will give from 5 ozs. to 6 ozs. to the ton. He wisely eliminated that, and simply took the result of a great number of assays which were taken to satisfy Mr. Ballard in respect to the existing machinery. I do not think it fair that you should draw the inference that the richest ore will only represent 4½ dwts. Our representative says that 3 dwts. will pay. Estimating the dwt. as worth 4s. (and Gen. Gordon will know it is worth 4s. 3d.) we still have a considerable margin, as you will see by the various reports. I do not think it a fair inference to draw that there is no ore in the property which will pay for working, considering what we have done. (Cheers.) The opinions given of the property by men recognised as experts are considerably at variance with those of Genl. Gordon. They think far better of it. (Cheers.) As regards the suggestion made by Mr. Peter Watson with reference to the shares being 5s. each, that was a matter entirely in the hands of the shareholders. As to the liabilities to the end of June, we intended to represent these at the meeting which is to succeed this, but I would reply to that question now.

NO LIABILITIES.

Up to the end of June all our liabilities are met, with this exception that the directors have not drawn their fees. We have between 500*l.* and 600*l.*, which we shall remit to the mine. There are no accounts that we know of unpaid, and no obligations we are aware of that have to be met.

Mr. PETER WATSON: That is very satisfactory.

The CHAIRMAN: Mr. Watson understands better than most men in this room that it is utterly impossible for any man, or any number of men, to say to 100*l.* or 500*l.*, what will be required to develope a mine to the paying point. If you are driving a level or sinking a shaft you

can estimate the amount to 2s. 6d., but when you are developing or exploring a mine it is impossible to say what will be necessary for the purpose of bringing it to a paying point. We called a meeting of the debenture-holders to discuss the terms with us, and those present said they would be prepared to take two 1*l.* shares in the re-construction company for every 1*l.* of interest and principal due. All the debentures-holders were invited, but not many came.

Mr. JENKINS: I should like to read to you Mr. Ballard's report received on February 11th—"The rich assays from tunnel No. 1 are as follows:—4 ozs. 0 dwts. 11 grs. gold; 1 oz. 0 dwts. 3 grs. silver, from the hard mundie stone; 3 ozs. 15 dwts. 3 grs. gold, 2 ozs. 11 dwts. 11 grs. silver, also from the mundic stone; 1 oz. 18 dwts. 14 grs. silver from the hard stone, and 1 oz. 1 dwt. 5 grs. silver. The low class ore will yield a profit to enable us to provide machinery to deal with the high class ore." These statements are based upon actual developments. (Hear, hear.) The points from which they were obtained are indicated upon the maps in our possession. (Cheers.)

A SHAREHOLDER: What quantity of rich ore is in sight?

The CHAIRMAN: It is impossible to say. We have sent large parcels of it in various directions for trial.

A SHAREHOLDER: Will it not be better to have a little sent here?

RESULTS *v.* ASSAYS.

The CHAIRMAN: I think it would be better to wait for results. I place very little confidence in assays. What the board most desire is to place before you the results of milling and mining. (Cheers.) We have not been able to do it so far, but are now on the eve of being able to apply that test to the property; in fact we expected to have a report telling you the first results of the milling, but something has occurred to delay it. Only actual results will give confidence to your board who, as soon as they fail to have confidenee in the property or its management will tell you. Carrying out the suggestion made by Mr. Watson, I am in a positiou to say that we will be only too delighted to receive any persons on the board nominated by the general wish of the shareholders or debenture-holders. We have invited several persons to join us, but thought it would be better to leave it to the shareholders to determine the question. It is owing to the liberal subscription of the debenture-holders that the company was saved last July.

The report was then unanimously adopted.

DIRECTORS AND AUDITORS RE-ELECTED.

The CHAIRMAN moved the re-election of the retiring directors, Mr. Jenkins and Mr. Wightman. I would say on behalf of my colleague, Mr. Jenkins, and I have had an experience of directors for 18 or 20 years, I know of no man more capable of discharging the duties of a director than he, or one who does so more loyally and faithfully. If you dissociate him from the management of the company you will act very imprudently. As regards Mr. Wightman, he is one of the largest shareholders, and also the largest debenture-holder in the company. He seldom misses a board meeting, but he tells me that if it be your wish he is perfectly prepared to make way for some other nominee of yours.

JUSTICE TO DIRECTORS.

Mr. GOTTO seconded the motion, and said: I think the directors have done the company good service. They have had very unpleasant duties to perform, and I do not thiuk we should be wise to increase their number. I think the company could not be in better hands than in those who have the management to-day. (Cheers.)

The resolution was carried unanimously.

Mr. JENKINS, in returning thanks, said: My desire is to give you the best of my euergies, for I am bound up iu the success of this company, for reputation's sake and for purse's sake. It will be for the extraordinary general meeting to deal with the question of directors in the new company.

Mr. WIGHTMAN also returned thanks, and said the directors might depend upon it that he would do his duty.

On the motion of Mr. BARNETT, the auditors, Messrs. Kemp, Forde and Co., were re-elected at a remuneration of 25 guineas.

EXTRAORDINARY MEETING.

The SECRETARY here read the notice convening the special meeting as follows:—"Au extraordinary general meeting of the above company will be held to consider and, if thought fit, pass resolutions to the effect of the subjoined proposed resolutions (with such modifications or amendments, if any, as may be adopted by the said meeting), and if the said resolutions are passed by the requisite majority the same will be submitted to a subsequent extraordinary general meeting for confirmation as special resolutions, at which meeting liquidators of the company will also be appointed."

RESOLUTIONS.

1. "That the Mount Morgan Extended Gold Mining Company, Limited, be wound up voluntarily under the provisious of the Companies Aets, 1862 to 1867." 2. "That pursuant to sec. 161 of the Companies Act, 1862, the liquidators be and they are hereby authorised to sell and transfer (subject to due provision being made for disseutient shareholders, if any) all the property and assets of the company to a new company, upon the terms of the scheme of re-construction now submitted to the meeting and identified by the signature of the chairman, and to enter into all necessary agreements for that purpose." The scheme of re-construction followed.

The CHAIRMAN, in moving the first resolution, said: All the details which have led up to this point have been fully explaiued already, so that I will simply move the resolution.

Mr. JENKINS seconded the motion, which was carried unanimously.

The CHAIRMAN proposed the second resolution, which Mr. JENKINS secouded.

Mr. GOTTO: What is the due provision made for dissentieuts?

Mr. GREENIP: The Act of 1862, which contemplated the trausfer of property from one company to another, and the passing of special resolutions to do it, provided that any shareholder who dissented from the scheme, and desired that his interest might be protected in some other manner, should have the right of giving the company notice within seveu days that he dissented, and required either that the directors should abstain from carrying out the scheme or make provision for the purchase of his interest. If the whole of the assets of this company are transferred to the new company the only way by which this interest can be purchased is through the new compauy, and therefore that protection is provided in this scheme. What the value of the interest of dissentient shareholders would be if further capital were not provided is a matter which each persou can estimate for himself. (Laughter.)

A CHANGE IN THE SCHEME.

Mr. PETER WATSON again urged his view that the shares should be 5s. each, that 1s. should be credited upon them as paid, and that there should be a liability of 4s. This would provide 28,000*l.*, and would go a long way towards proving the value of the mine. It would be much better for the debenture-holders to aecept 5s., because they would then get the benefit of the larger dividends paid upon the smaller capital. He moved, "That these shares be issued at 5s. shares, with 1s. credited, which would leave a liability of 4s. Let the debenture-holders take two shares of 5s. each.

Genl. GORDON seconded the resolution.

In reply to a question, Mr. GREENIP said that they need not fear a heavy expenditure under the new Stamp Act. They would not have to pay anything upon the machinery or upon the mine, and what was left would not cause much expense.

Mr. BARNETT thought that the debenture-holders were not being dealt with with sufficient liberality. That was the only objection he could see to Mr. Watson's plan.

The CHAIRMAN, in reply to a question, said the debenture debt was 8,000*l.*

A SUGGESTION AS TO THE DEBENTURE-HOLDERS.

Mr. GREENIP thought the debenture-holders should receive four shares of 5s. each in lieu of every 1*l.* of principal and interest due to them. All the interest had been paid to date, but a certain charge under this head was accruing.

Mr. JOHNSTON said he would dissent from Mr. Watson's scheme unless the debenture-holders were dealt with as Mr. Greenip suggested.

Mr. GREENIP pointed out the alterations which Mr. Watson's resolution would uecessitate, the chief amongst them being that the capital would be about 45,000*l.* instead of 160,000*l.*

Mr. WATSON hoped the directors would give the colonial shareholders time to fall in with the scheme.

Mr. GREENIP said this was provided for in clause 4.

Mr. LONG complained that the colonial shareholders had been kept badly informed of what was going on at the mine.

The CHAIRMAN said that everything was made known to them, and when the company was in difficulties, and they were appealed to, they would not come forward.

EASY INSTALMENTS.

A SHAREHOLDER asked how the money was proposed to be called up. He thought that the raising of the liability from 3s. to 4s. would act prejudicially to the company.

Mr. PETER WATSON: The extra 1s. a share is 7,000*l.*, divided amongst 1,200 shareholders. I think it much better to let the amouut stand, rather than run the risk of losing a fine property for 1s. a share.

I INTEND TO TAKE MY SHARES, AND MORE, IF I CAN GET THEM.

I believe there will be very few dissentients. I have heard something about this property very much to its advantage. There is a strong feeling in the colony that

SOMEBODY WANTS TO GET THIS PROPERTY

into their own hands, aud I have known such things done in my time. I have heard something very significant about this mine. I am a young-looking man, but I have been at this little game for 44 years. (Laughter.)

Mr. GREENIP replied to Mr. Long's question that in the original scheme the calling up of the 3s. per share was spread over 18 mouths.

The resolution was carried.

The meeting closed with a cordial vote of thanks to Mr. Henry Wilson for his able and courteous conduct of the business.

EAST POOL.

DIVIDEND OF 5s. PER SHARE.

A MEETING of shareholders in East Pool Mine was held at the Account House on Monday.—Mr. J. R. Branwell presided.

A profit was showu on the 12 weeks' working of 1,607*l.* The costs amounted to 11,219*l.*; including labour, &c., 6,930*l.*; merchants' bills (February, March, and April), 3,369*l.*; dues, 847*l.*; and rents, 70*l.* The tin sold (247 tons) is credited at 12,004*l.*; arsenic, 712*l.*; discounts, 69*l.*; and carriage, &c., 39*l.* The tin is credited at various prices, ranging from 50*l.* March 27th to 52*l.* 2s. 6d. on the 5th June. All tin has been sold by ticket. The profit this time is 1,607*l.*, as against 3,229*l.* at the previous meeting. It is thought the ores raised this time have been chiefly from the south part of the mine, the north part being chiefly under water, owing to the breakage of the engine at Wheal Agar. In March last 266 tons of tin were sold, realising 13,497*l.* and at an average price of 50*l.* 12s. 6d. Labour costs then amounted to 6,828*l.*; merchants' bills, 2,155*l.*; cash at bank, 3,739*l.*; bills not in maturity, 5,251*l.* Everyone then regretted that so small a dividend as 10s. was declared, and Mr. Woolcock expressed the hope that that would be the smallest dividend declared at East Pool, but Mr. Woolcock has had to be contented with a smaller dividend this time.

The CHAIRMAN, in proposing the adoption of the accounts, said they would have observed that the quantity of tin sold was less than at the last account by 18 tons, aud the average price realised was 2*l.* 3s. 6d. less than on that occasion. Of course, they had somewhat increased their sales of arsenic, but upon the whole the decrease was very considerable, the profit on that day being ouly 1,607*l.* 13s. 6d. The dividend they proposed to make that day was 5s. per share, aud uuder the circumstances—he would say emphatically under the circumstances—he hoped they would consider it satisfactory. If they did uot consider it satisfactory they must simply hope they would get a better one next time.

A REMINISCENCE AND A REGRET.

Mr. WOOLCOCK said for a very long time he had had the honour of

seconding the dividend that had been paid in that mine, but if he said he did so on that occasion with the pleasure he usually did, he would be telling them what was not uppermost in his mind. He, however, begged to second the proposition. When they looked back upon that mine during the past 10 years they could only regret that they were in such an unfortunate position as they were that day. He found that since October, 1879, the mine had paid an average dividend of 22s. per share. In October, 1879, it paid a dividend of 9s., hence that was the smallest dividend that had been divided amongst East Pool adventurers for the last 10 years. He did most sincerely hope the returns of the mine would enable the executive to give a better dividend next time.

The accounts were passed, and the dividend was agreed to.

Capt. Bishop then read the agents' report.

The routine business was transacted, and the meeting closed.

THE PORT DARWIN GOLD MINING CO., LIMITED.

We are informed by the secretary of this company that letters have just been received, *viâ* Hong Kong, from Mr. Welstead, written immediately after his arrival at Palmerston, from which it appears that he has lost no time in carrying out the instructions of the board. On the day of his arrival he called upon the Hon. J. L. Parsons, the Government Resident, and presented a letter of introduction with which he had been furnished by Sir Arthur Blyth. He was cordially received, and the Government Resident informed him he thought a proper course had been taken in sending out a director, as the affairs of the company required investigation, and he should be happy to render any assistance in his power, consistent with his official position. Mr. Welstead then endeavoured to communicate with the company's manager, and arranged to accompany him to the mine the following morning. On the next morning, when the manager failed to keep his appointment, at the Government Resident's request, Mr. Welstead joined the official party proceeding to the Howley district, for the purpose of inaugurating the machinery at the Mount Shoobridge Tin Mine, and thus had an opportunity of becoming acquainted with the officials and others connected with and responsible for the management and control of the mining interests of the colony. From Howley Railway Station he rode over to the company's mine, and found only the accountant in charge. As there was water in the shafts he was unable to go down. There was no appearance of anything having been done for some time on the property, and he learned that Mr. Salter had only been on the property once in 1888, and five days during the present year. Under these circumstances there was nothing for it but to return to Palmerston to see Mr. Salter with a view to obtaining an explanation of his conduct. The details of the investigation and explanation are too long for insertion, but it is sufficient to say that there appears no doubt that Mr. Salter has grossly betrayed the trust reposed in him by the board. Having obtained, with some difficulty, the necessary books and papers which had been in Mr. Salter's control, Mr. Welstead, under his authority from the board, immediately dismissed him from the company's service, and himself took charge of the property. From the above statement it will not be surprising to learn that the affairs of the company were in some confusion, but Mr. Welstead appears to have acted with great discretion and considerable energy in this exceptional position. He has again visited the mines, and states that he can get the water out and proceed to crushing at a very moderate expenditure, which amount has been duly remitted to him by cable." In the meantime, he adds, "I am arranging for public crushing where quartz can be carted to the battery, in order to keep the mill going until I can put through quartz from the shaft." The letters are dated from Palmerston, but immediately after the departure of the mail Mr. Welstead was returning to the Howley, whence, no doubt, his next advices will be despatched, but he states that there will be no other mail for nearly a month, and entirely confirms the statement already made as to the extreme irregularity of the mails from the territory. Among other matters which have engaged Mr. Welstead's attention has been that of a road from the railway at Howley to the company's property. He took part in a deputation consisting of mine owners, managers, and others to the Government Resident on the subject. The matter was very fully discussed, and the Government Resident said he was perfectly satisfied as to the importance of the road, and would make the strongest representations to the Government at Adelaide so that the works might be put in hand without delay.

NEW EMMA SILVER MINING CO., 1886, LIMITED.

GOOD NEWS—A FAIR START.

The following cablegram has been received from Salt Lake City :—"24 tons first-class ore sold during the week ; 25 tons concentrates sold during the week ; realising net $2,548 ; 10 tons concentrates produced during the week. Mill working satisfactorily.—(Signed) Wallace."

We learn from Mr. Sebastian B. Schlesinger, the European agent of the Philadelphia and Reading Railway Co., that the actual loss to the company caused by the Johnstown disaster, exclusive of the loss of business, will be within $250.000.

Holloway's Pills.—Weak Stomach.—The wisest cannot enumerate one quarter of the distressing symptoms arising from imperfect or disordered digestion, all of which can be relieved by these admirable Pills. They remove cankery taste from the mouth, flatulency and constipation. Holloway's Pills rouse the stomach, liver, and every other organ, thereby bringing digestion to that healthy tone which fully enables it to convert all we eat and drink to the nourishment of our bodies. Hence these Pills are the surest strengtheners and the safest restoratives in nervousness, wasting, and chronic debility. Holloway's Pills are infallible remedies for impaired appetite, eructations, and a multitude of other disagreeable symptoms which render the lives of thousands miserable indeed. These Pills are approved by all classes.

ABRIDGED PROSPECTUS.

THIS Company has been formed for the purpose of acquiring and further developing the valuable and successful business now being carried on under the name of the Indianapolis Cabinet Company, whose extensive desk and cabinet manufactory is situated at Indianapolis, the capital of Indiana, in the United States of America.

These desks are specially suitable for service in tropical climates, owing to the greatly improved method of their construction; one most important point being that elastic metal is used for the revolving curtain instead of cloth and glue, which quickly wears out in hot climates. These improvements are protected by 19 patents, most of them recently secured, the whole of which are acquired by the present Company.

In addition to the above-named patents, applications have been filed at the Patent Office for three new designs of exceptional value. The value of the patents, which have practically secured a monopoly to the vendors, cannot be better demonstrated than by the fact that at no time during the past three years have the vendors been able to execute all orders submitted to them.

Having regard to the dimensions of the business, the capital employed has been limited, and the profits have, to a great extent, been appropriated to the purchase of plant, and in otherwise providing for an increased capacity of production; but, in order to cope with the growing demand for their specialities, it has been decided by the vendors to convert the undertaking into the present joint-stock enterprise, the successful development of which can hardly fail to be greatly increased with the command of additional capital.

The progressively remunerative character of the business during the last three years is shown by the following statement of net profits, viz.:—

Profits for the year	1886...	...	$25,773.86	say	£5,314 4 0
,, ,,	1887...	...	$41,682.09	,,	£8,594 4 10
,, ,,	1888...	...	$42,707.87	,,	£8,805 15 0

These figures indicate an increase of over 65 per cent. in the profits made within the last two years, and over 300 per cent. increase in the year 1888 as compared with the average made in 1884 and 1885. The estimated profit for the year 1889 is £10,774, capable of being augmented to £11,854 by purchase of supplies for cash instead of upon credit. It is also calculated that, with an adequate working capital, a further profit of about £6,000 can be derived from the panel and veneering departments alone, bringing the actual and estimated profits up to a total of £17,854 for the year.

On the basis of the results for 1888, as certified, the profits would, after providing the 6 per cent. interest on debentures, and the dividend on the amount proposed to be called up on the preference shares, leave a surplus of over 10 per cent. per annum on the amount intended to be called up on the ordinary shares of the Company; but assuming the increased profits to be as estimated—viz., £17,854—over 40 per cent. would be available for the ordinary shares.

It will be seen that the interest on debentures and the dividend on preference shares are amply secured by the profits actually being made, thus offering a most desirable investment to those to whom security is of first importance; whilst the balance of the present profits show a substantial dividend on the ordinary shares, with every prospect of its being largely increased in the future.

For contracts see full prospectus.

The statements in reference to the property and business to be acquired by the Company, and the other statements in the prospectus, have been based upon detailed reports and valuations, most of them certified, furnished by officers of the vendor company and other prominent public officials.

Irrespective, however, of the numerous official and private confirmations, a special agent was sent out to Indianapolis with instructions to make the strictest inquiry into the position and prospects of the undertaking. From this gentleman the following "cable" has been received:—

"Having inspected the manufactory and working of the business of the Indianapolis Cabinet Company, I am of opinion that the statements contained in the prospectus as to the past success and prospects of increase of business may be thoroughly relied upon, and I think most highly of the undertaking. I consider the patents most valuable. The buildings, plant, and machinery are very extensive, and in a state of perfect efficiency."

The auditors of the Company, Messrs. Jno. F. Lovering and Co., London, and Messrs. Barrow, Wade, Guthrie, and Co., New York, London, and Manchester, were requested to examine the accounts at Indianapolis; and the solicitor of the Company in America, the Hon. Addison C. Harris, was directed to investigate the title to the property. Their respective reports are set forth in full in the prospectus.

In view of the concurrent testimony afforded by the various reports and valuations, the directors have great confidence in recommending this enterprise as a proved and profitable investment.

The directors are glad to be able to state that Mr. Francis A. Coffin, under whose management the business has been so successfully conducted in the past, has consented to remain with the Company as general manager of the works, on terms of remuneration which will depend to a great extent on the profits distributed amongst the shareholders.

Applications for shares or debentures should be made on the forms accompanying the prospectus, and forwarded to one of the Company's bankers, accompanied by a remittance for the amount of the deposit; or by letter addressed to the secretary, enclosing deposit of 10s. per share, or £10 per cent. in the case of debentures.

Prospectuses and forms of application can be obtained at the offices of the Company, of the Company's bankers, brokers, solicitors, and auditors.

GOLD MINING EXHIBITION.

ALEXANDRA PALACE, LONDON.

General Manager - - S. LEE BAPTY, F.R.G.S.

JULY 15th to AUGUST 17th, 1889.

Patrons.

THE RIGHT HON. SIR HERCULES ROBINSON, G.C.M.G.,
Governor of Cape Colony and Lord High Commissioner of South Africa.

Sir ARTHUR BLYTH, K.C.M.G., C.B.,
Agent-General for South Australia.

Sir CHARLES MILLS, K.C.M.G., C.B.,
Agent-General for Cape Colony.

Sir GRAHAM BERRY, K.C.M.G.,
Agent-General for Victoria.

THOMAS ARCHER, Esq., C.M.G.,
Agent-General for Queensland.

Sir F. DILLON BELL, K.C.M.G., C.B.,
Agent-General for New Zealand.

Sir SAUL SAMUEL, K.C.M.G., C.B.,
Agent-General for New South Wales.

Sir W. BULLER, K.C.M.G., F.R.S.

E. N. C. BRADDON, Esq.,
Agent-General for Tasmania.

AN EXHIBITION of the various APPLIANCES connected with the EXCAVATION, and subsequent TREATMENT, of GOLD ORE will be held at the Alexandra Palace, extending for ONE MONTH certain, but probably to a later date.

POWER WILL BE SUPPLIED GRATIS.

SPACE CHARGED AT NOMINAL RATES.

ENTRIES NOW CLOSING.

Applications for Advertisement in Catalogue, to be forwarded, at once, to Secretary,

G. LEIGHTON HARE.

GLOBE MILL COMPANY.

OFFICE AND SHOWROOMS:—

BLOMFIELD HOUSE, NEW BROAD STREET, LONDON, E.C.

A "GLOBE" MILL with eight wearing parts will turn out the same quantity of material as a 40-Stamp, 600-lb. Battery, which in stamps and dies alone has 80 wearing parts; the guide bearings, tappets, and tappet shaft bearings numbering a further 160.

WET or DRY MILLS in constant operation at their Reduction Works, Bermondsey Wall, S.E.

NOW USED BY H.B.M. GOVERNMENT AT WOOLWICH ARSENAL.

By permission of Captain Josiah Thomas, the Mill can be seen at work on tin stuff at the Dolcoath Mine, Camborne.

NOTICE.

Where sets of three, or more, Mills are supplied the Globe Mill Company undertake, if required, all renewals at a fixed rate.

First Award and Silver Medal by the Mining Institute of Cornwall, 1888, after the Mill had been running on tin stuff on the Dolcoath Mine. Received the only Award given for Grinding Machinery at the Royal Agricultural Societies' International Exhibition.

The Globe Mills are guaranteed to yield a greater product of material of equal fineness in a given time, with less first cost, less power, less space, less foundations, less labour, less slime, less water in wet grinding, and less cost for repairs than stamps, or any other system of pulverisation whatever.

TELEGRAPHIC ADDRESS—

QUINLAND—LONDON.

THE MINING MARKET.

CITY, FRIDAY EVENING.

FEATURES OF THE WEEK—DULNESS OF THE MARKET—A TRYING PERIOD FOR SHAREHOLDERS—ABSENCE OF NEW ISSUES.

THE position of the Mining Market has this week been what Mr. Muddle would call "precarious, and not at all permanent." A thunderclap saluted it when the Yuruari circular came out announcing an issue of a million shares of 2s. 6d. each, or the raising of capital to the amount of 125,000*l*. Yuruaris at once dropped, and were offered in all directions. It should not be forgotten that the object which calls for this special issue of capital is perfectly legitimate—in fact, it is a simple replacement of capital. The debentures have been a weight upon the company for years and the interest charges have been exceedingly heavy. It is unpleasant to have to water the capital by an issue of 1,000,000 shares, but it is even more disagreeable to have the whole of the property put in jeopardy by a charge of this character hanging over it. The meeting is called for Monday, when the subject will no doubt be fully discussed. In our leader columns we refer at some length to this matter, and can only ask our readers to consider what we say. A small call of 6d. per share has been made on Colons for the very practical purpose of providing the manager with the requisites necessary to work this most promising property.

Another feature of the week has been the very successful meeting held by the Palmarejo Company, which more than confirmed the hopeful news we have given about it for the last few weeks. It is evident, in connection with Balaghat-Mysore affairs, that there must be a change in the board. Great She has finished with its adjourned meetings, and the business has been completed, though without a strengthening of the board the shareholders are not likely to have much faith in its future. The meeting of the Colar Central Company held to-day is fully referred to in our leader columns, and it need only be said here that the acquisition of the Eastern Mysore property was unanimously agreed to by the shareholders.

The general tone of business has been that of dulness, and, if anything, prices are weaker than when we last wrote. There is, however, the feeling inside as well as outside the Stock Exchange, that a better time for mining descriptions is coming, though the present depression is extremely trying to holders who bought shares upon what appeared to be the best prospects of being able to get rid of them at a profit.

There is practically a dearth of new companies. It is generally considered that the capital of the Champion Reef Company has been secured.

AFRICANS.

The market for these shares would be really without change except for the downward move, as the principal changes will prove. A fall has taken place in Edwin Bray of $\frac{1}{16}$; Pigg's Peak, $\frac{1}{16}$; Horo Exploration, $\frac{1}{8}$; Moodies, 10s. paid, $\frac{1}{16}$; Ditto, fully paid, $\frac{1}{8}$; Central Langlaagte, $\frac{1}{4}$; Cornucopia, $\frac{1}{8}$; De Villiers, $\frac{1}{8}$; Ferreiras, $1\frac{1}{4}$; Geldenhuis, $\frac{1}{8}$; Goldfields of South Africa, $\frac{1}{16}$; Henry Nourse, $\frac{1}{8}$; Langlaagtes, Block B, $\frac{1}{16}$; Mays, $\frac{1}{16}$; Moss Rose, $\frac{1}{4}$; Nabobs, $\frac{1}{8}$; Van Ryn, $\frac{1}{16}$: and Western Langlaagtes, $\frac{1}{16}$. The following have risen: City and Suburban, $\frac{1}{4}$; Jumpers, $\frac{5}{8}$; Kleinfontein, $\frac{1}{8}$; Knights, $\frac{1}{16}$; Langlaagtes $\frac{1}{16}$; Randfontein, $\frac{1}{8}$; Salisbury, $\frac{1}{4}$; Simmer and Jack, $\frac{1}{4}$; Spes Bona, $\frac{3}{16}$; Stanhope, $\frac{1}{4}$; Vogelstruis, $\frac{3}{8}$; Wemmers, $\frac{5}{8}$; and Wolhuters, $\frac{1}{2}$.

Wolhuters	3⅜	—	3⅝

Diamonds.

There has been little or no business doing in Diamond shares with the exception of De Beers, which have had a rise on the week of 5/16. London and South African also show a rise on the dividend of 3s. 6d. per share; these shares we fully expect to see at a better price. The following show a fall :—Anglo-African, ⅛; Bultfontein, ⅛; and New Jagersfontein, ⅛; whilst a rise has taken place in De Beers of 5/16; South African, 6d.; London and South African, ⅝; and Burmah Ruby Mines, 3/16.

Anglo African	4⅝	—	4⅞
Bultfontein, New Shares	3⅜	—	3½
Central Dorsfontein	8	—	10
De Beers Consolidated	15 15/16	—	16 1/16

London and South African Exploration ...	17¼	—	17½
Read's Drift Land Co.	2½	—	2⅝
Burma Ruby Mines	1⅛	—	1¼ pm

Copper.

There has been very little business doing in the Copper market during the past week, as the following alterations will show :—A fall of ⅛ is registered in Copiapo, Libiola, Mason and Barry, and Panulcillo. The only rise of note has been in Cape Copper of ⅛.

Indian.

The Indian share market shows a fall on the week, although prices have been higher than they close this evening—the chief feature being in Mysore Gold, which close 1/16 weaker than when last quoted. A fall has taken place in Balaghat (17s. 6d. paid) of 6d.; Ditto (fully paid), 6d.; Goldfields of Mysore, 1/16; Mysore, 1/16; Ditto Wynaad, 3d.; Nine Reefs, 1/16; Ooregum, ⅛; and South-East Mysore, 1s. No improvement of note.

Australians.

There is really no business in these shares worthy of note, either for the fall or rise, as the few alterations recorded below will show. The following have receded :—Day Dawn and ditto "P.C.," 6d.; Etheridge, 3d.; Gympie Great Eastern, 6d.; and No. 2 Queen, 3d.; whilst others remain as last quoted.

Foreigners.

There has been but very little business in mining shares generally, and quotations have, as a rule, been downwards. The decline has been in Coromandel, St. Augustine, Victory, and Yuruari. The following are below the last quotations :—Balkis of 6d.; Barretts, 3d.; Colon, 3d.; Coromandel, 1s.; Kapanga, 6d.; Linares, ¼; Montana, 1/16; New Emma, 3d.; New Organos, 3d.; Palmarejo, 6d.; St. Augustines, 9d,; Transvaal, 6d.; Victory, 1/16; Viola, 6d.; Viso, 1s.; and Yuruari, 6d. Thd only rise to note has been in Carlisle of 3d.; Colombian Hydraulic, 6d.; Orita, 2s.; and West Argentine, 9d.

The following list shows the principal changes which have taken place :—

	Last Week.			This Week.

LATEST FROM THE MINES.

Indian Mines.

Nine Reefs.—The half-yearly interest warrants in respect of the Mortgage Debentures will be payable at the offices of the company, 38, Lombard Street, on and after the 30th inst.

Colonial Mines.

Gympie Great Eastern.—A cablegram from the mine, dated June 21st, gives the result obtained during the past month, viz. :—"24 days, 600 tons, 1,100 ozs., 3,860*l.* value, 2,850*l.* profit."

Midas.—"Yield for week, 197 ozs. (788*l.*)

Mount Albion Silver.—Telegram from the manager at the mines :—"During the last month has been forwarded 54 tons bullion, 66 tons ore containing 34,000 ozs. silver. We estimate the amount of ore in sight at 500 tons. Important discovery in other parts of the mine, which the directors consider very satisfactory."

Foreign Mines.

Brandley.—The coupons due on 1st proximo, on the debentures of the Brandley Mining Co., will be paid at Messrs. John Brown and Co.'s, 25, Abchurch Lane, E.C.

Elmore.—On and after Monday, the 24th June, the offices of this company will be removed to The Avenue, 11, Blomfield Street, E.C., where all communications and enquiries should be addressed to Mr. C. Harrison Smith, secretary.

Frontino and Bolivia.—Advices for April states: Produce, 1,110 ozs. of gold; value, 2,457*l.* 0s. 5d.; cost, 2,257*l.* 6s. 10d.; estimated excess of returns, 199*l.* 13s. 7d.

Guadalupe (Honduras).—Certificates will be ready to be exchanged for bankers' receipts on and after 27th June.

Josephine.—Cablegram from the superintendent :—"Yield of free gold for fortnight, $2,500; estimated value of sulphurets for fortnight, $950."

New Russell.—The result of last month's crushings (May) amounted to 77 ozs. of gold.

Pinos Altos.—The outrun for the week ending 15th inst. was $10,000.

Home Mines.

Dolcoath.—A dividend of 25s. a share was declared on Monday out of a profit of 5,909*l.* made during 16 weeks. In one part of the mine there is a lode of greater value than was ever before seen even in this famous mine.

Mellanear.—It has been decided to stop work at this mine. At one time it paid very good dividends.

FOR LATEST PRICES

AND ALL PARTICULARS OF FOREIGN AND HOME MINES SEE PAGES 1044 AND 1045.

Metals.

Copper has been steady. Warrants of G.M.B. have sold from 41*l.* 5s. to 41*l.* 10s., and three months at 41*l.* 5s. Closing price, 41*l.* 12s. 6d. cash, and 41*l.* 7s. 6d. three months. Chili bars, 41*l.* 10s. to 41*l.* 15s. cash. The stocks in Liverpool and Swansea have declined about 2,900 tons during the fortnight. Visible supply, 114,569 tons, against 117,420 tons on 1st inst. The Chili charters for the fortnight are given as 400 tons. We quote English tough, 45*l.* 10s. to 47*l.*; best selected, 47*l.* to 48*l.*; strong sheets, 52*l.* 10s. to 53*l.*; Indian sheets, 50*l.* 10s. to 51*l.*; yellow metal sheets, 5d.; ore, regulus, &c., 8s. to 9s. per unit.

TIN has been depressed, Straits selling from 90*l*. 15s. to 89*l*. 5s. cash, closing weaker at 89*l*. 2s. 6d. ; three months about 12s. 6d. to 15s. over cash : and Australian, par to 2s. 6d. premium. The Dutch market has been quiet ; Banca quoted yesterday, 54½fl., and Billiton, 54½*l*. English ingots, 94*l*. to 93*l*. 10s.

TIN PLATES dull, and ordinary coke quoted 13s. Liverpool.

SPELTER steady, and quoted about 18*l*. for ordinary brands ex ship here ; Birmingham, 18*l*. 10s. to 18*l*. 12s. 6d.

LEAD dull. Soft Spanish, 12*l*. 10s. sellers ; 12*l*. 7s. 6d. buyers. English, 12*l*. 15s. ; L. B. China Pigs, 13*l*.

QUICKSILVER has advanced to 9*l*. 5s. at Rothschilds ; seconds, 9*l*. 2s. 6d.

ANTIMONY firm ; 59*l*. to 60*l*.

LONDON METAL EXCHANGE.

4.25.—Closing official report.—Copper G.M. Brands, cash, 41⅝, 2, three months, 41¼, ⅝ ; best selected, 47, 8 ; strong sheets, 53; English tough, 45½, 6½. Tin : Fine foreign, cash, 89, ½ ; three months, 89½, 90 ; Australian, 89, ½ ; English ignots, 95, ½ ; spelter, 18.

At yesterday's Redruth copper ore ticketing 1,149 tons realised 3,520*l*. Standard, 56*l*. 11s. per ton.

GLASGOW PIG IRON MARKET.

3.15.—Business at 42s. 7½d., 42s. 9½d. cash ; 42s. 9½d., 42s. 11½d., one month ; closing buyers, 42s. 9d. cash ; 42s. 11d. one month ; sellers ½d. more. Market firm, small business. Middlesbro' closing buyers 37s. 9d., cash, 38s. one month ; sellers 1½d. more. Hematite done, 48s. 6d., 48s. 8d., cash, 48s. 7½d. 48s. 10½d. one month ; closing buyers, 48s. 8d., 48s. 10d. cash, 48s. 10½d., 49s. 0½d. one month ; sellers, 1d. more.

COMMERCIAL NOTES.

RAILWAYS.

The traffic receipts of the undermentioned railways for the past week show the following changes when compared with those of the corresponding period of last year : — Increases : — Caledonian, 2,563*l*. ; Eastern and Midlands, 59*l*. ; Great Northern, 1,354*l*. ; Great Western, 10,050*l*. ; London and North-Western, 16,911*l*. ; London, Chatham, and Dover, 5,057*l*. ; Manchester and Sheffield, 1,169*l*. ; Metropolitan, 526*l*. ; Midland, 9,981*l*. ; North British, 2,223*l*. ; North-Eastern, 26,525*l*. ; and North Staffordshire, 1,598*l*. Decreases : Hull and Barnsley, 454*l*. ; and London and Sonth-Western, 8,748*l*.

The Brighton Railway traffic return for the week ended June 15th exhibits an increase of 9,487*l*., and the South-Eastern an increase of 5,552*l*.

The approximate gross earnings of the Mexican National Railroad Co. for the second week in June were 66,572 Mexican dollars.

For the week ended June 15th the Grand Trunk Railway of Canada traffic return exhibits an increase of 1,618*l*., and the Chicago and Grand Trunk, 832*l*. ; but the Detroit, Grand Haven, and Milwaukee shows a decrease of 546*l*., making a net increase of 1,904*l*., and of 124,454*l*. for 24 weeks to date. The Mexican National Railroad gross earnings for the second week in June amounted to $66,572. For the week ended June 15th the receipts of the Buenos Ayres and Pacific Railway were $13,000.

The Mexican Central Railway gross earnings for the second week in June were $113,546, against $91,497 in 1888. For the eight days ended Juue 15th the Dutch Rhenish Railway receipts amounted to 11,175*l*., or $2,916 more than last year. The New York, Ontario and Western Railway gross earnings for the second week in June were $35,210, against $31,017 in 1808. For the same period the gross receipts of the Cincinnati, Washington and Baltimore Railway amounted to $36,100, heing $500 less than last year.

TRAMWAYS.

The traffic receipts of the following tramway companies for the past week show the subjoined comparative results :—Increases :— North Metropolitan, 1,020*l*. ; London, 594*l*. ; London Street, 262*l*. ; Provincial, 655*l*. ; Belfast, 283*l*. ; Southampton, 73*l*. ; Burnley, 68*l*. ; Edinburgh, 316*l*. ; Bristol, 734*l*. Woolwich and South-East London, 97*l*. ; Southwark and Deptford, 55*l*. ; West Metropolitan, 26*l*. ; North Staffordshire, 36*l*. ; Stockton and Darlington, 27*l*. ; Imperial, 168*l*. ; Swansea, 331*l*. ; Hamburg and Altona, 311*l*. ; Sunderland, 224*l*. ; Hull, 23*l*. ; Continental Metropolitan, 2,212*l*. ; Calais, 5*l*. ; France, 52*l*. ; Germany, 1,208*l*. ; Gothenburg, 162*l*. ; Bordeaux, 128*l*. ; Calcutta, 165*l*. ; and South London, 199*l*. Thoso of the London Southern exhibit a decrease of 1*l*., and the North London, 87*l*. The London Road-Car Company's receipts for the week ended June 15th amounted to 3,254*l*., against 2,664*l*. last year.

MISCELLANEOUS.

The Tasmanian Main Line Railway Co. notify that the quarterly coupons due July 1st next, upon the Five per Cent. (reduced to Four per Cent.) Perpetual Debenture Bonds will be paid as usual.

The Eastern and South-African Telegraph Co. notify that coupons due July 1st ncxt on their Five per Cent. Mortgage Debentures will be paid on and after that date at the hanking house of Messrs. Barclay, Bevan and Co., Lombard Street, E.C.

For the purpose of preparing interest warrants to June 30th, the transfer books of the West of India Portuguese Guaranteed Railway Co. will be closed from Jnly 1st to 13th inclusive.

The numbers are announced of drawn certificates of the New Oriental Bank Corporation, of Three-and-a-Half per Cent. Debenture Stock, to be paid off on and after 30th June inst.

DIVIDENDS DECLARED AND ANNOUNCED FOR WEEK ENDING JUNE 22ND.

	Carried forward.	
Agricultural Co. of Mauritius ...	1,768*l*.	1s. per share.
Alliance Marine Assurance ...	—	30s. per share.
Alliance Marine Assurance ...	—	bonus, 10s. per share.
Amazon Steam Navigation ...	1,120*l*.	4½ per cent.
Argentine Land and Investment Preference...	—	2½ per cent.
British Linen Co. Bank	—	7 per cent.
Colonial Bank	—	5 per cent.
Debentnre Corporation	—	7 per cent.
Dooars Tea Co.	—	7 per cent.
Estates Agency and Loan Co. of Mauritius	166*l*.	2½ per cent.
Hudson Bay Co.	—	14s. per share.
Henry Clay and Bock and Co. Preference...	—	8 per cent.
Henry Clay and Bock and Co. Ordinary	—	10 per cent.
Jarvis Conklin Mortgage Trust ...	—	$5.
London and Greenwich Railway ...	—	1*l*. 7s. 6d. per cent.
Maritime Insurance	—	10 per ceut.
Metropolitan Association for Improving Dwellings	—	5 per cent.
Pondicheri Railway	199*l*.	5 per cent.
Royal Exchange Assurance ...	—	12 per cent.
South of England Telephone ...	627*l*.	1 per cent.
West African Telegraph	—	5s. per share.

WINDSOR ROYAL SHOW.

MESSRS. ROBEY AND CO.'S EXHIBITS AT STAND NO. 1.

WE notice a "Robey" Mining Engine, fitted with their patent wrought iron tank foundations, large numbers of which, we understand, they have supplied to all parts of the world. They are admirably adapted for export and up country transit. These engines require no foundations beyond their own wrought iron tank foundations, which likewise serve as packing cases for sundry parts of the engine in transit. The only preparation needed for the reception of the engine is an excavation made in the earth of suitable size for receiving the wrought iron fouudations.

If required, these engines are supplied arranged for fixing separate from the locomotive type of boiler.

COMPOUND "ROBEY" UNDERTYPE ENGINE, fitted with patent automatic governor and link expansion gear.—This class of engine is specially suitable for driving electric light installations, mills, factories, and other machinery where perfectly steady running is required.

They are very powerful for the space occupied.

They work with perfect regularity, with very varying loads.

They are extremely economical in fuel, consuming under 2 lbs. of best Welsh coal per indicated horse-power per hour. The working parts are perfectly balanced so as to run safely at high speed.

They have large wearing surfaces of ample size, and run coal with heavy loads. They are well lubricated for long runs.

VERTICAL HIGH-SPEED ENGINE, coupled direct to dynamo.—This plant has been specially designed for working electric light machines on board ship and in mills, &c., and the arrangement is a very advantageous one where space is limited.

HORIZONTAL FIXED ENGINE.—This is fitted with patent automatic governor and link expansion gear, and is suitable for working at 80 to 100 lbs. pressure.

The expansion gear gives a range of admission from zero to ¾ of the stroke and a very perfect distribution of the steam.

HORIZONTAL FIXED ENGINE.—This is fitted with Richardson and Rowland's patent automatic trip expansion gear. As the result of a large experience with the different varieties of expansion gear, this patent trip gear was introdueed, and it has been found the simplest, most effective and most easily worked, and gives the most satisfactory results of any hitherto made.

NEW DESIGN OF VERTICAL ENGINE.—The main bearings, blocks, and piston guides are cast in one piece with the eugine framing, and are tooled by a special machine at one setting, so that all parts are made perfeetly true. All the details are well made and finished, and the lubricating arrangements are well attended to. This engine is fitted with patent automatic governor and link expansion gear.

NEW DESIGN HORIZONTAL ENGINE WITH MEDIUM STROKE, suitable for working at a pressure of 80 to 100 lbs.—This engine is made self-contained on one massive cast iron foundation, on which are cast the main beariugs. The crank shaft is bent out of a solid bar of steel, and is especially strong so as to resist heavy strains without risk of bending.

It can take the fly-wheel on either side, though it is best on the side opposite cyliuder, as by this means the straiu and wear are more equally distributed.

When required, the fly-wheel can be on one side and a driving pully on the other. This class of engine is specially useful where spaee is limited, or where the foundations are not good ; as being self-contained they do not get out of truth with any settlement of foundations. It can also be placed upon an upper floor, and merely requires bolting to the joists.

This engine is also fitted with Robey and Co.'s patent automatic governor and link expansion gear above described.

CENTRIFUGAL PUMP.—One of the advantages of this pump is that the side cover can be removed so that the working parts may be got to without disconnecting the piping.

SUGAR MILL AND HORIZONTAL ENGINE (combiued).—This arrangement has been specially designed for plantations ; the whole is fixed on a strong cast iron foundation plate, by which its erection is mueh facilitated and the foundation plate is made in two parts for the sake of greater ease in transit.

STONE-BREAKER AND ORE-CRUSHER.—This is fitted with a strong frame of rolled steel instead of the usual heavy cast iron frame.

By this arrangement great rigidity is secured, and the machine is well adapted for heavy work.

THE certificates of the Passburg Grain Syndicate, Limited, will be ready for delivery on and after Tuesday next, the 25th inst.

BRITISH MINING INTELLIGENCE.

BERTHA CONSOLS (19th June).—We are driving by the side of the lode in the 53-fm. level east, this being the most speedy way to reach the course of ore gone down below the level above (*i.e.* the 40). In Glasson's rise in back of the 40-fm. level the lode is large, and will produce 10 tons of mundic and copper per fm.; the lode in the stopes therefrom will produce 8 tons of mineral per fm. The lode in Cook's late stopes below the 30 east will produce 10 tons per fm. In the large stope west of junction the lode continues to produce a large quantity of mixed ores. All is working very satisfactorily indeed.—T. GREGORY.

CARPUAN (17th June).—Satisfactory progress is being made in opening out for the adit level on the course of the south lode. Having blasted through a bar of surface granite anticipate now to shortly intersect the lode, and hope to find it of a productive and valuable character.—R. KNOTT.

CWMYSTWYTH (19th June).—Satisfactory progress is made in driving the 30 cross-cut north, considering the nature of the rock. There has been nothing fresh cut since the branch of spar, containing spots of ore, intersected last week. Water continues to flow from the end as before, but the rock being close and compact we do not expect the water in the winze to drain until the lode is tapped. The stope in the back of the 15 east of the cross-cut on the new lode will produce 5 cwt. of lead and 1¾ tons of blende per fm., and the rock, though somewhat eased since our last report, is still stiff for breaking. In the stope in the back of the 15 west on the new lode the rock is better for breaking, and in the western end, where the lode has widened to 8 ft., the stope is all in the lode, which is composed of a soft blue slate and spar, disseminated with lead and blende to the value of 5 cwt. of the former and 2¼ tons of the latter per fm. At this point we have also a pare (2 men) rising for a fresh stope. The two stopes east of the cross-cut on the Comet lode will produce 8 cwt. of lead and 1½ tons of blende in the fm. each. In the stope west of the cross-cut on the same lode the men have been engaged during the past week filling and securing, but are now about to resume stoping again. The stope in the bottom of the 15 west on the Comet lode has become hard, and unless the ground or lode improves it will be stopped, and the men put on better paying ground. The Comet lode in the two stopes in the back of the 30 is 10 ft. wide, and will produce 7 cwt. of lead and 1¾ tons of blende in the cubic fm.—J. B. ROWSE, T. ROWSE.

D'ERESBY.—At the Gors shaft bearers for the cistern are now being fixed, and no time will be lost in getting the new lift at work, when the work will be greatly facilitated. The rise to the north of the shaft at No. 9 is reported to be worth 1½ tons to 2 tons of lead to the fm., and the stopes at Nos. 1 and 2 sumps at 1 ton to 1½ tons to the fm. The surface water has much fallen off, necessitating extra coals for pumping, &c.

DEVON GREAT CONSOLS (20th June).—Wheal Maria, Eastern shaft, Capel Tor lode.—During the past month the Eastern shaft has been sunk 2 fms. 5 ft., making it 7 fms. 3 ft. below the 86-fm. level, the ground proving favourable for exploration, and very congenial strata for mineral. The 86-fm. level west has been driven 1 fm. 4 ft. 6 ins., the lode proving 3 ft. wide, very promising, and yielding saving work of copper and arsenical ores. The 74-fm. level has been driven 2 fms., the lode proving 2½ ft. wide, composed principally of capel, with quartz, peach, and small quantities of copper and mundic ores. Ruder's winze in the bottom of the 74-fm. level west has been sunk 2 fms. 3 ft. This winze is being sunk by the side of the lode, so as to effect a communication with the 86-fm. level as speedily as possible. Wheal Emma, railway shaft, new south: Bray's cross-cut north at the 260-fm. level west, after being extended a distance of 20 fms.. and meeting with nothing considered of sufficient importance to warrant further prosecution, has been suspended. Bray's cross-cut south at the 260-fm. level has been extended 1 fm. 5 ft. 9 ins., making a distance of 4 fms. 4 ft. 7 ins. beyond the south part of the lode before intersected. No other portion of lode having been met with in that direction, and it being probable that no other portion will be met with, it is intended, with your approval, to suspend operations here also. Watson's engine shaft: The 160-fm. level east has been driven 4 ft., the lode (part carrying 4½ ft.) being very promising, and yielding for the greater part of distance 5 tons of copper ore per fm., and the present end is of the same value. The 160-fm. level west has been driven 1 fm. 1 ft.; the lode part carried 4½ ft. wide, and yielding throughout the distance driven 5 tons of copper ore per fm. The 148-fm. level west has been driven 1 fm. 4 ft. 6 ins., the lode proving 4 ft. wide; composed of capel and quartz, with fluor, and yielding from 1 to 2 tons of copper and arsenical ores per fm. The 136-fm. level east has been driven 1 fm. 2 ft. 7 ins., the lode proving 3 ft. wide; composed of capel and quartz, with fluor and small quantities of copper and muudic ores. This drivage is at present suspended. The 136-fm. level west has been driven 1 fm. 5 ft. 6 ins., the lode proving 4½ ft. wide, composed of a large proportion of capel, with quartz, fluor, and small quantities of copper and mundic ores. Lock's cross-cut north at the adit level west has been driveu 2 fms. 2 ft. 6 ins., the ground proving favourable for exploration, and congenial for the production of mineral.—I. RICHARDS.

DEVON UNITED (20th June).—Willesford's shaft: In the 132 east the lode is 3 ft. wide, very promising, and yielding a little good quality copper and arsenical ores. In the 132 west the lode is also 3 ft. wide, composed of capel and quartz, with peach, and small quantities of copper and mundic ores. In the winze in the bottom of the 120 sinking is being continued on the north side of the productive part of the lode. The machinery throughout the mine is in good condition and working well.—I. RICKARDS.

DRAKEWALLS (20th June).—The engine shaft is now down 10 ft. below the 147-fm. level, the lode in which is a little harder, and more mixed with capel: its present value is 20 tons of arsenical mundic per fm. for the length of the shaft, 12 ft. In the stope and rise in the back of the 147 west the lode is of the same value as stated in my last report, viz., 9 tons of mundic per fm. In the 132 west we are now going through a small cross-course which has shifted the lode a little to the north. We hope to see it again to the west thereof in the course of a few days. There is no change to notice in the winze sinking below the 132 west; the lode continues to produce 10 tons of mundic per fm. In the stopes in the back of the 132 west the lode is producing 7 tons of copper and mundic ores per fm. Satisfactory progress is being made in Rule's rise in the back of the 117 west. There is no alteration to notice in the winze sinking below the 90 west, the ground being still favourable for progress. We have commenced cleaning out the arsenic soot from No. 2 chambers of the new calciners. The necessary repairs to the flues of the old calciner are complete, and it is again working all right. We are urging on all the surface work as fast as possible.—H. RODDA.

EAST BLUE HILLS.—There is no change reported this week; the end and stopes are about the same value as when last reported.

GAWTON (18th June).—The lode in the rise in back of the 105 east continues to yield 10 tons of arsenical mundic per fm. The stope in the bottom of the 95 east is yielding 11 tons of arsenical mundic per fm. In the 95 east the lode is showing a strong masterly appearance, yielding 11 tons of sulphur and arsenical mundic per fm. Nos. 1 and 2 stope in back of this level will yield 10 and 11 tons of arsenical mundic per fm. The stope in back of this level, east of rise, will yield 12 tons of mundic per fm. The winze sinking in the bottom of the 82 is showing an improved appearance, and yielding 11 tons of mundic per fm. The stopes east and west of cross-cut at this level will yield 10 and 12 tons of arsenical mundic per fm. The stope in back of the 82 east will yield 9 tons of mundic per fm.—G. ROWE.

GLYNDWR.—The re-timbering of the engine shaft has now been completed to a depth of 42 yds. The cutting of foundations for pumping engine is proceeding rapidly, and is expected to be finished in the course of next week. Immediately the re-timbering of the engine shaft is completed a cross-cut will be put out south to intersect in new ground the lodes of the old Maes-y-Safn, which gave in that mine nearly 400,000*l.* profit. All the necessary preliminary work at surface will now be vigorously carried out, and it is probable that by the end of the autumn regular monthly returns of lead will be forthcoming. The shares are in the hands of first-class holders, and immediately the workings are drained and the lead ground reached they will and ought to command a high price, and will then be eagerly sought after.

GREAT FORTUNE.—The water is now down about 9 fms. Ladders have been fixed, and the shaft cleared and secured to that depth. Ladders have also been put in copper ore shaft, and the main lode will probably fall in with these branches at the 10-fm. level. Sinking for the incline tram on the north sett of Conqueror branches has been commenced, in order to facilitate the working of the tin ground at the 10-fm. level, and also in other directions. The stopes and pitches are improving, now valued in the aggregate of quite 40*l.* per fm.

KINGSIDE (19th June).—Taylor's shaft having reached a depth of 17 ft. below the 33-fm. level, we have stopped the sinking, and commenced to cut ground for bearers, cistern, and stop-plats, &c., prior to fixing new lift of pumps from the 22 to the 33-fms. level. This work is being pushed onward with all speed so as to resume sinking at the earliest date possible. The Pengueilan north lode in 22-fms. level driving east of Taylor's shaft is going forward in a large lode, carrying good strings of lead ore. The Pengueilan south lode in rise over the deep adit west of cross-cut yields saving work. The new lode in Burrell's level east is smaller than of late, but contains good patches of lead ore. There is no change in the cross-cut driving north of Pengueilan shaft at the adit level. The lodes in the stopes over the 11 and deep adit levels will yield from 8 to 9 cwt. of lead ore per fm. All surface operations are being pushed onward regularly.—J. B. ROWSE, W. H. PAULL.

MARKE VALLEY (20th June).—The sinking of Bellingham's engine shaft has been delayed for the past fortnight, and the men employed in fixing a plunger lift at the 80, as we have found such long drawing lifts to be very inconvenient for sinking, we expect this will be completed and most of the present lift taken to surface next week. In the 25-fms. level driving west the lode is 4 ft. wide and favourable for driving, now let at 3*l.* 10s., and worth 5*l.* per fm. The stope below this level has been suspended, and the men put to sink a winze below the 15. Not having reached the junction of the two lodes in the 15 east, it has been thought advisable to put out a short cross-cut to ascertain how far the south one is from the other, this is set at 6*l.* per fm.; the water is still issuing very strongly from the end, and it is expected to be near, although possibly taking a more nearly parallel bearing than when first opened on, this trial is at present being made through the elvan, while granite will undoubtedly be met with south of the lode. In the 15 west we are got into a channel of ground thought to be within the influence of the large cross course passing near our western boundary. In this the lode is disordered, and not at present yielding anything to value; price for driving, 50s. A winze has been commenced in the bottom with the view of ventilating the level below and laying open ground for stoping, and to facilitate this we have thought it advisable to sink by the side, carrying only a small portion of the lode—this is set at 5*l.* per fm. There are three stopes in the back of this level, worth respectively 6*l.* 7. and 9*l.*—one stope below the midway level worth 7*l.*, and two stopes in the back, each worth 6*l.* per fm. The stope below the adit on south part of lode is worth 5*l.* There is one stope below the adit east worth 6*l.*, and one in the back worth 5*l.*—W. GEORGE, F. RENALS.

MID-DEVON.—Report for week ending 15th June:—Surface: The pumping machinery has done good duty at 3½ revolutions per minute, which slowly drains the water in mine. A shaft: At 1 p.m. to-day the water was 53 ft. below the 80. C shaft: The 50 east stope No. 3 worked on by six men, has not changed in the appearance of strata or yield of ore; still equals for width of lode wrought on (about 12 ft.) to 6 tons of copper ore per cubic fm.—J. NEILL.

PRINCE OF WALES.—The engine-shaft is now down 9 fms. below the 155-fm. level; there is no change in the lode. In the 155-fm. level east the lode is now being taken down, and so far maintains its value. In the 90-fm. level east the lode is also being taken down, which looks well, and is yielding stones of rich tin. The stopes throughout the mine are producing the average quantity and quality of stuff. The calciner is now completed and in operation, and in the course of next week it is expected everything will be ready for returning tin.

PRINCE ROYAL.—Good progress is being made in draining, and the agents believe in about another week the mine will be drained to the bottom.

ROMAN GRAVELS (20th June).—The mine is now in fork at main engine shaft to the 125-fm. or bottom level. We have taken out the old drawing lift from said level to the 110, and sent it to surface. Preparations are now going on for the sinking of the shaft (by hand) a few feet. in order to put in a suitable pent-house, &c. When this is done the shaft will be sent down by nine men with

rock-drills, and the sinking will be pushed with all possible speed.—A. WATERS and SON.

SOUTH CONDURROW (19th June).—The lode in the 40 end east of engine shaft is worth 6*l*. per fm. Three stopes in the back of the 40 are worth 30*l*. per fm. in the aggregate. The 50 end east is worth 12*l*. per fm. The stopes in the back of this level are worth 8*l*., 8*l*., and 10*l*. per fm. respectively. The 60 end east is worth 7*l*. per fm. Two stopes in the back of the 60 are worth 12*l*. per fm. each. The lode in the back of the 70 is worth 18*l*. per fm. The 108 end west of Marshall's yields low quality tinstone. The sinking of Marshall's shaft is being urged on by nine men.—W. RICH, W. WILLIAMS, H. KING.

SOUTH DARREN (20th June).—The following bargains are let for four weeks :—To stope in the 142 west by six men at 3*l*. 15s. per fm. ; lode worth 2 tons silver lead ore per fm. To drive east to cross-course in this level by four men at 7*l*. 5s. per fm. ; lode worth 10 cwt. silver-lead ore per fm. To stope in the 142 east by four men at 3*l*. 15s. ; lode worth 15 ewt. of silver-lead ore per fm. To drive east on the lode in the 130 west by four men at 7*l*. per fm. ; lode worth 10 cwts. of silver lead ore per fm. To drive the 110 end east by four men at 7*l*. 15s. per fm. ; the lode is strong, and kindly worth 12 cwts. of silver-lead ore per fm. To drive a cross-cut in the 100 west by four men at 6*l*. 15s. The drivage is still in the lode and contains strings of lead. To sink a winze in the 90 west by four men at 7*l*. per fm. We expect to effect a communication here this month.—J. MITCHELL.

TIN ERA (17th June).—We have commenced driving east on the course of the lode recently intersected by the north cross-cut, with a full pair of men. It is 3 ft. wide, composed of quartz, iron, and a little tin, but at present not enough to value, but it looks promising for an early improvement.—R. KNOTT.

TREGURTHA DOWNS (19th June.)—We expect to reach the lode in about four weeks from this date, and we have every reason to believe that it will be far more productive than in any of the upper levels, seeing that the lode has doubled its value from the 67 to the 80. There is no change in the tribute department since our last report. All our machinery is working well.—JOHN PRISK, W. R. THOMAS.

VAN (20th June).—I am pleased to report that the lode in the 135 south level, is worth to-day fully 50*l*. per cubic fm. for lead ore. It is a very good feature to see these variations. The lode is going up strong in back of the level, and is letting out water very freely, accompanied by occasioual strong outbursts of gas. In saying that the lode looks well in the roof of the level, I do not mean to say that it is not as good in the sole or bottom of the level as well, but this improvement in the roof of the lead would indicate that the lode cuts through the grit, which in the 78 yds. of cross-cutting formed a ceiling above the ore ground. The 120 east is unchanged since my last, and the stopes afford me nothing to report upon this week.—W. H. WILLIAMS.

WEARDALE.—Report for week ending 15th June : Ore raised for the week, 82 tons ; ore dressed for the week, 72 tons ; ore and fume smelted for the week, 99 tons, producing 60 tons of pig lead.

WEST WHEAL GRENVILLE (18th June).—The forking lift in engine shaft has been dropped to about 5 fms. below the 100-fm. level, ground cut for skiproad and the same fixed to about 2 fms. under the 70-fm. level. The shaftmen are now cutting hitches for bearers at the 90 to carry forking lift preparatory to further dropping said lift. The men at Harvey's shaft have been clearing and securing the 90 east of shaft, clearing the *debris* accumulated in shaft from the 80 to to the 90, and hope to commence to-morrow putting down skiproad below the 80-fm. level.—T. HODGE, J. SKEAT, N. TENBY.

WHEAL METAL AND FLOW.—The Metal lode in the 35-fm. level east, although small, has a very promising appearance, and producing a little tin. In the winze below the level the lode is over 1 ft. wide, also containing tin, but there is not sufficient air for ventilation, which must be remedied by air pipes or some other appliance.

FOREIGN MINING INTELLIGENCE.

ANTIOQUIA (FRONTINO).—The directors have received advices for the month of March, dated 28th March :—281 tons produced 272 ozs., average, 18 8-10 dwts. Value of the gold, 724*l*. 10s. 6d. Cost at the mines, Medellin and in London, less exchange on cost, 511*l*. 19s. 4d. Estimated profit, 212*l*. 11s. 2d.

ASIA MINOR (1st June).—66 men driving, value of ends, 4 tons; 202 men stoping, value of stopes, 15 tons, 15 cwt. ; eight men sinking, eight men rising. A level has been started east and west under Lower Union, and the lode in both ends is worth 10 cwt. per fm. ; there is every indication of a very important discovery being made here. The stopes are yielding ore of very good quality, and the mines throughout are in excellent working order. Production to 7th June, 4,953 tons crushed ; yielded 649 tons of rich silver-lead ore. Corresponding period last year 4,992 tons crushed ; yielded 644¼ tons. The 31st May, 1st and 2nd June were Turkish Bairam holidays, and the dressing-floors were stopped. The stuff treated for the rest of the week was the tributors' ore from the new mine. Pappa Sawa : Number of men employed at the dressing-floors, 75.

CORTEZ (1st June).—During the week ending this date work on the mines has been as follows :—Boss tunnel advanced 22 ft. Development tunnel advanced 33 ft. Main tunnel : East drift advanced 3 ft. ; east centre stoped 2 tons of ore, carrying 75 ozs. per ton of silver. Middle tunnel west : Stoped 44 tons of ore, carrying 50 ozs. silver per ton. North-east upraise : Stoped 103 tons of ore, averaging 60 ozs. per ton. North-west upraise : Stoped 80 tons of ore, averaging 140 ozs. per ton ; east drift advanced 7½ ft. Ore hauled to mill, 141 tons, averaging 60 ozs. ; ore treated at mill, 137 tons. One of our roasters being repaired, which is the reason that the amount of ore treated at mill is not as much as usual. Bullion shipped, 16 bars, containing 15,882.00 ozs. of fine silver, and 16 85-100 ozs. gold.—WELSH.

DAY DAWN P.C.—Report for fortnight ending 27th April :—The output of quartz is : 1,915 trucks to the Excelsior mill ; 558 tons and 97 dray loads to the Defiance mill. No. 11 level east side has been extended a further distance of 9 ft , making a total distance of 17 ft. from the underlie. The formation is 10 ft. wide, carrying 6 ft. of stone of medium quality. West side or boundary stope carrying 7 ft. of stone of fair quality. No. 10 level has been extended a further distance of 10 ft., making a total distance of 251 ft. from the underlie. There are 3 ft. of stone in the face, of good quality. The leading stope over this level is carrying 8 ft. of stone, of good quality. All the rest of the stopes are looking well ; average width of stone 6 ft., of good quality. No. 1 winze on this level has been sunk a further depth of 10 ft., making a total depth of 87 ft. No. 9 level has been extended a further distance of 8 ft., making a total distance of 335 ft. from the underlie ; the formation is 12 ft. wide, carrying 6 ft. of stone, of good quality, the remainder being mullock intermixed with small leaders. The leading stope over this level is on 4 ft. of stone, of good quality. All the rest of the stopes are looking well. No. 8 level has been extended a further distance of 10 ft., making a total distance of 597 ft. from the underlie ; there are 3 ft. of stone in the face, of good quality. The stopes over this level are turning out a fair amount of stone of fair quality. The hanging-wall drive has been extended a further distance of 20 ft., and holed through to the footwall drive at a point 310 ft. from the underlie. No. 7 level : We are stoping over this level again on about 6 ft. of stone of good quality ; this set of stopes will cut out all the shoot of stone that No. 5 winze was sunk for. No. 6 level : No. 6 winze on this level has been sunk a further depth of 8 ft., and holed to the No. 7 level ; this winze has been sunk on the footwall only ; it is our intention now to cut the winze down, and show up whatever stone might be on the hanging wall ; at the bottom of this winze there is from 1 ft. to 1 ft. 6 ins. of nice-looking stone showing on the hanging-wall ; the formation is about 10 ft. wide. The stope over this level is carrying about 7 ft. of stone, of fair quality. The amount of quartz hauled from each level is as follows :—No. 11 level, 202 trucks ; No. 10 level, 595 trucks ; No. 9 level, 694 trucks ; No. 8 level, 391 trucks : Nos. 6 and 7 levels, 123 trucks ; total, 1,915 trucks. No. 2 shaft has been sunk a further depth of 14 ft., making a total depth of 257 ft. from the surface ; we have now fully one-half of the shaft in the formation, which is of a very soft nature, and requires close timbering. There is a vein about 1 ft. thick on the footwall, of very poor, white quartz ; machinery in good order.—T. LESTER.

DENVER (7th June).—I confirm my last of May 31st, and beg to report as follows :—The 200 level west : Though not having yet reached the point of our richest discovery in the drift, the lode in the back stopes maintains its value, and is yielding a good quantity of high grade milling ore. Since last reporting we have increased the force of men in these stopes which will enable us to supply an additional battery (five stamps) with ore next week. The drift at this level has met with harder ground. the advance for the week being only 8 ft., and is temporarily pinched. The 1,050-ft. level, main lode : The drifts east and west of the cross-cut (No. 2) show a very perceptible improvement, which is more apparent in the case of the former. East drift : The end is to-day in 17½ ft. from centre of cross-cut ; the ground is somewhat softer, and shows streaks of rich mineral. The end opposite, 21 ft. distant from centre of cross-cut, also shows more mineral, and has considerably improved in its general aspect. The width of the vein in this drift has diminished to 4 ft., and concomitant with this is a more decided tendency for reunion in the bifurcation of the vein attendant on the disappearance of the interlying horse of country rock.—F. RICKARD.

EAST AREVALO (MEXICAN) (27th May).—Since my last report we have driven the No. 3 level east 9 ft. 6 ins. ; the lode is about the same, if anything better. I have this day sent to Haceinda de Jesus, Haceinda de San Pasceul, and Haceinda de Puriruia to ascertain their charges for reducing our metal. I need not say that I shall get the best terms possible for the company. I intend to send to you the silver in bars, and also some bags of rich metal from our mine.—Capt. PRIDEAUX.

ETHERIDGE UNITED.—The mining manager reports for the fortnight ended 18th April :—During the past fortnight at the Canadian West the work has been confined to driving and stoping at the 139-ft. level. The western level has been advanced 9 ft. ; total distance from shaft, 14 ft. The reef looks very well here, it being mostly mundic stone, and is from 2 ft. 6 ins. to 3 ft. wide. I have let the western level on contract for 1*l*. 17s. 6d. per ft., which is a saving of 2*l*. 12s. 6d. per ft. according to the eastern level, which was let before my arrival at 4*l*. 10s. per ft. The crushing I mentioned in my last report, from 90 tons of quartz we got 46 ozs. retorted gold. It is my belief that not one-half of the gold is saved, the mundic stone being so hard to treat, there being so much sulphur and arsenic in it. I have forwarded you one box of the stone and one of the tailings, which have passed through the boxes, concentrators, Wheeler's pans, berdans, and settlers, and so received all the treatment we can give them here. Now you will be able to find out by treating them what we really lose. *Re* Lord Nelson Mine : At present the work is confined to stoping and driving the level west of shaft at the depth of 100 ft. The reef is from 2 ft. 6 ins. to 4 ft. in thickness, and the level has been advanced 14 ft. ; there are four stopes following the level taking out the reef 36 ft. high, 18 ft. long, and from 3 ft. to 5 ft. wide. *Re* Lord Nelson mill : The last cleaning-up at the above mill was on the 29th of March, when from 45 tons of stone we got 35 ozs. retorted gold. I am sorry to say that the dam will be empty this week. *Re* Goldsmith Creek battery : I mentioned in my last report about having to put down new tables for the other five head of stamps. I am now able to inform you that the new tables are in ; under the old ones we got 112 lbs. of silver, silver in Georgetown being worth 4s. 6d. per lb., that being a saving of 25*l*. 4s. for silver alone. I have also got 7½ ozs. of gold from it, making the total 43*l*. 16s. 6d. that was entirely lost.

FRONTINO AND BOLIVIA.—The directors have received advices from the mines, dated 24th April and 7th May ; also a letter from Messrs. Restrepo, dated 12th April. The statement of profit and loss for the month of April is as follows, viz. :—547 tons from general mines produced 646 ozs. ; tributers' gold, 464 ozs. ; total, 1,110 ozs. Also 2,320 lbs. of sulphurets containing 66 ozs. of bullion. Estimated value of the gold and sulphurets, 2,457*l*. 0s. 5d. ; cost at the mines, Medellin, and in London, 1,563*l*. 7s. 4d. ; paid for gold bought of tributers, 693*l*. 19s. 6d.—2,257*l*. 6s. 10d. ; estimated excess of returns, 199*l*. 13s. 7d. The dry weather continued during nearly the whole of the peroid during which the above returns were made, a few showers only having fallen. Since the close of the month under review showers have been frequent and sometimes heavy. During one of the heavy rains the water got into Silencio Mine and confined work to above the 150-ft. level. The water was being pumped out at date of last letter (7th May), and it is hoped the interruption to work will not be prolonged beyond a few days. At Cordoba three branches of

lode met with in the deep cross-cut of Rosario (now called No. 7 level Cordoba) were showing good indications.

GARFIELD (25th May).—My last report to you was dated 11th inst., and I give below the underground measurements, &c., for the past fortnight. Lancashire: An upraise has been started about 25 ft. back from the face of the west drift, tunnel No. 1, and is now up 9 ft., showing 8 ins. streak of quartz, containing spots of ore. Atherton: Stopes are looking well, and turning out about usual quantity of ore. Great Western: 150-ft. level west has been driven 5 ft. in footwall of vein; nothing to note here. Some very good ore is being extracted between winzes Nos. 14 and 15 on 150-ft. level. Lincoln mine: Usual amount of ore being extracted. The mill was started up again on 15th inst., and has since been doing fair work.—HOOPER.

— (2nd June).—The mill was shut down on 31st ult. for want of ore (This is in consequence of the scarcity of miners). Since we are unable to keep the five stamps continuously running, I consider that it will be more economical to shut down for about a fortnight, and then start up with 10 stamps.—HOOPER.

GOLDFIELDS NORTH QUEENSLAND. — Report from the manager:—The Spero Meliora shaft has been sunk 5 ft. for the week, making total depth 197 ft. The ground has been a little harder during the past week. I have now decided to open out and drive for the reef at 230 ft. Water about the same. Machinery all in good order, and working well. The Melbourne Exhibition shaft has been sunk 6 ft. for the week. We are still without quartz in the bottom of the shaft. The formation looks very favourable for a change, and I hope before many feet have been sunk to report the reef met with again. I shall now start to cart the stone we have on the surface to the battery in Georgetown. This should turn out well. We have about 40 tons.

GYMPIE GREAT EASTERN (2nd May).—Fortnightly report:—During the past fortnight the drive north at the 634-ft. level has been extended 8 ft.; total, 78 ft. There are about 2 ft. of crushing stuff, showing a little gold. The south drive has been extended 9 ft.; total, 118 ft. There are about 15 ins. of crushing stuff, showing fair gold in the last breaking down. The stopes north and south above these levels are all showing a large amount of crushing stuff, with fair gold. In the first stope over the level going south there is some very good gold, much better than I expected so low under the slate. On the whole this block of ground is opening up very well. The stopes above the 500-ft. level going north are all showing fair gold. I have discontinued those going south, as, according to the surveyor's plan, we are near our southern boundary. The stopes above the 364-ft. level on the old eastern reef were very poor, so I stopped them for a time, the reef having broken to the west, and a cross-cut has been started to try and pick it up again. As instructed, I have started to cut out a chamber at the 364-ft. level, so I can erect a windlass to sink a winze on the reef formation west of the Great Eastern reef, as you will see in the plan. There are from 4 ins. to 6 ins. of quartz in this level, and I feel certain it is well worthy a trial, as there may be more quartz on the top break than we had under the 500-ft. level where the old company worked it. There will be about 50 or 60 ft. to sink before reaching the slate. In the winze at the 580-ft. level to cut the No. 1 south Great Eastern reef we have driven south 15 ft. and risen east 17 ft.; there is no improvement in the faces. For the four weeks ending 24th April 600 tons of quartz were crushed, for a return of 1,077 ozs. 5 dwts. 12 grs. of smelted gold. Everything about the mine, winding engine and battery, is in fair working order. There are 75 men employed—65 at the mine and 10 at the battery.—J. JAMES.

— P.S.—Since writing the above, better prospects in the eastern winze and south drive at the lowest level have been met with, fair gold being seen in both faces.

— The secretary at Gympie, in his letter enclosing the above report, remarks:—"You will note that very good gold is being obtained 30 ft. below the slate in the lowest level on the Great Eastern reef; the prospects of the mine are very satisfactory."

HAMBLEY FREEHOLD (5th June).—My attention is now being directed to the proving of the vein before reported, and I intend for some time to come, to confine operations exclusively to prospecting along the strike of this vein, and I will carry out the plan proposed in your letter under acknowledgment. I am pleased to state that we have now uncovered the back of this vein for a length of 250 ft. Throughout this length it has the appearance of a persistent and strong vein, averaging in width 4 ft. It is very satisfactory further to know that as we descend, the vein becomes more impregnated with oxides, and pans more regular, and I think better than it did on the top of the hill. The tunnel has now been extended 160 ft., ground getting harder and necessitating blasting. We are able to drive about 2½ ft. a day, but I hope, in a further 50 ft., to intersect the vein. As soon as we can trace and identify the vein on its eastern strike in the low lands, I propose to start an adit level, following the course of the veiu, which will give us a large reserve of ore. It is impossible for us to determine the value of this vein per ton, except by dealing with average samples, containing 10 to 20 tons, and this quantity of samples can be better dealt with by a stamp mill, and I intend to order a five-stamp portable prospecting mill as soon as the vein is intersected in the tunnel.—E. B. C. HAMBLEY.

MONTE DEL ORO (11th June).—Fortnightly report: Taylor's engine shaft: The sinking of this shaft has been resumed, and although it is very wet, excellent progress is being made, as since we started 9 ft. have been sunk, and therefore the shaft is now 195 ft. deep. This work will be forwarded with energy, so as to cut the lode as rapidly as possible, when immediately after fixing the plunger and angle bob sinking will be commenced on the dip of the lode. The driving of the 186-ft. level south of the east cross-cut has been suspended, the miners being transferred to the shaft. The 186-ft. level north of the west cross-cut is 114 ft. long, having been extended 13 ft. in the past fortnight. In width the lode averages from 4 ins. to 6 ins., and carries a little quartz, intermixed with slate. Shaft No. 6: On account of the quantity of water the sinking of this shaft on the course of the lode has been temporarily suspended. Shaft No. 5: From the shaft the north level has been extended 144½ ft. of which 12½ ft. were driven for the fortnight. Here the lode is about 4 ins. wide, and composed of a soft fluccan, which at present contains no quartz. Shaft No. 2: A distance of 140 ft. north of winze No. 1 was reached in the intermediate level, when the miners broke through to ancient workings, and operations in this direction were then discontinued. Winze No. 7: The winze is situated in the bottom of the intermediate level, and in siuking it the men are making capital speed, having already sunk 22 ft. The lode is 6 ins. wide, and carries a small seam of quartz, the remainder being a soft flucan.—J. ROBERTS.

MOUNT MORGAN EXTENDED.—The directors have received report No. 39 from the local committee (Mr. R. Ballard, M.I.C.E.), dated Rockhampton, May 2nd, which states that satisfactory progress was being made with the completion of the erection of machinery and buildings, but that several important points of exploration had been temporarily suspended in consequence of all the available funds being required for the completion of the erection of machinery and for advancing the necessary surface works. A further shaft, No. 2, was being sunk at the Immanuel lode at 34 west of No. 1 Immanuel shaft; this shaft was then down 9 ft., being in a mass of boulders, with rich oxidised wash dirt, "showing colours nearly every dish in trying it." It is expected that this shaft will strike the Immanuel lode at 18 ft. to 20 ft. With reference to the Immanuel No. 1 shaft, the manager reported, on the 26th April, "The lode looks very nice;" on the 27th April, "Ore from lode looks very well;" and on the 29th April, "Pushing down, very nice stone."

NEW EBERHARDT.—The following cable was received on the 17th inst.:—"Mine very nearly the same; daily output quantity, 6 tons; weekly, 42 tons; 125 tons mill; 100 tons mine. I can pay month expenses. Gross proceeds mill last month, $8,000; monthly expenses, $3,500. I estimate yield for June $12,000."

—The mine manager reports under date June 2nd, as follows:—Number of tons of high grade ore assorted and put on the ore dump, 20 tons; assay value of same, $54 per ton. Ore of a lower grade put on the dump for the week, 10 tons; assay value of same, $34.57 per ton. Total amount of ore extracted and assorted for the week, 30 tons. Mine: We have quite as much ore in sight to-day in our mine as at any time during the past month, the only change is a slight falling off in the value per ton. but from present appearances I think our ore will be much better next week. It can safely be said of our mine at this time, and for the last three weeks, that the output of ore will meet all expenses, and I am still hopeful of doing better. Mill: Our mill is running steadily, and doing excellent work; the average pulp assay as per battery samples for the past week was $50.80 per ton; average per centage obtained as per pulp assay, $81.48. Number of bars bullion produced for the month, 8 bars; the standard value of these bars $8,191.61. Bullion shipment: Herewith I enclose shipping receipt for 4 bars shipped; total, 6,565.94 ozs. Standard value, $5,420.01.

NEW EMMA (25th May).—I have to report work carried on at the mine for the two weeks ending to-day as follows:—Level No. 1: South-easterly advanced 15 ft.; total, 296 ft. Rock continues seamy and strongly impregnated with oxidised iron, but is very hard, and the seams still narrow. However, I hope for a change before we advance many more feet. Raise from No. 1 advanced 7 ft.; total, 68 ft. Does not show much if any change; the galena seam continues, as does the small stringers of ore, mentioned in former letters, although narrow. Level No. 1, north-westerly: We are still opening up old workings, exposing and running low-grade ore to mill. Worked six men full time. Level No. 3, south-easterly, advanced 28 ft.; total, 497 ft. The rock has been very hard the past few feet, seams having closed and showing less iron, but is now changing again for the better; rock getting softer; seams give hopes of widening, and more iron coming in. Have worked four men full time. Level No. 4, north-westerly, advanced 27 ft.; total, 117 ft. This level continues looking very favourable. Although the rock is a little harder, and the seam not so wide, rock continues strongly saturated with oxidised iron, and showing occasional small particles of ore. Worked four men full time. Believing the weather had settled, we again started mill on 11th inst., as already advised in my letter of that date, and ran it until Monday, 13th inst., when heavy snowstorms again set in, compelling us to stop until Monday, 20th inst., since then we have run steadily. Mill working quite satisfactorily. We now have some 25 tons crude ore, and about 15 to 20 tons concentrates, *en route* to market, which will be sold the coming week. Shall ship another lot before end of month.—H. C. WALLACE.

NEW LIVINGSTONE (20th April).—I have to report that since the new contract was started the contractors have sunk the shaft 8 ft. 6 ins., making the total 186 ft. 6 ins. from No. 2 level. The country has been hard and without stone until Thursday last, and since then the reef has made to a width of 1 ft., and by present appearances I think it will continue to iucrease as we go down. The stone is white and of poor quality at present, but I hope to have something better to report at the end of the next fortnight. The machinery and everything about the mine is in good order.—N. MAYNE.

NINE REEFS (25th May).—Mining operations: Malleson lode, main shaft—310-ft. level south: The drivage of this level has been resumed, an advance of 1 ft. having been made; the total length now being 7 ft. 6 ins. The portion of the vein in the drift is about 16 ins. wide. The greater part of the vein is still on the footwall. Morrison's shaft: The men have been employed in cutting through the vein at a depth of about 64 ft. below the 185-ft. level; the width of the vein at this point is about 13 ft.; the assay of the portion nearest the hanging-wall is 14 dwts. 8 grs. gold per ton. Hodgson's shaft: The cleaning up and enlarging of this shaft is being pressed with all vigour, the depth attained being 65 ft. 6 ins. I hope to be obtaining gold from this part of the mine during the month of June. Stopes: No. 1 stope in the back of the 185-ft. level north of main shaft: Vein 6 ft. wide; assay, 13 dwts. 1 gr. gold per ton. No. 3 stope in the bottom of the 185-ft. level south of Baynard shaft: Vein 4 ft. 6 ins.; assay, 3 dwts. 6 grs. gold per ton. No. 4 stope in the bottom of the 185 south of main shaft: Vein 4 ft. 6 ins.; assay, 3 dwts. 6 grs. gold per ton. No. 5 stope in the bottom of the 185-ft. level north of main shaft: Veiu 6 ft. wide; assay, 2 dwts. 14 grs. gold per ton. No. 6 stope (first part) in the back of the 310-ft. level north of main shaft: Vein 5 ft. wide; assay, 3 dwts. 6 grs. gold per ton. No. 6 stope (second part) in the back of the 310-ft. level north of main shaft: Vein 5 ft. wide; assay, 3 dwts. 22 grs. gold per ton. Champion lode, Vyvyan shaft: Winze sinking under the 145-ft. level south of Vyvyan shaft advanced 5 ft. 6 ins.; a total depth of 12 ft. 6 ins. This winze is being sunk under the vein. Rise in the back of the 145-ft. level south of Vyvyan shaft advanced 4 ft.; a total height of 6 ft.; vein 1 ft. 4 ins. wide; assay, 16 dwts. 7 grs. gold per ton. Stope: North stope in the back of the 145-ft. level north of Vyvyan shaft: Vein 14 ins. wide; assay, 2 dwts. 14 grs. gold per ton. New shaft is being enlarged and prepared for the putting in of the

timber necessary to support the ground. You will, I think, feel disappointed at the apparent falling off in the assays; but there is no appreciable difference in the return from the mill.—Capt. Bennetts.

NORTH MEXICAN (31st May).—The shaft will be by to-morrow 191 ft. deep. The mules have to work hard already to hoist the bucket. Very soon we will have to hitch up to the whim four mules at a time in place of two that we have now, so in order to continue on well it would be advisable for you to send the winding engine as soon as possible, with enough rope for same. The incline of the shaft is such that there is a great deal of friction on the bucket, which takes pleuty of power to lift it up, so you must not depend much on the horse whim. The bottom of the shaft begins to look better, as if we will strike some ore again. The vats in the mill are full, and I am keeping them so all the time. I have painted the two large smoke stacks of the mill, as the rainy season is beginning to set in. This week I started to timber the Pulbrook shaft at the Durana mine below the 100-ft. level. I hope when we begin sinking that shaft again we will find some ore.—R. S. Carlisle.

ORITA (30th April).—Yesterday we terminated run No. 41, which may be considered the ending of our financial year. The result of the run was $5,283 from the sluice and $670 from undercurrent, making a total of $5,953; cost account, $1,568; showing a profit of $4,390. During the above run we were short of water for over six days, and owing to a dip in the bedrock we had to clean down on a gravel bottom, so that a considerable amount of gold must have remained behind, but will be recovered when we bring in more grade. Mine: We are now drifting in to get grade for the dip in the bedrock, and we have to start the drifting from a point 600 ft. back from the face of gravel. There is very little chance of my being able to get washing in the channel before five weeks. The rock is getting very hard in the cut and ground sluice. We are going to make run No. 42 in the branch sluice, where we have a vast amount of old works to clear away. Owing to the branch sluice now being ready for washing at any time we are stopped in the main. I expect to be able to make constant washings, and only have stoppages when making a general clean-up; therefore, when I omit the date of re-commencing in the cablegrams, you may take it for granted we are washing in the branch sluice and losing no time.—H. J. Prender.

OSCAR.—Lode No. 3 has not been yielding so much quartz as hitherto. The men, however, are making fair progress, and we hope soon to report an improvement. Daw's lode: The shaft and 420-ft. level have somewhat improved. In the latter we have seen a little visible gold. In the 370 north we have about 18 ins. of quartz. All other places show no alteration to call your attention to.

OURO PRETO (23rd May).—Passagem Mine—Mining operations: Incline shaft No. 2 was sunk 6.60 metres. The quartz lately discovered is still holding down, but has been somewhat irregular in size. At present a branch of about 1 metre wide is standing across the breast, the ground on each side being quartzite. Under the floor of the incline one of the lower branches has just been met with, and some stones of ore with visible gold have been broken. Stoping: The great bulk of the ore milled is still being derived from the line of stopes from the 265 level south-west, where 367.00 cubic metres of ground were broken last month. Along a face of over 30 metres in length the lode is very regular, averaging about 3.00 metres thickness of quartz, with strings and patches of pyrites throughout. At the 215 stoping in bottom on lower lode was suspended, to allow of a sink being being put down through the ore, when stoping can be carried on to better advantage. A wire rope transmission was put in from main rods in shaft to work a lift in the sink, and we shall soon know how deep this ore holds. Splendid stones of pyrites and tourmaline ore are coming up from bottom, and we appear to have a big bunch of rich ore at this point. At the 315 level 100 cubic metres of ground were excavated; the outer stope has holed to shaft stope, where there is a very large body of white quartz. A good quantity of ore has been broken this month in the side of the inner rise (16) over 215. The lode here is very large, but considerably mixed with schist. Construction: A wire rope has been put up for raising sands from new stamps for barrels and for pans, and a road with tram lines has been made from stone-breaker floor to remove pickings, and to clear ground for new floor. Retaining walls in dry masonry have been built on the water-course, and a force is still employed on this work.—H. J. Gifford.

PESTARENA UNITED (15th June).—Mid-monthly report.—Val Toppa district: In the end south on eastern branch No. 1 level, a bed of decomposed rock has come down from the roof, and is dipping before the end. The ground above appears to be more settled, and carried strings of quartz. The cross-cut east at the intermediate level under zero has traversed a strata of foliated schist 1.30 metres wide, which is intermixed with veins of quartz and pyrites. A stone of pyrites from here gave by assay, 12 ozs. 14 dwts. of gold per ton, and a mill trial of ½ ton of this rock gave 11 dwts. 20 grs per ton. I think by the appearance of the ground now in the cross-cut, that we have got through this orey ground, and a drive on it northwards will now be started; this, no doubt, is the ore for which the cross-cut was started. In the cross-cut east at No. 4 level the ground is more jointy, and letting down a quantity of water, otherwise there is no change.—W. Roberts.

— (14th June).—Midmonthly report.—Pestarena district: The 90 fm. end driving east on the Caunter lode shows only a splice of ore in the roof, and by the present appearance we think this end is leaving the ore shoot. The lode in the 100 fm. east is still wide, but only about 60 centimetres go to the mill, and is estimated to produce about 8 tons of 1 oz. ore per fm. The lode in the 110 fm. east is composed of two branches, which appear to be diverging; the one on the footwall carries about 50 centimetres of ore, and produces 6 tons of 18 dwts. ore per fm. At this level west a winze has been commenced, so as to effect communication with the 130 fm. cross-cut. The lode here is 1 metre wide, with about 50 centimetres of ore. The sterile quartz in the 110 fm. end west from cross-cut has dwindled down, now forming a regular branch 20 centimetres wide, carrying a little pyrites. This, we think, favourable for an improvement. The driving of the 130 fm. cross-cut has been discontinued, and the men set to drive east and west on the last branches traversed, which no doubt will prove to be the Caunter. The 120 fm. end north from winze on No. 1 lode shows a lode 50 centimetres wide, and is producing about 6 tons of 10 dwts. ore per fm. The 130-fm. end south has about 20 centimetres of loadey matter on a well-defined wall, but it does not give any ore. The 140-fm. cross-cut is in a broken calcareous schist. In the winze sinking below this level a little ore has come in in the south end, and no doubt this will extend through to the 150-fm. level. The 150-fm. end north carries about 50 centimetres of a mixed rock and ore, and is producing about 5 tons of 5 dwts. ore per fm. The end south is going forth on a good line, but it does not produce any ore. The 160-fm. end north shows a mixed lode 50 centimetres wide, with pyrites thinly scattered throughout, and is producing a little low grade ore. There is nothing new that calls for remark in the 70-fm. cross-cut. The stopes continue to produce much the same as when last reported upon.—W. Roberts, W. H. Trelease.

RUBY AND DUNDERBERG CONSOLIDATED.—Report upon the mines for the week ending 26th May.—Dunderberg: 13 tons ore shipped from here during the week by tributers. We have about 30 tons ore broken in the mine ready for shipment. There is no change to report. Eagle's drift: We have raised 6 ft. during the week, making a total of 231 ft. driven. The ground here at present is exceedingly hard. We have six contractors and 17 tributers at work here. Lord Byron: We have shipped 29 tons from here during the week. We have 10 tributers at work here.

— Telegram received from Eureka, dated 18th June:—"32 tons tribute ore shipped; 23 tons tribute ore sold for smelting, producing to company $322."

SANTA BARBARA.—Under date of the 17th May, Mr. Treloar states:—The output of stone from the mine is 1,116 waggon loads, of which 690 loads came from the No. 4 stope, and 426 loads from the new shaft. The number of waggon loads per man drilling is 31.81, and the total number of holes drilled in the mine 2,122, of which 304 were in the No. 3 stope in breaking up rocks, 1,027 in the No. 4 stope, and 791 in the new shaft.

SOUTH-EAST MYSORE (25th May).—Mining operations.—Rogers' shaft: Sinking under the 260-ft. level has advanced 5 ft. 6 ins., the total depth now being 294 ft. 6 ins. The vein in this shaft is about 5 ft. wide; the assay 4 dwts. 1 gr. gold per ton. Stope in the back of the 120-ft. level north of Thomas's shaft; vein, 3 ft. wide; assay, 3 dwts. 6 grs. gold per ton. The vein in this stope is of a very promising character. Stope in the back 80-ft. level north of Thomas's shaft: Vein 2 ft. wide. As this stope has only been just commenced, no assay has been taken, but in driving the level good gold-bearing vein matter was obtained. Stope in the back of the 260-ft. level north Lavelle's shaft: Vein 3 ft. wide; average assay of three samples, 6 dwts. 8 grs. of gold per ton. Milling: The stamps mill is working well, and we are now obtaining a fair amount of amalgam. We hope to increase the monthly returns of gold very shortly; that is, as soon as the hoisting gear now on the mine is put in place, and a few minor changes made, requiring, say, from one month to six weeks to complete.—Capt. Bennetts.

VALLEY.—I yesterday sluiced with the Blake pump 1¾ cubic yds. of dirt from a point about 200 ft. north of the Meate's shaft. It was upon the spur from the main hills where the dirt is thin; only about 9 ins. to 2 ft. over the cement. It went 73c. to the cubic yd., and I took took everything from surface to cement. I am now testing another piece lower down the hill, which pans out very rich; about $2½ to the cubic yd. I shall probably run off a large strip of this, so as to get a good reliable test. If the thin dirt on the hillsides will pay, the deep banks in the valley will in all human probability pay far better, and I need not say that 73c. will pay splendidly, and $2½ means immense wealth. At the Meate's shaft it is 7 ft. to cement on the north side, and will average right through about 12c. to the cubic yd. This would not pay much, but would cover expenses, and the Meate's shaft is sunk at one of the few places on the estate where one would say there could hardly be any gold. It lies just round a spur, so that none of the gold from main gulch could very well get there, and there is no minor channel from the hills which could bring any. It is in a small local gulch not more than 300 yds. long, and separated from the hills by a divide and another small gulch, so that nothing could anyhow get into it from the hills. The little there is must have floated in during very high floods from the main gulch stream. The gulch which divides this gulch from the hills is very rich. I have panned out dirt there worth as much as $20 to the cubic yd.

THE YURUARI CO., LIMITED.

CIRCULAR TO THE SHAREHOLDERS.

14th June.—After mature consideration, the directors have decided upon submitting the enclosed resolution to an extraordinary general meeting, to be held at Cannon Street Hotel, Cannon Street, on Monday, the 24th inst., at noon. The directors are pleased to state that after negotiations with the solicitors representing the trustees for the debenture-holders, they have arrived at an arrangement, subject to the sanction of the holders of a majority of the bonds, for the payment of those on 1st September next. Provided the enclosed resolution is duly passed and confirmed, the directors propose offering the new capital to the shareholders at a price to be fixed hereafter, so as to liquidate the debentures outstanding, amounting to about 57,000*l*. The new capital thus created for the purpose of paying off an outstanding liability of the former company will not mean an actual increase in the capital of the company, but be practically only the issue of new stock in place of debentures, and thereby get rid of the large annual payment of 10 per cent. upon the present debentures. The directors are pleased to state that the advices just to hand from the mines, as reported in Tuesday's *Financier* and *Financial Times*, are the best that they have received for some time past, and they are in hopes that advice of first crushings will be received so as to enable the chairman to report at the above meeting. The next mail from the mines being due on Monday, the 24th inst., the directors are in hopes that other interesting information will be to hand by the date of meeting. In advices received on Monday last the manager states that he believes the large stock of quartz now in the chutes and ready for crushing will yield at least half an ounce to the ton. Important improvements having been added to the mill, it should now be able to crush at least 4,000 tons per month, in which case, provided the yield is only half an ounce to the ton, a profit of 3,000*l*. to 4,000*l*. per month should be available, and the produce, it is expected, will be largely increased as soon as the lode in the water shaft has been sufficiently developed to admit of the mill being kept running with the best available quartz. The manager's letter throughout is of an encouraging character, and the directors will be glad to take the opportunity of the meeting now convened to furnish every

information to shareholders. If you are unable to attend the meeting, kindly sign and return enclosed proxy form.—F. R. Robin.

STARTLING PROPOSAL—DEBENTURES TO BE CLEARED OFF BY AN ISSUE OF 1,000,000 SHARES AT HALF-A-CROWN EACH.

An extraordinary general meeting of the Yuruari Company is called for Monday, when the subjoined resolution will be proposed: "That the following article do form part of the articles of association of the company, *videlicet*, that the capital of the company be increased by the sum of 125,000*l*., divided iuto 1,000,000 shares of 2s. 6d. each, such share to rank *pari passu* with the present share capital of the company, and that the board of the company be and they are hereby empowered to issue such shares in every respect as if such shares had formed part of the original capital of the company, for such consideration and upon such terms in every respect as the board shall think fit.—F. R. Robin, Secretary.

THE MONEY MARKET.

City, Friday Evening.

With the absence of demand for the export of bullion, some large arrivals of gold have been taken to the Bank, the influx on the *Gazette* week being nearly 400,000*l*., and the market in consequence with some expectatiou of a reduction in the Bank rate, has been easy during the week. No alteration, however, was made, although the Bank return was a stronger one, the stock of bullion owing to the reflux from the provinces beiug 690,000*l*. better, so that with a decrease in the note circulation the reserve has improved 973,000*l*. to 15,485,000*l*., as compared with 13,869,000*l*. at this time last year. The proportion of reserve, however, has only improved about 11 per cent., to 43½ per cent., as the liabilities under deposits have increased 1,275,000*l*. The private securities have augmented 430,000*l*., by which the private deposits have benefited. The tenders for the issue of 5,000,000 Exchequer Bonds, bearing 2¾ per cent. interest, were received on Monday, and were allotted at a price equal to about par. The Paris Exchange has been steadier at a recovery since the completion of the liquidation, and money at Berlin has relapsed after the sharp rise to 2¾ per cent. last week. At Buenos Ayres, owing to the reported abandonment of the redemption scheme, the premium on gold has risen to 74 per cent., which, unless checked must result in a serious crisis.

Again a fair enquiry for loanable capital was experienced, and call mouey closes to-night at ¾, 1 per cent., and over the half-year at 1¼, ½. But discount was easier, three months bills being accepted at 1 5/16; and the market is, undoubtedly weak, in view of anticipated heavy arrivals of gold from beyond the seas.

The Bank to-day bought 26,000*l*. in gold; bar silver was dull; exchanges on India easier; and Rupee Paper flat, and somewhat nominal.

Business at the Stock Exchange has been extremely quiet, there being so many attractions outside the "House" that a great many members have avoided the City altogether. The effect of the recent panic on the Continental Bourses has been entirely obliterated, but beyond that the changes have been trifling and unimportant. The Funds have been dull, and New Consols have given way ¼ per cent. Old Consols are no longer quoted in the "Official List," and canuot be transferred, but after July 6th holders can obtain the money, so that, practically, the time-honoured Old Consols are no longer a "quotable" security. Colonial, Inscribed, and Indian Government Securities, together with Home Corporatiou Funds, have not been in so much favour, and brokers have put the price down a point or two. Foreign Government Bonds have reflected the movements on the Continental bourses, and Greek Bonds have risen 1, Egyptian Unified, ⅜, and the rest ¼ to ½. South American Currency Loans have been very weak, on the alarming advance in the gold premium of Buenos Ayres to 74 per cent. Home Railway Securities have been irregular, and although the traffic returns were regarded as satisfactory, particularly the Scotch lines, whose returns compare with the Glasgow Exhibition traffic. The fluctuations in Brighton Deferred Stock have been the feature in this department varying betweeu 153½ and 155. Metropolitan fell ¾, and Hull and Barnsley nearly ½ per cent. Very little alteration has taken place in the American Railroad Market beyond the advanee in the Northern Pacific, and Reading Bonds, and a decline in Atlantic Firsts and Wabash Ordinary shares. Grand Trunk Stocks have also shown but trifling alterations, but Mexican became quite buoyant on reports that the material for the competing line would be carried on the Vera Cruz route. In the Miscellaneous department Cable Stocks were heavy on rumours of a new competing cable. The Nitrate Group was fairly steady, and in Industrial and Commercial Undertakings only a few of the most active sorts have shown any signs of life.

The tendency to-day has hardly been so good, the markets being idle and featureless, so that the realisation, generally made at the end of the week had quite an undue influence upon the quotations. New Consols advanced ⅛, to 98, ⅛ for money, the account price being 5/16 higher. Foreign Government Bonds were dull, with a general decline of ⅛ to ¼ per cent. Egyptian Unified relapsed ⅜, and the Ottoman Defence Loans, ½ per cent. The fall in Argentine Railway Issues has been the feature of the markets, said to be on fears that the increase in the gold premium mentioned above will seriously affect the profits of the undertaking. Colombian Bonds have agaiu advanced. In the Home Railway Market some influential buying of Brighton "A" sent the price up to 154¾, after being 154⅜. The Scotch lines, together with Great-Eastern and Sheffield "A" have improved, but Chatham, Midland and Metropolitan receded. United States Railroad Securities were dull, and the active issues receded ½. Grand Trunk Stocks were a shade lower, but Mexican were firm, and the Nitrate Group was also a shade stronger.

Annexed are the final quotations to-day:—Consols Account, 98, 98⅛; Egyptian Preference, 103⅝, 103⅞; Egyptian Unified, 91 3/16, 91 5/16; French Four-and-a-Half per Cents., 103¾, 104¼; Hungarian, 86½, 86¾; Italian, 96 5/16, 96 7/16; Mexican 96¼, 96¾; Peru Five per Cents., 15¼, 15⅜; Peru Six per Cents., 17 1/16, 17 3/16; Russian, 1873, 101, 101¼; Portuguese, 67 13/16, 67 15/16; Spanish, 76 1/16, 76 3/16; Turkish, 1871, 92¼, 92¾; Turkish Defence, 99½, 100; Caledonian Railway, 119¾, 120; Great Eastern, 76⅜, 76⅝; Great Western, 159¼, 159½; Brighton "A," 154¾, 155; North-Western, 183½, 183½; Metropolitan, 88¾, 89¼; Metropolitan District, 34½, 35; Midland, 144, 144¼; North British, 57½, 57¾; North-Eastern, 173¾, 174; South-Eastern "A," 114, 114¼; Grand Trunk, 10 1/16, 10 3/16; Ditto First Preference, 68¾, 69; Ditto Second, 48¾, 49; Ditto Third, 25¾, 26; Mexican Railway Ordinary, 50⅜, 50⅝; Canadian Pacific, 57⅛, 57⅜; Denver 17¾, 18; Erie, 28⅜, 28½; Milwaukee, 73⅜, 73⅝; Lake Shore, 107⅞, 108⅛; Louisville, 71⅞, 72⅛; Atlantic First, 31⅜, 32; Ontario, 17⅞, 18⅛; Ohio, 23¼, 23¾; Norfolk and Western, 52⅜, 52⅞; Reading, 24⅜, 24¾; Union Pacific, 62⅜, 62⅝; Wabash Preference, 29½, 30; Ottoman Bank, 11¼, 11⅜; Anglo-Telegraph, 52, 52¼; United Telephone, 14½, 15; Hudson's Bay, 20⅜, 20⅝; Suez Canal, 93½, 94; Guinness 31½, 32; Allsopp's 8¾, 9¼; Bryant and May, 13¼, 13½; Primitiva Nitrate, 26½, 27; Nitrate Railways, 23¾, 24; Water Gas, 6½ prem.

THE DENVER UNITED BREWERIES, LIMITED.

This company has been formed for the purpose of amalgamating the Zang and the Holzman Breweries, and carrying them on under one management. The breweries are both situate in the City of Denver in Colorado. They are said to be doing a large and increasing business, and by their amalgamation will secure the practical monopoly of Denver and the surrounding district. The books have been examined by Messrs. Deloitte, Dever, Griffiths and Co., and Messrs. Hart Bros. Tibbetts and Co., who certify the nett profits of both concerns for the years 1887-88 at 66,832*l*. By the amalgamation it is anticipated the profits will be largely increased. The price to be paid for the properties including all equipments, stocks, book debts, and bills receivable is 585,000*l*. The capital of the company is 400,000*l*. divided into 20,000 Eight per Cent. cumulative preference shares of 10*l*. each, and 20,000 ordinary shares of 10*l*. each; and in addition to which 200,000*l*. six per cent. debentures of 20*l*. each are offered for subscription, redeemable at 5 per cent. premium on 31st December, 1901. The list of applications will close on or before Monday, 24th June.

REPORT OF MEETING.

DOLCOATH.

DIVIDEND OF 25s. PER SHARE.

A three-monthly meeting of adventurers in Dolcoath was held on the mine on Monday, under the presidency of Mr. W. Rabling.

According to the statement of accounts, the labour costs to May 25th had been 12,003*l*. 4s. 2d.; tribute, 1,692*l*. 17s. 11d.; merchants' bills, 5,232*l*. 14s. 7d.; Camborne parish rates, 321*l*. 1s. 8d.; Stannary dues, three months, 32*l*. 1s. 9d.—total debits, 19,282 0s. 1d. Tin sold—507 tons 17 cwt. 2 qrs. 15 lbs., at an average price of 52*l*. 17s. 10d., for 26,864*l*. 6s, 5d.; less dues (1-15) 1,790*l*. 19s. 1d.; making 25,073*l*. 7s. 4d. Extra carriage, 71*l*. 3s. 3d.; discount on merchants' bills, 39*l*. 0s. 8d.; total credits, 25,191*l*. 16s. 3d. Profit ou the 12 weeks' working, 5,909*l*. 16s. 2d.

The Chairman read the committee's report, which recommended that the adventurers' subscription to the Miners' Hospital at Redruth be increased to 25*l*. He proposed that a dividend of 1*l*. 5s. 0d. a share be declared, which would allow them to carry forward a balance of 5,301*l*. 16s. 0d.

Mr. John Mayne seconded, and the motion was carried.

In supplementing his report, Capt. Thomas said: The lode in the engine shaft as you will see is gradually improving. Last time it was worth 30*l*. a fm., and now it is worth 40*l*. After about a month we shall begin to sink that shaft again. We are now, as stated iu the report, cutting the ground for fixing a new lift. When that is completed, I hope we shall be able to sink the shaft pretty rapidly during the summer months, and before we get down another level I confidently expect we shall have a still better lode. You will remember that I told you several times that there was a crossing which interfered with the lode in that shaft, but we appear to be getting through it iu the eastern part of the shaft. I have no doubt that in a few fathoms sinking the lode will still further improve. At the bottom of new east shaft, 40 fms. east of the engine shaft, there is standing the

RICHEST LODE WE HAVE EVER HAD IN THE MINE.

After sinking the engine shaft a few fathoms further we shall be able to sink that shaft. I believe there is a lode there for the length of a shaft worth 200*l*. or 300*l*. a fathom. (Applause). The eastern ground is still opening up very well. The most important improvement in the mine is, I think, on the south lode, which we have intersected at the 328 south of Harriett's shaft. That lode is worth for 6 ft. wide 40*l*. a fm., and to show the extent of the uuexplored ground in that part of the mine I may say that we have 360 fms. from here to the western boundary entirely unexplored. That is also unexplored to the east for over 100 fms. to the east of that cross-cut, so that we have an enormous quautity of ground to open on the south lode in the western part of the mine. Of course we cannot say what the value of it is, but there is work enough there for the next 20 years to open up the south lode only in the western part of our sett. We are openiug up a very good piece of ground on the south lode east of the old sump between the 314 and the 295. There is some good tin ground standing iu the back of the 302 towards the eastern shaft both in the back and the bottom of the level. We have not been working that yet, and cannot do so without hindering the shaft, aud as it is vastly important to the mine that that shaft should be sunk as rapidly as possible, we are going on with that work, and I suppose we must leave that tin ground there for a little while, uutil we get deeper, and are able to put it back to the eastern shaft at the 302. It is there, and available for taking away after a while. We are making excellent progress in the sinking of that shaft, as you will see. At the last accouut we had 2 fms. more to sink to reach the 302. We have since sunk that, cut a large plot at the 302, and sunk the shaft 11 fms. under that level. (Applause.) We are going down very rapidly with that shaft, aud the 352 is being driven by boring machine towards it. At the present rate of working in the next 12 months we shall have holed that shaft to the 352, and shall be getting down through tin ground to the 372, 388, and 400. That shaft is uot only

important for drawing stuff and sending down timber, by which the shafts here are greatly hindered, but it will also vastly improve the ventilation of the mine. At the 302 there is now a strong current of pure and fresh air coming down from surface, and when we have holed to 375 I have no doubt the same air will be brought down to that level, and will cool down the bottom of the mine. As to the accounts, they are in a very satisfactory state.

THE PRICE OF TIN HAS GONE DOWN

1*l*. 11s. 7d. per ton compared with the last quarter—52*l*. 17s. 10d., as against 54*l*. 9s. 5d. That would make a difference to our returns of 800*l*. The price of tin is, of course, not in our control. Other returns are slightly over what they were at the last account, and even with the reduced price of tin we are enabled to declare a dividend of 25s. My own opinion is that that is a very satisfactory state of things.

The meeting then closed.

ESSAMAN GOLD MINING CO., LIMITED.

MR. C. J. HARVEY'S REPORT.

June 17th.—I regret that an accident to my hand, causing a severe illness, has delayed the report of my recent visit to the company's property until my return to England. I may premise that I am more than ever convinced of the immense value of your possessions, and that only good management is required to repay your shareholders handsomely for their investment. When I left the property in September, 1887, I laid down a plan for opening up the Prestea and Broomassie sections, which, on my return to it a year afterwards, I found had been considerably departed from, and as, acting on your instructions, the management was for this and other reasons changed, I need not further allude to the matter. Prestea: My first report was necessarily based on an examination of only the small portion of the reef, which had been intersected by Essien's tunnel, and having now examined it in the level for about 500 ft., I am able to give you a better idea of its character. It is of a variable width, from 5 to 15 ft., averaging probably about 8 to 10 ft., and consists of several distinct bands varying in thickness and richness, and most difficult to separate. Veins of graphite and yellowish brown clay containing gold also intersect the reef in places, and at intervals shoots of exceeding richness are met with, on one of which, in the native concession recently acquired, the miners have, in exceptionally dry seasons, been able in several places to get below our level, while all the information obtained on my first visit led me to believe the maximum depth reached by them was 90 to 100 ft. This necessitates a change in our plans, and while the present level is being continued, I must strongly urge you to lose no time in pushing down a shaft to cut the reef 60 ft. below it, which will open up an immense extent of virgin ground, richer, I believe, than anything found above. I selected a spot for this shaft at a point between two of the rich shoots, near the northern boundary of the section, in order to get under the native shafts above-mentioned as soon as possible, and the work had been commenced when I left; but for want of labour not so much progress had been made as I could have wished. However, I hope more Krooboys will have arrived soon afterwards. In the meantime, in accordance with my instructions, the whole of the reef taken out is being passed through the mill, as while the average is reduced by the inferior portions, the poorest of them are good enough to pay for crushing, and from the experience I have gained I am convinced that with sufficient stamping power even 5 or 6 dwts. per ton will pay expenses, and with such a splendid reef to work upon the whole, when fairly open, should give at least 1 oz. per ton, though of course the returns must of necessity vary. The new shaft should be down by the end of this year, and in the course of the following year there should be enough ground open to supply another 20 head of stamps, which should be shipped in May. Mill: The 12 heads of stamps are doing very good work, and the other 12 heads would soon be erected. The supply of firewood is not yet sufficient in quantity, and more rails must be sent to facilitate its transport. Treasury Mine: With our better knowledge of the nature of the old workings, which on this hill have been very extensive, this mine should not be opened by a level, but by a shaft, interseeting the reef at about the same depth as the shaft in Prestea, so that the two levels will be in time connected. Winding and pumping gear must be provided, and the quartz from this section can be brought to the Prestea stamps by a short tramway. Qua Badoo concession: The lode in this concession is only traceable by the native workings on a hill lower than those at Prestea and Broomassie, and a careful examination convinced me that it would be useless to cross-cut for the reef, which has evidently been worked down to water level, and it must therefore be attacked by a shaft when work is decided upon. Broomassie: The level driven on this concession has, in my opinion, been useless, for the simple reason that it is in ground too shallow to give sufficient backs to work, and if continued would intersect the shafts sunk by the tributers at about their lowest point. For this reason, and labour being scarce, I determined to suspend operations here and to concentrate all work on Prestea. There are two courses available to open up this mine, viz., to enlarge and continue sinking the intermediate shaft, now 66 ft. deep, a further 60 ft., cross-cut the reef and drive on it, when the rich shoot from which we obtained 3½ ozs. per ton from the tributers quartz, would be reached at about 350 ft. from the shaft. To do this, winding gear and a pump will be necessary, and this plan certainly offers the readiest means of opening out the mine at a very moderate expense. The other course is to drive a tunnel 370 ft. long at the foot of the south-east face of the hill, which would cut the reef at 170 ft. from the surface, and enable the stamps to be placed nearer to a good water supply than in the other case, but the time required to drive the tunnel would, of course, be greater than to sink the shaft. The opinion I expressed of the great value of this mine is in no way modified, and I trust no long time will elapse before it is taken in hand. Generally speaking, my conviction that no part of the world offers better prospects for mining than the Gold Coast is more and more confirmed, and its development by European enterprise must be merely a matter of time now that the way has been made clear. Steady, sober men must be selected to send out, and they need have no fear of the climate.—C. J. Harvey.

AFRICA.

LATEST FROM THE GOLD AND DIAMOND MINES.

Consort Reef.—The African Gold Share Investment Company, Limited, have been appointed agents in London to this company.

Gordon Diamond.—Week ending 15th June.—Loads blue hauled, 6,400; loads blue washed, 5,100; value of diamonds produced, 1,800*l*.

South African.—The following particulars of work relate to the week ending May 18th:—Blue ground hauled, 5,515 loads: blue ground washed, 4,573 loads; diamonds obtained, 1,369 carats; estimated value, 1,610*l*.

London and South African Exploration.—The directors of this company have declared a dividend of 3s. 6d. per share, less income tax, for the quarter ending the 30th inst., payable on and after that date. The transfer books will be closed from the 21st to the 30th inst., inclusive.

South Standard.—Report dated Johannesburg, 24th May:—All the foundations will be ready by the time plant arrives, after which progress will be more satisfactory. The main shaft has been sunk 4 ft., and timbered 6 ft. Total depth, 67 ft. 6 ins.; the rock is getting harder, and I think after another 10 or 12 ft. we shall be able to dispense with timbering. The leader has nearly run out of the shaft; shall drive back for it at the 100 ft. level. From the appearance of formation, I believe we shall strike a reef within that depth.

Witwatersrandt "Venture Syndicate."—The manager at the mine, writing under date 23rd May, says:—This week I have nothing of importance to report. The mine is progressing in a very satisfactory way, and the work is still continuing without interruption. We are still going down in the shaft, and are now in hard rock. The water at present seems to have diminshed considerably. I have found it necessary to timber the shaft up to the present depth, as it would have been unsafe without it. This has been rather an expensive item, as wood is very scarce, but I think now we are in hard rock no more will be needed.

Essaman.—This company has sold, through Messrs. Johnson, Matthey and Co., 199 ozs. gold, the produce of April crushing realising 758*l*. 7s. 6d. The manager reports: I am glad to say that 19 days' crushing has yielded about 180 ozs. I am sending you about 200 ozs., but this includes what was left behind from our last crushing. We have a big lode now in every face, and the stone is as good in quality, on the average, as any we have previously had. We are still crushing everything as it comes from the mine. Mr. Harvey has returned to England, and his report will be in the hands of shareholders in a few days. We publish this in our present issue.

Douglas Developing Syndicate.—Report dated Johannesburg, 24th May.—Shaft C has been sunk 2 ft., and timbered 6 ft. Water is now making at the rate of 450 gallons per hour; this keeps the boys going nearly the whole time. The last 4 ft. is all through banket, showing good prospects of coarse gold. The dip cannot yet be ascertained, but think this reef will prove fully 6 ft. thick; pannings appear better as we approach the footwall. Shaft D has been sunk 2 ft., greater part of the week timbering; total depth, 54 ft. Formation is turning to hard red slate, bringing large quantities of water. From the nature of rock now appearing I believe we are near a reef. At present I have four miners and 29 Kaffirs working in both shafts. Upon the arrival of engine 8 will be released, and with those I will open up block 97. A new company the "Monitor" has taken up the ground adjoining us south, and they have commenced work, which will materially assist us.

Transvaal Gold Exploration.—Mine manager's advices, dated 20th May.—Mines—Theta vein: The weight extracted from this vein for week was 70 tons, assaying 12 ozs. 4 dwts. gold per ton, and 30 tons, assaying 1 oz. 4 dwts. per ton. Three drives were being put in. In one, where the vein was smallest, it was cut off by diorite. In others it continues without material change. Beta vein: Extracted during the week, 10 tons, assaying 1 oz. 13 dwts. per ton. Columbian Hill: From drive 22, 115 tons have been extracted, assaying 2 ozs. 11 dwts. per ton. The vein is 5 ft. thick, and has every appearance of continuing. Jubilee Hill: Ore extracted at this place from trench No. 804 was 15 tons, assaying 2 ozs. 14 dwts. per ton, and from No. 807, 5 tons, assaying 4 ozs. 8 dwts. per ton. Brown's Hill Mill—Battery: During week the battery was at work 96½ hours, and crushed 99 tons of Theta ore, assaying 6 ozs. gold per ton. Usual clean-up from plates yielded 515½ amalgam. Want of transport hindered operations. Pans: These ran 132 hours, and treated 35 tons mixed blanketings, assaying 4 ozs. 9 dwts. gold per ton.

Namaqua.—The second ordinary general meeting of the shareholders will be held at the Terminus Hotel, Cannon Street, on Friday. The transfer books will be closed from this day to the 28th inst.

The National Provincial Bank of England are now prepared to issue certificates of deferred charge North-Western Railway, against delivery of allotment letters and bankers' receipts.

The letters of allotment and regret for England and Holland in the Lankat Maatschappy have been posted.

Removal.—We are requested to state that on and after the 24th inst. the offices of the United States Gold Placers (New Company), Limited, the Gold King, Limited, the Gooding Placer, Limited, the Gold Queen, Limited, the Comstock Mining Company, Limited the Manica Ophir Mining Company, Limited, and the Matabele Concessions, Limited, will be at 31, Lombard Street, London E.C. instead of 3, Broad Street Buildings, E.C., as heretofore.

Gold Mining Exhibition at the Alexandra Palace.—We are pleased to be able to state that the exhibition has secured good entries, including Messrs. Harvey and Co., 1,500 ft., C. Appleby and Co., 1,000 ft.; Davey, Paxman and Co., 800 ft.; W. G. Bagnall, 400 ft.; Sandycroft, Vacher, Hathorn, &c., &c., &c. Entries can *still* be received for quartz, nuggets, fuses, assay apparatus, picks, &c. It is possible there will be blasting experiments in grounds, and the lighting will probably be by the Lucigen Company. Mr. G. Leighton Hare is the secretary.

THOMAS THOMPSON,

STOCK AND SHARE DEALER,

8½, ANGEL COURT, LONDON, E.C.

Telegraphic Address:—"NOSMOTH," LONDON.
Telephone No. 509.

Bankers:—THE CITY BANK, LIMITED, and THE ROYAL EXCHANGE BANK, LIMITED.

Mr. THOMPSON transacts business in all classes of Securities, Bonds (Foreign and Colonial), Banks, Railways, Insurance, Telegraph, Tramway, Gas, Water, Mining, and all Miscellaneous Shares. Shares sold at special prices for Forward Delivery (One, Two, or Three Months) on Deposit of 20 per cent.

Orders by Letter or Telegram promptly attended to.

THE

Mining World & Engineering Record.

ESTABLISHED 1871.

Shareholders desiring FULL REPORTS of the MEETINGS of the Companies in which they are interested should Subscribe to and Read the MINING WORLD—6d. weekly. One Guinea per annum, post free.

Half-year, 10/6; Quarter, 5/6. All subscriptions payable in advance. Subscriptions for the Continent, £1 3s. 6d.

Orders to be sent to

W. Dunbar Quinlan,

234, 235 & 236, Gresham House, Old Broad Stree London, E.C.

CONTINENTAL AGENCY,

at which the MINING WORLD may be purchased every Saturday

PARIS	- - -	224, RUE DE RIVOLI.
NICE	- - -	15, QUAI MASSENA.

Subscriptions will also be received at the same addresses.

NOTICE TO READERS.

Replies to Annual Subscribers will be sent by wire or letter, as may be necessary.

Non-Subscribers must send fee of 5s. 0d., in order to have their enquiries answered in "Mining World," or by wire or letter, as requested.

J. L. D.—Take your profit.
P. R.—Unsaleable on the market.
R. James (Newcastle).—Hold all except Nos. 1 and 7. Sell these at best.
B. Stones (Weymouth).—We are afraid your money is lost. You can only wait.
Investor (Newport).—At the present state of the market we advise a purchase.
N. Hadley (Wilts).—Sell Nos. 3, 5, and 6, for what they will fetch. Keep others.
H. S. Worston (Manchester).—We cannot say unless you explain to us more fully what you wish done.
X Y (Bristol).—Buy a few more of each. You may yet get out without a loss.
M. Mills.—The name is quite fresh to us. Send the address and we will make enquiries.
O. O. (Southampton).—As far as we know he has absconded.
Dubious One.—Have nothing to do with the company named. Your money is lost if you do.
S. A. P. R. (Fifeshire).—Join both re-constructions. You cannot go wrong by so doing.
Banker (A. A.)—You cannot do better than hold on until September.
Capitalist (R. H.)—Messrs. John Taylor and Sons are the managers. Their address is Queen Street Place, London, E.C.
Inquirer.—Sell La Velera shares if you can.
Durham Allen Reef.—We expressed our opinions pretty freely about this concern last week. Get rid of your shares as soon as you can.
G. M.—Champion Reefs should be taken up.
G. W. D.—The "Great She" board requires strengthening in the region of the backbone. Mr. Lewis Levy's proposal should have been adopted.

The Mining World.

LONDON: SATURDAY, 22ND JUNE, 1889.

The "MINING WORLD" is not the property of a Mining Speculator nor under the control of any clique.

THE STATE OF TRADE.

THERE can no longer be any doubt that the trade of the United Kingdom is expanding very considerably, and that the condition of things generally is healthier and sounder than it has been for some years past. In the staple industries, iron, coal, and textile manufactures, a great amount of activity is observable. During the depression, which has now given place to a period of prosperity, the stocks of pig and manufactured iron and steel rose to an unprecedented amount with the result that prices dropped away continuously, and furnaces were shut down in considerable numbers in all the leading centres, particularly in Scotland. But within the past few months the demand for home consumption and for export has been so great that stocks have been run down very rapidly, and they are now quite unusually small. In the same way, and as a necessary consequence, the coal trade has assumed an unwonted condition of vigour. Then, when we turn to the great textile industries, the cotton, woollen, and worsted manufactures of Lancashire, we find that the long standing depression has been replaced by very brisk trade. Mills which were closed for months together are again in full swing; other mills are being erected, and in spite of a general advance in the prices both of raw materials and of manufactured articles, the orders now in hand give a guarantee that full employment will be given to operatives for the whole of the current year at least. The improvement in these leading branches of our trade is naturally reaching on industries of lesser proportions. As we stated last week the tin trade, for instance, has settled down into a condition of fair activity, and of something more than fair activity in connection with the manufacture of tinplates. Lead is, unfortunately, dull, though even that metal shows some signs of recovery; while copper is decidedly firmer again.

If any additional evidence were needed of the revival in trade, it can easily be found in two directions; one, the traffic receipts of the railway companies: the other, the returns of the Banker's Clearing House. The figures in the former case lead to the expectation that the gross receipts of the principal English and Scotch lines will, in the curreut half-year, show an increase of fully a million and a-half sterling over the corresponding half of last year, and of this about a million will be due to the larger quantities of goods carried. Then, the returns of the Banker's Clearing House to date, exhibit the enormous increase of 347,000,000*l.* over the clearings to about the same date a year ago. Evidences such as these are unmistakable. They show clearly that trade is expanding very rapidly, and as money is cheap and abundant—the stock of coin and bullion in the Bank of England alone exceeds 23,500,000*l.* — there is every prospect that the expansion will continue to make progress as the year advances. The one unfavourable element in the position is the labour disputes in the coal trade and amongst the seaman and firemen engaged in our mercantile marine. There seems reason to believe, however, that the spirit of compromise which has already done so much towards restoring harmony between employers and employed in South Wales, will spread to other districts, and that by mutual concessions any check to business from this cause will be obviated. If this should be the outcome of the disputes, there will be no reason for disatisfaction in the condition of the trade and commerce of the United Kingdom.

GYMPIE GREAT EASTERN.

The mining share market just now offers some favourable opportunities to investors, for even in companies sound in position and very encouraging in prospects the prices of shares are exceptionally low. A case in point is the Gympie Great Eastern Company, the shares in which stand at over 50 per cent. discount. Rather more than a year ago, it will be remembered, the shares in this undertaking suffered a heavy fall in consequence of a somewhat gloomy report upon the property by Mr. Davey. We have always held that the pessimist views raised by this document were misplaced, and the course of events has fully justified our opinion in the matter. We have not the slightest doubt that Mr. Davey reported in the most absolute good faith; but, as the phrase runs, no miner can see beyond the end of his pick, and the progress of the development in the past year has shown that the auriferous deposit from which the returns have been made is of a more lasting character than Mr. Davey supposed. At all events, the crushings have gone on uninterruptedly, and the profits obtained have provided the means of opening out the mine in depth, and at the same time, of paying handsome dividends to the shareholders. The company is just about two years old, and during its existence the shareholders have received 8s. 9d. per share in the shape of dividends, or about 22 per cent. on their investment. As things go, 22 per cent. is uot a bad yield, and, as the indications in depth lead

to the belief that the rich deposit from which returns are at present being made will again be cut at a lower level, we think the shareholders have every reason to be satisfied with their property and its prospects. Bunchiness is not the characteristic of the Queensland mines generally, and we are confident that Gympie Great Eastern will prove no exception to the rule. It may be of interest to show in tabular form what have been the results of the working during the current half-year, as shown by the monthly returns. The particulars are as follows :—

	Tons.	Ozs. of Gold.	Value.	Profit.
January ...	580	960	£3,360	£2,400
February ...	600	990	3,460	2,300
March ...	600	1,029	3,560	2,500
April ...	600	1,077	3,770	2,600
May ...	600	1,067	3,730	2,670
June ...	600	1,100	3,860	2,850
Totals ...	3,580	6,223	£21,740	£15,320

These figures are, of course, only approximately accurate ; but they are not likely to be very materially altered when the year's operations come to be stated in full detail. They show, at all events, that the yield of gold and the profit obtained have gone on increasing, and that very nearly three-fourths of the gross yield of the ore is net profit. Under these circumstances it is certainly strange that Gympie Great Eastern shares should be so unduly depressed in the market. The only good point about the matter is that it gives those who have confidence in the property the opportunity of securing an interest in it at a very cheap price.

PALMAREJO.

IN another column will be found a *verbatim* report of the Palmarejo Mining Company's general meeting, and we invite a perusal of it. From a mining point of view the statements are interesting and instructive. Mr. Pigou, the chairmau, has by his late visit to Palmarejo and by his able address from the chair proved himself not only capable of active administration, but of concisely explaining the position of affairs to his shareholders. We feel bound, however, to comment upon the reserve exhibited throughout the whole of his statement, which appears to us to have been too closely confined to facts. All stated was favourable and most encouraging, yet we think "the advantages shortly to be made known" aud to which he alluded in so pointed a manner should have had a clearer exposition, or else have not been referred to. Of course the position of a new chairman is necessarily delicate, as he cannot, out of respect to the old board, dwell too much upon personal effort ; at the same time the bold expression of personal conviction has so much weight that we welcome it where it is forthcoming. Had such been fully brought home to the shareholders of a well-known company when their position was almost identical with that of the Palmarejo, many of those who sacrificed their shares at 15s. would have retained their interests and participated in the subsequeut prosperity. The Palmarejo is not a mining company in an ordinary sense of the expression, and we have no hesitation in calling public attention to it us an association likely to occupy a prominent place among the successful exploration companies of the future. No critic has ever ventured to throw a doubt upon the great wealth of the lodes already developed. The reserves of ore ready for transit have been stated at three millions sterling, without reckoning the lower and probably richer levels. The work rcally depends upon engineering rather than mining science, and every shareholder should take a keen interest in the progress of it. It is towards an undertaking such as the Palmarejo Mining Company that we look to increase public confidence in mining enterprise, and bearing this point in view we propose from time to time to criticise not merely the prospects of the Palmarejo, but the administration of the company's affairs. Our criticism will certainly be made in no hostilc spirit, although we shall not shrink from expressing our views in plain words, and, we trust, for the benefit of the large body of shareholders in this concern.

THE TRANSVAAL GOLDFIELDS.

(From our Correspondent.)

22nd March.

HAVING devoted my attention in previous letters to the De Kaap and Witwatersrandt Goldfields, I now proceed to give a brief description of the other goldfields of South Africa under their proper heads, and if my readers will refer to a map they will at once perceive the enormous area of auriferous deposits in this country, extending from the Knysna in the south, to the Tati in the north, a distance of upwards of 1,200 miles as the crow flies.

KLERKSDORP.

In a certain sense Klerksdorp may be said to be one of the most noted towns in the Transvaal. Although only a mere hamlet until about eighteen months ago, being situated on the great northern road to the interior, it was looked upon by hunters after big game, by travellers intent on scientific explorations, and by missionaries, as the last outpost of civilisation from which they could obtain their supplies, and here it was for a long period that hunters brought down their loads of ivory and other produce for disposal. At last, about the end of 1887, it got noised abroad that auriferous deposits had been found in quartz on the town commonage, and the Government having been prevailed upon to declare the locality a public goldfield, it received considerable attention, although at that time the Witwatersrandt fields were the great attraction. For some months Witwatersrandt kept the excitement in suspension, but it was soon ascertained that the Klerksdorp reefs were as rich as their rivals, and the result has been that during the last six months the once despised hamlet has become a large town and the centre of a promising mining industry. Already there are 14 companies and syndicates at work, and notwithstanding the present temporary depression in the share market they are in considerable public favour. Of these the Nooitgedacht may be called the pioneer, and the crushings of this company are attracting considerable attention. On this subject I shall have more to say in future letters. Investors and speculators will do well to keep the Klerksdorp Goldfields in view. The area of auriferous ground is very large, so much so that some experts aver that the reefs continue from thence to Johannesburg, a distance of about 100 miles north-east, and that they also extend right through to Middleburg, which is 50 miles further. And I may add that not a fourth part of this large tract of ground has yet been properly prospected.

MALMANI.

The Malmani Goldfields are situated on the western side of the Transvaal, contiguous to the Bechuanaland frontier. The principal town is Zeerust, aud it is asserted that gold-bearing reefs run along both banks of the Malmani River to its junction with the Marico, and the country in that direction is well wooded, and has a considerable water supply. Gold has been known to abound here for some four or five years past, and two or three companies have commenced operations, but, somehow or other, the Malmani district is under a cloud, and the works are carried on in a spasmodic sort of fashion. Serious difficulties have been encountered owing to the hardness of the rock, to the erratic nature of the reefs, and to the presence of unmanageable quantities of water, which rapidly flood the workings whenever a mine is opened out. This really means a want of capital, because mining engineers who have examined the reefs contend that there is every prospect of an average of an ounce to the ton, which could be obtained if capital and good engineering work were brought to bear on the properties.

THE TATI FIELDS.

In point of years the Tati Goldfields may be said to be the oldest known modern goldfields in South Africa. It must be remembered that the Tati is far beyond the extreme northeru frontier of the Transvaal, and that more than 20 years ago, when it was rumoured that there were auriferous deposits there, adventurous prospectors found their way thither, it being outside the Transvaal, where, at that time, a rigorous law was in force prohibiting goldseeking in that State under any circumstauces. The first expedition of any note which proceeded to the Tati was under the supervision of Sir Johu Swinbourne, Bart., aud Capt. Levert. They left England in 1868 with a costly equipment, and they reached the Tati, by way of Natal, in April, 1869. They found that several prospectors had preceded them, and quite a little village camp was formed, a small stamping battery in working order, and several shafts sunk. From some cause or other the crushing machine did not work well, and ultimately it turned out a failure, but the richness of the ore was so apparent that specimens were sent home to Messrs. Johnson and Matthey for assay, and these were certified to yield from 5 to 60 ozs. to the ton. Notwithstanding these results, the expedition was not a success. Want of capital, and, above all, want of experience, brought about a want of faith, and for several years the Tati Goldfields were practically abandoned. Nothing daunted, Capt. Levert again returned in 1876, and erected new crushing machinery, and from 19 tons taken from one reef he extracted 42 ozs., and from another reef 2 tons yielded 16 ozs. In 1870, Sir John Swinbourne left a Mr. Griete in charge whilst he returned to London, and during his absence, in 1872, upwards of 2,000 ozs. were sent home from this locality. In the meantime the prospectors obtained deeds of grants and concessions from the native chief in favour of what was called the Limpopo Gold Mining Company. These grants extended from the River Tati to the River Shashi, and considerable work was done in the old mines found there, but they could not work the numerous reefs discovered for the want of sufficient capital and proper machinery. Several hundredweights of quartz were brought down to the Diamond Fields, and assayed, in 1881, proving the richness of the gold, and on the strength of this, the concession was offered to a financial firm in Paris for 100,000*l*., but the negotiation fell through. A Mr. Dobbie and his friends then fitted out an expedition on their own account, a Mr. D. Francis providing the machinery, it is said, to the extent of 10,000*l*., but they also were unfortunate, as several members of the expeditiou fell victims to the summer fever. Subsequently, troublous times befel the whole country during the series of native wars that took place about this time, and Matebeleland, where the Tati is situated, was deemed unsafe. Within the last two or three years, however, the Queen's protectorate has been extended over the whole territory, and there being, beyond all doubt, large areas of auriferous reefs between the Tati and the Shashi, we shall, doubtless, before very long hear of other prospectors again trying their luck. I am not quite sure whether

the somewhat notorious Rudd concession, which I notice was the subject of some questions in the House of Commons a month ago, covers all or any part of what is kuown as the Tati Goldfields, but whether it does or does not, I should strongly recommend my readers to watch carefully all I may have to say in future on the subject of that famous concession.

(*To be continued.*)

THE CHAMPION REEF GOLD MINING CO. OF INDIA, LIMITED.

THE joint production of the Mysore Gold and the Goldfields of Mysore Companies has received the baptisual name of "the Champion Reef Gold Mining Company of India, Limited." The name is justified by the geographical position of the property, or properties, acquired. The sponsors are Sir Charles Tennant (chairmau of the Mysore Company), the Right Honble. Lord Ribblesdale (chairman of the Goldfields of Mysore), and a number of other experienced and influential gentlemen, including Mr. John Taylor, of the well-known and highly respected firm of Messrs. John Taylor and Sons. In passing we may say that the mining operations will be under the immediate superintendence of this firm, and this is a guarantee that no money will be wasted, and no time lost in bringing about the very reasonable hopes that are held forth in the prospectus. In fact, few mining enterprises of which we have cognisance have ever started upon a broader basis of facts or upon a more solid substratum of actual results than the Champion Reef Company. It is a matter of history that the Mysore Company, which is selling part of its property, has already yielded considerably over a quarter of a million sterling in gold, and it is equally notorious that the Ooregum returns are increasing month by month, that for May alone having been 5,260*l*. The properties are divided on the map which accompanies the prospectus into three blocks, having a total area of about 453 acres, and a length of about 5,470 ft., or upwards of a mile on the run of the lodes. That part acquired from the Mysore Company lies immediately between, and contiguous to, the Mysore Mine to the south, and the Ooregum to the north, with a length of 3,490 ft. on the course of the Champion lode. It is practically an extension of the ground now being worked by the Mysore Company to the south and by the Ooregum Company to the north. The property acquired from the Goldfields of Mysore, Limited, consists of a section of ground known as the Coromandel block, together with a block to the west, situated between the Nundydroog Mine to the south, and the Balaghat Mine to the north, and having a lineal measurement on the run of the Champion lode of 1,930 ft. In Prospect shaft, on this block, quartz has beeu found which was left standing by the ancients, worth from 15 dwts. to 1½ ozs. to the ton. The various shafts are provided with pumping and winding machinery, which is included in the purchase price, and which will be taken over in full working order. Mr. Bell Davies has reported most favourably upon this sett, and it should not be forgotten in regard to this gentleman that it was he who, so far as English capital is concerned, discovered the Colar goldfield. It was, in fact, upon his report that the original Mysore Company was established. Judging from our correspondence there seems to be, upon the part of some of our readers, a misapprehension which we are anxious to remove. The vendor companies are not proposing to sell 453 acres for 200,000*l*., as has been supposed. The purchase price is really 132,000*l*., of which the greater part is in fully paid shares. The actual terms are as follows: 22,500 in cash, 87,500*l*. in fully paid shares, and the balance (22,000*l*.) in cash or shares, or partly iu cash and partly in shares, at the option of the directors, whilst 68,000 shares completing the capital, are reserved to provide for working capital. If it should be argued that these terms are onerous, it should be remembered that the new company is practically buying a proved mining sett, and that the shares of the Mysore and Ooregum Companies are selling in the market at about 1¼ million sterling. If the vendor companies were proposing to sell on these terms, before their mines had been proved, the terms might not only be described as onerous, but absurd, but as the success of the Colar field in general, and of the property to be bought in particular is now a matter of common knowledge, we can only come to the conclusion that those who may become shareholders in the Champion Reef Company will be acquiring at par, an interest which, at no distant date, there is every probability they will be able to sell at a premium.

CONSOLIDATED ESMERALDA REPORT.

IN anticipation of the meeting, on Monday week, the report of the directors of the Consolidated Esmeralda, Limited, has been issued, and it is accompanied by that of Mr. Colcord, the manager. The value of the bullion extracted during the year was 13,648*l*., and the total amount since work was commenced, in August, 1887, was 20,607*l*. The estimated profit of the Durand Mine was 6,104*l*., but all of it has been spent on capital account. The operations during the year are considered by the directors to be so satisfactory as to be worthy of further extension in the new financial year upon which the company has now entered; and the various paragraphs in the report, each of which will be read with the greatest interest by the shareholders, lead up to the re-construction of the company for the purpose of finding the working capital, which can, as the reports of the directors and manager show, be so advantageously employed. The present capital is 500,000*l*., and that of the new company will be the same, in 1*l*. shares, credited with 17s. 6d. as paid; and the calls, by sixpenny instalments spread over long intervals, will furnish an amount of 62,500*l*., and thus provide Cousolidated Esmeralda with that financial backbone in the shape of working capital which has hitherto been denied it by hard fate. Each of the shareholders will be entitled to a similar number of shares in the new company to that they hold in the present company, and we cannot think that auy of them will refuse the offer made—indeed, we anticipate a very strong demand for the shares. That there is every warrant to proceed is found in the substantial fact that 2,463 tons of ore have been crushed, and that 5,267 ozs. of standard gold have been extracted. It is impossible to find space this week to do justice to the merits of this report, but the general position is summed up in the words, "the mine has never looked better than it does at the present time." We observe in Mr. Colcord's report that operations have been concentrated upon the Durand aud Live Yankee Mines, and also upon the perfection of the mill. Mr. Colcord sketches out his plan of future operations, invites criticism and inspection of his work by an unbiassed and competent expert, and wishes that he may address himself chiefly to this point—whether the developments have been "of sufficient importance to justify the company in increasing their expenditure to the extent of putting the Del Monte machinery in order, clearing the water from the shaft, and extending a drift to the Durand from that point. We have reached the limit with present facilities and must consider plans for future operations. This being the most feasible, as requiring the least outlay, should first be considered. The next and only other alternative is a new shaft on Middle Hill."

At the forthcoming meeting we feel persuaded that the shareholders will support the policy of the directors, which commends itself to practical mining experience as well as to common sense.

YURUARI.

THE resolution to be submitted by the Yuruari directors to the extraordinary general meeting, which will be held on Monday, will come at the first blush as an unpleasant surprise to the shareholders. The issue of 1,000,000 shares at 2s. 6d. each is no light matter, even though it be made to get rid of the incubus of a debenture debt which burdens the company with interest charges, and may, under contingencies easily to be imagined, threaten its very existence. It does not follow that if the resolution is passed the shares will be issued; but even assuming that they are, when the first call of 6d. per share is made, the new issue will be on precisely the same footing as that now existing. It has been urged in letters we have received that the directors might have made a call on the existing shares sufficient to clear off the debentures, and there is a great deal of force in the suggestion; but still the board must be presumed to know the position of the company better than outsiders, and the shareholders on Monday next will be able to demand from them any explanation that may be considered desirable. We are inclined to think that a call, or calls, on the existing shares would have been preferable, but we are prepared with open mind to listen to what the directors may have to say on Monday. We cannot but admit that there is force in their remark that "the new capital thus created for the purpose of paying off an outstanding liability of the former company will not mean an actual increase in the capital of the company, but be practically only the issue of new shares in place of debentures, and thereby get rid of the large annual payment of 10 per cent. upon the present debentures." The disadvantage of the new capital will be that it will permanently water the shares, aud its advantage will be that it will not menace the existence of the company like the debenture issues which it replaces. Meanwhile, all the news from the mine is decidedly encouraging, and we understand that the directors desire nothing so much as to meet the shareholders face to face, so that they may give them all the information they possess, and every explanation that may be desired.

COLAR CENTRAL AFFAIRS.

AT the meeting of this company, held yesterday, the scheme of the directors with reference to the acquirement of the Eastern Mysore property was adopted by the shareholders without a dissentient voice. The statement of Mr. Malcolm Low, M.P., the chairman, was so explicit that it left scarcely a question to be asked, or an explanation to be given. Mining on the Colar Central section has practically failed, and though operations will still be conducted at what is called the No. 4 shaft, actually the hopes of the shareholders are now centred in its Eastern Mysore ground, which has been acquired upon what we cannot but regard as astonishingly favourable terms. The surprise of everyone is that the Eastern Mysore shareholders had not the backbone to find money for the development of their own most promising mine, but their neglect has been Colar Central's opportunity. There has been exposed in this mine, by costeaning pits and trial shafts, a continuous run of at least 700 ft. of a promising lode and Mr. Oakley's reports and letters are full of encouragement to proceed with that vigour and determination which has hitherto characterised the action of the board. We must

certainly compliment Mr. Low and his colleagues on the promptitude with which they recognise facts and shape their policy in accordance with them. When gold mining in the Wynaad had proved abortive, they, as directors, saved the Indian Consolidated Company by buying, at almost a nominal price an important tract in the Colar field. Later on they sold for a substantial sum a portion of this tract to the Colar Central Company. Recognising that operations thereupon had not been attended with the success there was every reason at the outset to expect, they have now, as Colar Central directors, on ridiculously low terms, bought what is regarded by experts as a proved property, and have thus given to the latter concern a chance which did not appear to be within its purview two or three months ago. For the full details of this property, and for the gratifying auspices under which its development has commenced we must refer our readers to our full report of the meeting held yesterday. The interests of Colar Central and Indian Consolidated are so identified (for the shareholders to a large extent are the same) that no apology was needed from Mr. Lambert for the statement he made that, not being quite satisfied with the manner in which works have been carried on at the latter company's mine, the directors had asked Capt. Plummer to make a special report upon them. When this is received a meeting of the shareholders will be called.

BALAGHAT MYSORE.

AT the adjourned general meeting of this company, held on Wednesday last, nearly two hours were spent in a somewhat acrimonious discussion, which led to no practical result. A requisition has, however, been placed in the hands of the secretary, asking that another meeting may be convened, for the purpose of removing the present board from office, and electing another in its place. We regret that this quarrel should have arisen at a time when the company is suffering from ailments which are almost inevitable in the early stages of a mining company's history. That there is gold on the property has already been proved, and we have little doubt it is there in paying quantities; but, like its remarkable neighbour, the Mysore property, its riches will probably be found as depth is attained. It therefore behoves those who have the management in their hands to exercise the greatest prudence and economy in the development of the property. The present board, notwithstanding the concessions they have made with regard to their fees, have not, it is evident, the confidence of all their constituents, and under the circumstances we think a change may be beneficial.

A CURIOUS ARRANGEMENT — AN AMERICAN BREWERY COMPANY SELLS TO AN ENGLISH COMPANY.

BEFORE listening to the siren voice which speaks in the pages of the prospectus of Schmidt Brewery Company, of Chicago, Limited, we invite our readers to ponder one or two facts. This is an American brewery company, which is selling its property to an English brewery company, but for the reasons of such sale the prospectus may be searched in vain. This omission we can supply, inasmuch as the intermediary between the vendor company and the purchasing company, a Mr. Harry Fleet, has fixed the purchase price at 240,000*l.*, of which he is to accept 65,000*l.* only in fully-paid shares. The vendor company will make a very good bargain if it can only make these terms with the British public, who we trust are not quite so enamoured of the modern Baal of Beer as to bow down and worship it at such a price as this. By a sort of "nails in the horse's shoe" process, the persons who have become connected with this affair in the capacity of directors, and who are remarkable for nothing so much as their financial courage in rushing into a concern from which men of more prudence would shrink, figure up the profits to a fanciful total of 14 per cent. on the ordinary shares. The capital of the purchasing company is, first of all, of ordinary shares to the amount of 75,000*l.*, cumulative eight per cent. preference shares, 80,000*l.*, and six per cent. debenture stock 95,000*l.* There is an ominous allusion to a "brewery war," and to bad debts. On the whole, we are not enamoured of this prospectus, and cannot advise our readers to apply for shares.

A THIRTY PER CENT. COMPANY.

NEXT week there will be held the meeting of the New Guston Company, Limited, whose experience has been somewhat unique. It was registered on September 15th, 1887; on November 15th, 1888, it paid its first dividend of 2s. per share; on December 24th of the same year it paid its second dividend of 2s. per share; and on July 1st of this year it will pay its third dividend, also of 2s. per share, or 30 per cent. on its working capital in 10 months. At the time the present shareholders took over the mine it was considered valueless. Under the auspices of the present committee of management, who took office in June, 1888, and whose names will be recognised as those for the most part of gentlemen who occupy a similar position in connection with the successful Montana Company—Mr. Frederick P. Crowther, Mr. Thomas Phillpotts, Mr. Stewart Pixley, and Mr. Dyson Weston, with Mr. John Darlington as consulting engineer—the mine was re-constructed with 17s. 6d. per share credited as paid, leaving a liability of 2s. 6d. Of this liability 1s. was paid up when the shares were allotted, leaving a liability of 1s. 6d. per share. It is by the expenditure of this 1s. per share that the dividends of 6s. per share have already been declared, with prospects of "more to follow." The mine, which is situated in the Red Mountain district of Ouray county, Colorado, was discovered in the autumn of 1881 by a party of four prospectors, who, in the following year, discovered the claim called the "Yankee Girl." It was owned then by a syndicate who converted it into the Guston Silver Mining Company, which, after executing various works, finally went into liquidation. The present management, before connecting themselves with the property, caused a thorough technical examination of the ground to be made, and after pumping out the water, decided to do certain work, with the result that within 12 feet of the main shaft an important discovery was made on the 12th August, 1888. From that time until the present the ore produced and sold has realised 45,000*l.* The capital of the concern is small—92,500*l.* called up, leaving a balance in reserve of 7,500*l.* The mine superintendent is Mr. Schwarz, and the general manager is Mr. George Crawford. The latter gentleman is part owner of the "Yankee Girl," and it was the success of this mine, some 300 ft. off, that induced him to take an interest in Guston affairs. The produce of the company is mainly silver, though there are traces of gold. There is also found in the ore from 4 to 6 per cent. of copper which has hitherto paid nearly the whole cost of treatment. It will be gathered from these facts that at next week's meeting the committee of management will have no ordinary statement to make to the shareholders.

PROSPECTS OF EL CALLAO.

THE report of the directors of this company has now been issued. That of Mr. Hennen Gennings was published in anticipation some weeks ago, and to that we need only refer now by stating that it showed the extensive character of the work that had been done on the property. "Besides the explorations which have been going on in the direction of the 'pay shoot,' an examination has been made around the area of the cave which took place in 1879. In this portion of the mine a large amount of rich and profitable ore was found. The remaining ore in this area was given up as lost until 1888, since a fruitless attempt was made some years back to penetrate into this fallen space. At the instance of the board, Mr. Jennings undertook new exploring works, but just opposite where the first attempts were made, and succeeded in choosing a spot easy of access. The area investigated by him up to the present time contains more rich ore than was supposed to have remained in these old works; the hoisting up of this material will soon commence, and it is thought it will result in a considerable increase to the income for the current year." The directors properly regard El Callao as mainly now upon an exploratory basis. The returns are sufficient for the purposes of exploration but not for those of dividend as well. It is well for the shareholders that such is the case, for otherwise they would have to raise fresh working capital. Expenses have been, and are being reduced in all directions, and all through the report one can read between the lines the absolute belief the directors have in the continuity of the lode. Besides its mining property the company has several investments in loans, which will be converted into cash, and it also has an asset in the Union Company, which is estimated to be worth 1,200,000f., which is regarded as its reserve fund. This money was advanced to give El Callao a direct interest in the Union Company. The Union Company has met with intermittent success, but it cannot be affirmed that the success of the mine is assured. Its capital is 2,575,000f., of which the El Callao Company holds the before-mentioned sum of 1,200,000f. The directors say:—"If, by necessity or convenience, we should require the 2,400,000f. which we possess in the Union Company, it would be easily obtained; but the directors do not advise the general meeting to sell its interest in this mine. On the contrary, it should be kept, because we repeat that it is a property having all the probabilities for a prosperous future. Its grounds are situated precisely in the centre of the Moeupia Valley where the first mines of the Yuruari were discovered, and where more quantities of extended gold deposits are found than in any other spot in the mining region." The report, though it cannot claim to be a brilliant one, has in it much ground of encouragement, and it is quite possible from what is said, and a good deal more so from what is being done, that El Callao may yet experience a return to something like its former prosperity.

A PECULIAR CONCESSION.

THE shareholders of the Pondoland Exploration and Mining Company, Limited, do not seem to get much "forrader." They supposed they were buying a perfect concession, and had only to concentrate their energies upon developing their property for whatever it might be worth. This was probably the view of the directors in March last, when they sent out some Cornish miners, and the preliminary equipment. Since then, from the letters received, it appears to be a matter of beer, grog, and presents. There was a good supply of beer in the place, and until this was consumed the native potentate, it was stated, would remain invisible. A little later on, when the beer had disappeared, and the grog had followed in due course, and when, probably, the dusky chief had come to his senses, he denied, in the public prints, that he had ever granted any concession to the person who was the vendor to the company. A telegram from a Mr. Girling, who is mixed up in the concern, dated May 28th, laconically states "negotiations have fallen through." The best thing the directors can do is to return the unspent capital to the shareholders, for we quite agree with several of the speakers at the meeting that not a sixpence of it should be expended in enforcing the title. The discussion was acrimonious, because the board seemed inclined to go on, but shareholders, who know what they are about, will at once give them written notice forbidding them to expend any more of their money, and demanding the immediate return of their proportion of what they have in hand.

REPORTS OF MEETINGS.

THE COLAR CENTRAL GOLD CO., LIMITED.

THE CONTRACT WITH THE EASTERN MYSORE—SHAREHOLDERS RATIFY IT UNANIMOUSLY, AND WITHOUT THE LEAST ADVERSE CRITICISM—STRONG CASH POSITION, AND GOOD MINING OUTLOOK —A WORD ABOUT INDIAN CONSOLIDATED.

THE third ordinary general meeting of this company was held at Winchester House, Old Broad Street, yesterday, to receive the report of the directors, and the balance-sheet for the year ended the 31st December, 1888, and to elect two directors and an auditor.—Malcolm Low, Esq., M.P., J.P., chairman of the company, presided.

The notice calling the meeting was read by the SECRETARY,

A COMPLETE STATEMENT OF THE COMPANY'S POSITION.

The CHAIRMAN said: Now that we are engaged in holding the ordinary annual general meeting, the first resolution to be proposed is, "That the report dated the 13th inst., and the accounts as audited for the year 1888 (which have both been in your hands for some time, and which you will no doubt allow to be taken as read), be received and adopted." To keep ourselves technically in order, I now beg formally to propose that resolution. But the whole business before us to-day has to do with more than the matter in the report. It includes also the consideration of the matter which will be before us at the extraordinary meeting to follow. And the two matters belong so closely one to the other, depend so strictly the one on the other, that we should be doing injustice to ourselves and to our business if we were to attempt artificially to separate them. Therefore, although constructively we have now nothing before us but the report and the accounts, I propose, with your permission, to deal at once, and at the same time, not only with these, but also with the intended purchase of the Eastern Mysore property; and I hope then any speakers who may follow me will avail themselves of the same indulgence. The method may perhaps look faulty to the eye of the mere stickler for form, but it will commend itself, I think, to the practical men of business whom I see before me. (Hear, hear.) It will give us one complete discussion instead of two incomplete ones; it will save us useless repetitions; and the result I hope will be, that if after full discussion we shall be agreed on the resolution before us, then the passing of the resolutions of the extraordinary general meeting will not take us long—will then be, in fact, almost a matter of form. Now our disappointment in the mining of the Colar Central section has been very great. We all must feel it keenly, and none of us, I can assure you, more keenly than your directors, who are among the largest shareholders in the company. Of course, all mining is a speculation. That is a truism that we all knew when we entered on the undertaking. But certainly, as a mining undertaking, our property appeared a most promising one when we entered on it two and a half years ago, and that not only on account of its own quartz outcrops, but also from its position on the north and south run of the Mysore lodes. Even at the last meeting we still had good expectations, especially from the cross-cut east, and drive south at the 200 ft. level at Low's shaft, and from the sinking of East Boundary shaft.

NO. 4 SHAFT.

Since then, as we explain in detail in the report, these hopes have not been realised, the quartz we were then following, proving, in all instances, either to have no permanency in depth, or else too poor to work or too unpromising to pursue. Of all our mining points, one only looks at all promising at the moment; and that is a new one. I mean at the new shaft which we call No. 4 in our report. On the whole, the large amount of work now done, both in sinking and driving, forces us to admit, not indeed the certainty, but the probability, that we have here what is, unfortunately, not uncommon in mining elsewhere, viz., that though we have the same lodes as our more fortunate neighbours to the north of us, yet, that those self-same lodes are poor and disordered in the one case, while they are rich and settled in the other. We know something about mining, we have done all that men can do to succeed. We have had in Mr. Algernon Oakley a local agent, whose professional attainments and ability are of the highest class on the field. On this side we have had all the advantage of the closest and most unremitting attention of one of the most eminent mining engineers in the world; but, unfortunately, gentlemen, neither Mr. Oakley nor yet even Mr. John Darlington, can make poor disordered lodes rich and strong, nor force quartz to yield more gold than nature has put into it.

THE NEW PROJECT.

Well, then, our report, after having dealt in detail with our own mining, goes on on the subject of the new project to say this:—"The board, under all the circumstances, think it well to submit for the approval of the shareholders a project, which they recommend after mature and careful deliberation, for acquiring, on very favourable terms, a neighbouring property, possessing good prospects in the early future. On sanction of this project the directors would suspend for the time all work in the present sett, except the sinking of No. 4 shaft, and would transfer all the rock-boring plant to the new property, and concentrate all present mining energies on the vigorous development of the same." Our report goes on to say: "The property proposed to be acquired is the Eastern Mysore Gold Company's Block, situated a little to the north of this company's property, and immediately adjoining the Mysore Mine on the east. Under provisional arrangements, made with the Eastern Mysore Gold Company, the mining on this block, together with all its machinery, and plant, has been under the charge of Mr. Oakley since the 27th April last. A favourable expression of opinion was obtained by telegram from that gentleman some weeks ago, and that opinion has been followed by the reports subjoined." Well, gentlemen, you have all read the reports of Mr. Oakley, dated the 14th and 18th of last month, and can form your own opinion of them. To us, who know how guarded and careful Mr. Oakley is in making any professional statement, the mining report on the southern section of the property is highly encouraging. (Hear, hear.) As to machinery, it is clear that no new expensive machinery will be required at all. You will notice the stress Mr. Oakley lays on the ueed of rock-boring machinery; but we ourselves have plenty of rock-drills with air compressors and all appurtenances. And if you consent, as we hope you will, to the proposed purchase, we shall this very day telegraph to Mr. Oakley to put these to work at once on the southern works of our new acquisition. But for the rest, the new property has ample machinery of the more expensive kinds. There is pumping and hauling machinery, and plenty of engine power; and there is also a stamp mill, complete in all its parts. We shall be buying a mine already equipped with machinery sufficient for all mining development for a long time to come. Now, let me show you some of the mining points on the plans behind me. There is the sett, not more than some 2½ miles from our own.

WORKINGS EXPLAINED.

You see it immediately adjoins the famous Mysore Mine on the east. It has not, of course, the same lodes, but parallel ones. Here you have a general map of the property, the red dotted lines merely showing the general run of surface outcrops as given in the Eastern Mysore Company's last report. Mr. Oakley divides the workings into two sections—the north and the south; and in this enlarged plan we have marked the chief workings in each section. In the north section, Rennie's, Muscoom's, and St. Stephen's shafts were put down in ancient workings. But these old workings, it appears, were cut off by a hard bar of ground, and Mr. Oakley shows that further exploration ought to be made here to recover the lode. He cannot, of course, say positively that the lode will be regained, but what he does say is that the circumstances and indications are such that the effort to regain it ought to be made. In regard to the southern section, Mr. Oakley speaks with much more confidence. From him, cautious as he is, I read what he says as very highly encouraging. By means of costeaning pits and trial shafts we have exposed at surface a continuous run of at least 700 ft. of a promising lode. (Hear, haar.) This will be attacked in depth from James' and Marden's shafts, and Mr. Oakley's words in respect to this lode are these:—"I consider the prospects are encouraging. The lode is persistent and strong, and I see no reason to anticipate why it should not hold in depth. The country enclosing the lode is of a favourable nature, and there are no cross-courses at surface to interfere with the run of the lode." Mr. Oakley would make James' shaft, which is now down 118 ft., the main shaft of the mine. He would push forward the present cross-cut east on the 100-ft. level with rock drills. In another 50 ft. we should strike the lode, and would then drive north and south on the course. The sinking of James' shaft itself would of course be continued. The lode will dip into it on a lower level. Meanwhile the drift north on the lode on the 90 ft. level from Marden's shaft would be continued so as to prove the lode in that direction, and one or more of the present trial pits south and north of Marden's, would hereafter be sunk as regular shafts on the dip of the lode.

EXTRACTS FROM MR. OAKLEY'S LAST LETTER RECEIVED SUBSEQUENT TO ISSUE OF OUR REPORT.

"James shaft will intercept the lode in depth. The cross-cut east on the 100-ft. level is now in 55 ft. 6 ins., and should in about another 50 ft. cut the lode. Marden's shaft, on south end of lode, is now down 90 ft.; the lode being 3 ft. 6 ins. wide, and carrying about 5 to 6 dwts. of gold per ton. We have started a drift north, which is now in 14 ft., and has a lode some 3 ft. wide, and worth 4 to 5 dwts. per ton. The ground here is very good for sinking and driving, and should the quartz improve a little in value, ½ oz. rock in such ground should be worth as much as 1 oz. rock in the tighter ground found elsewhere. Williams' shaft—I do not know it by name; it must be one of the trial pits I mentioned—is down now 40 ft. on the same lode further north (*i.e.* north of Marden's); the lode is strong here, some 2½ ft. of quartz, and shows about 2 dwts. worth of gold in the pan. No. 1 shaft—this must be another of the trial shafts, and, I think, south of Marden's—this is now down 35 ft., showing the quartz strong, and carrying 2½ and 2 dwts. of gold to the ton."

THE BEST THING YET DISCOVERED.

As far as we can see up to date, this lode is about the best thing yet discovered. I think it will prove a true vein, and last in depth. All we want now is more gold in the quartz, and there is no reason why this should not occur. (Hear, hear.) I would mention that the property is held on the same tenure as our own, on lease which has yet more than 20 years to run, and which the Mysore Government would, no doubt, renew. The terms, which we have been able to secure after much negotiation, are certainly not exorbitant. We pay only 500*l.* in cash. The remaining consideration is 56,350 of our own fully-paid shares. Of these 6,350 are available already as forfeited shares, the property of the company. The remaining 50,000 shares have to be created and issued, and to effect this purpose we have framed the resolutions which will come before us at the extraordinary general meeting. The nominal capital of the company will then be 200,000*l.*, instead of 150,000*l.* We have spent much time and taken much pains on the project, and we now heartily recommend it to your acceptance. May I add a word on the subject of the accounts. These are brought up to the 31st December last. In the balance-sheet you will see on the debtor side an item of 4,628*l.* on account of forfeited shares. This is the amount remaining owing on 6,350 shares at the time they were forfeited. It is, of course, not all loss, for we have first the forfeited shares themselves, and then we have also the difference between 6,350*l.* and 4,628*l.*, or 1,722*l.* in cash, which had been paid to us on those shares before they were forfeited. Then our resources at the date of the balance-sheet were, investments valued at cost price, 34,220*l.* To this at least 1,000*l.* ought to be added for improved values since dates of purchase, making, say, 35,220*l.* Add to this, 2,232*l.* in bank and in the hands of the agent, also 2,751*l.* due on unpaid calls; total, 40,183*l.* From this amount deduct 1,000*l.*, shown as due to sundry creditors, and we get the figure of 39,183*l.* as representing our effective cash resources on the 31st December last. As to the expenditure and receipts account, I need detain you on two items only, the directors' fees and the consulting engineer's fees. The former are fixed, as you know, by the articles of association at 1,200*l.* a year, but for many

months past we have been taking at the rate of 1,000*l.* only. Now, after the present month, we propose to make a further reduction of 250*l.* We have made these reductions without any solicitation or even suggestion from outside, and we hope you will think them satisfactory. (Hear, hear.) Of course our time is money to us as to other business men. Our work here takes up a good deal of time, and it is very anxious work. You would not, I know, wish us to go without any remuneration, first, because that would be unjust to us, and next, because it is unwise in the case of any commercial undertaking — unwise I mean in the interest of all the proprietors — to throw it on to the mere charity of its managers. (Hear, hear.) I have also to announce, although I do so with regret, but as Mr. Darlington insists upon it I have no choice in the matter, that as the directors have reduced their fees he wishes also to reduce his, and in future he will only take 150*l.* per annum. (Hear, hear.)

A REPRESENTATIVE BOARD.

The only other point is the question whether, as has been suggested to us from some quarters, we should invite to the board a new director by way of his officially representing our new shareholders if we should pass the resolutions at the extraordinary meeting. In regard to this, I may first state that a large number of Eastern Mysore shares are already held on this board, and that therefore the new shareholders are adequately represented. In the next place I must say that this is a simple case of purchase of a property by this company, and not a question of amalgamation at all. Then from the general point of view, we do not think that adding to our numbers would advantage the company, especially when two out of the four of us have personal knowledge of the ground. On this, as on all other matters, we would, of course, be guided by any generally expressed wish of the shareholders, but so far as we are concerned we see no reason for a step, which would, of course, again increase the company's expenses in this item, just after we have arranged to reduce them. (Hear, hear.) I beg now to propose the adoption of the report and accounts. (Loud cheers.)

Mr. GILLESPIE : I have mush pleasure in seconding the motion.

QUESTIONS.

Genl. BERESFORD : It is quite true the Eastern Mysore shareholders are represented as far as the vendor shares are concerned, but there are 25,000 outside that number that are not represented on this board at all.

A SHAREHOLDER : You mentioned the stamps on the Eastern Mysore property. What sort of stamps are they, and what is their capacity ? I believe the Colar Central Company have no stamps at all.

A SHAREHOLDER : What is the distance between the Colar Central and the Eastern Mysore, and what means will there be for moving this machinery, and what is the expense likely to be ?

The CHAIRMAN : With regard to Genl. Beresford's question, we are aware that there are a certain number of shares that were not vendor's shares, but I take it that now all the shares are on the same footing. I do not know whether he is correct as to the numbers, but I take the shares simply as they are.

Genl. BERESFORD : I think I am under the number.

The CHAIRMAN : With regard to the Huntington Mill, which is now on the Eastern Mysore Company's property, the capacity is about equal to the ordinary 10 stamp-head gravitation battery. The distance between the two properties, the Colar Central and the Eastern Mysore, is about two and a half miles. There will be no sort of difficulty in moving either light or heavy machinery, but as a matter of fact we have no heavy machinery to move.

THE EASTERN MYSORE PROPERTY IS FULLY EQUIPPED

with all pumping and hauling machinery and stamps, and all we have to move is the rock-drills, the compressors, and the pipes—a very small matter indeed, which will take but little time or money.

A SHAREHOLDER : Do we intend to abandon the Colar Central Mine ?

The CHAIRMAN : We intend to push on the sinking of No. 4 shaft only for the present.

The report was unanimously adopted.

The CHAIRMAN : The next question is the re-election of Colonel Lindsay and Mr. Lambert, and I beg to propose that they be re-elected. Col. Lindsay knows the ground, and as regard to Mr. Lambert I can only say he is a tower of strength on any board. (Hear, hear.)

Mr. GILLESPIE : I beg to second the motion.

The motion was carried unanimously.

ALL THE SHARES REPRESENTED.

Mr. LAMBERT : On Col. Lindsay's behalf and on my own I beg to thank you for having re-elected us in the kind manner you have done. I should like to take this opportunity of stating that as a rule I never recognise myself as representing any certain section of the shareholders, but as representing the whole, and, therefore, whether there is one particular 25,000 shares, or another 25,000 shares, I always seek to do the best I can for the general body ; and when Genl. Beresford becomes one of us in virtue of his position as an Eastern Mysore shareholder, as well as a Colar Central shareholder, he will find that we will carefully look after his interests as if they were our own, and as a matter of fact they are, for we are all large shareholders. (Hear, hear.)

Genl. BERESFORD : It is not on account of myself I speak, but on behalf of a large number who are quite apart from my interests in this company.

The CHAIRMAN : I feel sure no person can have misapprehended Genl. Beresford as speaking for himself.

Mr. LAMBERT : I only wanted to assure Genl. Beresford that outside the vendor's shares the Eastern Mysore shareholders will be as well represented and taken as much care of as if they had a direct representative on the board. (Cheers.)

Mr. PROBYN moved the re-election of the auditor, Mr. Albert S. Hicks.

The motion was seconded and carried unanimously.

THE EXTRAORDINARY MEETING.

AN extraordinary general meeting of this company was next held for the purpose of considering and, if approved, of passing the following special resolutions :—1. "That the directors be, and they are hereby authorised to purchase on behalf of this company, the mines, property, and effects of the Eastern Mysore Gold Company, Limited (except any moneys in hand or debts due to such company), as from the 1st day of April, 1889, and to undertake the debts and liabilities of the said Eastern Mysore Gold Company, Limited, as from the same date, in consideration of a sum of 56,850*l.* to be paid, as to 500*l.*, in cash, and as to 56,350*l.*, by an allotment to the Eastern Mysore Gold Company, Limited, or to its nominees, of 56,350 shares of 1*l.* each, fully paid, in this company." (2.) "That the capital of the company be increased to 200,000*l.*, by the creation of 50,000 new shares of 1*l.* each, which, with 6,350, part of the existing capital of the company not yet issued, shall be issued to the Eastern Mysore Gold Company, Limited, or to its nominees, as fully paid-up." (3.) "That the directors be, and they are hereby, authorised to carry out the agreement dated the 29th day of April, 1889, between the Eastern Mysore Gold Company, Limited, and this company with such, if any modification, not being substantial variations of the same as to the directors may seem expedient, and to execute such deeds and documents, and do all such acts as they may consider expedient for carrying the said purchase into effect."

The CHAIRMAN : Under the circumstances of our apparently complete accord, and the very pleasant way in which we have got through these proceedings to-day, I feel it would be a very poor return for your kindness to inflict a further speech upon you. We went fully in the first meeting into the question of the proposed purchase, and I may tell you that, as directors, we have expended a great deal of time and trouble in negotiating it, and recommend it most heartily to your acceptance. (Hear, hear.) I beg to propose these resolutions *en bloc*.

Mr. GILLESPIE seconded the motion, which was carried unanimously amidst cheers.

The CHAIRMAN : That, gentlemen, concludes the business of our two meetings, and I do hope the next time we assemble we shall have much more cheerful matter to bring before you. I am not an over sanguine man, but I do think very highly indeed of the prospects of this company. (Cheers.)

A SHAREHOLDER : When will the next meeting be held ?

The CHAIRMAN : The next meeting will be held on the 8th July for the purpose of confirming these resolutions, and the next half-yearly meeting will be held in January, because, as you know, we hold half-yearly meetings.

A WORD ABOUT INDIAN CONSOLIDATED.

Mr. LAMBERT : On the question of meeting, I should like to say something in regard to Indian Consolidated. I know a great many of the shareholders in Colar Central are also shareholders in that company, and in the usual course we would have held the meeting of the Indian Consolidated a little earlier than this, but not being very well pleased with the progress of the concern, the directors have taken the step of getting a report from Capt. Plummer, the manager of the celebrated Mysore Company—(cheers)—and so soon as that report is in the hands of the directors it will be submitted to the shareholders, and the meeting will be called. (Cheers.)

CHAIRMAN AND DIRECTORS THANKED.

Mr. BEAUMONT : I should like my fellow shareholders to join me in a very cordial vote of thanks to you and your colleagues—not only to you, sir, for your very able conduct in the chair to-day, but for the highly satisfactory arrangement you have made in purchasing this property. (Hear, hear.) I am perfectly certain it will turn out uncommonly well, and I feel sure that you have made a most advantageous arrangement for all concerned. (Cheers.)

Mr. L. P. SWINBORNE seconded the motion, which was carried with acclamation.

The CHAIRMAN: We are very heartily obliged to you for your kindness, and to Mr. Beaumont for the appreciative speech he has made. I heartily join with him in hoping that the partnership upon which we have now entered will be one of great advantage to us all. (Cheers.)

The proceedings of a perfectly unanimous meeting were then brought to a close.

MOUNT PERRY COPPER AND REID'S CREEK GOLD.

THE COPPER COLLAPSE—THE ATTENTION CONCENTRATED ON THE DEVELOPMENT OF THE GOLD MINE.

THE ordinary general meeting of the Mount Perry Copper and Reid's Creek Gold Mines and Smelting Company, Limited, was held on Thursday at Winchester House, Old Broad Street, E.C., under the presidency of Mr. A. J. Lambert, the chairman of the company.

Mr. JOHN MIRFIN (the secretary) having read the notice convening the meeting, the report and accounts were taken as read.

The CHAIRMAN moved the adoption of the report and accounts, and said since the directors last met the shareholders, as they were doubtless aware, a great change had taken place in the position of the copper market. Last year the price of copper ranged to a very high figure, and as they possess a very valuable lode of copper at the mine, they, in concert with the directors in Queensland, felt it was better to develop that mine as quickly as possible, for the purpose of getting good results by placing the metal at the best price. The preparation for the production of a large quantity of ore was met with some disappointment, and some expensive work was caused in the first instance by the timber in the mine, owing to the water in it becoming rotten, and it had to be re-timbered. Capt Bennett sent his

FIRST SHIPMENT OF METAL FROM THE MINE

in the month of November—within 11 months of the formation of the company, and he (the chairman) thought they could not but say that was satisfactory on his part. They had every reason to believe that this development would have continued, and continued at an increase, and at the then high price of copper, they would have done very well ; but, as they are aware, in the month of February last there was a very sudden collapse in the syndicate working the copper market, which resulted in the fall in the price of copper to the extent of something like 50 per cent. That was something over which, of course, they had no control, and could not avoid, much as they

regretted it. As soon as they saw what had happened the directors telegraphed Capt. Bennett to

ABANDON MOUNT PERRY,

at any rate for the time, and concentrate his energies entirely on Reid's Creek, where they had got a lode with a very fair supply of gold in it. That instruction Capt. Bennett proeeeded to act upon, and at the present moment the work at Mount Perry was only what was absolutely necessary, the whole strength being concentrated on Reid's Creek. Up to the present moment the development at Reid's Creek was not entirely satisfactory, but he was pleased to say by the latest accounts it seemed that things had improved, and they now heard, under date of the 24th of April, that the lode at the main tunnel had improved, being at present 1 ft. wide, and carrying good auriferous mundic. He had also at Reid's Creek driven a tunnel for the purpose of enabling him to carry the whole produce of the mine to the Cornish crusher he had erected, and which would enable him to take it direct to the machinery by tram-road, which, of course, was very desirable. The collapse in the copper market was

A VERY GREAT DISAPPOINTMENT.

They also had another disappointment in the shape of the ore at the bottom of the main shaft not continuing as good as was antieipated at the time the company was formed. They would see by Capt. Bennett's report that the ore at the bottom of that shaft gave about 22 per cent. of copper ; at the time they formed the company it was believed to be 29 per cent. These were changes one could not guard against, but there was no reason to believe it would be a permanent drawback, and that they might not seek for an improvement. It would be seen from the accounts that a certain quantity of ore had been bought ; that was necessitated because of the development at Reid's Creek not having proceeded far enough ; in the future they would be using their own ores practically entirely. They would notice by the balance-sheet that they had

SOLD 1,280*l*. WORTH OF LAND.

That was only a small portion of what they possessed in the Mount Perry township, and Capt. Bennett believed that the remainder of the property there would be sold at very considerable prieos, and should his views be realised the amount, of course, would be treated in the same way as the other—carried to the capital account. He estimated the value of the remainder of the property at something like 17,000*l*. There was a very interesting subjeet to a good many shareholders on which he was not able to give information that day as he would have desired, and that was the cost of production. Capt. Bennett wrote on the 28th January, under the head of "Quantity of ore, quality, and cost of raising," that he could not give these particulars until they were ready to break the ores from the main points, and they would not be ready for stoping for another three weeks, but when the preparations were made the directors would have no reason to ask again for the particulars. He was, he said,

"AIMING TO BUILD UP A GOOD PROPERTY"

and make it a success, and he had no more doubt of its success than of his existence. He held 2,000 shares as a guarantee of his faith in it. (Applause.) It would be noticed that with the exception of Mount Perry and Reid's Creek they had practically spent no money on the other properties, and these properties remained in the hands of the company to be dealt with if the opportunity should arise under the head of subsidiary companies, and they had every hope that some day they would be in a position to do that. One of the board, Mr. Andrew Mcllwraith, was at present in Australia, and had promised to visit the property. At the next meeting no doubt he would be present, and be able to give them the fullest information regarding the property. At the conclusion of this meeting an extraordinary meeting was to be held for the durpose of altering the articles so as to meet the requirements of the Stoek Exchange.

Mr. T. K. Weir seconded the motion.

In reply to Mr. Stock,

The Chairman said the two items in the accounts—shipment in transit 4,834*l*. and stock on hand, 2,175*l*.—meant that since it had arrived in England it had been realised ; it belonged to the working of last year and therefore appeared in the accounts. Everything raised since the date the accounts were made up to would go into the account for the present year.

Mr. Witt : Then those shipments for from February to June have yet to appear.

The Chairman : They will be in this year's accounts.

THE CHAIRMAN DECLINES TO PROPHESY THE FUTURE OF COPPER.

Mr. Witt : What do you consider the future of copper ?

The Chairman : No opinion I could give on that subject would be of the slightest value. The copper market is in that peculiar condition that no man could tell what is likely to be the future, and do you expeet poor me, knowing nothing about the copper market, to give an opinion ? If I had an opinion I do not think it would be wise to express it, nor would it be worth anything if I gave it.

Mr. Witt urged the desirability of having half-yearly meetings.

The Chairman said the directors tried to give the shareholders full information by announcing the shipments, and any of them could get further information by calling at the office. However, half-yearly meetings could be held if the shareholders wished it, but it must be borne in mind it would entail some extra expense.

The motion was then carried unanimously.

The Chairman moved that the retiring directors, Messrs. Vernon Magniac, and T. K. Weir be re-elected.

Mr. R. Gambles seconded the motion, which was carried.

The auditors, Messrs. Monkhouse, Goddard and Co., and Messrs. Jackson, Gourlay, Taylor, and Macrae were also re-elected.

SPECIAL MEETING.

This concluding the ordiuary business, the meeting became special.

The Chairman proposed the resolutions *en bloc*, and explained that the alterations were entirely for the protcetion of the shareholders, and of a mere formal character.

Mr. Weir seconded the motion, which was carried, and this concluded the business.

CORDOVA UNION GOLD.

WANT OF FUNDS—WATER SUPPLY CUT OFF—DEBTS AND DIFFICULTIES.

An extraordinary general meeting was held on Monday, at the Cannon Street Hotel—Mr. R. J. Laing in the chair.

The Secretary read the notice convening the meeting.

POSITION.

The Chairman : Our object in calling you together to-day is to tell you our present position. I am sorry to say that we have come rather to a standstill for want of funds, owiug to nearly 40,000 shares not having been taken up by the shareholders of the Union Company. When we started this company we had promises from a great many people among the holders of these 40,000 shares. A great many of them promised to take up shares, and continued so to promise, but they have not done so. That would have meant 40,000 shares, or 10,000*l*., which would have given us 4,000*l*. in cash and 6,000*l*. coming in later on. Had we had the money we should have been in no difficulty in carrying on the affairs of the company, and we believe we should have brought it into a satisfactory condition. Since the starting of this new property we have obtained, we have had a letter from Messrs. Cowland and Rickards, in which they state they are opening up the mines. They have opened up three shafts, one the Orehard shaft, 188½ ft. It is 4½ ft. wide and 6 ft. long, and at the bottom of it is a drift to the south 92 ft. ; so that we have done a considerable amount of work at that shaft. The centre shaft is 148½ ft. It is a triple shaft, 4½ ft. by 12 ft. In the Cowland shaft they got down to 45 ft., and then water came, and they stopped it for the time being. In addition to that, most of the machinery has been sent out. I will read the report of Mr. Rickards, in which he gives you the exact position of all these.

PROGRESS MADE.

He says, "Progress has been made as follows :—Orchard : The drift south has advanced 31 ft. ; total, 92 ft. Considerable improvement has taken place in the appearance of the ground, and quartz has been cut which carries gold. It is a great pity that the financial arrangements prevent any further working at this point. Centre : Shaft sunk 11½ ft. ; total, 148½ ft. ; we are still on the footwall, though the ground is changing, and we should soon be in the lode. Mill has been idle through want of water. A pump put up at the river will now supply us with water, and we expect to recommence the crushing on Monday, 3rd." The question of shortness of water is owing to Mr. Rathgeb having cut off the supply of water. He broke down our dam, and cut off the supply, and we have had to make another dam, and make a fresh watercourse. Our machinery is fixed, tramways are completed, and we have two concentrators, and everything is in a very advanced state, and we would go on if we only had the funds. In the meantime, Mr. Rathgeb has foreclosed for want of the payment now due to him. When we made the arrangement, the instructions sent out by the solicitor, who was instructed by the board, were that the payments were to be made at certain fixed dates, and also that certain clauses were to be put in to prevent any sudden foreclosure, and to give us time ; that is to say, certain notice would have to be served upon us before foreclosing. We were led to believe that the whole arrangement was carried out in accordance with these instructions, but when we got the document Mr. Davis, our solicitor, found it was not so carried out. We have taken advice on the other side from one of the judges there, and he is of opinion that we have got six months' grace, and that Mr. Rathgeb cannot touch us for six months. If we get our money together, and pay him, we can still be free from him, and go on as before. All the reports we have had from Mr. Cowland and Mr. Rickards have led the directors to believe that we have got a really valuable property there. Mr. Cowland had no doubt about it. Mr. Rickards, who was over here a short time ago, believed that we had a very fine property indeed. Mr. Cowland's own words were that he could never wish for a better mine. We are, however, in this position —that just as we are on the point of getting something to pay we are stopped for want of funds. The directors, who are satisfied that they have a very good property, and some of the large shareholders have made themselves personally responsible for a large sum of money, which has been advanced on the security of further calls, and that, at any rate, will show you that they have faith in the undertaking themselves. We have 18,000*l*. to pay Mr. Rathbeg, and the calls unpaid are 11,743*l*. Of course, if the 40,000 shares come in, and give us another 10,000*l*., we should have plenty of money. Our object at present is to raise money by preference shares, and the resolution we propose to lay before you is this :—"That the capital of the company be increased by the creation of 30,000 new shares of 1*l*. each, to be called preference shares, to which there shall be entitled the special rights and privileges following :—(1) Accumulated preferential dividends at the rate of 20 per cent. per annum on the amount paid up with respect to such shares, with liberty to the company at any time after five years to pay off the capital and interest at six months' notice, and thereafter the shares to be cancelled and extinguished. (2) In the event of distribution of the capital or assets of the company, the preference shall be entitled to be paid off in full, with interest at the rate of 20 per cent. per annum, in priority, before the ordinary shareholders receive any assets in respect of such ordinary shares. (3) The holders of the preference shares shall be entitled to a vote for every share. (4) The calls in respect of such preference shares shall be made at the times and on the terms and conditions to be fixed by the board of directors at the time of the issue thereof, and otherwise subject to the articles of association of the company, as if they had been part of the original capital of the company. We hope that some of you will see your way to take up these shares rather than let a good thing like this drop.

VIEWS OF A LARGE SHAREHOLDER.

Mr. Heiron, in seconding the resolution, said he must confess that it grieved him that the affairs of the company had come to such a stage that it was necessary for them to have such a resolution before them. He was one of the largest shareholders in the company, and it was only due to other shareholders that they should know something of the facts. He felt they would then consider that the directors would deserve more commiseration than blame. One might naturally ask how it was that after such a short life they needed to raise 30,000*l*. He could answer that very shortly. It was owiug to a legacy left them by the old company. When the old company died, and the new

one rose, Phœnix-like, from its ashes, they owed 10,000*l.* to the vendor in America. He allowed them to build a mill on land which they thought belonged to them, but the vendor, knowing that it was his own, let them go on, and when the time came showed himself in his true colours, and took action to compel them to take the mill off his property. He succeeded, and they thought it better to compromise, and a compromise was entered into, by which they took over certain property, including a mine and timber land, at a cost of 23,000*l.* That was not the fault of the directors.

DIRECTORS DO THEIR BEST.

They did their best to get better terms, and higher terms were at first demanded; so that it was not their fault that Mr. Rathgeb insisted on these terms being adopted. They had hoped, if the shareholders supported the scheme, that it would have gone on all right. They had sunk three shafts, and Mr. Cowland, who was an independent man, reported that it was a good mine, and that with very little expenditure it could be made a paying one. The true facts of the case appeared in a mining newspaper a few weeks ago, in which was a report from their own manager, and he thought every statement he made could be substantiated if necessary. They had paid the instalments due to Mr. Rathgeb; they had to find money for machinery, and they were hoping day by day that more shareholders would come in to take up their proportion. There were two shareholders holding 3,000 shares who had written and called at the office several times, and had done everything except send in their cheques. One of them went so far as to ask the board not to forfeit his shares; but he did not take them up. There were no directors' fees to be paid, and nothing had been paid to them for a long time. The bank lent money on the security of calls, coupled with a personal guarantee of the directors and some of the shareholders.

MR. RATHGEB'S ACTION.

They warned Mr. Rathgeb that they should not be able to meet the payment of 600*l.* on May 1st, and they asked him for six months' grace. He refused, and foreclosed, and it remained to be seen what his further course would be. Unless Mr. Rathgeb would give better terms, he (the speaker) would not find any more money, as he was not going to improve the mine for Mr. Rathgeb. They were thousands of miles away, and he had a mortgage on the mine; but one of the first things to be done was to endeavour to see if he would not give them better terms—easier terms of payment. It was no use to develop this mine to let it go into his hands again. He thought it was fair to the directors to tell them these facts. He might further add that, feeling the responsibility of the situation, they thought it wise to act in concert with some of the large shareholders of this company. If this company went wrong, and unless some of them came to the support of it, he should stand to lose about 10,000*l.*, and there were others who were in the same position. Unless Mr. Rathgeb would give them better terms, he for one should be inclined to let him take the mine, as if they made a failure in one payment, he would come down and swoop on the property. The mine was, however, of no use to him at present if he got it. He had another mine, and he would be glad to sell that. He thought if they took up a firm attitude towards him, they would succeed in getting what they desired. He seconded the resolution.

INSUFFICIENT INDUCEMENT.

Mr. GASKELL said he did not wish to say anything against the scheme, but he thought 10 per cent. was not sufficient to induce shareholders to come forward. The West Argentine, which had been re-constructed, was an instance of this. They made a proposal for 10 per cent. preference shares, and out of 100,000*l.*, they only got 15,000*l.* He thought if they offered 10 per cent., they would only get a small support, and it was better to offer 20 per cent. or 25 per cent. Their present capital was 100,000*l.*, and if they gave 20 per cent. on their 30,000*l.*, it was only 6,000*l.* a year. He did not wish to object to the scheme, but he thought, in the interest of the shareholders, it was better to have a scheme which was certain to be carried.

THE SOLICITOR GIVES ADVICE.

The SOLICITOR (Mr. George Davis) said if they found the money, as was proposed, they ought to understand what they found it for, and what they should get if they succeeded. He was not an experienced mining man—he thought his connection with the Union was about the first he had, except as a solicitor; but he would not put another shilling into the Cordova if it was to be left in the care of the American owners. If they managed to find sufficient he should be glad to pay off the American owners, so as not to be subject to these annoyances and troubles. They ought to try and get better terms from Mr. Rathgeb, and the only way was to pay him a sum of money, and bring their title deeds here and deal with them as they saw fit. They had got the whole of these mines, which they had been advised were of considerable value, but wanted developing. They had a mill which had cost 8,000*l.*, and the freehold of the ground on which it was built had been conveyed to them. They had 30 stamps and 160 acres of timber land adjacent, which was of considerable value if the mines were to be worked. If they obtained the capital, and had to pay Mr. Rathgeb in full, they would have to pay 18,000*l.* to clear him off. They would then have the mines, the timber land, the 30 stamps, and the mill. If they could get the 30,000*l.* they would be in this position: Suppose they paid him the 18,000*l.*, they would have 12,000*l.* left on preference, and 11,000*l.*—nearly 12,000*l.*—upon the shares already subscribed, which would have to be paid up or be absolutely lost if the thing could not be carried on. They would then have 23,000*l.* to go on with the developing of the mine, and, if they could not proceed with it, they would have all this property left, which ought to be worth at least 30,000*l.*, the amount of the new capital which was going to be raised. They had now 115,000 of the new shares taken up, and they were now proposing to raise 30,000*l.*; that was a quarter of the shares at present held. Whether they paid 20 per cent. or 10 per cent. for a few years did not matter, as it was infinitesimal. He would not care whether it was 10 or 20 per cent., because they proposed to pay the preference shares off after five years. He was prepared, as a shareholder, to agree that the resolution should be amended to the extent of substituting 20 per cent. for 10 per cent. on the amount of capital called up. Under either circumstance he should be prepared to take up his quota. He strongly urged the proprietors to understand this—that if they did not carry this scheme into effect, all the money that had been put into the concern would be absolutely lost; but if they did carry it out they would be in a much better position, as they would free themselves from all the annoyance and worry and trouble of having a vendor in the position of a mortgagee. It would be their own freehold to deal with in any way they pleased. If he had the money he should be pleased to take the whole of the preference shares, as the persons who took the preference shares would become the first mortgagees.

ISSUE OF THE WHOLE MATTER.

The resolution was then amended, making the interest 20 per cent., and was carried unanimously.

On the motion of Mr. HIRON, seconded by Mr. BEAUMONT, it was resolved that a committee should be appointed to confer with the directors as to the position of the company, pending the meeting to be called for the confirmation of the resolution just passed.

Mr. Hiron, Mr. Gaskell, and Mr. Urwick were appointed as the committee, with power to add to their number.

A vote of thanks was then accorded to the chairman, and the proceedings ended.

THE NEW CALIFORNIA, LIMITED.

ENCOURAGING POSITION OF THE COMPANY—LARGE PROFITS—THE MINE IN A BETTER POSITION THAN IT HAS EVER BEEN.

THE ordinary general meeting of the members of this company was held at Winchester House, Old Broad Street, on Wednesday—Mr. H. T. Walker (the chairman) presiding.

The SECRETARY (Mr. W. H. Rowe) read the notice calling the meeting, and the minutes of the last ordinary general meeting were also read and approved.

The CHAIRMAN (who was received with applause) then said: Gentlemen, the report and balance-sheet now presented to you is so simple that it scarcely calls for any remark from me. The report of the mine manager for the year is also very full, and subsequent extracts from his reports for the present year pretty well give you the position of the mine up to date. Had it not been for the heavy cost of sinking our main shaft, it is apparent that we should have made a profit rather than the small loss that we have made. This was accounted for by the falling off in the quality of the ore that we were then crushing, and also the heavy expenses in sinking the shaft that I have just alluded to. I think an important thing to which I should refer, so far as the report is concerned, is the necessity there was of making the final call. That became absolute owing to the money being required in the first place for the proper working of the mine, and to pay off the balance of the original mortgage to the late Mr. Heiron. Then, it will be remembered, that in the latter part of 1887 we were doing very good work indeed, but, unfortunately, in January, and up to the month of August we got into poor ground, and were not doing as well as we had expected. However, in the month of August, as the report tells you,

WE CAME INTO A VERY RICH BODY OF ORE

in the 1,800 level—about 557 ft., I think—from the main shaft on the west. This discovery has continued from that date up to the present time. To prove the extent of this discovery it was necessary to continue the 1,900 level. That has been continued, and a telegram received this morning reports that the body of ore in the 1,900 level is very fine—(applause)—so that you see from the time this discovery was made in the 1,800 level west, it has continued, with more or less variation. So soon as the 1,800 and 1,900 levels are connected by the winze, which we call No. 2 winze, our returns, instead of being what they are now, will be very materially increased indeed. (Applause.) That is a satisfactory feature, I think, and the value of the ore at this point also averages from $300 to $500 per cubic fm. There is another important feature in regard to this discovery—that it is in a direct line below the valuable ore body in the 1,600 level which we discovered in 1885. From that point also we realised a very large sum of money, and the inference our manager attaches to it is that as we go west, and as we go down, we shall come into the same rich body of ore that we had in the 1,600 level above. During all this time your manager was impressing upon us the necessity of providing a sum of money to properly develop our property in the way of cross-cuts, and also to secure the adjoining properties, which became absolutely necessary if we were to continue mining on our property, because it must be borne in mind that the California by itself, is only some 50 ft. wide, and therefore there is very little room to cross-cut. Under the advice of Mr. Rickard, we have obtained the Governor Adams, the Rhode Island, and the Badger State, which will lead us into the Oakland. We were not able to get into the Oakland before we acquired the Badger State, but now with these additional properties we shall be able to cross-cut on an extended scale, and a very important point that your directors will have to decide with Mr. Rickard during his stay in London is as to the best means of making this ground in the east pay at the earliest possible moment.

FRUITS OF THE DEBENTURE ISSUE.

Well, with the view of obtaining these properties and developing our mine the directors, after very mature consideration, authorised an issue of 10,000*l.* of debentures, and I think that the fruits of their action is being borne out already. (Applause.) You will observe by the reports that have been presented, that up to the present time really only three or four points in the mine have been attacked, with the result that the discovery was made in the 1,800 level to which I have just referred; so that it was quite necessary that if we were to carry on operations we should have the money that has been raised. Mr. Rickard is present in the room, and therefore I will not go into what I may call the details of the mining. I will just touch upon the position of affairs, so far as the report is concerned. Now, as I said before, when the connection between the 1,800 and 1,900 levels is made, we anticipate that our returns will be considerably in excess of what they are now, and, should we have the good fortune to discover good ground in the least, there is no reason in the world why the California should not rank as one of the first dividend paying mines. (Applause.)

f you refer to the directors' report you will see that we give you the esults for January, February, March, and April.

GRATIFYING PROFITS FOR FIRST FIVE MONTHS OF 1889.

The telegram in to-day enables me to amplify the figures given there to this extent—that the mining profits for the first five months of this year will be something like 5,600*l.*—(applause) and the number of tons treated will be a little over 4,000, yielding 3,175 ozs. of gold. (Applause.) The actual value of the gold taken out of the mines for the five months is over 11,000*l.*, which, gentlemen, considering we are only workiug one point to any great extent, is a very fair result. If, as our manager assures us, this good ore is going to continue, there is no doubt that at the end of June, as the figures show you, the directors will be in a position to resume the payment of dividend. (Applause.) I will not go so far as to say what that dividend will be, but you have the figures before you, and, therefore, will be able to judge pretty well what it will be. That is a question the board have not decided, and I think you will consider it wise that they should not do so until they have actually got the money in hand. Under all the circumstances, I think the present position, and the outlook that we have, certainly warrants the directors in taking the view they have done, and inserting the paragraph in the report, to the effect that we hope to resume dividends at an early date. The last report that we received from the minc is of a very satisfactory nature, inasmuch as instead of using only 25 head of stamps on our own ore we have increased it to 35. Then the value of the ore in the 1,900 level, which has been confirmed by the telegram that I referred to just now, has been very good, and also the 1,700 level cast.

A GOOD FORECAST.

There the discoveries are turning out to be good, and Mr. Rickard anticipates, I believe, that by the time he gets back we shall be getting something like good payiug ore, so that I think all round the prospects of the mine—certainly for the next two years—far exceed anything I have known since I have been connected with the company. I must say that has only been brought about by the persistent manner in which the directors and manager have coutinued the developments. We have had some bad times to go through ; and sinking the shaft, as I said before, cost us a large amount, and we did not know whether we would come into a good body of ore like that we had in the higher levels. The shareholders, I am sure, will give us credit for having spent the money in the best possible manner, and the results, as given in the report, prove that we have done the right thing. (Applause.) I do not know that I have anything further to say with regard to the report. As to the continued prosperity of the mining operations, Mr. Rickard being present, I shall ask him to say a few words upon that point. I will, however, read the telegram that we have received for the month of May, which is dated the 19th inst. :—"May output, 770 tons, 670 ozs. ; value, 2,310*l.* ; mining costs, 980*l.* ; expenditure on mine development and exploration account, 180*l.* Fine lode, 1900.—RICKARD." Note.—Draft for $10,000 (2,000*l.*) on account of profits to end of April hasbeen received at the London office from the mine. That shows a net profit for the month of May of 1,330*l.* (Applause.) So soon as the winze connecting the 1,800 or 1,900 levels is made there is no doubt in the world, from what Mr. Rickard says, that our returns will be far in excess of 1,330*l.* We are only 20 ft. away from the winze. There is a paragraph in the report with reference to the retirement of Mr. Dumbell. He was obliged to retire, inasmuch as he had been living in India for the last 18 months. The board very much regret his retirement, because he certainly brought an amount of business talent to the board which was of very great assistance to us, and, although he is not here, he has approved, I believe, of the action the directors have taken during the past year. In the place of Mr. John Walker, who retired owing to ill-health, Mr. Malcholm has been elected to a seat at the board—(applause)—and this gentleman will not only bring the business talent to the board that Mr. Dumbell possessed, but he will also bring some extensive mining intelligence, and that again will be of great service, owing to our consultations with regard to the cross-cutting and the further development of the property. In conclusion, I think, I am quite in order in congratulating you on the present state of affairs. (Applause.) To show you the interest that is being taken in the California, I may say that last year no less than

112,000 SHARES WERE TRANSFERRED,

so that we have practically got a new body of shareholders. The shares then ranged somewhere about 8s. or 9s. each, and there must have been some interest in the company so far as the value of it is concerned. I will move, in conclusion, the adoption of the report and accounts. (Applause.)

VIEWS OF A NEW DIRECTOR.

Mr. H. G. MALCHOLM, in seconding the resolution, said the California had been known to him for a number of years, almost from its inception on this market, but it was only during the last few months that he became a shareholder, and, from the invitation of the board, a director. He hoped to fully warrant that trust which they had placed in him, and which he hoped to see confirmed by the meeting. The California Minc was well known as a true fissure lode ; that was, they had a sort of crevice right down to any depth almost that was attainable that could be worked, and at the present moment they had gone down a depth of nearly 2,000 ft. The mining plant and machinery which they had consisted of a first-rate 75-stamp mill, and all the necessary equipment for obtaining a very much greater depth. It had often been mooted at meetings of shareholders of this company that they might get down to 3,000 ft. or 4,000 ft., so that practically, although they had those new claims, they had not exhausted by any means the lode of the Hidden Treasure and Californian mines. With regard to the policy of the directors, he had this to say, and he thought it would be easily understood by the shareholders, that they meant to gradually augment the output so as to reach the fullest capacity of the miuing machinery. On the basis of the present monthly returns, he thought they might safely say that this was practically a minimum profit that was being earned by the company. The eastern portion of the mine, which might be said to be almost unproductive, might at any moment add to the output, so that they would reach the full capacity of the mine of 70 or 100 tons, the present daily output being only some 30 tons, and the value to the company of such an increased output could be readily understood. The two new claims, Rhode Island and Governor Adams, gave them a mining area of 2,275 ft. of what they fully believed to be parallel lodes. The original California and Hidden Treasure lodes covered a mining area of 1,800 ft. This 1,800 ft. of claim has been wrought upon with varied success during a period extending over 15 to 20 years, and yielded in gold not less than 600,000*l.* sterling. If, therefore, they discovered parallel lodes of equal richness in either of these claims they would at once almost, he might say, double the value of the compauy's property. That this would be so, he thought, would at once appear to their mind, from the fact that they had a shaft which was down 2,000 ft. They had thus far not done one bit of cross-cutting and, therefore, could hardly estimate what the value of the adjoining claims might be to the company once they discovered anything rich in those mines. Of course, he did not want to excite them into the belief that they had parallel lodes of equal richness there, but at the same time, the district absolutely abounded in parallel lodes, even of greater richness than those of the California itself. (Applause.)

QUESTIONS.

Mr. WILSON asked whether all the debentures had been taken up.

The CHAIRMAN said that so far as the necessary requirements of the company were concerned the debentures had been subscribed for, and an undertaking had been given to the directors should they want the balance to be taken.

Mr. WILSON asked what the amount of purchase money was for the new properties ?

The CHAIRMAN : 3,000*l.* in cash.

Mr. WILSON said that Mr. Rickard would no doubt give them an idea when the connections between the 1,800 and 1,900 levels were likely to be carried through. He saw in the balance-sheet, "Debenture issue deposit, 1,000*l.*," and he would like to know what that was ? Perhaps the chairman would kindly tell them also what amount of actual cash they had in hand now, independent of the debentures. With regard to the development work, he had an idea in his own mind that the cost of that work should have come out of the debenture money. He presumed they borrowed it for that purpose. He thought it ought to be spread over some years, and not come out of the funds of the company every month. He thought it would have been as well if the directors had left the filling up of the vacancies which had occurred in the board until this meeting, and given the shareholders some opportunity of a say in the matter. In a small company like this, he considered six directors would be quite sufficient. He did not say that they were not all efficient, but it would be as well to economise as much as possible.

Mr. DANIEL asked what amount represented office rent, and what salaries in the item of 300*l.* in the balance-sheet ?

The CHAIRMAN, in reply, said that the 1,000*l.* referred to by Mr. Wilson was merely a matter of account. It was deposited with the company as a *bonâ fide* to the contract being carried out by the persons who had taken the debentures. The actual amount of cash in hand would be gathered from his opening remarks. They had made in five months an actual mining profit of 5,560*l.* With regard to the development work, the debentures were not created in 1888, and it was the policy of the directors, with the sanction of the shareholders, to develop from the proceeds of the debentures, and create a development account, and spread it over a number of years. With regard to the directors, the number was created by the shareholders themselves. It was not done by the wish of the board at the time. He believed it came about in the re-construction of the company. There were one or two gentlemen who would not retire, and he supposed—to make things comfortable—the shareholders elected them, and they insisted at the same time on having one or two other gentlemen who represented other interests. Mr. Barber, who came forward for re-election that day, had been a member of the board for many years along with himself. They originally joined it, owing to some little difference of opinion between themselves and the then directors. He need not tell them that they had worked very hard to try and bring the California into a dividend-paying condition. That was the only end they had in their minds. Mr. Malcholm took the place of Mr. John Walker, owing to the fact that he represented the contracting parties with regard to the debentures. He had a very large interest also in the shares. Many thousands, he believed, he was interested in, and, therefore, he thought that while the number of directors might appear large, the interest represented was so paramount that he considered the shareholders should re-elect these gentlemen. As to the question of office rent and salaries, the 300*l.* included the salary of the secretary and clerks and the office rent—everything, in fact—and he thought it was a very small sum indeed. (Applause.) He did not know any compauy that did it cheaper.

The resolution was then put and carried unanimously.

The CHAIRMAN said the next business on the agenda was a resolution which Mr. Johnson had given notice of.

A RESOLUTION.

Mr. B. L. JOHNSON said he thought the shareholders ought to congratulate the board on the efficient manner in which they were conducting the affairs of the company. Not long ago they were in a very desperate condition, but with much foresight the directors had put them practically into the position of a dividend-paying company. Therefore, he thought they were to be congratulated. As to his resolution, they would see in the report that the manager returned development expenses as nearly 3,000*l.*, and he (Mr. Johnson) considered that it was only fair that the year 1889 should commence free from any debit balance carried forward. He, therefore, begged to move the following resolution :—"That the amount standing to the debit of the profit and loss account, for the year ending 31st December, 1888, viz , 2,380*l.* 12s. 8d., be transferred and added to the account headed 'Preliminary development of mines.'" He could only hope that if the directors were able, in the course of a few months, to give them a dividend, they would also take the opportunity of creating a reserve fund. By doing so they would place the company on a very sound foundation, and he had no doubt they would go forward in the future as a dividend-paying concern.

Mr. SOLIAGUE had much pleasure in seconding Mr. Johnson's resolution. He visited the company's property last October, and went all through the levels and shaft ; in fact, he saw everything that was

to be seen. With regard to the two properties they had just acquired—the Governor Adams, and the Rhode Island—he did not see how it was possible to fail when they had at least three mines, and only one working now. If they applied their debenture money to development, the mine in its present state would pay a dividend. With regard to the directors, he quite agreed with the gentleman who spoke that seven or eight directors were too many, and if the directors could arrange among themselves to reduce the number, it would lessen the expenses in London.

A SHAREHOLDER said that his opinion was that the last dividend paid by the old company was the ruin of it. They paid it before they could afford it, and he should not like the same thing to be repeated again. He would rather wait a little.

The CHAIRMAN observed that the last dividend was paid a few years ago, and the mine was in a very different position now to what it was then. The circumstances were entirely different, and the interests were different—in fact, the whole affair was different. Mr. Soliague referred to the number of directors and to the mine. He (the chairman) thought that 200*l.*—which would be saved by the number of directors being reduced by two—divided amongst the shareholders was a very small amount to be considered; but what he would undertake to try to induce his colleagues to carry out was this—in the event of any gentleman retiring the vacancy should not be filled up. (Applause.) Mr. Johnson also advised that they should create a reserve fund. That, he thought, was an excellent plan, and he would also try and induce his directors to consider this suggestion favourably.

The resolution was unanimously agreed to.

ROUTINE BUSINESS.

The CHAIRMAN then proposed the re-election of Mr. W. H. Barber as a director.

Mr. C. H. THOMPSON, in seconding, remarked that Mr. Barber had been a very efficient colleague, and in difficult times they had been very much indebted to him.

The proposition was adopted.

Mr. BARBER said he had always had the interests of the company at heart. He joined it some years ago, when great troubles and difficulties were before them, and he was pleased to say that the position they now stood in was so very different that it was not merely a pleasure to be on the board, but an incentive to continue to do the best he could for it. (Applause.)

The CHAIRMAN also proposed the re-election of Mr. H. G. Malcholm to a seat on the board.

Mr. SOLIAGUE seconded the motion. Without saying anything disparaging of the board, he did not think there was a man in the room, barring the manager, who understood the business of the company as well as Mr. Malcholm, therefore he had very much pleasure in seconding his re-election.

The resolution was agreed to *nem. con.*

Mr. MALCHOLM remarked that it was a great source of satisfaction to himself to find that he had succeeded in so short a time in gaining the confidence of the shareholders. Certainly he thought they owed him a debt for the past year. He would not like to go into full details, but he had rendered them very large services indeed. Whether the property of the company was going to realise their high expectations he did not know, but the chances were there, and whatever the directors could do would certainly be done for the interests of the shareholders. The one weak point in all mining companies was undoubtedly their financial position. He was there for the pupose of seeing how their finances were dealt with, and to meet the needs of the mine, and he thought that, so far, with the assistance of his colleagues, he had succeeded in giving Mr. Rickard a free hand in everything that he required. He had further pledged himself that he would in the future, as long as he was connected with the company, provide ample means for developing the property. (Applause.)

The auditor, Mr. Leslie, was re-appointed, on the motion of Mr. Wilson.

VIEWS OF THE MANAGER.

Mr. A. RICKARD (the manager) then gave an account of the property and the results of the past year's operations. He commenced by acknowledging the great assistance that Mr. Malcholm had been to him personally, and, he thought, to the company, in the difficult position in which they found themselves before they discovered the ore, and at a time when they were struggling on for want of funds. Mr. Malcholm had given him to feel that he had sufficient backing to proceed with such operations, as, in his judgment, seemed necessary to open up the mine, and to bring it into a more happy condition than had previously existed. If they would kindly turn to his report, which the directors had published along with the others, they would find that in the closing paragraph a salient point brought forward was "that the ore ground between the 1,600 and 1,800 levels has singularly failed to maintain the continuity it showed in the upper levels, and the important question now is whether this state of things will continue on further development. To my mind there is abundant reason for the contrary, and, judging from the continuous and unbroken range of rich ground opened up by the 1,800 west workings, together with the recent discoveries in the 1,700 west and 1,600 east levels, I am disposed to place great confidence in the mine, feeling satisfied that the results will be of a very much more satisfactory nature for 1889 than have been those for the year under consideration." They had certainly proved the lode, as Mr. Malcholm had well put it, to be a true fissure vein, and, moreover, it was a contact vein, which had been proved to be continuous to a depth of nearly 2,000 ft. It was

A STRONG AND WELL-DEFINED VEIN,

and one to be depended upon. Between the 1,600 and 1,800 levels they had a distinct change in the position of the lode and the adjacent rocks, which accounted entirely for the impoverishment which came in and spoiled their results so badly in the first part of the year. He had now to tell them that the lode had resumed its old condition in the deeper levels, and the news they had received that day satisfied him that the ore ground would be found to be continuous below the 1,800 level. On the whole, he felt satisfied that they had before them a very fine thing indeed. He thought the chairman was quite justified in saying that the returns would improve. The connection between the winze would be made within the next three or four weeks, and that meant that they would be able at once to work the ground that lay overhead, which they had not done up to the present time. When he was last down the mine—on the 20th of last month — he examined the ground in the 1,900 level, where there was a magnificent lode. In one place it was 11 ft. wide, and assayed 5 ozs. to 6 ozs. per ton. Beyond that point there was also good ground, and altogether their prospects there were simply grand. In regard to the other parts of the mine the western ground was of a very promising nature, and the eastern portion particularly so. Up to the present time they had gone through a good deal of low-grade ore, which would just pay and nothing more. He wanted something richer, if possible, and their idea was not only to have one point to draw from, but several, which would assist them very materially. They were mining and prospecting at several points, in order to see if they could not find similar ore bodies in other levels, and, of course, they had the expectation of finding those ore bodies distributed over various parts of the mine. The machinery at the mine was quite sufficient for the whole of the output, and the shaft was in very good condition. Referring to the parallel lodes, he said the difficulty in mining was to sink and open ground. Sinking was an expensive matter. It required time and a great deal of machinery. In their case they had a shaft 1,900 ft. deep, working almost at every level, and they could by means of air-drills, which he wished the board to sanction, prospect or drive tunnels from their workings into the new ground. The district was a vein district such as Cornwall, but rather better, because the veins were more numerous. The fact that California had gone down 2,000 ft. proved that those veins were continuous; therefore the reasonable inference was that by cross-cutting they would get into new veins, and, finding those veins, they had a new thing entirely. It was not a vein for one, or even ten years, but a thing that would last as long as they wanted it. With regard to the Governor Adams lode, he had seen returns of 560 tons of ore, and the average was about 15 dwts. The Governor Adams was one of the first points they would attack. Then the Rhode Island was also a well-defined lode; and they had the Berkeley and the Oakland. All those points would certainly open up a new scope for mining entirely. He was very pleased indeed to be able to come before them with the good returns that had been made. He did not take any credit to himself beyond having simply done his duty, and to the best of his knowledge and experience conducted the affairs of the company for the best possible results. (Loud applause.)

THANKS TO MR. RICKARD.

Mr. SOLIAGUE proposed a cordial vote of thanks to Mr. Rickard for the able manner in which he had carried on the manipulation of the company's property during the last 12 months. (Applause.) He also proposed a similar compliment to Mr. Stevens, the mine captain, and Mr. Lewis, the mill captain.

Mr. BARBER seconded the proposition.

The CHAIRMAN remarked that the most satisfactory position in which they stood was, no doubt, due to Mr. Rickard's untiring energy and skill in working the mine, and he believed the recommendations he had made to the board with regard to the new properties were likely to give the company very material prosperity in the future. (Applause.)

The proposition was passed by acclamation.

Mr. RICKARD expressed his sincere thanks to the shareholders for their kindness in acknowledging the efforts he had made in carrying on the business of the company. It strengthened his hands, and he would go back feeling that they were unanimous in the business they had in hand, and the end they had in view. He would also like to say that to his head man, Mr. Stevens, and Mr. Lewis, their very able and efficient mill captain, he owed a great deal for their assistance. (Applause.)

A cordial vote of thanks was also passed to the chairman, and the proceedings then terminated.

THE COLON GOLD MINES, LIMITED.

CIRCULAR FROM THE BOARD — REQUIREMENTS OF THE MINE NECESSITATE A SMALL CALL.

SEVERAL specifications having been received by the company from its manager at the mines, requiring machinery, stores, and other material, it becomes necessary to open a credit account in Colombia. The board have accordingly made the small call upon its members notified in the accompanying circular. I am glad to take this opportunity of communicating to you that the manager writes most favourably of the mines, and urges the board to take immediate steps to secure some additional water-rights, the acquisition of which he considers will render the mines even far more valuable than was anticipated.—F. E. LAMBERT, Secretary.

THE SECRETAN COLLECTION.—An event of considerable importance in artistic circles will take place in Paris at the beginning of the approaching month. The valuable and extensive collection of pictures belonging to M. Secrétan will be sold at the galleries of Mr. Sedelmeyer, in the Rue de la Rochefoucauld. M. Secrétan was the promoter and organizer of the Copper Syndicate, and lost his fortune at the collapse of this ambitious speculation. His fine house has already been put into the market, and the pictures are duly catalogued in two elaborate illustrated folio volumes, prepared and published by Messrs. Boussod, Valadon and Co., who, in conjunction with M. Sedelmeyer, have the management of the sale.

MR. T. H. COLLINS, F.G.S., of the firm of J. H. Collins and Son, 13, Basinghall Street, E.C., will be leaving shortly on his fifth mining tour through Canada, British Columbia, the United States, and Mexico, and is open for additional commissions.

HOLLOWAY'S PILLS.—Weakening weather.—The sultry summer days strain the nerves of the feeble and decrepit, and disease may eventuate unless some restorative, such as these purifying Pills, be found to correct the disordering tendency. Holloway's medicine gives potency to the nervous system, which is the source of all vital movements, and presides over every action which maintains the growth and well-being of the body. No one can over estimate the necessity of keeping the nerves well strung, or the ease with which these Pills accomplish that end. They are the most unfailing antidotes to indigestion, irregular circulation, palpitation, sick headache, and costiveness, and have therefore attained the largest sale and highest reputation.

R. O. YEATS,
General Manager.

WANTED an experienced MANAGER who has been accustomed to Diamond Mining at Kimberley, to proceed at once to take charge of a Diamond Mining property in India. £600 per annum will be paid, and a commission on profits, to a suitable man. First-class references as to experience, &c., are necessary.—Address in the first instance to "Z 1896," care of Samuel Deacon and Co., 154, Leadenhall Street, E.C.

ELMORE GOLD COMPANY, LIMITED.
NOTICE IS HEREBY GIVEN, that on and after MONDAY, June 24th, the OFFICES of this Company will be REMOVED to the AVENUE, 11, BLOMFIELD STREET, LONDON WALL, E.C.
By Order,
C. HARRISON SMITH,
Secretary.

THE NAMAQUA COPPER COMPANY, LIMITED.
NOTICE IS HEREBY GIVEN, that the SECOND ORDINARY GENERAL MEETING of the Shareholders of this Company will be held at the Terminus Hotel, Cannon Street, in the City of London, on FRIDAY, the 28th day of June, 1889, at Twelve o'clock noon, in order to receive the report of the Directors and a statement of Accounts made up to the 31st December, 1888, and to transact such other business as may be incidental to the meeting.
Holders of Share Warrants to Bearer will receive a Ticket of admission to the meeting on depositing their Warrants at the Company's Office, in accordance with the Articles of Association, two clear days previous to the meeting.
The Transfer Books will be closed from Thursday, the 20th day of June, to Friday, the 28th day of June, both days inclusive.
By order of the Board,
C. LEWIS BENNETT,
Secretary.
34, Leadenhall Buildings,
Gracechurch Street, London,
19th June, 1889.

THE ENGLISH CROWN SPELTER COMPANY, LIMITED.
NOTICE IS HEREBY GIVEN, that the ORDINARY GENERAL MEETING of the above Company will be held at Winchester House, Old Broad Street, E.C., on TUESDAY, the 25th day of June, 1889, at Two p.m., and
NOTICE IS HEREBY FURTHER GIVEN that at the close of the above Meeting an EXTRAORDINARY GENERAL MEETING of the Company will be held at the same place, when the subjoined Resolution will be proposed.
Should the Resolution be passed by the required majority, it will be submitted for confirmation as a Special Resolution to a Second Extraordinary Meeting which will be subsequently convened.
RESOLUTION.
(1.) "That in pursuance of article 38, the capital of the Company shall be increased by the issue of £16,000 in 16,000 shares of £1 each; such shares to be issued at the times and in the manner determined by the Directors."
(2.) "That in pursuance of article 43, and of section 21 of the Companies' Act, 1867, the present capital of the Company, viz., £84,000, divided into 21,000 shares of £4 each, shall be sub-divided into 84,000 shares of £1 each."
By order of the Board,
J. MORRIS BOWEN,
Secretary.

DUNCAN'S TRAMWAY MANUAL FOR 1889.
(TWELFTH EDITION.)

Now Ready, Price 5s., Post Free,

This Book contains every needful information relating to all the Tramway Companies in the kingdom, as well as those abroad the capital of which is held in this country. It is the acknowledged authority on all matters relating to Tramways.

It gives an Analysis of the Accounts of each Company for the two past half-years, and the Traffic Tables of all the larger Companies.

It shows the exact financial position of each Company, and gives the names of those connected with its administration and management.

Mr. Duncan has endeavoured to make it a safe guide to Tramway investors, as it deals solely with actual facts, from which the intelligent Shareholder can, at a glance, form his own opinion.

It is an invaluable Book of Reference, and both large and small investors may save themselves from serious loss by having it at hand to consult.

EDITED BY MR. W. W. DUNCAN, TELEGRAPH STREET, LONDON, E.C.

Published by Messrs. EFFINGHAM WILSON and Co., Royal Exchange, E.C.

CAPT. FRANCIS RULE, Manager of the Santa Gertrudis and other Mexican Mines, and formerly Manager of the Real del Monte Company's Mines in Pachuca, and having a Mining Experience of 30 years in that country, Offers his Services to Inspect, Survey or Report on any Mining Properties in Mexico.

REPORTS OF MEETINGS.

PALMAREJO MINING CO., LIMITED.

A BUSINESS-LIKE AND ABLE STATEMENT — INEXHAUSTIBLE RESERVES—CONFIDENCE IN SUCCESS ON A LARGE SCALE—THE DIOS PADRE.

THE ordinary general meeting of the shareholders of the Palmarejo Mining Company, Limited, was held at Winchester House, Old Broad Street, E.C., on Tuesday, under the presidency of Frederick Pigou, Esq., chairman of the company.

Mr. ROBERT J. SCRIVEN (secretary) read the notice convening the meeting.

The CHAIRMAN, who was received with cheers, said: Gentlemen,—I beg to thank you for this extremely kind reception, which, from so large an assembly, I regard as a great personal compliment. We on this side of the table meet you for the first time as a board, after about six months of office; and having given the company's affairs our close attention, I think I am able to furnish you to-day with a very fair *resume* of our prospects. I am assisted in this by the able help afforded me by my colleagues, who have each devoted much personal attention to the common object we have in view, namely, to make this undertaking, not a partial, but a great and permanent success. Most of us know the position during last year. The company was advised by an expert (Mr. Moreing) whose unbiassed opinion was of the greatest weight, that a very large sum of money must be expended to complete the means for conveyance of our ores, and provide the water power for treatment. Month after month elapsed, and many different schemes had been propounded without meeting general approval, until certain shareholders negotiated, and successfully carried through, proposals for founding the Mexican Mineral Railway Company, which would, as a first work, complete our railway and conduit upon certain terms. These terms were sanctioned by you at the last general meeting. Credit is due to the late board for the preliminary furtherance they gave to the scheme. Had it not been for this plan succeeding your company, with its splendid properties and prospects, its good credit, and large funds in hand, must inevitably have been re-constructed, a circumstance which would have thrown a permanent slur upon it, greatly to the injury of the proprietors. These difficulties are over, but to appreciate the present it is well to remember what we have passed through. The Mexican Mineral Railway Company, which is well established, and has large capital, is now constructing the railway and conduit to provide our mills with power, and connect them with what I may, without exaggeration, describe as our *rich and inexhaustible* ore reserves, which will repay us for all the trouble we have experienced. Gentlemen, if the engineering works had at the outset been judged with the same skill as the mineral questions connected with Palmarejo, you would by this time have been in receipt of large profits, and probably your second mill would have been in course of construction. So much for ancient history. I am glad to leave it, and the delays and annoyance of the past, behind us, and state our present position in as few words as possible. You are no doubt most of you aware that I have recently returned from Palmarejo. (Applause.) There I met with universal courtesy. I found all the company's officials well informed and anxious to assist me in my observations. Here I may remark, in answer to the enquiries of several shareholders as to whether there is any mine at Palmarejo, that my visit was made purely for administrative purposes, and not for the purpose of discovery. Indeed, if I had had the smallest doubt of the practical correctness of the reports which had been made by so many competent authorities, as to the enormous value of the Palmarejo Mines, I should not have accepted a seat on the board, nor would I have taken the trouble to visit the property. My business was simply to make acquaintance with the company's officials and the general state of affairs on the spot, and to determine the best means for carrying on the business of the company, a share in the management of which I had undertaken. The policy of stopping the old mills, with the consequent waste and employment of so many hands sorting, &c., which can now be occupied to better advantage on the all important new works, is one which I feel sure you will readily endorse. I was on your property for several weeks, and without wishing any of you the rather qualified pleasures of a journey into Northern Mexico, I really feel that any shareholder who takes the least interest in mining matters, and could inspect for himself, would be contented if he saw our mines and the prospects before us, provided we carry out our designs. The 50-stamp mill at Zapoté is an important section of these designs, because it will show us what we can do; and we, as a board, and our officials and advisers abroad are taking every care to avoid mistakes. (Cheers.) We wish to be quite sure of starting right, and shall try no experiments in this first mill, but proceed on metallurgical principles which are well understood and tested, and which will, without doubt, treat our high grade refractory as well as our free milling ores to the best advantage. The plans and specifications for this mill are in order, the grading and building preparations going on, and we have arranged to import the machinery in ample time to suit the other arrangements. It will be one of the finest mills in Mexico, and should set a good example, because the neighbourhood, as well as our own large territory, extending over 60 square miles, is very rich, and we are really the pioneers of capitalists on a large scale in the district. This mill is calculated to be ready before the railway and conduit are complete, and as regards progress in these works, shareholders in the Mineral Railway Company will no doubt be kept well advised. From the day this mill starts working you will be in receipt of handsome and permanent returns, even if we should have to depend merely on the value of the reserves above the Socorro level. But, gentlemen, there is another element upon which I almost hesitate to touch; that is the high, though, of course, speculative, value of the Dios Padre tunnel, which is being driven on the lode, more than 350 ft. below the Socorro level. Opinions of experts are unanimous that below the Socorro the ore bodies are as rich as those found in the higher levels, and, like them, contain large chimneys or chutes, the value of which runs into probably hundreds of ounces per ton, or even higher still. Should such be the case, and we shall know before very long (probably before our mill goes to work), I need not point out to you how altered our figures will be. Profits at 80,000*l.* per annum have been calculated by Mr. Moreing and others as the moderate estimate of the result of working our first mill upon $30 ore. This calculation speaks for itself, because we have the stuff there capable of extraction, as it is wanted, sufficient to run several such mills for many years; but you can arrive at the great difference in result (with the same working expenses and cost of extraction already provided for in that calculation) were we treating $75 or $100 ore. Every $20 per ton beyond the first $30 should add about 80,000*l.* to the annual profits on working this mill. It will be a grand day for the future of this company when we strike the rich ore bodies ahead of us in the Dios Padre tunnel level. Make no mistake about this, gentlemen: so far as anything in mining can be looked on as a certainty we have a certainty before us here, and I trust that our purse will permit of our prosecuting the work with the vigour it merits. (Cheers.) I made, as far as I could, a personal inspection of the whole of the workings (an operation which gave me several days hard work), and I was much pleased with the survey. Some further exploratory work can with advantage be carried on in one or two of the upper levels, and our expenditure within the mine is at present limited to the Dios Padre tunnel and to this exploratory work, which I decided upon when at Palmarejo after consultation with the manager and mine captain. I spoke of this tunnel as a speculation—though a good one—with regard to the ore bodies ahead, but I want you to understand that the Dios Padre tunnel is not *merely* a speculative experiment, as it will in any event be of the greatest value in effecting an economical output of the ores to the railway terminus, which will be below its mouth, and with which the proper connections will have to be made. Reviewed generally, we have, of course, work before us, hard and anxious work, but only, I believe, such difficulties as are inseparable from undertakings in undeveloped and distant countries, and I have no doubt whatever that we shall overcome these difficulties, and accomplish the work. When fully equipped we cannot fail to pay dividends of a large and permanent character, and our profits should thenceforward increase. Certain shareholders have had the courtesy to give me notice of intended questions, to which I shall be pleased to reply to the best of my ability, and, as I observe, they deal with many points to which I should otherwise refer in these remarks, I will not detain you further, but move the adoption of the accounts for 1888, and of the directors' report which is in your hands. (Loud cheers.)

Mr. M. I. BROWNE (Liverpool): Mr. Chairman, I have great pleasure in seconding your motion. The accounts, as you have submitted them, are in a clear, concise and businesslike form such as we have not hitherto had the pleasure of receiving. As it is not desirable that we should to-day go back and dwell upon matters affecting the past history of the mine, our wish being for information with regard to its future development, I would, with your permission, suggest that you should put the motion, and let us adopt the report and accounts, after which I have two or three questions to ask on behalf of some of the Northern shareholders.

The motion was put and carried unanimously.

QUESTIONS.

Mr. BROWNE: I have been requested to ask one or two questions, one of which, I am afraid, is rather a Mexican Mineral Railway question, but still it trenches very much upon Palmarejo interests, and if you can answer it I have no doubt you will do so. My friends in the North will then, by means of the papers, be able to see what your view is. The first question I would put is—What will be the entire length of the railway, as now proposed, and the conduit, and when do you expect that they will be in operation? Secondly, do you consider the financial position of the company strong enough to complete

the new mill and continue the development of the mine? With the amount of work that we have on hand, this is a very important point. Our position has undoubtedly improved, but do you, as a board, consider that the company is strong enough to carry out the work that you contemplate with satisfaction to yourselves, and so enable you to realise the great hopes that you have expressed with regard to future development? (Hear, hear.)

Mr. PIKE: I would suggest that the meeings be held every six months in future instead of anuually.

Mr. DE MATTOS: You have stated, Mr. Chairman, that Mr. Moreing estimates from $30 ore 80,000*l.* profit from our first mill. What is your view as to that calculation? Secondly, setting aside altogether purely market influences and operations, and especially in view of a letter written by yourself, dated Palmarejo, March 6th, are you of the opinion that our shares are to-day honestly worth par, if not a small premium? (Laughter and cheers.) The letter I refer to contained the following remark:—"Please tell my colleagues that I am very pleased with the property. All that has been said about its value is, so far, within the mark, and the place teems with prospects which are of perfectly iucalculable valne in the future." (Hear, hear.) The chairman has, at auy rate, given us some very good information. In the past informatiou was denied us, and we were living in a fool's paradise; but if we can in future depend upon getting every information, be it bad or good, whatever may come in, I do not think we shall fall into the condition in which we found ourselves some little time ago. That is why I put the question, not as to market influences, but as to whether the property is warranted in standing at 400,000*l.* in value. (Cheers.)

Mr. HAWLEY: I should like to ask why our shares are not officially quoted upon the Stock Exchange?

THE CHAIRMAN REPLIES.

The CHAIRMAN: There is one question which has not been asked and which I fully expected. I am rather surprised that it has been overlooked, for I had notice that it would be asked. The question is—Why did you stop the mill? It appears to me to be a very reasonable question, and I will, therefore, refer to the subject presently. With regard to Mr. Browne's question, as to what will be the entire length of the railway and conduit, and when do I expect that they will be in operation?—Mr. Browne is a man of business, and he knows very well that one has to be a little careful about referring to other people's business in a public meeting. The length of the railway will be about 12 or 12½ miles, and the conduit, or water-ditch, will be about 10 miles. As to when I expect they will be in operation—I cannot tell you that here now. The shareholders of the Mexican Mineral Railway Company itself have not been informed, and I cannot tell Palmarejo shareholders Mexican Mineral Railway Company's business before their own shareholders are informed of it. (Cheers.) I may, however, tell you that the workiis being pushed on with every possible energy. The operations are in charge of a thoroughly competent engineer, who is accustomed not only to railway work, but to mountain railway work, and in countries where they have not a workshop at their elbow to which they may turn; and I think I may say that in no hands could the work be carried on more quickly and effectually than it is being carried on now by the engineer in charge. (Cheers.) The next question was as to whether I considered the financial position of the company strong enough to complete the new mill, and continue the development of the mine? Yes, gentlemen, I do. (Cheers.) There are very few companies in this country—certainly very few mining companies that have not yet got to work—that have so good a position as we have. We have a considerable sum of money in hand, and I believe we shall have no difficulty whatever in completing our work. Now, I will tell you why the mill has been stopped. The ore crushed last year was some 6,200 tons; the average assay value was not $30 per ton, but $58. (Cheers.) The total value of this ore was 53,182*l.* I am not now estimating, but am speaking from the actual figures—the total value, 53,182*l.*; the net value about 35,000*l.*; and the loss—that is to say, the difference between what we realised and what was in the ore—was between 17,000*l.* and 18,000*l.*, which was irrecoverable. We could not hope to get it with the old mills at Palmarejo. Well, we did not want to throw away 17,000*l.* or 18,000*l.* this year, and we decided to keep the ore in hand until we could treat it ourselves. (Cheers.) That I think, gentlemen, answers that question. As to the Stock Exchange quotation—I have only recently been appointed to the chair, and that matter has not been brought before me, but so far as I am aware, there is no reason why we should not have an official quotation, and we will consult our brokers on the subject. With regard to holding six-monthly meetings—I hardly know what to say. We propose to give you quarterly reports, and if you really want half-yearly meetings, I shall not at all object. I shall be happy to meet you whenever you like; but, although we are in a good financial position, these meetings are somewhat expensive, and if we have too many of them we will be simply indulging in a luxury when we might be spending the money to better advantage. (Hear, hear.) Mr. De Mattos asked whether I thought the shares were worth par. I am a pretty big shareholder, and I think they are worth more than par. (Laughter and cheers.) Depend upon it, before we go to work they will be quoted a good deal above par, and you may judge yourselves how soon you like to go in and discount the future. Mr. De Mattos also referred to Mr. Moreing's estimate, that $30 ore would bring in net profit of 80,000*l.* per annum; and he wants to know if I am of opinion, from my observations, that this is a moderate estimate even if working $30 ore only. I am not a mining engineer, and therefore do not know; but Mr. Moreing is a very cautious man, and I believe he does know, and I think he has given you a very correct estimate. I can say no more.

Mr. GOLD: I should like to know what is intended to be conveyed by the remark in the report as to the advantages that will become more appareut after the 50 stamps are working. The paragraph reads:—"The directors are particularly anxious not to enter into speculative matter in this report, nor to lead the shareholders to expect greater results in the future than the plain facts warrant. They therefore content themselves with stating that they are perfectly satisfied, from the information gained by the chairman on the spot, not only that the whole of the estimates furnished at the outset and confirmed by the independent report made last year are not exaggerated, but also that the value of the company's property, in respect to matters not estimated or previously referred to, is very great, and that these advantages will become apparent when the new mill is set to work." It probably has regard to the water-power. I believe ours will be the only water-power in the country. Shall we gain any advantages indirectly from that source—that is to say, from other properties which will be dependent upon our water-course?

The CHAIRMAN: When that paragraph was inserted it was as much as we could tell you, and it is almost as much as I can tell you now. There are some advantages that we have and some that we expect, but if I were to proclaim them in this room I might be telling too much. I must ask you not to press that point at present. You shall know about it all as soon as we can safely tell you. Probably by to-morrow morning the report of this meeting will be published in Mexico. The report of the last meeting was printed in Mexico to my knowledge before it was printed in London. (Laughter.) I think it is not desirable to say too much. If we had been able to say more we would have put it in the report.

Mr. GOLD: With regard to that paragraph a slight misconception has been conveyed to my mind on the matter. There is an idea current that you will probably have to purchase another property. Has such a question been proposed?

The CHAIRMAN: Certainly not; we have quite as much property as we shall be able to manage for a great many years to come. (Cheers.)

Mr. CORNFORTH: With regard to a Stock Exchange quotation may I say one word? The vendors' shares and the original shares are thoroughly mixed together now; they have been dealt in without any difference being made between them, and I hope the board will take care, if they secure a quotation, that they will do so for both classes of shares.

The CHAIRMAN: I think the shareholders may be quite certain that that point and any other point connected with the usual course in applying for a quotation will be attended to by the board. We have it in our mind, and no doubt we shall be advised by our broker as to the proper course of procedure.

Mr. SMITH: Is Mr. Applegarth still in the employ of the company? If I remember rightly, at the last meeting of the company under the old *regime* he spoke favourably of the property, and said he had a great many shares aud did not intend to part with one of them until they were 5*l.* each. (A VOICE: 7*l.*) Is he still a shareholder? We have not seen his name mentioned in the reports lately.

The CHAIRMAN: Mr. Applegarth, so far as I know, holds every share he ever had. (Cheers.) He is not in the employ of the company; he is only a large shareholder, and I believe retains the whole of his interest.

SPECIAL MEETING.

RE-ELECTION OF DIRECTORS.

The CHAIRMAN: Now, gentlemen, with your leave we will make this meeting a special meeting for the election of directors and auditors. The board thought that it would be desirable that they should be re-elected by the shareholders, remembering that they elected themselves at the last meeting, and, therefore, they would like to know that they have your support. That is a point which we must leave to the meeting.

Mr. J. W. HART: Gentlemen, I have very great pleasure in asking your support to the proposition which I shall make to the meeting for the re-election of the present directors, and, uo doubt, it will be a unanimous vote. I arrive at that conclusion from the fact that to-day we have had placed before us certain statements, very concise in their form, clear and explicit, in no way ambiguous, and, as far as my judgment goes, it leads me to believe that they are most sincerely and correctly stated. (Cheers.) With those few remarks, I think I need not detain you any louger, but will simply move that the present board be re-elected:—Messrs. Frederick Pigou (chairman), Edward J. Duval, T. Eley Sykes, and William J. Woods.

Mr. DE MATTOS seconded the motion, which was carried by acclamation.

Mr. J. CARR: I beg to propose:—"That Messrs. Cooper Bros. be re-elected auditors at a remuneration of 30 guineas."

Capt. BOND seconded the motion, which was agreed to.

The CHAIRMAN: Gentlemen, that concludes the business. I thank you for having attended so quietly to what I had to say, and I am exceedingly obliged to you for the kiud way in which you have unanimously re-elected the board. We mean to carry this thing through to success, and we have no doubt that we shall do it with your support. (Cheers.)

Mr. APPLEGARTH: Before we part I think we ought to pass a vote of thanks to our board, and I am sure if the shareholders knew how hard the directors have worked in connection with the company's affairs they would feel like according them a very hearty vote of thanks. I happen to know what they have done, and the attention they have paid to the company's affairs, and I am sure there are very few boards in London that have been so diligent and faithful to the company they control as these gentlemen have, and we cannot too highly appreciate their services. (Cheers.)

Mr. GOLD seconded the motion, and with the brief reply of the CHAIRMAN, the proceedings of a very satisfactory meeting were brought to a close.

MELLANEAR COPPER MINE CO., LIMITED.

SHAREHOLDERS DECIDE TO WIND UP THE COMPANY.

AN extraordinary general meeting of this company was held on Thursday, at the Offices of Messrs. John Taylor and Sons, 6, Queen Street Place, for the purpose of passing a resolution to wind up the company voluntarily—Robert Henty, Esq., J.P., in the chair.

The SECRETARY (Mr. W. F. Garland) read the notice convening the meeting.

WHY THE COMPANY SHOULD BE WOUND-UP.

The CHAIRMAN: Gentlemen, you will all know from that notice for what purpose we have assembled to-day. It is a very disagreeable purpose, but one which seems to admit of no control. When we have met here from time to time, and when fresh mouies had been advanced circumstances were very different from what they have since proved and what we reasonably expected. Amongst other things the price of copper was such as gave us great encourage-

ment, and we had reasonable expectation, and that expectation was fulfilled, that the copper we were extracting and could extract would go far to paying the expenses of deepening the shafts, so that we might more effectually prospect for tin; but that was entirely done away with when we all thought that expectation was absolutely fulfilled by the unfortunate collapse of the copper market, copper having dropped to less than half the price it had been. This left us not only without any profit, but put us at once in such a predicament that it would not even pay for taking it out of the mine. Since that time circumstances have gone from worse to worse. Men who were then working on tribute and might earn small wage have all left us. That, of course. put an end to all expectatiou of getting copper—iu fact, it would have been suicidal to attempt it, because every ton of copper raised only involved the company in further loss.

TIN GIVES OUT.

That was not all. It was always believed by Capt. Gilbert, and there is no reason to suppose now, but that that opinion was a very fair and just one, and well grounded—that when the shaft had been sunk to a sufficient depth to try and get under the portion of ground which had been yielding a fair quantity of tin, and which from time to time had shown an increase, they would come to richer ground—that the increase would have continued. There again we have been disappointed, for later events have entirely falsified all the expectations that were reasonably formed of it. That portiou of the mine is now practically barren, and therefore we have not a single thing now in the mine which will yield, I may say, a farthing. There is

ONLY ONE ALTERNATIVE—

to wind up the company. Some people think the mine will be carried on by a new company, but that company will need a large amount of working capital, and it is perfectly useless for us to suggest any such thing. For a long time this mine paid excellent dividends, and we expected and hoped, as in other mines in Cornwall, as the mine was developed, and as the shafts and workings were carried to a greater depth, we should not only, have done well, but should have improved. There has been no fault in the working of the mine. We all know we cannot see into the depths of the earth, and so we have worked upon the ordinary conjecture which a mine works upon, and we have been disappointed, and there seems to be nothing left but to pass a resolution winding up the company. We have practically no money iu hand, but we have the machinery, and so on.

THE LORDS HAVE MET US VERY FAIRLY.

They have at once accepted our proposal to discontinue the pumping, and they have also made no difficulty upon the notice to give up the leases. I have nothing further to say to you, but we all regret the course we are obliged to take, but there is no alternative but to adopt the course the directors recommend. I beg to propose "That the company be wound up voluntarily."

Mr. SAMUEL J. WILDE (director) said that if the price of copper had remained at anything like what it was in the days when they were paying their dividends, they would have beeu able to sink the shaft considerably deeper. He believed some day or another people would come forward with their 15,000*l*. or 20,000*l*., and go on with the mine. He felt very confident tin would be found there in depth. He seconded the resolution.

THE LIQUIDATORS.

Mr. MICHELL suggested that before the resolution was passed the names of the official liquidators, and their remuneration, should be stated to the meetiug.

The CHAIRMAN said the names could not be inserted in the resolution, but he thought Mr. Garland, the secretary of the company, would be a very desirable person, and that with him Mr. Wilde might be associated. These two gentlemen had been long connected with the concern, and were thoroughly conversant with all the details.

The motion was carried unanimously.

The CHAIRMAN said they had adopted the only wise course open to them. The confirmatory meeting would probably be held on Friday, 5th July.

The proceedings then closed.

HARRIETVILLE GOLD MINING CO., LIMITED.

STATUTORY MEETING—FAVOURABLE PROSPECTS FORESHADOWED.

THE statutory general meeting of the shareholders of this company was held at the Cannon Street Hotel, on Mouday—under the presidency of the Right Hon. Lord Ribblesdale.

Mr. JOHN GARLAND (secretary) read the notice convening the meeting.

PRELIMINARIES.

The CHAIRMAN: Gentlemen, this meeting is a statutory general meeting, which it is necessary to hold within four mouths from the date of the incorporation of the company, which was registered on the 22nd of February last. The nominal capital of the company is 170,000*l*. The actual capital, however, is 150,000*l*.; the reason of this being that during the progress of negotiations for the purchase of the properties, the advices received from the mine were of such a satisfactory character, that the directors were advised that it would be quite safe to go to allotment with a less amount of working capital than it had been originally intended to provide. The working capital was thus reduced from 50,000*l*. to 30,000*l*., the whole of which has been subscribed.

MODIFICATION OF TERMS WITH VENDORS.

Of course this is a very considerable modification, and perhaps I had better explain to you how it arises. The original arrangement was that the Australian vendors should receive a total of 80,000*l*. iu cash and shares. No modification has taken place in that; they have received the 80,000*l*. in cash and shares, but instead of receiving 50,000*l*. in cash, and 30,000*l*. in shares, they have received 40,000*l*. in cash and 40,000*l*. in shares. They were willing to agree to this proposal when it was suggested by your board. The advices which have now been received from our own superintendent, Mr. Davey, who in no way advised us as to the purchase of the mine, but formed his judgment independently, fully confirm the opinion that no large amount of working capital will be required, and the company has thus the advantage of the smaller amount of capital, viz., 150,000*l*., instead of 170,000*l*., upon which to pay dividends. The cash purchase money, 40,000*l*., was duly remitted to Melbourne and paid to the vendors.

TRANSFER OF LEASES.

The transfer of the leases and mining rights to our representative at Melbourne was executed on the 29th March last, and possession of the mines handed over to the company on the 1st April. The company's superintendent, Mr. T. G. Davey, who was appointed by the managers and consulting engineers, Messrs. John Taylor and Sons, arrived at the mines on the 27th April, work having been carried on at the mines in the interim by Mr. Turnbull, who was appointed to take charge temporarily by our solicitors at Melbourne. Mr. Davey is an experienced mining engineer, known to Messrs. John Taylor and Sons, and formerly employed by them. Immediately prior to his leaving for Harrietville, he was engaged in managing an important mine in New South Wales. He has had great experience in mining and metallurgical operations, and we consider we are very fortunate to have secured the services of so able a man. We have also sent out a young man (Mr. Alfred Rouse, from Cornwall) as accountant and assayer.

TELEGRAM FROM MR. DAVEY.

We have received the following telegram from Mr. Davey, dated 16th May:—

"Crushed during the last six weeks 360 tons, yielding 413 ozs.; six stamps; mine is looking well. I recommend putting up 10 more stamps at once, worked by water-wheel, also concentration works for pyrites. I estimate the cost of erecting the machinery at 5,000*l*."

This has been published in the newspapers, and has, no doubt, been seen by many of the shareholders. We regard this message as a very favourable one, and immediately on its receipt cabled, authorising Mr. Davey to erect the machinery which he recommended. We have since received from him his first letter, dated April 30th. He had only been at the mine two or three days, and was unable to report in detail. This is an extract from his letter:

"I have visited the mines twice, and am well impressed with the appearance of the ore reserves. It is, of course, premature for me to attempt to give a detailed account of their peculiar features until I have had time to thoroughly examine the work already done. I may state, however, that the natural facilities for working the mines and treating the ore are such as are seldom met with. The drive on the lode south of the lower tunnel of the Mons Meg is being extended, the lode being fully 5 ft. wide and showing gold freely. At the Tiddledee little work is being done at present."

He had evidently seen enough to impress himvery favourably as to the appearance and prospects of the mines, for in the same letter he asks if any shares of the company are procurable, as he would like to purchase a few.

LETTER FROM MR. TURNBULL.

I will read you a letter from Harrietville, dated 8th May, 1889, and it came to hand this morning. It is from Mr. Turnbull, whom Mr. Davey advised us to engage. Mr. Davey, at the time this was written, was at Melbourne.

"As regards the mine, the south drive in the lower level in Mons Meg Mine is opening up well. The reef is from 5 to 6 ft. wide, and showing gold all through the stone. The crushing mill is working well, and the stone crushed so far is looking fully as good as the last crushing. There is nothing new to report as regards Tiddledee. As I told you before, there is a lot of work to be done in this mine before there will be much return from it."

Well, of course, that we always expected. I will read you, in immediate connection with that letter, a telegram dated 12th June. He is referring to the crushing on the 31st May:—

"Mons Meg: 15 days, 148 tons, 210 ozs. Tiddledee: 100 tons, 25 ozs. Have bought complete battery 12 stamps, with new portable engine of 12 h.-p., and sheds for 500*l*."

That is an exceedingly good purchase I am told by people who are acquainted with the price of machinery. Of course the ounces in the Tiddledee Mine were not very flattering, but that is exactly what we were led to expect in the letter of 8th May. Probably he was dealing only with old stuff, and his machinery was not in working order. During the erection of the new works the returns from the six stamps which we are erecting, and which seem to be in thorough good order, at Mons Meg, will not only pay all expenses but give us a very good profit. Already up to the 16th ult.

WE HAVE PRODUCED 413 OZS. OF GOLD

of the value of 1,700*l*., which must have left a good profit to the company. (Cheers.) I may here mention that the gold produced obtained the very high price of 4*l*. 2s. 6d. per ounce. I think we may congratulate ourselves on having secured a property which has the appearance of being a very valuable one, and which when worked on a large scale may, I think, be expected to pay handsome dividends to the shareholders. (Cheers.) The chairman concluded by offering to answer questions.

QUESTIONS.

Mr. CHAPLIN: How many shareholders are there now?

The CHAIRMAN: About 350.

A SHAREHOLDER: Are you likely to get an official quotation?

The CHAIRMAN: We hope so soon.

A SHAREHOLDER congratulated the board upon the promising outlook as foreshadowed in the lucid statement of the chairman.

Another SHAREHOLDER asked if the share capital would be reduced in consequence of the new arrangement with the vendors.

The CHAIRMAN: No, there will be about 20,000 unissued shares.

On the motion of Mr. FERGUSSON a cordial vote of thanks was passed to the chairman and directors, and the meeting then separated.

BALAGHAT-MYSORE GOLD MINING CO.

ANOTHER LONG DISCUSSION LEADING TO NO PRACTICAL RESULT—A SPECIAL MEETING TO BE CONVENED TO CONSIDER RESOLUTIONS FOR THE APPOINTMENT OF NEW DIRECTORS.

THE adjourned ordinary general meeting of shareholders was held at the City Terminus Hotel, Cannon Street, on Wednesday—Mr. D. F. Carmichael in the chair.

Mr. E. O'DWYER (secretary) read the notice convening the meeting.

WHAT HAS HAPPENED SINCE MAY 22ND.

The CHAIRMAN: Gentlemen, at the close of the last meeting Mr. Ogle, a gentleman who had taken some part in the discussions—most of you had left the room, but a few of us were there—made the following remarks:—"I would suggest the adjournment of this meeting, so that some few of the shareholders should have a conference with the board on some of the poiuts raised, and I hope we may meet together in a more fricudly spirit in the future. The first fault of the directors is that they have not a profitable mine, and not paid a dividend; but beyond that, the meeting seems to think that the mine has not been managed as it ought to be. I would suggest that the meeting be adjourned for a mouth." On the day following, Mr. Ogle came to the office and uiade the suggestion which he had already made at the meeting, that some eminent mining eugineer should meet Mr. Darlington and discuss with him the aspects of the mining question. He looked down the list of shareholders, but, unfortunately, we had not a mining engineer, whether of emineuce or otherwise, on the list of shareholders. Mr. Ogle theu said he would bring three geutlemen—Genl. Sankey, Col. Tenuant, and Col. Campbell Walker—to meet the directors. A day was arrauged, and the board were all there, but through some unfortunate misunderstanding these gentlemen did not know that was the day fixed. Mr. Ogle wanted to know why the other gentlemen were not there, and why a notice had not been sent to them; but the secretary said he was uot aware that notices had to be sent. However, after a good deal of telegraphing, we did get Col. Tennant, and he, with Mr. Ogle, went to Mr. Darlington's office and spent two hours there. Mr. Darlington laid all his plans on the table, and made the best explanation he conld of them. When those gentlemen rose to go the members of the board said they hoped they were satisfied, and they said, "We will consult the other gentlemen on the committee, and let yon know." A day or two after that we had a letter from Mr. Ogle, saying he regretted that himself and the shareholders acting with him had arrived at the conclusion that matters were unsatisfactory, and, therefore,

THEY INVITED US, IN VERY POLITE LANGUAGE, TO RESIGN OUR SEATS AT THE BOARD.

Then we had nothing to do but to issue a summons for a fresh meeting, and to pnt the agenda paper before the Shareholders' Committee. They then wrote, saying they regretted we had not consulted them before laying this agenda paper before the shareholders. What I wish to say abont the position taken by these gentlemen is this. They tell you in the circnlar they have sent to you that "at the conclusion of the meeting the shareholders proposed that a committee of their number should confer with the directors, which was agreed to by the board." I do not think that is quite the right way of pntting it. We did not think the committee had been formally appointed by agreement with the board, and we got into some trouble in consequence. These gentlemen seem to have rather magnified their office. If they were a formal committee, appointed by you to examiue iuto all the questions relating to the mine, then it would be onr duty to say to the shareholders, We have met the committee you appointed and we regret that they do not agree with us, and so on. I believe we have lost a great many votes in consequence of what we have done. Some gentlemen who had sent us their votes after they got the circular withdrew them, thinking it a very queer thing that we had uot mentioned that we had met the committee and so forth. However, we had got something definite at last. They at first said they regretted that the condition of things was unsatisfactory, and uow they say no satisfactory reason is forthcoming "for the change of front on the part of the board," and for not sooner adopting the views of their loeal agents concerning the development of the mine. It was stated at the meeting that the agents at the mine, Mr. Oakley and Capt. Pryor, were always wishing to push to the south, but that we had put a stop to that and gone to the north, and that that is the origin of the mischief that has occurred. It was said too that we should have had a very good mine if we had followed the advice of our ageuts. That is a very good statemeut until it is answered. In 1886, from May to December, we just got about 60*l*. or 70*l*. of gold—just a handful, and in 1887 we got you a hatful, say 500*l*. or 600*l*. worth. Then, surely, it was time to consider what should be cut off in the operations, and after consulting with Mr. Darlington the board suspended operations to the south of the north engine shaft. We did not inteud to do so for ever and ever; but

WE HAD GOT INTO GOOD GROUND ON THE NORTH,

and we told you in submitting our report for the year ending 31st December, 1887, that "a considerable amount of developmeut has been done in other parts of the mine besides those mentioned above, but although promising indications and occasionally small quantities of qnartz have been met with, no important discovery has been uiade. The directors have, therefore, decided to restriet operations, for the present at least, to the northern part of the mine, where the prospects are so favourable." Well, that was at the end of 1887. We did go on exceedingly well, and in May, 1888, Mr. Oakley came to England. We had our meeting in June, and you heard what he said. He did not say one single word about our neglecting his advice, and so forth, which it was quite open for him to do. He was in the greatest spirits about the condition of the mine, and Capt. Pryor was equally sanguine, and said that our prospects were splendid—we were in the midst of immense riches. At the end of 1887 it was a question what we should put a stop to, and we put an end to the exploratory works to the south, and went to the north, and although we have not had 20,000*l*., as Mr. Oakley prophesied, we have had 10,000*l*., at any rate. When Mr. Oakley was here the June return gave 370 ozs., and the July return 356 ozs. Then they got smaller and smaller, and we had to look round again.

THE NORTH HAD NOT PROVED SO FLOURISHING

as Mr. Oakley and everybody else supposed, so we wrote on the 3rd January inviting them to give their suggestions as to the south, in consideration of the northern ground not having proved so well. They were invited to reply by telegram, and to make some definite recommendation, after putting their heads together, and this is what they said:—"We recommend you to push ahead with 270 south drift and cross-cut." That was on February 1st. On February 4th the board wired back to them: "Agreed," and asking them to give written explanations, because we wanted more than a telegram. We wanted to have something in writing. The Chairman then read the letters received from Mr. Oakley aud Capt. Pryor, and proceeded: You will see that we are charged with not having satisfied the committee, and as to no satisfactory reason being forthcoming as to the change of front on the part of the board, but I think the explanation I have given you, and the letters I have read—and we have all the papers here to give you any further information at once—will show that the statement that has been put before you by the committee is a one-sided statement and they ought to hear the other side. I shall conclude by moving this resolution: "That the item of 892*l*., directors' remuneration, appearing in the revenue account, having been reduced by the sum of 130*l*. 4s., paid to the company, and credited to the current year's accouuts, the report and accounts for 1888 be received and adopted." If you do not choose to pass this we shall not accept it as a vote of want of confidence. (A laugh.) There is plenty of opportunity for yonr doing so—there is the very simple way provided by the articles by which you can do it in a few days or weeks; but we think this business ought to be finished, and we hope, as a mere matter of form, that you will pass this. If your real object is to turn out the directors, you will have pleuty of opportunity of doing so.

MR. OGLE QUESTIONS THE LEGALITY OF THE PROCEEDINGS.

Mr. W. OGLE: I think this would be a good opportuuity for me to say that the board are advised that their proceedings in attempting to pass these resolutions are irregular and illegal. You are in error in stating that the business of the last meeting was not concluded. The three things that were put before the shareholders to vote upon were the report and statement of accounts, the election of new directors in the place of those retiring, and the re-election of the auditors. It is not uecessary for me to go over the ground, but I simply say that those resolutions were put from the chair, and were seconded, and voted upon, and the decision was almost unanimously to the contrary. Theu. on the advice of your solicitor, they were put as an amendment, and this was carried *nem. con.* in the whole of the three cases. I raised an objection, which I subsequently withdrew, to the effect that instead of being put as an amendment it ought to have been put as a substantive motion. Your solicitor said he had advised the other course, and was prepared to take the responsibility of doing so, and I bowed to his superior kuowledge of the law. But if we are to take your (the chairman's) reading of what was our duty, we should have to say that the meeting could not be concluded unless we accepted first of all your report and accounts, because in acceptiug it, according to the board's version, we did uot finish the business as far as that is concerned, and the same with the directors aud the auditors. Then it is

A PERFECT FARCE

to call them together and to ask them to pass the accounts, if you are to say that if they do uot pass them the busiuess is not finished. What are the shareholders called together for? Clearly to approve or disapprove of the reports and accounts. They disapproved, and as there was no other business to do, the meeting was at an eud. I suggested, for the purpose of probably being able to report to the shareholders that we had gone into matters, and that we were satisfied that thiugs were in order, that we should call another meeting to pass the accounts and report, and whatever other business we thought was necessary.

THE RESULT OF OUR INTERVIEWS, HOWEVER, WAS NOT SATISFACTORY,

particularly on the question upon which the chairman has given you such an elaborate explanation now, an explanatiou which we did not get when we attended before them. I pressed particularly for such information as I could judge by. What I asked for was this. You received in 1887 and 1888 strong recommendatious from your managers to sink on the south shaft. You did not do so. You have given us two reasons: oue, the letter of Genl. Sankey to the board, and another, from your consulting engineer. The reasons were different, and I said, "Will you show us the correspondence between yourselves and the mining engineers on the other side, showing what reasons you have to give for not carryiug out their recommendations. If the reasous were good, of course all our objections would be at an end; but we never could get to that point at all. We could not get the correspondence. Mr. Darlington very politely read to us a lot of letters, but none of them bore ou the point at issue. We thought that people in whom the board had every confidence ought to be people whose views should be received. If Mr. Darlington did not agree with them he ought to have exchauged ideas, and come to some conclusion. As far as we could gather, uo conclnsiou was come to. Surely the two meu out there should know as much about the boundary as anyone, and they would not have been likely to recommend a course detrimental to the iuterests of the company, and, therefore, we were dissatisfied with their explauation. I wish to make an explauation as to the

COMMUNICATIONS WHICH PASSED WITH THE COMMITTEE.

The committee was unquestionably appointed on my suggestion, and we fixed there and then, as well as we could, upon a committee. The chairman seemed to argue that we, in a uot very courteous manner suggested they should resign. I believe we did not put it in a discourteous manner.

The CHAIRMAN: I said nothing about discourtesy at all.

Mr. OGLE continuing: All that was said was that if we were in their places we should tender our resignations. That was all that was said. At any rate that is the position—the committee were not

satisfied, and they said, not being satisfied, they should recommend to the shareholders that we should have a change in management. (Hear, hear.) Whether or not they are to blame for the management and for our want of success is another question. It may or may not be so, but at any rate new blood might do good, and the new board would consult the people on the spot who are the best judges. I have no desire to do anything discourteous, but I do say this—that I think the course we propose to adopt is the proper course, and the course that ought to be adopted.

PROXIES.

The directors have sent out proxies—those proxies are illegal also. The law seems to be this:—This meeting is a continuation of the last meeting, and if proxies had been sent in for the last meeting they would be available for this meeting; but that not having beeu done the proxies for this meeting are totally illegal. I do not know anything about the nnmber of proxies. We did not send out proxies, because we did not wish to do so, and moreover we knew they were illegal. I hope the board do not intend to use the proxies, be they many or few.

THE DIRECTORS' FEES.

Mr. HENRY WRIGHT (director): The motion before you has not been seconded, and it is not in order to go on with the discussiou until it has been seconded. No one has made any objection to the report; it is only the accounts that have been objected to, and the ouly objection to the accounts was the extra fees in it. I thiuk I am correct in saying the only fault found was that there were fees there which were not defensible. Well, the directors considered that, and although there was a good defence for the course taken, we waived that in deference to the meeting. In adopting the principle for last year, we thought we were in duty bound to make the correction for the whole period. So we have dealt not only with the fees for the year, to which objection was taken, but also for previous years. The only objection raised is, therefore, now removed, and as a matter of business we onght to pass those accounts. With regard to any other matter, as to the resignation of directors and payment of other gentlemen, we are quite prepared to deal with that when that is before you. If you will kindly dispose of the question of accounts, we will then go into the other subject—the retirement of the directors, which we are qnite prepared to consider. We have no wish to hold our office any longer than we have the support of the great majority of the shareholders. I think we had better postpone the other matters until that is disposed of.

A SHAREHOLDER WITHDRAWS HIS PROXY.

Mr. PROBYN: I attended the meeting of the 22nd May, but, unfortunately, was obliged to leave before it was finished. Afterwards I received your circular stating that at the original meeting, held ou 22nd May, the shareholders declined to finish the business placed before them, and an adjournment thus became necessary. With that you sent a paper. I therefore signed the proxy paper, but a few days afterwards I received a letter from the committee, iu which they designated your statement inaccurate. From what you have told us to-day I do not think it was quite accurate, and it was very injudicious to put it as you did. The gentlemen here said the proxies were illegal, but it was a most injudicious circular of yours to put forward to the shareholders—in fact, most misleading. I therefore beg to withdraw my proxy, so that I may have a free hand.

A COMMON SENSE VIEW.

I am aware on occasions of this sort that the directors and mining engineer are not the slightest to blame. People are a little hard when they do not get their dividends, but I think it is unfair to come down on the directors and mining engineer for what is not their fault. No one accuses the directors of dishonesty in any way, and, therefore, I do not see why we shonld object to pass these accounts. The money has been spent. It may have been spent injndiciously, but we are all liable to mistakes. If the accounts are passed we can then go into the other question.

A LEGAL POINT.

Mr. STAPLES: I question, Mr. Chairman, whether we can legally take np the question of accounts at all. A meeting was called for the purpose of passing the accounts. It was put to the vote, and those accounts were refused. They have since been altered by the restitution of a cousiderable amount of fees. The clause in the articles of association on which they took their extra fees is one which does not reach this case at all, and I am only surprised that gentlemen sitting on that side of the table could have justified themselves in taking the fees. That clause was a very proper clause, but it was most improper for them to use it as a cloak for taking the fees they did. We were expecting, and that rightly, that under the circumstances under which we have been placed for some time past it would have been only courteous and proper to tell us they had only taken half their fees. How miserably we were disappointed when we found they had not only taken their pound of flesh, bnt they had dipped into our coffers for more. I think it right for them to do what they have done, but I do not think they need our thanks for it. As regards this meeting, it is not a legally constituted meeting. A special general meeting must be held for the purpose of passing those accounts. I think it would be illegal for this meeting to take up that which the other meeting had left, and I think under the circumstances a special general meeting should be called. I ask whether the time has not come to remove the gentlemen on the other side of the table. (Hear, hear.) I see they have lost the confidence of the shareholders, and if we go on in the same way as we have before we shall come to the end of our tether before we reach the success which I feel sure is to be won.

Mr. JAMES (auditor) said the accounts now put forward were the same.

A SHAREHOLDER: The accounts that you passed allow the directors to have taken 850*l*., their full amount, and a sum in addition, without any protest from yon or without bringing the matter before us.

Mr. JAMES: One story is good till another is told. I am merely explaining a misapprehension which has arisen. The accounts put forward are the same as put forward before. You say we drew no attention to extra fees being taken. There again is a misapprehension. It is not for us to alter your articles. We did draw the attention of board to it, and we were referred to the articles. I say that anybody who reads the clause in the articles specially dealing with this is bonnd to admit that we passed that which you by your gospel allowed us to pass.

A SHAREHOLDER'S VIEW OF THE CONCESSIONS MADE BY THE BOARD.

Mr. WEST said that the concessions made by the directors were not of a very important character. The directors informed them they had returned a certain amount of money, but he could not give them any great amonnt of credit for that. That money was money they had no right to take in the first instance. He thought if they had paid some little deference to the views of the shareholders they would have voluntecred to reduce their fees by at least one-half until the mine becomes a paying concern. But there was no proposition of that sort. The next concession, if it was a concession, was the retirement of two of the directors, but they did not say that this retirement would be for the benefit of the shareholders, or for the benefit of the continuing directors—(cheers)—because on the last occasion it came out that when one of the directors was away his fees were divided among the others. He would be glad to know whether the fees would be taken by the continning directors, or whether the shareholders would receive the benefit. The next thing was the resignation of Mr. Darlington. When he (the speaker) read this he jumped at the conclusion that they would save at least 200*l*., but reading on he found that the appointment of the best mining engineer to fill the post was receiving the careful consideration of the board. If the company had a good manager, it was perfectly clear they did not want an engineer to interfere with him in this country. On the other hand, if they had a bad manager the sooner they got rid of him the better. They had been asked to pass these accounts, and proceed to other business, but supposing they did pass these accounts, they would then be met with the objection that this is a continuation of the former meeting. That would be very likely to arise if they passed these accounts.

The CHAIRMAN: I just wish to answer the last speaker. He wishes to know whether the 300*l*. a year, which would have gone to the two other directors, will be divided amongst us. The articles of association say that the remuneration of the directors shall be at the rate of 150*l*. a year for each director, and an additional 100*l*. to the chairman, such remuneration to be divided amongst the directors. If there are only three directors I do not see how we can get the fees of two others. This remuneration is to be divided amongst the directors.

Col. HENRY C. BYRDE: I think it is fair to Mr. Darlington to say that he had relinquished one half of his salary, and said he would only ask for 100*l*. fees instead of 200*l*. At the last meeting I rose to say a few words when it was getting late, but some gentleman called out "time," and I sat down. I will only ask you to bear with me for five minutes.

THE SHAREHOLDERS CAUTIONED.

You are engaged in a most important business, and it has taken a long time for the directors to get fully initiated into the business they are carrying on. I feel we have been very careful and attentive to our business. If I had felt that you were dissatisfied with my administratiou of your affairs at any time I should have retired from your board, but I wish to say one or two things as a matter of warning before any steps are taken for our dismissal, if it is to come to that. I beg to refer you to the Mysore Mine, which, out of a capital of 135,000*l*. they had expended 110,000*l*. before they got any gold whatever. It was not nntil Capt. Plummer took charge of the mine, and after he determined upon sinking one shaft, and one only, that he was successful. After sinking down that shaft for a considerable depth he came upon a true fissure vein, and this constituted the success of the Mysore Company from that day to the present. He was also consulting engineer to the Nundydroog Mine, and the same thing happened there.

THREE ELEMENTS OF SUCCESS.

There are three elements of success—there is perseverance, there is good judgment and there is economical expenditure. I maiutain that the board have exercised all these three qualities, but I fear another element of success has not existed, and that is the patience of the shareholders. (A VOICE: Confidence.) We are not only interested as shareholders, we are interested in our credit in the success of the nndertaking. We give uutiring attention, patience and care to the development of these mines, and every resolution we adopt is for the purpose of developing them successfully. We have scarcely been three years at work, and we have obtained upwards of 10,000*l*. worth of gold, but we have only in our workings fallen in with what is known as gash veins; they do not measure more thau 10, 12, or 14 ins. in width at the utmost.

A SHAREHOLDER rose to order, and said this was not what they were called for, and he did not see why time should be taken up in going over the same gronud as before.

Col. WALKER said the question was whether this meeting could consider the accounts, being merely an adjournment of a meeting at which these proposals were rejected. What they proposed to do was for Genl. Sankey to lay before the meeting the proposals of the committee.

THE SOLICITOR'S OPINION.

Mr. HILLIARD (solicitor) said he had been requested to speak upon the legal aspect of this question. He had had a conference with Mr. Ogle who moved the adjournment, and mentioned to him it would be a convenient mode, because, in his (the solicitor's) opinion, the accounts were still before the meeting, aud if alterations were made, which were satisfactory to the gentleman who moved the amendment, the accounts might be passed as amended.

Mr. OGLE: I beg your pardon, sir; will you refer to what took place?

Mr. HILLIARD (continuing) said he was perfectly aware that the amendment which was moved was an amendment which was practically a negative, and had the same effect as a negative to the substantive resolution. It was his opinion that if after that negative, at that same meeting the directors had consented to an amendment of the accounts agreeable to the shareholders it would have been competent. He had not taken any barrister's views on the question. There was another thing he wished to mention. There was no doubt what Mr. Staples had stated was correct. If they conld not touch the question of accounts and appointment of auditor they could not do anything at all. Any other matter would have to be brought forward by a proper notice aud a separate meeting. If the law on the other side of the table was correct, the meeting was practically at an end.

GENL. SANKEY'S STATEMENT.

Genl. SANKEY: I think there has been a misapprehension about this meeting. I was obliged to leave the previous meeting before it was over, but I was given to understand that the proceedings came to almost a deadlock, and it was the object, and a friendly object, at the time to get the shareholders and directors together in a friendly way, and in order to get them out of this deadlock that a committee was appointed. I had never looked forward to taking part in the matter, but from what I have been given to understand, the committee went as carefully as they possibly could into explanations, and as Mr. Ogle said, the letters and other matters that were shown then, and the explanations given, were of a very inadequate character. Of course, there has been a good deal said since, but at that time the explanations seemed to be most inadequate, and we could not possibly come to any other conclusion than we did. It was meant in a friendly kind of way, and we hoped that the directors would have seen the position they were placed in, which was this—that the directors had lost the confidence of the shareholders. That is really the outcome of the whole thing. I have no unfriendly feeling to the directors, and I am exceedingly sorry that Mr. Darlington should also have taken a wrong view of it. The outcome is this—the committee have not been satisfied with the explanations they have received. The development of the mine to the south, as indicated and advised to Mr. Oakley and Capt. Pryor, has not been followed. It has been before the committee and before the consulting engineer for a very long time, and now there certainly has been a change of front. That has been rather confirmed than otherwise by what the chairman has read out to-day. All I asked for was to explain how it was now at the eleventh hour they had decided to develop the mine to the south. The explanation at the last meeting was something connected with the boundary. Mr. Darlington is reported to have said: "My explanation was the boundary question, of the existence of which they were aware." There is the distinct admission on the part of Mr. Darlington himself that they were aware of this question of the boundary all along. There is the advice anyhow of the engineers on the spot, which has not been carried out, and I do not feel any more satisfied than I did when I first raised the objection. I beg now to suggest, as representing the committee, that the number of the directors be reduced to three; secondly, that the remuneration of the directors be 100*l.* each per annum, and 50*l.* extra for the chairman, and we recommend a radical change in the board of the Loudon management generally.

A REQUISITION.

We submit as a requisitiou for your consideration the following:—

"To the Directors of the Balaghat-Mysore Gold Mining Company, Limited.

"We, the undersigned, being not less than 10 in number, all members of the Balaghat-Mysore Gold Mining Company, Limited, holding in the aggregate shares in the nominal amount of not less than one-tenth of the issued capital of the company, do hereby, in accordance with the articles of association of the company, require you to convene an extraordinary meeting of the members of the compauy. The objects for which we desire the special meeting to be convened are to consider, and, if thought fit, pass the following resolution, or a resolution to a similar effect, viz.:—'That the present directors of the Balaghat-Mysore Gold Mining Company, Limited, viz., Henry Wright, Heury C. Byrde, and D. F. Carmichael, be, and are hereby removed from the office of directors of the said company; and, if thought fit, to pass resolutions for the appointment of new directors of the company. If the resolution be passed, we bereby require you at the proper time to convene a second extraordinary meeting, to consider, and, if thought fit, confirm the resolution as a special resolution, and appointing directors in place of the directors removed."

This will be served upon the secretary at the ordinary offices of the company, when the due amouut of signatures representing no less than the amount named are obtained. The committee have also been actively engaged in another matter. They have opened up

NEGOTIATIONS WITH A FIRST-CLASS FIRM OF MINING ENGINEERS

to advise us as to the general management of the mine, and as to the selection of the gentlemen to take the place of the gentlemeu now on the board. There is just one word more I have to say. One gentleman, with the best intention in the world, mentioned that it would be very desirable to trust to our local professional officers at Balaghat. I mentioned at the last meeting that I had no acquaintance with Capt. Pryor, but from what we know both Capt. Pryor and Mr. Oakley are very estimable and worthy servants of the company, but it would be very short-sighted to dispense with the services of first-class advice in London. To my mind you never pay too dearly for first-class professional advice of any kiud, and I think it would be rather shortsighted if we did not get the very best professional advice we could in London.

Mr. WRIGHT: There is one question upon which there has been a misconception—that is with regard to the committee. I wish to say there was no such thing as a committee appointed. It was suggested that a few shareholders who had been meeting together should meet the directors for such explanatiou as the directors were able to give them. A recommendation coming from a committee of shareholders would have very great weight, but when you take upon yourselves to call yourselves a committee, which you are not, you are saying that which is not right. There was no such thing as a committee appointed. All I can say is that

THE PROPOSAL OF GENL. SANKEY HAS THE GENERAL APPROVAL OF THE BOARD.

The only question was whether we should take the initiative or whether we should leave it to you. We shall abide by the decision, and we shall give you every assistance you require, and when the meeting is held we shall offer no opposition, but I shall ask you to be prepared with three names to take our places, so that we can retire as early as possible in the interests of the company.

Mr. PARTON PARRY attempted to make some remarks, but the meeting refused to give him a hearing.

Mr. DARVALL asked who bore the expense of all the printing and postage on the papers they received.

The CHAIRMAN: The directors.

The CHAIRMAN then put the resolution, which was lost.

Genl. SANKEY asked shareholders who were willing to sign the requisition to come forward, and put their names to the paper, and said he had himself signed for 5,757 shares.

The meeting then terminated.

THE PONDOLAND EXPLORATION AND MINING CO.

IMPORTANT NEWS FROM THE MANAGER—QUESTIONS ABOUT THE TITLE—WISE RESOLVE OF THE BOARD.

THE statutory meeting of the shareholders of the Pondoland Exploration aud Mining Company was held on Monday at the City Terminus Hotel, Cannon Street—Capt. Charles Selwyn, M.P., in the chair.

The SECRETARY having read the notice convening the meeting,

The CHAIRMAN said: This is a statutory meeting, and I have very little to say to you after the circular which has been issued to the shareholders. I will read you a letter received on the 11th June from Mr. J. R. Girling. It is dated the 9th of May, aud he says:—

LETTERS.

"I came on straight here to see the chief, but as yet have only seen Umhlaugaso, whom I addressed as if nothing had happened, assuring him of the good feeling existing betweeu the company and the chief and his people, as shown by the fact of my bringing about 250*l.* worth of presents instead of about 10*l.* worth, which I promised, also showing him the watch, which fairly staggered him. There is a lot of beer at the Great Place, and until it is finished I shall be unable to obtain an interview. In the event of their objecting to allow us to work, we shall still commence, and if they obstruct us we shall claim protection from the Cape Government, which will be given. If they persist the country will be taken over, and then, as ours is the only concession recognised by Government, all will be plain sailing. A German has shown me gold obtained from alluvial diggings somewhere in the country. Some of the pieces were as big as peas, and has offered to tell me the place for a consideration. Other men have also offered to show gold-bearing reefs of quartz for a money payment. From all I hear the property must uot be given up. I mean that sharebolders must not be afraid to allow their mouey to remain in such a good-looking thing. The man Cook passed himself off as Messrs. Rothschilds' agent, and has gone back to Cape Town. I would not give him a sovereign for the 1,500*l.* with which he bribed these people. He also fills them full of grog, and lies until the poor devils were persuaded to believe that I had sold their country! This was proved to them by showing a prospectus of the company, in which is stated that 40,000*l.* were paid to the vendor (me), the price got for their country. I do not fear the result, if I could only get at them, which I shall do as soon as the presents come down, if not before."

That, gentlemen, is the letter we have received from Mr. Girling, the vendor of the concession, but we have received also by the same mail a letter from one of our directors, Mr. Alexander Gordon, who went out to South Africa on behalf of the company. Mr. Gordon writes on the 12th January:—

12th May.—"On arrival here I find that the news I sent you from Cape Town about the 1,500*l.* paid to Sigcau by Mr. Cook confirmed. During Mr. Girling's absence in England the people have evidently been lead to believe that he was a fraud, but now that he has returned, and has let them have a glimpse of the presents intended for them, I do not doubt that his influence will predominate. My idea is that Cook is speculating on giving us trouble, so as to get the company to buy him off. This is the only explanation that I can see, and I do not believe that the consequences will be worse than some little delay in getting to work, and the trouble and annoyance caused to Mr. Girling. I have telegraphed to you for 1,000*l.* to be remitted for following reason:—From what I gathered from the Secretary for Native Affairs at Cape Town, and from what I gather here as to the state of the country, I have come to the conclusion that the annexation of Pondoland is not a very remote contingency. The Secretary for Native Affairs stated to me that in the event of such an occurrence the company would not be allowed to retain a monopoly of the whole country, but would have the priority in selecting and pegging off a certain (not mentioned) number of claims, and would also receive certain compensation. I, therefore, shall do all I can to push on the prospecting of the country, and would be glad if more men from England were despatched at once, hoping as I do to be able to telegraph that we are in peaceful possession before you receive this letter. The invariable formula for annexatiou is, I learn, that the country is annexed by the Imperial Goverumeut, and then handed over to the Cape Government. I would therefore suggest that every means be taken to keep the existence and legal rights of the company well before the uotice of the Colonial Office. Sigcau expresses his willingness to sign anything for anybody in return for money payments, but his siguature held by us, being the first, is valid, and no repudiation on his part will hold good in the eyes of the authorities. I have seen Mr. Aiken, who expected that I would state the terms upon which a sub-coucession would be granted. This, of course, I was unable to do, and uow I hear from him that the people in London for whom he is acting have communicated with you. I shall be glad to hear your views on the subject. I believe that 500*l.* for each claim of 140 ft. by 50 ft. on a reef is an average price in the Transvaal. As Mr. Aiken will not disclose the whereabouts of the place where he would mark off his claims, no guess can be made as to their value, but I would suggest chancing that to make a beginning, provided the extent of land demanded be not too large. Mr. Aikeu's suggestion to use of a square mile I should consider too much, as if marked out along a reef, long aud narrow, it would cover an enormous extent far beyond their means of working.—ALEX. GORDON.

"P.S—I have arranged with the agents of Reuter's in Durban to have a telegraphing address registered both here and in London.—A. G."

Well, gentlemen, that is the letter we received, as I told you, on the 11th June from Mr. Gordon. You will notice that he states he hopes to be able to send us a telegram stating that he is in possession of the property, and able to work the concession; but, unfortunately, the

telegram he did send, which we received on the 28th May, states as follows :—

"Negotiations have fallen through ; my intention is to insist on fulfilment of contract."

SOUND DECISION.

Well, gentlemen, that telegram we alluded to in the circular which was sent out to each shareholder, and I feel to-day that we can do very little until we have further information. We must wait a certain period longer before coming to a final decision. All I can tell you is this—that the directors have no intention of paying any money to the vendors until they are perfectly satisfied as to the title to the concession. We have every reason to believe that our property will turn out a valuable property. The fact of Mr. Girling having obtained this concession, and having come to England, and this dark potentate, Sigeau, having granted another concession, ought not to frighten us too much, because, now Mr. Girling is back there, no doubt we shall find that Sigeau will say that the concession to Mr. Girling must be completed. It is only right, and the directors wished to repeat once more that they will call, with your permission, a general meeting directly they get further information of a definite character from the Cape. At the present moment our solicitor is in communication with the Cape Government, in order to ascertain their opinion as to our status in South Africa. Directly we receive information, we intend to call a further meeting of the company, but in any event no money will be paid before a general meeting of the company has been called. We shall be glad to hear any remarks made by any shareholders. We have told you exactly the state of the case. We have paid no money away, and have worked at a very small expense. We have sent out Mr. Gordon, with three miners from Cornwall, in order to see if mining rights would be given. The expense is not great ; the whole sum of money expended amounts to 2,400*l.*, and all that has not been spent. 1,000*l.* was only sent out the other day, and a considerable part of that is, of course, in the hands of Mr. Gordon, one of our directors.

SATISFACTION EXPRESSED.

Mr. THOS. BEARD said as no other gentleman appeared desirous of addressing the meeting, he would make one remark. He was perfectly satisfied with the explanation which had been given. He thought the shareholders should abstain from pressing the directors. As there was nothing else to be done, he begged to move a vote of thanks to the chairman for presiding.

Mr. DAVIS seconded the motion, but said he should like to add a few remarks of his own. The directors were acting as stakeholders between the company and the vendor. Until they were satisfied that the concession made to Mr. Girling was confirmed he was quite prepared to await the result of the investigation into the conduct pursued by Mr. Cook on the other side was made known. He felt they could not be better represented on the other side than by Mr. Gordon, and he thought it behoved them to wait until they had further news in order to know what their position was, and he was quite sure that Mr. Gordon and Mr. Girling would do all they could in the interests of the company, and that the title to this property would be ultimately confirmed.

Mr. TRUBSHAWE asked if the directors had received notice that Sigcan had published a notice in the Cape Town *Gazette*, stating that he had never granted Mr. Girling a concession, and that this notice was signed from the Great Place. He should also like to know whether the directors intended to contribute funds towards the question of forcing the concession.

The CHAIRMAN said the directors were fully aware of the so-called repudiation by Sigcan. In the circular sent out to the shareholders they would see that reference was made to such repudiation in the *Cape Times*. This would show the directors were fully aware of what was going on.

Mr. TRUBSHAWE said the circular was dated on the 3rd June, but by the last mail he said, by the Cape Government *Gazette*, a notice was issued absolutely repudiating the concession. He wished to know if the directors had any information subsequent to June 3rd.

The CHAIRMAN said they were aware that it had been published in the *Cape Town Times*.

Mr. TRUBSHAWE said what he referred to was the official notice, and he would just express his opinion that the directors should not on any account spend a penny piece in enforcing the title. That should be left to the vendor and concessionaire.

Mr. DAVIS said the chairman had stated that the money would not be paid over to the vendor until the title was secured.

NO LAW.

Mr. TRUBSHAWE said he wished to speak upon another point, and that was that none of the shareholders' money should be spent in enforcing the title. He, as a shareholder, objected, and would not have his money spent in enforcing the concession. He gave the directors notice that if he found his money spent in that he should object to it.

A SHAREHOLDER said it was manifest that considering the great distance between this country and South Africa some delay must be expected, and the meeting could not be in possession of information with regard to the property so soon as if they were a shorter distance away. He thought the fact that the representative of the shareholders was in the company in South Africa was proof that the directors were doing all they could to prove their title to the property. Mr. Trubshawe must see that it would take time.

The CHAIRMAN read a letter from Messrs. Rothschild with reference to Mr. Cook, in which they stated that they had authorised no one to represent them in Pondoland.

A SHAREHOLDER said the chairman had not answered the question as to spending money in enforcing the concession.

Another SHAREHOLDER said he thought, if the concession turned out to be absolutely valueless, they should have their 2,400*l.* returned. It seemed to him very much as if they had bought a pig in a poke.

The SOLICITOR said he did not see that they would have any right to call upon anybody to pay back the 2,400*l.* The money was spent by the board in investigating the title to the property which it had purchased, and in all cases of purchase of property, whether in Middlesex or Pondoland, the purchaser incurred certain expenses in investigating the vendor's title. He did not suppose they would suggest the desirability of fetching Mr. Gordon back, as that would be incurring further expense, and possibly losing the chance of everything.

A SHAREHOLDER : Has he purchased any concession ?

The CHAIRMAN said he had produced a concession duly authenticated. He thought they would agree with him that the directors had taken ordinary precautions. They had not paid the money over, and would not do so until the title was found to be good. In order to ascertain that they sent out one of the directors accompanied by three miners. Had they been able to go about and work under the concession, they would have been satisfied that they had a good title to the concession, but they found that their concession had been repudiated, and, therefore, they declined to pay anything. They had no intention whatever in spending the money of the company in enforcing the title.

Mr. LAYTON said, as to the payment of this 2,400*l.*, if the title to the concession turned out to be bad, he presumed the vendors would have to pay the expenses.

THE DIRECTOR SENT OUT.

Another SHAREHOLDER thought the directors should not be hampered in supporting the director that they had sent out, and he thought they should leave it to the board to do what they thought best, and see what chance there was of carrying through the business.

Mr. LOVERIDGE asked what was the earliest date at which they had the information of the repudiation of the concession ?

The CHAIRMAN said that they had from the Colonial Office information to that effect on the 8th May.

Mr. LOVERIDGE : On what date were the miners despatched ?

The CHAIRMAN : On the 27th March.

Mr. RUDDERFORTH said he thought the objections raised by the shareholders would be met if it was understood that the directors did not intend to spend any more than the 2,400*l.* with regard to the investigations which were taking place. He thought that would satisfy the objections of the gentlemen who had spoken.

Mr. GILBERT said there seemed to be something beyond the concession, because, by the *Times*, the German Government intended to subsidise a company to explore Pondoland.

The CHAIRMAN : I do not think they have any concession. (Laughter.)

Mr. TRUBSHAWE said, in reading the reports, the chairman had referred to certain presents that were being prepared, by means of which it was expected to induce the chief to ratify the concession. He objected to his money being spent in that way. If Mr. Girling had a concession he must enforce it, and he thought they must ask the directors to pledge themselves that they would spend no more money till Mr. Girling gave them the concession. He had had 10 years out there, and he knew that White Brothers had a prior concession and intended to enforce it, and he must object to any of the shareholders' money being spent in enforcing the title to their concession.

A SHAREHOLDER asked how it was, if the last speaker knew the concern to be bad, he should have taken up shares ?

Mr. TRUBSHAWE said he was assured that the concession was quashed, and that this company's concession would hold, but his information since was that Whites absolutely intended to enforce the contract.

The SOLICITOR pointed out that the concession was granted in 1877. It was to the effect that they were to open up works and mines not previously made over to other parties. For this they were to pay to the chief 100*l.* a year, and their information was that this had not been paid. Concessions had been made to others, and even by the wording of their own concession all that Sigcau said was that he desired his heirs and executors to carry out the terms of the concession. Whether Messrs. White's was a good concession was a question which had to be investigated.

Mr. BEARD : If Whites is a binding contract there is an end to us.

The SOLICITOR : Yes.

Mr. TRUBSHAWE desired to move that a cablegram be despatched to Mr. Gordon desiring him not to spend the 1,000*l.* sent to him.

The CHAIRMAN said no such resolution could be brought before the meeting without seven days notice.

A SHAREHOLDER : I should like to ask when the next meeting will be held.

The CHAIRMAN : As soon as we get definite information from the Cape.

Mr. GILBERT asked what the miners were doing out there ?

EXPENSE TO DATE.

The CHAIRMAN said they had spent less than 6d. a share in expense.

Mr. GRANT thought they were spending the shareholders' money in trying to prove that it was a good concession.

Mr. RUDDERFORTH asked if the directors had any objection to stating a date at which they would call a meeting, and allow the shareholders to express an opinion, as at present they could not do so.

The CHAIRMAN said to meet the wishes of the shareholders they would call a meeting within the next two months. (Oh, oh.)

A SHAREHOLDER asked if the chairman would undertake that no money beyond the 2,400*l.* should be spent. (Hear, hear.)

The CHAIRMAN : How can we ?

ACRIMONIOUS DISCUSSION.

A somewhat lengthy and not very amicable discussion ensued, and the CHAIRMAN at last consented to take the sense of the meeting as to whether the next meeting should be held within two months or within one month.

On a show of hands the numbers appeared to be about equal.

A division was then taken, when there were 37 for two months, and 36 for one month.

The CHAIRMAN declared, amid some signs of disapprobation, that the meeting would be held within two months.

A Shareholder rose to speak, when

The CHAIRMAN declared the meeting closed, and the proceedings came to an abrupt conclusion.

THE MIDAS GOLDFIELD CO., LIMITED.

MINE LOOKS HEALTHY—SATISFACTORY TELEGRAMS—WORKING FOR FUTURE RESULTS.

THE ordinary general meeting of the shareholders of the above company was held at the City Terminus Hotel, under the presidency of Warren William de la Rue, Esq. (chairman of the company).

Mr. GUY ROBINS (secretary) read the notice calling the meeting.

CHANGES IN DIRECTORATE.

The CHAIRMAN: Gentlemen, since I last had the pleasure of addressing you we have sustained a very severe loss in the death of Mr. Frederick C. Bryant, who was associated with this company from its foundation, and took a very sanguine view of its future prospects. It was he, indeed, who induced me to join the board; for he was familiar with the direction on the other side, and having visited the mine on several occasions, he had formed so strong an opinion of its ultimate paying powers, that he not only decided to join the directorate himself, and embark a considerable amount of capital in the company, but he also induced myself and others to become members of the board. I need hardly say that, personally, I felt his loss very much, because we leaned upon him a great deal in the transaction of the business of this company, and he was always here to give us the very best advice. Lord Kintore had to retire, very much to his regret, consequent upon his accepting the post of Governor of Southern Australia. Just before he left England he wrote me a letter, in which he expressed his most sanguine belief in this company, and promised that he would visit the mine at the earliest opportunity and write me fully upon the subject. I have not heard from him yet, because I suppose his official duties have been very onerous. Mr. Wilberforce Bryant was good enough to say that he would fill the vacancy caused by the death of his brother. He is a large shareholder in the company, and, as is known to most of you, he is a gentleman of very great business experience. Mr. Hugh Astley has taken a lively interest in the company since its formation, and as he is resident in London, and would be always available, we deemed it desirable to nominate him to fill the other vacancy on the board. Mr. Macleay, as you know, is a member of the well-known firm of Duncan, McNeil and Co., and is chairman of the Day Dawn P.C. of Queensland; so that his co-operation is of great service to the board.

MINING OPERATIONS.

You have before you our report for the year ending 28th February, and I ask you to turn to the map enclosed in that report in order to follow the few observations that I wish to address to you. When we took over the mine the No. 1 shaft was, considering its capacity, yielding a very large return; and that went on for some considerable time; but although the wash at that particular point is by no means exhausted, it was found that, owing to the loss of levels and other causes, it could not be worked so cheaply from the No. 1 shaft as was held desirable. Therefore it was decided to block out all the ground within the vicinity of that shaft, and then to attack the wash by means of a new shaft in course of construction. I may say that work on the No. 1 shaft has been continued and it is now being deepened so as to work the Sulky Gully lead, which is somewhat to the north of the lead which has hitherto been worked from the shaft, and also to test two quartz lodes which have been found in the vicinity. The work at No. 1 is therefore for the present unremunerative, but it is being vigorously pressed on with. When we took over the property No. 2 shaft was very nearly down to its full depth. It bottomed within a few weeks of our signing the agreement, but events have proved that it was not so near the wash as was hoped by the local management—in fact, for the last 12 or 13 months all the available force at No. 2 shaft has been expended in making that long drive which you see indicated upon the map. Of course, as that drive was being made, constant rises or feelers have been put up to try and strike the wash, and I am now glad to say that

A VERY RICH WASH HAS BEEN STRUCK

at the end of the drive. (Cheers.) I have here a small piece of the wash, and after the meeting, perhaps some of the shareholders would like to inspect it. You will see that it is of an extraordinarily rich character. You can easily break some of it, and you will find very large lumps of gold in it. We are led to hope that shortly we shall be getting a large return of this character of wash. In that connection I may say that since we had news from the mine *The Melbourne Argus*, of May 6th, has been received by us, containing a short paragraph with respect to our property. They state that the eastern bank of this wash has not yet been met with (the western bank has) and yet the river or wash has been proved to be 200 ft. wide. So that when the eastern bank is found, of course it stands to reason the wash must prove itself to be more than 200 ft. wide. Until both the banks have been found, and the probable course of the old river-bed has thus been determined, the actual active work of blocking out cannot be commenced, and that is the reason, we believe, that up to now the returns of gold have not been so large as one might have hoped for.

A SATISFACTORY TELEGRAM.

Last Saturday, however, we received a telegram to the effect that the yield for the week ending Friday night was 197 ozs., the estimated value of which is about 800*l*. That is almost as large a return as we have ever had from the mine, and the probability is that in a great measure it is the result of continuing the drives and not blocking out. Possibly some of that wash may have resulted from a little blocking out work, but I am inclined to think that it is not so, and that it all came from the driving work. If you refer to the map again you will see that there is a shaft at the south-east corner of the mine—No. 3 shaft. We commenced working at that shaft a long time ago, but the machinery that was temporarily erected for carrying it on proved to be insufficient, and the work at No. 2 shaft was so engrossing that it was determined to suspend work at No. 3 for the time being. It is now, however, being vigorously proceeded with. We have received a telegram to the effect that the Midas Consols Company, which is on the north-east boundary of our property, have bottomed on payable wash; also that the King Midas Company, to the south-west boundary of our claim, have bottomed on payable wash. This is very encouraging indeed, because it is an indication that there is gold in our immediate neighbourhood, and we hope that with the No. 3 shaft we shall strike the same wash as the King Midas Company have struck. The diamond drill bores which have been sunk in the northern portion of our property have shown

A RICH INDICATION OF GOLD,

and the fact that the Midas Consols Company, whose property is in the north, have bottomed on gold, leads us to believe that we shall find a rich body of wash in that northern part of our property. This was not in any way expected by us when we took over the mine. At that time it was considered that the northern part of the claim would not be remunerative, but the fact which I have mentioned, and the opinion of our mine manager, Mr. Bryant, goes to confirm us in the belief that this portion of our property will be very valuable to us ultimately. I omitted to say just now that at No. 1 shaft we have again struck payable wash, but we cannot hope to have any yield from that shaft for some few weeks to come. My co-director's brother, Mr. Theodore Bryant, and Mr. Trummer, both of whom are large shareholders, happened to be going out to the Colony on private business, and they were good enough to undertake to inspect the mine on our behalf, and to give us their views regarding it.

INDEPENDENT TESTIMONY.

We have received a letter from those gentlemen, dated 18th March, extracts from which I will read you:—

"On March 15th we proceeded to Ballarat, and were met by Hon. Mr. Gore, Mr. Dixon, a large shareholder, Mr. Bryant, and Mr. Burnett, secretary. The following morning we visited the mine, in company with these gentlemen, and thoroughly inspected your property. We are of opinion that in your mining manager, Mr. Robert Bryant, you have a man thoroughly conversant with his profession, and practical, but in addition, rigidly upright and honest. The amount of work carried on, and its substantial character, surprised us. The ventilation of the mine left nothing to be desired. As regards the prospects, we can only say that they look satisfactory—perhaps without going too far we might say most encouraging, but as all mines are risky it is impossible to say more. We saw a pan of alluvial dug and washed—yield 6 dwts. One machine from same source yield 27 ozs."

Mr. Trummer has not yet arrived in England, but Mr. Bryant has reached home, and has been kind enough to come here to-day, and no doubt will convey to you personally the impression which he formed of the mine.

AN IMPORTANT CONSIDERATION.

There is one very important consideration, which I should like to bring to your notice, and that is that we believe the mine has been most conscientiously worked for future development, and not for immediate results. That opinion Mr. Theodore Bryant holds very strongly. He tells me that he was very much impressed with the manner in which the work had been tackled, and the economical mode in which it had been carried out. He says that he is quite sure that Mr. Bryant, our mine manager, has done everything he can for the future development of the mine, and has not sought, as he might well have done, to have simply approached those portions of the wash which would give him a rich return so as to produce an immediate effect. He has worked for the future, not for the immediate present, and that I think is a very important consideration. I will now, with your permission, invite Mr. Theodore Bryant to say a few words, in order to convey to you what he has already conveyed to us—his general impression of the visit he paid to the mine.

VIEWS OF AN EYE-WITNESS.

Mr. THEODORE BRYANT: Mr. Chairman and fellow shareholders: Last January I left England for the purpose of looking after some interests that I had in Australia, among others those of the Midas Mine. On the arrival of Mr. Trummer and myself in Melbourne we were met by Mr. Burnett and Mr. Bryant, the manager, and the latter told us that he would like us to defer our visit to Ballarat for about 10 days in order that the drive that he was carrying out to strike the wash might be more forward. Well, we had other things to attend to, and it was 10 days before we proceeded to Ballarat. We arrived there in the evening, and on the following morning drove over to the mine, a distance of about 7 miles. We carefully examined the position of the mine, especially in reference to other mines that are working, and have paid, and are paying, very handsomely, notably the Madam Berry Mine. We could see at a glance that our mine lay between two series of mines, and in virgin ground. I suppose anyone who has had any dealings with mines knows that they are extremely eccentric, and the sinuosity of these old subterranean rivers is extraordinary. You may think with one shaft on your property that you are all right for the wash, and then you come to a full stop; you decide to sink another shaft, and having done so, you do not strike it. In the present instance you see that payable wash has been struck again, so that it is very difficult for anyone, of even 20 or 30 years' experience, much less a novice, as I was, to say how it will run. You have to sink for the river underground, and as I had not one of those telescopes that Jules Verne speaks about, I could not see below the surface. (Laughter.)

COMPLIMENTS TO THE LOCAL MANAGEMENT.

As regards the outlay of capital, your manager, Mr. Bryant, has, I believe, laid out every penny of it as though it were his own. The ventilation of the mine, the machinery, the engines—everything has been thoroughly well done, and economically. All the gold the mine yields, Mr. Bryant believes, comes into his hands, and is deposited at the bank, every precaution being taken to guard the miners. I, of course, shall be very glad if this turns out to be an exceptional mine. From what we know of the surrounding district, and what has gone before, we are warranted in believing that you have a very valuable property. But, at the same time, I should not like to say anything which I could not guarantee. The impression of Mr. Trummer and myself, however, was that the prospects of this mine are very satisfactory. I do not know whether there is anything else that I need add. I took one or two photographs of different portions of the property, and I brought home a piece of the rock that the diamond-drill cuts out. It is on the table, and any shareholder may examine it. I should like to add that it is merely a coincidence that the manager of the mine should be a namesake of my own.

QUESTIONS.

Mr. P. BROWNE asked whether the Sulky Gully lead had beeu struck either in No. 1 or No. 2 shaft.

The CHAIRMAN: They have struck the Sulky Gully lead at No. 1 shaft within the last three weeks. I made a slight inaccuracy just now when I said that it would be three or four weeks before we commenced to obtain gold from it. I think it will be about eight or 10 weeks before we get the gold.

Mr. BROWNE: When you struck thc lead I thought you would obtain paying gold.

Thc CHAIRMAN: There is au iumensc dcal of work to bc got through in the way of ventilation, and in mauy other ways. It takes several weeks before blocking out can be commenced.

Mr. BROWNE: Then soon we shall be returniug from No. 1 shaft quite as much as from No. 2. At present we are not returning anything from No. 1.

The CHAIRMAN: The yield that I have announced as having been telegraphed to us is entirely from No. 2 shaft. We hope to obtain a yield within the next two months or so from No. I shaft, but what that yield will be, of course I am not in a position to say.

The motion adopting the report and accounts, moved by the CHAIRMAN, and seconded by Mr. ASTLEY, was carried unanimously.

Mr. MACLEAY proposed the re-election of the chairmau.

Mr. ASTLEY seconded the motion, which was carried unanimously.

On the motion of Mr. BROWNE, seconded by Mr. GONNE, the auditor was re-appointed, and a votc of thanks to thc chairman terminated the proceedings.

PAHANG EXPLORATION AND DEVELOPMENT CO.

CREDENTIALS OF THE COMPANY—A MANAGER WHO WILL BE PAID BY RESULTS.

THE statutory meeting of this company was held, on Tuesday, at the City Terminus Hotel, Cannon Street—Mr. Alderman Hart presiding.

The SECRETARY (Mr. W. G. E. Hervey) read the notice convening the meeting.

THE OBJECTS OF THE COMPANY EXPLAINED.

The CHAIRMAN: Gentlemen, this, as you know, is simply a formal meeting we are bound to hold iu conuection with the Acts of Parliament, so that you may have an opportunity of meeting within four months of the registration of your company; but the directors feel that upon this occasion it is due to you that we should give you some information as to what they had done during the four months that they have had control of the company and its funds. (Cheers.) You may recollect, those who have with you, or have iu your minds, the terms of the prospectus that was issued, that we were to take over three concessions. One concession had reference to timber in the Malay Peninsula, and thc district of Pahang, while the other two concessions had reference to minerals—silver, tin, and other minerals. The first concession was assigned to the company on the 19th March last, and the other two concessions at the time of the assignment of the first were not in this country, but were sent from Singapore to England after that date. We completed the assignment of those two latter concessions on the 14th of June, a few days ago. Gentlemen, the directors believe they have in the property, which belongs to you as shareholders, a very valuable property iudeed. (Cheers.) We have not only had the advantage of some inspectiou by parties outside the company, who have reported to us their opinion as to the value of your concessions—more especially the timber coucession—and we have the advantage of having ou the board

SIR FREDERICK WELD, THE LATE GOVERNOR OF THE STATE OF PAHANG,

—(cheers)—whose persoual and intimate knowledge of the country, or certain portions of the country, enables him to give his testimony of the large and great value of your possessions. It may seem to many outsiders a very large property to hold when you are talkiug of over 3,000,000 acres of land that bears timber, but when you recognise the fact that this is one of the earliest concessions made by the Sultan of Pahang to the concessiouaire you can well realise that there was not full knowledge of the property that there might have been by subsequeut experience. This is an undoubted fact that we hold by far the largest portion of valuable property which is covered with timber, and there are means of access to that timber by reason of the river Pahang, which gives us an advantage of working it, and with facility of conveyiug it to thc mouth of the river, aud treating it for English aud other markets. I may tell you that thc first anxiety of the directors when they got the first concession was to get to work, and the ouly way to work the timber, successfully was to mark it and cut it, and get it to the market. We have in our employ 300 coolies cutting your timber and getting it ready for the market. We took into consideration the steps to be taken in England with the view of

WORKING THE TIMBER ADVANTAGEOUSLY,

and we sent out within a very few weeks of getting the concession sufficieut machinery to get to work and cut some timber. We then invited tenders for the large quantity of machinery necessary to work our concession successfully. Tenders came in, and one, for a little less than 5,000*l*., was accepted of a competent firm, on condition that the machinery was finished in six weeks, to enablc us to seud it out to Siugapore. We had penalties in that contract which enabled us to insist upon payment, or rather a deduction of the amount to be paid, of 250*l*. per week for any time they were beyond the time of the contract. We also offered to them, as being a fair contract, to makc an extra payment to them of 250*l*. for every week they saved in the contract. The result of that has been that the whole of the machinery is completely finished. We have a certificate of the engineer as to its efficiency, and as to its fulfilling the terms of thc specification, aud that will be shipped duriug the present month. I think the ship sales on the 28th of June. Until we get the concessions in regard to the minerals assigned we are unablc to take anything more than the iuitiatory steps with the view of starting prospecting for minerals.

THE MANAGER TO BE PAID BY RESULTS.

Arrangemeuts arc being made, and proper parties arc being employed. We have engaged a manager at a moderate salary, and with a percentage of the profits to be earned by his industry as a recompense for his services. (Hear, hear.) The directors believe that this is the best way of couductiug commercial undertakings. We give our manager only 500*l*. for managing the business of the company, with a percentage on the net profits after those profits are divisible among the shareholders. (Cheers.) There is under our consideration now the necessity, which will no doubt be presently carried into practical operation, of purchasing one or two steamers with a view of facilitatiug not ouly the conveyance of your men to Pahang, but carrying to them the necessary supply of food, and erecting huts and houses for their accommodation, so as to savc as much time as possible. I think you will sec from what I have said that so far as the business part of the matter is concerned, and so far as arrangiug thc details, that your directors have not been idlein doing all they could duriug thc four months. (Cheers.) Another matter which has engaged our close attention was that having made the arrangemcnt to get the timber to sell it. We have received from Pahang samples of nearly all the timber growu there. These sample are over 100 in numbcr, and when I tell you that we have among our timber some of the most valuable timber which is appreciated and approved of by dealers in Loudon, such as teak, marabout, mahogany and rosewood, you will readily understand from the scarcity of that timber in the English market, that should we be able to supply the wants of the English public we may get a good price for the timber. Carrying out our views as to the development of our trade in that respect, we appointed a well-known gentleman in London, who has devoted many years to this particular trade. Again, with him, for the very small salary of 300*l*. a year, hc is to be our manager, but with a satisfactory commission upon the profits he makes ou the sale of the timber. Therefore, with as much caution as we could exercise we have started the working of these concessions in a way which will be highly beneficial to all those interested. The machinery, whichwill be sent out during the present month, is expected to arrive at its destination in two months from the time it starts; the calculation made for the time to work it is within eight or 10 months from the time of its arrival. That is rather a long time, but when I tell you that that machiuery has been made, the plaus having been sanctioned by the board, to render it capable of dealing with some 2,000 tons of timber per month, I think you will realise

THAT WILL BE A LARGE BUSINESS,

if we are able to fulfil in the earlier stages our special arrangements. Now, with regard to our sale of timber in London, there is a peculiarity in the timber trade—they make offers of timber to sample. I am glad to tell you that we have already got that kind of order to the extent of 3,000 tons of this very hard wood. (Cheers.) Should this wood turn out to sample we have repeat orders to nearly three times that quantity. Therefore we have laid the foundation in a satisfactory way. We have to endeavour to arrauge for active and regular work abroad, and also for the sale of our timber when it arrives. Besides this, I may mention that there is very little native timber near Singapore, except that which we have control over. The result will be that there will be a large demand at Singapore for this timber, and, therefore, we shall have a local tradc in connection with that deuiand which, I think, will bc highly satisfactory. Again, you must recollect this, that you are

ENTRUSTED WITH THESE GREAT POWERS

by the Sultau of Pahang, with the consent of the English Government, for the main purpose of developing the country. The directors, therefore, realise that they not only had what I might term a commercial responsibility, but also a responsibility of developing this country in such a way that may not only secure to them good results with regard to income, but also satisfy thc Government, for whom, iu a degree, we are trustees, so that we may havc other and further advantages when we carry out to the full the trust which is now with us. That has guided, and, I thiuk, will continue to guidc, our deliberatious in the future. For instance, it may, or it may not, be known that in sending a large number of natives into this country to work your timber, and other concessious, you must provide them with food. You cannot get food in those wild districts—a very large portion of the districts being almost entirely uninhabited. Well, now, what is ou our minds is this, that we shall not seek to makc extreme profits by carrying food up the river and selling it to our own *employes*, but get a fair and reasonable profit, only which will tend to give confidence to those whom we employ, and to give confidence also to the native races whom we hope by and by to get into our employ, aud to satisfy the head men of the tribes who exercise a vast and powerful influencc over thc natives. When I spoke of two steamers I meant to say two small launches costing about 250*l*. to 300*l*. each, which will be all we want at present to open up all the settlements and to do all thc work which we shall require in connection with our concession. The effect of that will be to keep in touch with them, to render safe those whom we may leave at our various stations up the river, and also insure the steady work of those whom we employ. Now, gentlemen, there is one other

MATTER OF GRAVE IMPORTANCE,

about which I thiuk we have at least brought to a satisfactory position. You may recollect that the prospectus stated that the company contemplated the setting aside of 20,000*l*. in connection with the railway yet to be built. The principle on which we have acted, and one which has been accepted by the railway, who already have a concession in a neighbouring country, and whose railway is considerably advanced is to let them bring up the railway to the verge of our territory, and theu we will pay them 20,000*l*. for it. You must know that if we touch minerals of any quantity wc must have a more expeditious way of getting to market than sailiug down 200 miles of river, which is navigable only 200 miles only from its mouth, but not beyond, so we consider it of the highest and first importance that we should have a railway through our territory. The arrangements we contemplate now are such that the company shall have the option of making this arrangement either to guarantee, according to the custom of this part, a certain percentage on the capital outlay upon thc railway of the company which will build it, the cost thereof being a fixed sum per milc, or to pay a given sum per mile as a kind of bonus to them for bringing the railway through our territory. There is a third position, which will be to allot to them through our territory—I use the word in a reserved sense—a certain number of acres for every mile they may build. Thc effect of that will be that when we are able to survey thc land we are dealiug with, the extent of country, incidents of its mountains, rivers, and timber arrangements,

and also of its minerals, we can then, with experience and with our eyes open, decide which course will be the best in your interests. Now, gentlemen, I think I have fairly touched upon all that is necessary to tell you at this meeting, giving you, as far as I think judicious, sufficient information to let you know what the directors have done, and I hope satisfied you that they have so commenced their labour, that there is that great chance of success in connection with the working of this undertaking, which will be satisfactory to all those interested. (Cheers.)

THE LATE GOVERNOR OF PAHANG ON THE COMPANY'S PROSPECTS.

Sir FREDERICK WELD said that Pahang was a country he had taken very great interest in, and as Governor he drew the relations of Pahang closer to the English influence than they had ever been before, and the Sultan of Pahang had now accepted a Resident who would really adminster the country, so that it was a British Governor, with a Resident under him—the Governor of the Straits Settlements—with whom they had to deal. It appeared to him that any Governor would do what he would have done, namely, encourage any company who would co-operate and help him to develop the State for the good of the people, and the commercial welfare of the country. He, therefore, had great hopes that they would have a very great deal of co-operation. He was simply speaking from what he would have felt if placed in a similar position. They had therefore great means of benefitiug the country as well as benefiting themselves. Their duties as directors were, first of all, to look after the interests of the shareholders, but when the interests of the shareholders were, as he held them to be in this case, absolutely identical with the interests of the people of the country, then he thought they were carrying out a work in full confidence that they would have the co-operation of the rulers of the country. He had been to Pahang two or three times, and if he had remained longer in the country he had fully intended going through it from one end to the other. But his term of office came to an end before he could do that, but from all he knew, he believed that the country was capable of immense development. The State of Perak, which had been longer under English influence, was certainly

ONE OF THE MOST PROSPEROUS STATES IN THE WORLD.

That state had a larger revenue than Pahang at the present moment, but some dozen years ago it was just as wild as Pahang. Tremendous strides had also been made by the State of Selangor. He had authorised a railway being made there, and it had been let for 28 per cent. upon the initial outlay to Chinese merchants, but they would not be allowed to keep it at that, because it was now held to be worth more than 28 per cent. return upon the capital. That shows something as to what railways will do in that country. Where a railway was made hundreds of Chinese flocked in, and took up land right and left, and by this means a traffic in minerals as well as in rice and other kinds of food would pass over the railways, which would thus pay in a wonderful manner. He thought therefore that the board were wisely helping the promoters of the railway to the land over which the company had rights. He was able, from excellent knowledge, to state that the gentlemen, who were undertaking that railway, were men fully able to put down and

WILLING TO PUT DOWN 600,000*l.* OR 700,000*l.*

to carry that railway out. That railway would, no doubt, do an enormous amount for this company, because they would be able to carry on operations, and get their stuff to market during the monsoon when shipping operations were stopped. He felt confident that minerals would be found upon the company's property, especially tiu. Gold they might or might not have. There was, however,

GOLD IN PAHANG,

though whether on their property he could not say. He showed the chairman the other day a gold watch chain made from Pahang nuggets of considerable size. There were traces in the country of immense workings brought about by some unknown race, but they were merely pits. There was no idea of lateral borings or galleries at that time. He had no doubt that it was a gold country. Large quantities of tin, however, had been produced in the Malay Peninsula, and he knew of one man—a Chinee—who in one year, from that source and by trading with the natives, made 125,000*l.*, about 100,000*l.* of which was profit. It did not follow that because they got tin in one part of the Peninsula that therefore this company would get it, but he had great hopes of doing so, and it was very unlikely that the tin producing territory would stop where an arbitrary line might be drawn. He cutirely agreed with what was stated in the prospectus, that there was no reason to suppose that

THE COMPANY'S MINERAL CONCESSION

might not be as rich as any other part of the Peninsula. Quite independently of the question of tin, he might congratulate the shareholders upon the results likely to be achieved from the timber. The timbers spoken of were classed as mahogany, teak and so on, aud the trade evidently took them up as being of great valuc. In working new countries they must remember that delays might arise which might defer their hopes for a time, but in his opinion he did not see why, at their next yearly meeting, they should not have something more than expectation, and why they should not have

SOMETHING SUBSTANTIAL TO OFFER THE SHAREHOLDERS.

He thought they had a very fair prospect of such being the case. His official dispatches had been quoted, and he thoroughly adhered to all he said to the Secretary of State, namely, that "it is an exceedingly rich couutry, richer, probably, and larger than Perak; it marches with all our native States, and is capable of great and immediate progress." If he, acting as one of their directors, could do anything to promote that progress, it would be a pleasure to him to do so, and he should be delighted and most happy if, in promoting the interests of those States he should do what he must do at the same time—make this company a success.

The CHAIRMAN theu moved: "That article 85 of the articles of association of the company be altered by striking out the whole of the article after the word 'nine,' in line 4. and substituting, therefore, the following:—'A first director may act before acquiring his qualification, but shall in any case acquire the same within one month of his appointment, and unless he shall so do, he shall be decmed to have agreed to take the said shares or stocks from the company, and the same shall be forthwith allotted to him accordingly.'"

Mr. GEO. SIMS seconded the motion, which was carried unanimously.

Mr. BEARD proposed a vote of thanks to the chairman and directors, and

Mr. VAUGHAN COUSINS (late police magistrate at Singapore), in seconding it, said that he had visited Pahang, and what he saw convinced him that the country was a very rich one, and he had seen in the possession of the Sultan of Pahang large quantities of gold taken from the mines of the country.

The vote having beeu agreed to, was carried unauimously, and the proceedings terminated.

THE EXCELSIOR GOLD MINING CO., LIMITED.

A COMPANY THAT ENDS IN DISAPPOINTMENT.

THE first ordinary general meeting (being the statutory meetiug) of the shareholders of the Excelsior Gold Mining Company, Limited, was held at Cannon Street Hotel, Cannon Street, on Thursday last; and notice was also given that immediately after the conclusion of the statutory meeting, and at the same place, an extraordinary general meeting of the shareholders of the Excelsior Gold Mining Company, Limited, would be held, at which the following resolutions would be proposed:—

(1.) "That this company be wound up voluntarily." (2.) "That Mr. James Ford, of 23, College Hill, in the City of London, chartered accountant, be aud he is hereby appointed liquidator for the purpose of distributing the assets of the campany."

Mr. E. Bailey presided.

Mr. L. J. LANGMEAD (the secretary) read the uotice calling the meeting.

The CHAIRMAN stated that that was the statutory meeting of the company, held under the Companies' Acts. He had not much to say. He could only tell them that difficulties and delays had arisen; the vendor not being able to come to terms with the owners in Africa. There was no doubt that the property was of great value. Since the issue of this notice calling the meeting and proposing the return of its capital, further offers of assistance had been received, and very good ones. It would be for the shareholders to consider their acceptance or otherwise. If it was decided to wind up,

THE MONEY WOULD BE RETURNED IN FULL AND 5 PER CENT. INTEREST.

The offer they had would permit of a settlement being arrived at with the owuers.

The meeting having been made special, a discussion arose, and the question of an adjournment was advocated; this, however, met with no support, and the resolutions for the voluntary liquidation of the company, and the appointment of liquidators as set forth in the uotice calling the meeting, were carried almost unanimously.

A vote of thanks to the chairman closed the meeting.

GREAT SHE GOLD MINING CO., LIMITED.

BUSINESS COMPLETED—A PESSIMISTIC RESOLUTION DEFEATED—POSITION OF MR. LEWIS LEVY, AND THE SHAREHOLDERS' DELEGATES—10 DWTS. TO THE TON IN ALL TESTS.

THE adjourned meeting of this company took place at Winchester House on Thursday—Edward Coleman, Esq., chairman of the company, presiding.

Mr. ALICK R. RAMSAY (secretary) read the notice calling the meeting.

UNFINISHED BUSINESS COMPLETED.

The CHAIRMAN: Gentlemen, It was not necessary under the articles of association to send any notice of this meeting, but we thought it better to give you a reminder, and in doing so we sent you our views of the report made by Mr. Furlonge, and as to how its recommendations should be dealt with. What we have to do now is to complete the business unfinished at the last adjourned meeting. The first busiuess is the re-election of the directors. I beg to move that Mr. T. P. Gaskell and Major Gordon be re-elected directors of the company.

Mr. HENRY SMITH: If this company is to go on it will be a question to be determined hereafter, but I for one have no hesitation in saying that

I HAVE PERFECT CONFIDENCE IN THE BOARD,

and I have great pleasure is seconding the nomination of these two gentlemen.

The motion was carried unanimously.

The CHAIRMAN: I now propose the re-election of the auditors, Messrs. Edwards, Jackson and Co., who are well known in the City of London. The directors have put in 20 guineas merely as a guide to the shareholders as to what their remuneration should be.

Mr. THOMPSON moved the resolution.

Mr. LEANE seconded the motion, and it was carried unanimously.

Mr. RUMMINS: Have the accounts already been audited?

The CHAIRMAN: The African accounts were not completely audited in Africa, at the first meeting of which this is an adjournment. but since that date we have received the accounts from Africa, audited by Mr. Forbes, who is well-kuown in Barberton, with the exception of some items for which he requires vouchers from Mr. Kenrick. We have written to Mr. Kenrick and requested him to duly supply the vouchers to Mr. Forbes for the purpose of completing his audit. Other items he could not audit in consequence of the origiual receipts having been sent to the company's office here. The secretary has to that extent partially completed what Mr. Forbes was unable to do. We have gone as far as we can, and have no doubt that the audit will be successfully completed by Mr. Forbes.

Mr. RUMMINS: What did the experimental crushing cost?

The CHAIRMAN: The particular sum has never yet been specified in the accounts. They did not keep a separate accouut of the cost. At the same time it resulted in a loss, inasmuch as only 4 dwts. to the ton were realised, and we know very well it would require, with the

rough means of transport they then had, 10 dwts. to the ton to pay. The

STEAM TRAMWAY WILL BE OPENED

within the next three or four weeks, and when that is done the cost of transport will be so much diminished that Mr. Firbank tells us in his report the 6 dwts. will leave a profit. A letter received this mail from Mr. Firbank, who is now acting as manager for the company, tells us that he is steadily getting 10 dwts. to the ton, and he hopes the ore will be better as it gets lower down ; but the working shows continuously 10 dwts. to the ton, and Mr. Firbank is a man on whose word we can implicitly rely. We hired a mill for three months, and paid for it 375*l*., or 125*l*. per month, and the result of the gold was nearly 300*l*.

Mr. THOMPSON : Is there any report from the manager since the report from Mr. Firbank ?

The CHAIRMAN : Mr. Firbank has written by this mail. There was also a short letter from Mr. Kenrick, but he did not say very much with regard to the workings. The letter was fairly satisfactory, showing that

THE YIELD WAS 10 DWTS. AND REGULAR,

with every chance of steady improvement. It stated that everywhere driving along the reef it was the same as in the standard block, similar to the Sheba, and it was 28 ft. thick.

A SHAREHOLDER : I presume these 10 dwts. are merely taken from assays.

The CHAIRMAN : Yes, but they are constantly being taken. You will notice that that is also Mr. Furlonge's report. The average is fully 10 dwts.

Mr. HENRY SMITH : We received a circular from the committee making certain recommendations. I presume they are ready to move those recommendations, because if they are not I am prepared with a substantial resolution.

The CHAIRMAN : We have really only four directors who regularly attend our meetings, and if there are any vacancies we do not intend to fill them up.

PREMATURE.

Mr. THOMPSON : I move a vote of thanks to the chairman.

A SHAREHOLDER : No, no ; the meeting is not concluded.

DIRECTORS PROPOSED WHO WILL WORK UP.

Mr. LEWIS LEVY : As one of your delegates all I have to do is to propose the single resolution, which you have already read in the circular. I am very sorry Mr. Derring is not here. Business has kept him away, and I have a letter of apology from him. That resolution might help the directors, because in replacing those who wish to resign we are losing nothing, and we may gain something, because the directors who are not here to-day never seem to be of any assistance to the company, whereas three shareholders' delegates would possibly create more confidence in the work that has to be done and would certainly be more active members. The proposition I have to submit is already in our united circular, that as three of the directors voluntarily resigned (directors who never appear, and who, in fact, are myths) in their places three shareholders be appointed to act with the directors on the same footing—of course and be recompensed in the same proportion, that is, as to the proportion of their fees, because it is not reasonable that men should work for nothing. I will state at the outset that my time is fully engaged, and I cannot serve. All I have done in the past has been in the interests of the shareholders—those gentlemen I recommended upon the faith of the prospectus to come into the concern with me, and having investigated it and brought to its present position (a very altered position, from ozs. to the ton to dwts.) I do not feel inclined to take any further steps in the matter. I do not mind if I lose my money, though, perhaps, I am as largely interested as any other individual shareholder. The only proposition I can make is "That three independent shareholders be appointed to act with the board of directors on an equal footing."

Mr. MILES seconded the motion.

A SHAREHOLDER : Will the articles allow it to be put?

The CHAIRMAN : Under the articles this could not be done, because it would require a special resolution to create a new article to give power to the shareholders to appoint a consultative committee, who should have voting power with the directors. At present there is no such power in the articles.

Mr. LEVY : A meeting could be called. (Hear, hear.)

The CHAIRMAN : It would require 90 days' notice and a three-fourths majority.

A JOB'S COMFORTER.

Mr. HENRY SMITH : We have received two circulars, one from the directors and one from the committee of consultation, with neither of which I can agree. In the remarks I am now making I am not going to occupy a position of any hostility to the directors. I believe they have done their best, and I know from my own experience that shareholders often look upon directors as their natural enemies. The same kind of feeling very often exists between shareholders and directors as exists between a ferret and a rat. (Laughter.) In my opinion shareholders, if things go well say "what clever men we are," and if things go badly they say "what infernal rascals those directors are." Now I do not see that the directors have done anything wrong, I believe they have done their best except in one point. I think they went to allotment upon an insufficient amount of capital subscribed, but I believe the blame really rests with the vendors of this property. Their greediness and their voracity were so great that they prevented the general public from coming in because they argued fairly that even if the thing turned out to be a success, in consequence of the profits having to be divided over half a million sterling they would get very little and the vendors would get everything. If you cast any blame, do not cast it upon the directors but upon the vendors of the property. Mr. Furlonge's report reads to me

LIKE A FUNERAL ORATION,

but it is evidently an honest report ; he tells you you have a property in the Transvaal, and not merely upon paper. He also tells you there are traces of gold, and then he recommends you to spend 6,000*l*. to call up the whole of the capital to test this property, whether it is of value or not. If you follow his advice, what then? One of two things must happen—either the property is of no value, in which case your money will be lost, or, on the other hand, the report may be favourable, in which case your work will then have to begin *de novo*, and you will have to put your hand in your pocket and find fresh capital. 6,000*l*. is all you have, and you will have to commence *de novo*. It is much better to look stern facts in the face.

YOU HAVE GONE IN FOR A PRIZE AND DRAWN A BLANK,

and it would be very much better to cut your loss than to send good money after bad. (Cries of "No.") There are two classes of shareholders in this company, and I appeal to each. There are those who are sanguine like Mr. Deering and Mr. Levy, and there are those who are not sanguine, like myself. The sanguine shareholders can form a company of their own, and work the property with a capital of 30,000*l*. or 40,000*l*., which they can get almost upon their own terms. The non-sanguine shareholders, if the concern is wound up (not under the supervision of the Court), will save their remaining call, and if the property is sold for anything they will possibly receive something back. Advice has been given to go on, no doubt with the best intentions, but I ask the shareholders, in the following resolution, to reject that advice and follow me :—"That the directors be requested to convene a meeting at the earliest possible date, with a view to submit to the shareholders a motion for the voluntarily winding-up of the company, and that all expenses, except those which may be absolutely necessary, shall in the meantime cease both in London and in the Transvaal."

Mr. RENALD seconded the motion.

ANOTHER VIEW.

Mr. SPENCER HARRY : There is, perhaps, a third class of shareholders who are neither very sanguine nor so pessimistic as Mr. Smith, but who regard matters from this point of view—that they have put down 75 per cent. of their money, and feel inclined to have a little run for the remainder. (Cheers.) They feel inclined to narrow the field of operations, and to attack certain specific portions of the property where the bar—according to the report of Mr. Furlonge, which reads like a genuine one—will be struck. We are separated from a most valuable adjoining property by simply an imaginary line, and there would appear to be nothing between us but a dip in the gold formation and the Sheba reef. My recommendation would be that we should follow the reasonable advice of the directors rather than the pessimistic counsel of Mr. Smith. I observe that our manager is a gentleman who was originally sent out to look after the accounts. Has he mining experience? I know he has associated with him a Cornish miner.

COMMON SENSE.

Mr. LEWIS LEVY : There are two alternatives—either to go on or wind up. If we go on and pay our 3s. 6d. we have a chance of getting something out of the property ; if we wind up we shall still have to pay our 3s. 6d., and have no chance of getting anything out of the liquidation. (Hear, hear.) Our liability will be incurred to the fullest extent whichever way we proceed, and upon that you may depend. It rests with you to say whether you will throw that 3s. 6d. into the lap of the liquidator, or follow the advice of the directors, backed by the report of Mr. Furlonge. I rely on his report, and consider the advice he has given us should be followed. However much I may blame the action of the directors in the past, I feel strongly inclined to support them in the present. I do not think you will save 1s. a share in winding-up. Let us go on, and possibly we may find a rich gold shoot after all.

Mr. THOMPSON said the report of Mr. Furlonge looked to him like a genuine document. He thought it would be a very unwise course to take to wind up the company and hand it over to a few shareholders. If anything were to be got out of it let it be got out for the benefit of the shareholders as a body.

Mr. WEST : I cannot agree with the observations made by the mover of the resolution. In the first place, having paid 16s. 6d. into this concern, I prefer risking the other 3s. 6d. rather than losing that 16s. 6d. I am surprised that a gentleman who has put forward such pessimistic views with regard to the future of the property should be sanguine enough to expect to get anything back from a liquidation. (Laughter.) Whether the company goes on or is wound up,

THE 3s. 6d. WILL BE REQUIRED ALL THE SAME.

I should very much rather expend the balance on the mine in preference to having it swallowed up in liquidation expenses. I have had some experience of liquidations, and must confess that, although I am more sanguine as to the mine than Mr. Henry Smith, I have not the least confidence in ever getting anything back if the matter goes into liquidation. Therefore, I think the best thing we can do is to adopt the proposal of the directors—investigate the value of the mine, and see whether, with our limited capital, we cannot get back what we have already put in. (Cheers.) If we find that we have a successful mine, then, in all probability, the shareholders will not part with it.

WHILE THERE'S LIFE THERE'S HOPE.

Mr. LEVY : I have had a good deal of experience in mining, and I know that while a mine lives there is hope, and after all a living dog is better than a dead lion. (Cheers.)

The CHAIRMAN said the motion was, in any case, out of order, as no notice of it has been given. However, he would take the sense of the meeting upon it presently. Mr. Firbank was a gentleman who had had large experience of engineering and tunnelling work, and with the assistance of an expert, who would go once a month, or once a quarter, to direct the works, he thought the company could do very well, and save the great expense that would be incurred by the permanent attendance of an engineer. The company could not afford his salary, and without him they could make a saving of 300*l*. a year. They proposed to have an office in Barberton, which would be maintained at merely a nominal expense. There was a time when the rich Sheba Company's shares were tossed about in South Africa at 1s. 6d. each, and no buyers, but those shares ultimately went to 60*l*. or 70*l*.

A SHAREHOLDER : The information you have given us as to a continuous reef worth 10 dwts. to the ton, and that it will pay when the tramway is completed, is the most important that we have yet had. (Hear, hear.) We have 2 miles of property like the Sheba, and why abandon it? It would be a great mistake to take such a hasty view of the situation as Mr. Smith has suggested. The chairman then said

he would test the feeling of the meeting in regard to Mr. Smith's proposition.

On being put to the meeting three voted in its favour, the rest of those present being against it. The resolution was therefore rejected.

A vote of thanks to the chairman closed the meeting.

REPORT OF THE SHAREHOLDERS' DELEGATES TO THE SHAREHOLDERS.

"Anticipatory of the adjourned meeting of the above company on the 20th inst., we beg to place before you, as concisely as possible, the present situation and future prospects. Basing our advice on the independent report, which was by our instrumentality obtained, we can without hesitation offer you suggestions which we consider conducive to our mutual interest. The circular of the directors adopting the propositions and acting upon the lines advocated in Mr. Furlong's report, is no doubt in accordance with the views and wishes of the majority of shareholders. We, as your delegates, can but advise that the proposed course to be pursued and embodied in the directors' circular is the best that under the circumstances can be done. We consider it useless reverting to the past. Our hopes rest entirely upon that paragraph 'in the event of a fortunate discovery of a rich gold shoot,' and this, under the new *modus operandi*, may occur. We have only one proposition to make, and that is, 'That three directors voluntarily resign, leaving Mr. Coleman, Mr. Cooper, Mr. Gaskill, and one other, and that three independent shareholders be elected as a permanent consultative committee, having the same board-voting power as the directors.' In conclusion, having effected what we consider was the only object of our appointment, nothing further is left for us to do but to thank the directors for their co-operation, the secretary for his courtesy, and the shareholders for their support.—F. DEERING, F. BREUER, L. LEVY."

THE ARUBA ISLAND GOLD MINING CO., LIMITED.

IMPORTANT RESOLUTION AGREED TO UNANIMOUSLY—HARMONY IN THE CAMP—ALL INTERESTS IDENTICAL.

PURSUANT to a requisition signed by members of the Aruba Island Gold Mining Company, Limited, holding in the aggregate shares to the nominal amount of one-fifth of the capital of the company, the directors of the company convened a special general meeting of the members, which was held at Winchester House, on Thursday, for the purpose of considering, and, if thought fit, passing the following resolutions, that is to say :—

(1.) "To increase the number of directors, and to elect the same." (2.) "To accept the resignation of any of the present directors who may resign at that meeting, such director, or directors, to be eligible for re-election, and to fill up such vacancy, or vacancies, if any." (3.) "To fix the future remuneration of the directors." (4.) "To remove the registered office of the company to Sheffield."

John Widdecombe, Esq. (chairman of the company), presided.

Mr. ARTHUR WIDDECOMBE (secretary) read the notice calling the meeting.

The CHAIRMAN said : Gentlemen, you will only be troubled with the first resolution to increase the number of directors, and to which resolution the directors, until Tuesday last, objected, for reasons which need not now be repeated. On that day a meeting was held by the directors, and their solicitor, and the solicitor of Mr. Alfred Ibbotson, at which the following compromise was agreed to, viz. :—1. The directors are to continue to promote, in co-operation with Messrs. John Taylor and Sons, the establishment of a sub-company to resume at the earliest practicable period the business of gold mining in Aruba. 2. This company will have 12,500*l.* in the capital of 60,000*l.* of the sub-company, instead of only 10,000*l.* as originally proposed. 3. If the sub-company is established, and the agreed amount of working capital is subscribed for, Mr. Ibbotson will abandon all his claims against this company. 4. If the sub-company is not established Mr. Ibbotson's claims are to be referred to arbitration. 5. The proceedings in the action commenced against Mr. Ibbotson are to stand over *sine die*. 6. The offices of the company are to remain in London so long as the company can pay its annual expenses out of income. The only business to be done at this meeting, therefore, is the election of four additional directors of the company, without pay, until approved of at a future meeting of the shareholders, and it is proposed that those directors shall be Mr. Alfred Ibbotson, and Messrs. Stone, Fenton, and Carr. This condition being as it was, one of the terms of the compromise arrived at by the directors, the directors do not oppose it.

MR. IBBOTSON TRACTABLE AND CONSIDERATE.

Mr. MONRO : It is my pleasure to have to second this motion, and I am glad to be able to say that in the negotiations we have had with Mr. Ibbotson in this matter he has been most ready to consider everything we have put forward ; so much so, that he has really yielded to us everything that we asked him to yield, with the exception of one little point, as to whether the No. 3 or the No. 7 was "the number of perfection" on the board, but being in favour of No. 7, we have settled in that way a matter which has been a question for so many "centuries." (Laughter.) I beg, therefore, to second the resolution which has been proposed by the chairman.

The motion was put to the meeting, and carried unanimously.

A SHAREHOLDER proposed a cordial vote of thanks to the chairman, which was carried unanimously, and

The meeting was brought to a close.

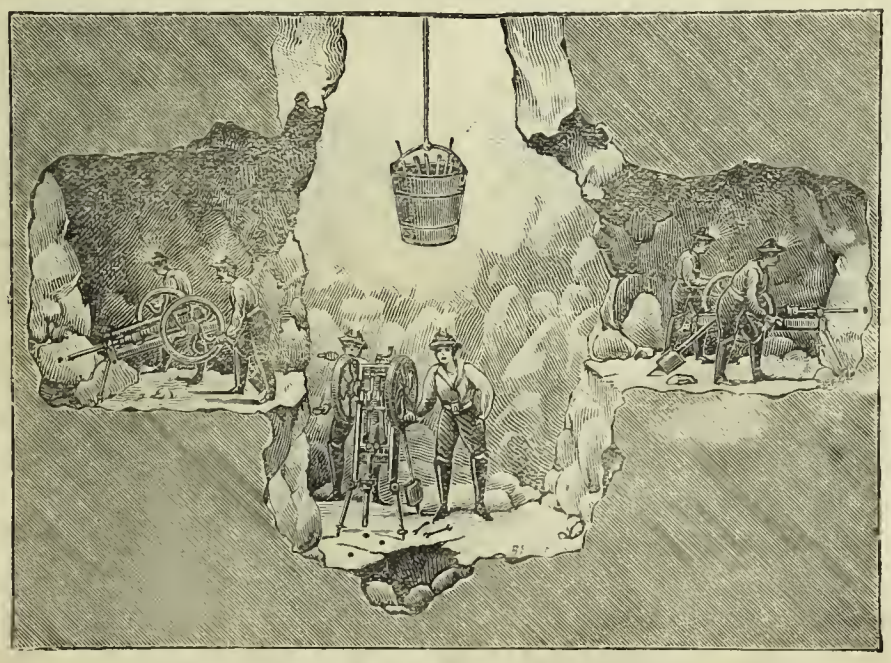
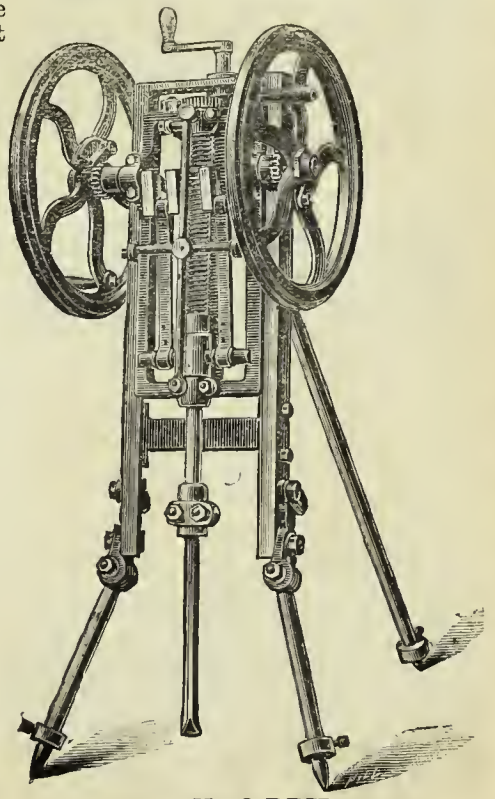
MANUFACTURERS, 73A, QUEEN VICTORIA STREET, LONDON.

It is perfectly automatic, and bores hôles from ½ to 2½ inches diamcter at the rate of 1 to 2 inches per minute in hard rock. It will work equally well in any direction or on any uneven surface. No skilled labour required to run it. No expensive repairs. Made in two sizes, and can be worked by electric motor if desired. Hundreds of these Machines are at work in all parts of the world in Mines, Quarries, and for all kinds of rock excavating. It is the only *effective* and *durable* hand-power Rock-drill ever made.



SHOWING DRILLS AT WORK SINKING AND DRIVING.



No. 2 DRILL.

MINING MACHINERY

Of Latest Approved Designs as developed in American Practice.

The ultimate success of the African Goldfields must depend on large economical Mills, crushing the maximum quantity of ore with the minimum outlay for fuel and labour.

As an illustration of what can be done with superior machinery reference is made to the Montana Company's Mill. This consists of three rock-breakers, 60 stamps and 24 Frue Vanner concentrators. It crushes daily 120 tons of hard quartz, burning six cords wood (3 tons coal) per 24 hours, and employs 15 men in the 24 hours. The engine has been run four months at a stretch without once stopping.

The following extract from the "Engineering and Mining Journal" shows the difference between Fraser and Chalmers' Mills, and those of less experienced firms:—

"STAMPS AND STAMPS.—The El Callao Company has two mills of 60 stamps each; the new one supplied by Fraser and Chalmers representing the best modern designs and workmanship. Both mills are run under one management, and the old mill has been much improved on its original condition.

"Old Mill crushed 31,770 tons in 48½ weeks, cost 24.60 fcs. per ton.

"New Mill crushed 29,000 ,, 25 ,, ,, 8.60 fcs. per ton.

"New Mill will probably crush 60,000 tons in 51 weeks. The rock is a very hard quartz."

The cost of freight and erection is nearly as high for a poor mill as a good mill. The difference in first cost between ordinary mills and the best mills can be made up in the extra saving on a month's run. The large masses of low-grade ore in Africa cannot be worked to a profit with expensive fuel and labour except by improved mills. The days of small mills and rich rock are numbered, as proved by experience in all other goldfields.

THE MINING MARKET.

CITY, FRIDAY EVENING.

SHARE MARKETS WEAK—THE SETTLEMENT—FAILURES—FOREIGN SHARES BEING QUIETLY ABSORBED—HOME MARKETS FIRM, BUT TIN IRREGULAR—COPPER.

THE share markets have exhibited a shaky sort of feeling this week, as though the hot weather had led to drinking, and drinking to a sharp attack of *delirium tremens*. There has been an absence of confidence, especially when buyers put in an appearance, and could find no sellers. There has, however, been a certain amount of attention given to foreign shares, and small parcels have been picked up. The move in Californias seems to betoken better prices for American shares presently.

The settlement has passed off quietly. Buyers should, in all cases, insist upon the delivery of their stock, for in this case they will help to harden their market, and give the tone of firmness to it which it needs just now more than anything else. By leaving their shares undelivered they are simply playing into the hands of the bears.

There have been two failures on the Exchange, one being that of a person largely interested in the South African share gamble. It is believed that the Hatton Garden *coterie* have been hard hit by the shortcomings of this individual.

The Home Market has only shown activity from its tin side. There has been a fair demand for certain shares, though it cannot be said to have become general.

Copper Stocks are now being cleared off by a healthy trade demand at the rate of about 6,000 tons per month, and an improvement upon existing prices is anticipated. The present outlook for copper is better than it has been at any time since the failure of the syndicate.

AFRICANS.

There has been a considerable amount of business in African shares this week, and prices would, no doubt, have further improved but for the fact of the failure of a somewhat large operator. The making-up prices of the principal shares are as follows :—Bantjes, 1⅜; City and Suburban, 8¾; Crown Reef, 5½; Crœsus, 1¾; De Villiers (Robinson), 3¾; Ferreiras, 13; Goldfields of South Africa, 2 1/16; Heriot, 3½; Jubilee, 4½; Jumpers, 12½; Langlaate, 3⅞; Salisbury, 13; Thomas Reef, ⅜; Van Ryn, ¾; Wemmer, 5; Wolhuter, 3⅝.

The following show a rise on the week :—Republics, 6d.; Sheba, 1/16; Thomas, ¼; Thomas, Preference, ½; Johannesburg Waterworks, ⅛; Aurora, ⅛; Bothas, 1/16; Central Langlaagte, ¼; City and Suburban, ⅛; Cornucopia, ⅛; Crown Reef, ⅛; Crœsus, ⅛; De Villiers, ⅛; Durban Roodepoort, ¼; Ferreiras, 1¼; Geldenhuis, ⅛; Heriot, ⅛; Henry Nourse, ⅜; Jumpers, ½; Langlaagtes, 5/16; Langlaagtes, Block B, 1/16; Main Reef, 1/16; May's Consolidated, 1/16; Moss Rose, ¼; Salisbury, ½; Simmer and Jack, ¼; Spes Bona, ¼; and Wemmers, ⅛. The following have fallen :—Pigg's Peak, 3/16; Black Reef, ⅛; Dornkop, 1/16; Goldfields of South Africa, 1/16; Jubilee, ⅛; Kleinfontein, ⅛; Randfontein, 1/16; Van Ryn, ⅛; and Vogelstruis, ¼.

Diamonds.

There has been a very dull market in these shares during the past few days, and in consequence prices have given way The following are a few of the making up prices on Wednesday last :—Anglo-African, 4½ ; Bultfontein, 3½ ; Bultfontein Consolidated, 1⅛ ; De Beers, 15 9/16 ; Gordon, 1 ; Griqualand, 5¾ ; London and South African, 17½ ; Read's Drift, 2½ ; and New Jagersfontein, 11¾. A fall is shown in De Beers of 5/16 ; New Jagersfontein, ¼ ; and Burma Ruby, ⅜. The only rise is in South African of 6d. No other change to note.

Copper.

Dulness has characterised Copper shares all this week, and close prices has been out of the question. The following have receded :—Bratsberg, 6d. ; Cape, ⅛ ; Mason and Barry, ¼ ; Namaqua, ¼ ; Rio Tinto, 3/16 ; Tocopilla, 3d. No rises to note.

Indian.

Indian shares have again been neglected. The great difficulty of dealers has been to get a really close price ; in fact it has at times been almost impossible to do so. A fall is registered in Mysore Gold of 3/16 ; ditto Reefs, 6d. ; Nundydroog, 1s. ; Ooregum, 1/16 ; and South-East Mysore, 6d.

Australians.

There has been an absence of business in this market. The principal dealings were in Gympie Great Eastern. Great difficulty is experienced in delivering the shares in consequence of the jobbers being short of stock. A fall has taken place in British Broken Hill of ¼ ; Moruya, 6d. ; and the only improvement is in Day Dawn and Gympie Great Eastern of 6d.

Foreign.

A considerable business has taken place in these shares. those mostly dealt in being Balkis, Esmeralda, Emma, New California, Orita, Palmarejo, Potosi, St. Augustine, Victory, and Yuruari. The account showed a great scarcity of Balkis, California, Emma, and Victory shares, the jobbers in some cases giving a back of 1d. per share. The following have fallen :—Barretts, 6d. ; Carlisle, 3d. ; Consolidated Esmeralda, 6d. ; Garfield, 6d. ; Monte del Oro, 6d. ; New Emma, 3d. ; Orita, 2s. ; Palmarejo, 1s. ; St. John del Rey, 3d. ; United Mexican, 1/16 ; Venezuela-Austin, 3d. ; Victory, 3d. ; Viso Tin, 1s. ; and West Argentine, 1/16. A rise is shown in Colombian, 1/16 ; Frontino, 3d. ; Montana, 1/16 ; New California, 3/16 ; Pinos Altos, 1s. ; and Potosi, 9d.

The following list shows the principal changes which have taken place :—

LATEST FROM THE MINES.

Indian Mines.

Champion Reef.—Letters of allotment to applicants for shares have been posted. The shares have been quoted at ⅛ premium.

South-East Mysore.—The board of the South-East Mysore Gold Company have received no detailed report this week, but learn that all is going on satisfactorily. The annual report of the directors, to be presented at the general meeting early next month, will be in the hands of the shareholders in a few days.

Colonial Mines.

Day Dawn Block and Wyndham.—The directors have received the following cablegram from the general managers at Charters Towers, giving the result of the crushing for the fortnight ending 22nd inst. :—"1,450 tons crushed ; yield of gold, 1,218 ozs. ; approximate value, 4,200*l*. Fortnight's expenses, 2,360*l*."

Day Dawn P.C.—The manager at Charters Towers gave the result of this company's crushing for the fortnight ending June 22nd, viz. :—"1,046 tons, 1,483 ozs." (Estimated value, 5,042*l*.)

English and Australian.—The directors notify that the coupons due 1st July next on their 6 per cent. debentures will be paid on and after that date by Messrs. Barclay, Bevan, Tritton and Co., Lombard Street, E.C.

Midas.—Cable from the mine :—"Yield for week, 201 ozs. (804*l*.)."

Mosman.—Cablegram from the manager, Mr. W. Holliman, at Charters Towers, Queensland :—"Crushing outside ores (about 1,200 tons) finished. The mill commenced running on Eastward Ho ! stone, after having been thoroughly overhauled, on 17th June, at which date there were 1,300 tons of quartz (from Eastward Ho ! and North Australian Mines) in the paddock ready for crushing."

Mount Albion.—Telegram from the manager at the mines :—"To the 15th June, 605 tons ore raised containing 44,000 ozs. silver (or about 72 ozs. per ton) ; 415 tons ore smelted, containing 18,000 ozs. silver, producing 64 tons silver-lead bullion, containing 16,000 ozs. silver. Shipped per Taroba, 84 tons ore ; 54 tons silver-lead bullion containing 40,000 ozs. silver. Last week has been forwarded 45 tons."

Mount Leyshon.—Cablegram :—"365 ozs. ; 610 tons ; 20-stamp mill running 8¼ days."

Mount Morgan.—Messrs. Laughland, Mackay and Baker have received the following telegram from Queensland :—"We pay 125,000*l*. 1st July, being 2s. 6d. per share for the month of June."

Foreign Mines

Colombian.—Cablegram of the returns for the month of May, being the final clean up for the financial year, 1888-89 :—"We have cleaned up after a run of 1,100 hours. The gross returns are 6,500*l*. The net profit is 5,400*l*."

East Arevalo.—Telegram from the mine manager, dated 25th June :—"Have been treating the ore. Shipped bullion amounting to $2,500."

Moruya.—Advice, dated May 16th, from the manager at the mine :—100 tons raised. Shall now stop raising, and put men on to sink 50 ft. on underlie before again driving.

New Hoover Hill.—The directors have sold, through Messrs. Pixley and Abell, the bullion obtained during the month of May, weighing 125 ozs., which realised the sum of 429*l*. 9s.

Pinos Altos Bullion.—A telegraphic advice states that the out-turn for the week ending 22nd inst. was $14,000.

United Mexican.—San Cayetano property : Gross returns, week ending June 22nd, $3,900 ; expenses, week ending June 15th, $7,100. Week ending June 15th returns balanced expenditure. El Cubo property : Expenses week ending June 15th, $4,760. Two holidays.

West Argentine (in liquidation).—The transfer books of the company will be finally closed on Saturday, the 29th inst.

HOME MINES.

PRINCE OF WALES.—At this meeting a call of 4s. per share was made. The prospects are encouraging.

WHEAL KITTY.—A call of 5s. per share was made this week.

TICKETING FOR TIN ORES.

A tin ticketing took place at Redruth on Tuesday last, when 170 tons were offered (average standard 88.89), with the following results :—

METALS.

COPPER has been in good demand, and smelters and manufacturers are full of orders. The market for warrants has been rather variable. G.M.B. warrants for cash closed last Friday at 41*l.* 13s. 9d., declined to 40*l.* 10s., but improved yesterday to 41*l.* buyers. Sellers ask 2s. 6d. to 5s. more. To-day spot is quoted 41*l.* 5s. Three months fixed has been sold at 5s. to 10s. per ton under spot parcels. This morning business was done at 40*l.* 15s. to 40*l.* 17s. 6d. three months. We quote English tough, 46*l.* to 47*l.*; best selected, 47*l.* to 48*l.*; strong sheets, 53*l.*; Indian sheets, 51*l.*; yellow metal sheets, 5d.; ore, regulus, &c., 8s. to 9s. per unit.

TIN.—Straits declined from 89*l.* 5s. to 88*l.* but yesterday improved to 89*l.* 5s. cash, buyers. This morning business was done at 89*l.* 7s. 6d. cash, and 90*l.* three months; three months has ruled 10s. to 15s. over cash; and Australian, about 2s. 6d. premium. The Dutch market followed ours; Banca declined from 54½fl. to 53¾fl. cash, improved to 54¼fl., and Billiton to 54fl. The Billiton sale in Batavia realised an average of 60.82 per picul, a parity of 53¼fl. per 50 kilos. and 90*l.* per ton; English ingots, 93*l.*

TIN PLATES are quiet and quoted 13s. Liverpool, for ordinary coke.

SPELTER is dearer. 18*l.* 15s. for old brands, ex ship here; Birmingham, 19*l.* 7s. 6d.

LEAD is dull, and sellers of soft Spanish, 12*l.* 7s. 6d.; soft English, 12*l.* 10s. to 12*l.* 15s.; L. B. China pigs, 13*l.*; sheet lead, 13*l.* 10s.

QUICKSILVER. Rothschild's price is still 9*l.* 5s.; seconds want 9*l.*

ANTIMONY firm; 60*l.*

LONDON COAL EXCHANGE.

Wallsend :—Hetton, 15s. 6d.; Lambton, 15s.; Tees, 15s. 6d.; Hetton Lyons, 14s. 6d.; Wear, 14s. 6d.

LONDON METAL EXCHANGE.

4.32.—Closing official report.—Copper G.M. Brands, cash, 41½, ⅞, three months, 40⅞, 1¼; best selected, 47, 8; strong sheets, 53, 4; English tough, 46, ½. Tin: Fine foreign, cash, 89⅜, ⅞; three months, 89⅞, 90⅜; Australian, 89½, 90; English ignots, 93; spelter, 18½, ⅝.

GLASGOW PIG IRON MARKET.

3.17.—Business at 43s. 8d., 43s. 6½d. cash; 43s. 10d., 43s. 9½d., one month; buyers, 43s. 6d. cash; 43s. 8d. one month; sellers 1d. more. Market easier, good business. Middlesbro' done, 38s. 11½d., 38s. 10d. cash; 39s. 1½d. one month; buyers 38s. 9½d., cash, 39s. one month; sellers 38s. 10d. cash, 39s. 1d. one month. Hematite done, 49s. 1½d. cash, 49s. 3d. one month; buyers, 48s. 11d., 49s. 1½d. cash, 49s. 2d., 49s. 4½d. one month; sellers, 1d., 1½d. more.

THE NEW EBERHARDT CO., LIMITED

THE directors present the statement of accounts made up to the 31st December, 1888, together with Capt. Wm. Read's report to the same date. The testing of the Monitor property is going on vigorously, and the reports that the directors have published from time to time show a steady increase both in the weekly output, whilst the quality of the ore is of a high grade. Developments are being energetically pushed forward by Capt. Read in the more favourable directions for the finding of ore, the most promising indications being in the north shafts, and in the south drift. In the latter drivings the weekly output has increased since December from 5 tons, of an average assay of $50.28 per ton, to 42 tons; assay value, $58 per ton; it being distinctly understood that anything over $30 is clear profit. The mill, which commenced work on the 12th April, is running steadily; with the new mullers that been have put in, and with the cleaning of the water ditch, good work is being done. There are 400 tons on the ore dump ready to be milled, of an average assay value of $50 per ton, which can be worked at a good profit. Capt. Read also expects to make a profit on custom milling, and the usual monthly profit on tailings of $1,000 is being kept up. There are 17 bars of bullion in the hands of Prof. Thomas Price, of San Francisco, awaiting realisation (including the 11 bars shown on balance-sheet), the average value per bar being about $420. A special meeting is called for the purpose of making the necessary alterations to the articles of association of the company, with a view to obtaining an official settlement and quotation of the company's shares on the Stock Exchange. At a board meeting held on the 16th January, Mr. Sacré reluctantly explained that owing to a possibility of his being called abroad for some months on business, he considered it would be only prudent to add another director to the board. In consequence of this, and at Mr. Sacré's suggestion, Mr. J. Russell Clipperton was asked to join the board, which he consented to do, and took his seat on the 13th February. Mr. Sacré definitely resigned his seat at the board on the 13th March, to the great regret of his colleagues. The board have to announce with the deepest regret the death of their esteemed chairman, Mr. F. J. Bladon, which took place on April 20th. A vacancy at the board necessarily occurring, the directors duly elected Mr. Osmund Gibson, C.E., of 60, Queen Victoria Street. Mr. Clipperton was requested to take the chair, and was duly elected chairman of the company on 15th May.—A. H. OXENFORD, Secretary.

Mr. Reads sends a report upon the working of the mine for the five months ending December 31st, 1888 :—Development : Total length of prospect drifts run, 395 ft.; total length of new cross-cut, 77 ft.; total length of winzes sunk, 92 ft.; total length of prospect shaft sunk, 212 ft.; making the total developments for the five months 776 ft. Tailings worked : Amount of dry tailings worked from August 3rd to December 27th, 1888, equals 2,389 tons; assay value of same, $16.85 per ton; bullion product of same, standard value, $19.261.46; total number of bars produced, 26. Ore at mine : Amount of ore extracted at the mine and ready for shipment to the mill, upwards of 75 tons. The assay value of this ore I estimate at $50 per ton, which, I am sure, is a low estimate. Custom ore crushed : Amount of custom ore crushed and not worked in pans, 216 tons at $4.50 per ton, equals $879; this amount is now due to the company. I very much regret that I am at this time unable to report the development of a good substantial ore body, but it is my constant aim to report to you the exact situation, no matter what it may be, but we are earnestly and faithfully labouring to bring the mine to that standard for which we have all so long and patiently waited.—W. READ, Manager.

The Golden Grain Bread Company, Limited, opened another refreshment *depot*, at 5, Austin Friars, Old Broad Street, on Tuesday, June 25th.

NAMAQUA.—The first annual meeting of shareholders of the Namaqua Copper Company, Limited, was held, yesterday, at the Cannon Street Hotel, Mr. Charles Howard in the chair. The chairman referred to the difficulty which the company had been placed in, owing to the failure of the Société des Metaux to fulfil its engagements, by which three cargoes of ore, amounting to 2,229 tons, had realised about 16,000*l.* less than the contract price, consequeutly the directors were unable to recommend the payment of a further dividend for 1888. As regarded the future of the company, the chairman spoke hopefully. The cost of production has been diminished, the excessive stocks were diminishing, and the low prices were checking increased production, and even with the present low price of copper the directors hope to be able to pay a dividend.

THE BRAVO MINE SYNDICATE, LIMITED.—The third ordinary general meeting of this company was held at 110, Cannon Street, on Tuesday—Lieut.-Col. Charles D. Rich in the chair. The chairman explained the position of the undertaking, and expressed the regret of the board that both cross-cuts from the tunnel to the old workings had had to be temporarily abandoned in consequeuce of bad air. He stated, however, that instructions had been given to sink on one of the old winzes, from which rich ore had been obtained by the late owners, and that the manager was of opinion that within a short time good results would be obtained from this development. The cost of timbering, &c., was calculated not to exceed 500*l.* When the weather grew cooler it was thought that the air in the tunnel would improve, and allow of operations to be resumed at that point, but in any event the tunnel would prove of great value in the future working of the mine. The chairman concluded his remarks by moving that the report and accounts for 1888 be received and adopted. This was seconded by Mr. A. Buchan Hepburn, and carried unanimously. Col. David Milne Horne and Mr. Hepburn having been re-elected directors, a vote of thanks to the chairman closed the proceedings.—J. B. PALMER, Secretary.

BRITISH MINING INTELLIGENCE.

BERTHA CONSOLS (26th June).—In the 53-fm. level east, by the side of the lode, the ground is favourable for working, and continue genial for ore. Some very good brauches of rich copper and mnndic have been broken this week. The lode in Glasson's rise in back of the 40 at new engine shaft is still looking well, and will produce over 10 tons of mineral per fm. Stopes therefrom will produce 10 tons per fm. The stopes in back of the 40 east will produce 8 tons per fm., and rich tin ore also. Eddy's new winze below the 30 east will produce, for the part of the lode carried, 7 tons per fm., but there is more lode standing, which will be taken down at a future time. All is working well in aud on the mine.—T. GREGORY.

DEVON GREAT CONSOLS (27th June).—Watson's engine shaft: In the 160-fm. level east and west the lode is 5 ft. wide, very promising, and yields in each direction 5 tons of copper ore per fm. In the 148-fm. level west the lode is 4½ ft. wide, of a promising character, and is yielding 2 tons of copper and arsenical ore per fm. In the 136-fm. level west the lode is 4 ft. wide, composed of capel and quartz, with fluor and small quantities of copper and mundic ores.—I. RICHARDS.

DEVON UNITED (21st June).—Willesford's shaft: In the 132-fm. level east the lode is 3 ft. wide, composed of capel and quartz, with peach and a little copper and arsenical ores of good quality. In the 132-fm. level west, the lode is 3½ ft. wide, very promising, and is yielding a little copper and mundic ores. In the winze in the bottom of the 120-fm. level west, the sinking is still being continued by the side of the lode, the ground being favourable for exploration, and congenial for the production of mineral.—I. RICHARDS.

DRAKEWALLS (27th June).—In the winze sinking below the 132 west the lode will produce for the length, 9 ft., 11 tons of mundic per fm. No change to noticc in the lode in the stopes in the back of the 132 since last advised.—H. RODDA.

GAWTON (25th Jnne.)—The lode in rise in back of the 105 east is carried 4 ft. wide, which is chiefly capel and arsenical mundic, yielding 10 tons per fm. The value of the lode in the 95 east is a little affected by the influence of a small cross-coursc, which we believe will again improve as the drivage advances.

MID-DEVON (22nd June).—Surface: The pumping machinery is doing fairly well at three revolutions per minute: it has been stopped several hours this week for repairs in shaft and alignment of rods. The surface water has fallen off considerably. We have had no appreciable quantity of rain for some weeks, and weather is very hot. A shaft: At 1 p.m. to-day the water in shaft was 40 ft. below the 80. C shaft—The 50 east: Stope No. 3 worked on by six men; section of lode carried 12 ft. wide, equal to 6 tons of ore per cubic fm.; strata easier for progress, and retains its congenial character.—J. NEILL.

MORGAN (19th June).—Manager's report:—Accompanying this please find my report of work done at the above mine during the last four weeks ending Jnne 16th. It will be seen that we have but a small amouut of gold on hand at present, caused through the mill only working 18 days, owing to great scarcity of water and the low grade ore which has been put through. It will be remembered that I mentioned in my last report having found visible gold in the immediate level, and from which place we have crushed a few tons of ore, which yielded most of the gold, which is on hand at present. We have crushed 389 tons of ore, which yielded 463 ozs. of amalgam, and which will, after retorting, yield about 170 ozs. of gold. It will be hard to estimate the quantity of gold which the clean up for the eud of June will yield, owing to the mill being hung up through reason mentioned above, but if the mill was crnshing to its full capacity we might possibly give 500 ozs. *Re* the scarcity of water: When the new machinery is ereeted this cannot oeeur again, as the Turbine, which is replacing the wheel, will work with a far less quantity of water than is necessary to run the present wheel, independent of that, we shall have an auxiliary steam engine in the event of water running short. The mine—Harvey lode: There is no perceptible change in the ore yet since last month. No. 2 tunnel: The ground is a little easier to work than it was at the beginuing of the month, and is looking about the same as last month. We have one drill at work in the face. The rise in No. 2 tunnel to meet No. 2 winze: The ground here is very hard at present, but shows a quantity of blende, and a very fair prospect of gold when panned. Big lode: The ground here is very hard, but is improving in appearance. West end of Chidlaw lode, driving west: There is a little dig on the footwall here, but the quartz is very much mixed up with the country. I have taken the men out of here to stope in No. 1 winze at the back of the stope, where we had gold in the intermediatc level. New shoot: This is looking much better than it did at the beginning of the month. Old stope east of No. 2 rise: I have seen gold here at three different points, and the stope in general in looking better. West of No. 2 rise? I have had some very fair prospects from two different points where I am working here, and believe that in a few days we shall have some good stuff. No. 2 winze: I have started to stope at east side of winze to make room for two shifts to work, so as to enable us to get out and store what good ore we have here ready for delivery at mill, as soon as we have sufficient water to resume operations. No. 1 winze or intermediate level: This level is still looking very satisfaetory, some very good pieces of gold-bearing quartz being taken out yesterday. South-west level driving east: The ore from this level now and then shows fair prospeet. The men have been taken out of here to stope in the intermediate for reasons stated *re* No. 2 winze.—N. G. RIBBLE.

PHŒNIX UNITED (26th June).—The setting report is to hand. There are at various points throughout the mine nine pitches at tributes varying from 3s. 6d. to 11s. in the £ for tin.

ROMAN GRAVELS (27th June).—Main engine shaft: We have this week lengthened the main rod, and fixed a 7-in. drawing lift, whieh will be used in sinking the shaft below the 125. The men are to-day putting in a dam to keep the water baek, and will to-morrow commence the deepening of the shaft in order to put in a suitable penthouse, &c. Wheu the latter is fixed, we purpose letting the sinking of the shaft, by contract, to nine men with rock-drills for a depth of 15 fms. We have nothing new to report to you from any of the stopes or ends uow at work.—A. WATERS and SON.

RUSSELL UNITED (27th Jnne).—The 80-fm. level has been driven west during the past month 4 fms. 4 ft., where the lode is of the same promising character, and continues to yield fair class stamping work; worth 5*l*. per fm., and the end is reset to seven men for the month, at 5*l*. per fm. The rise is now 8 fms. 1 ft. 6 ins. above the back of the level, where the lode is ft. wide, and worth for the length carried 7*l*. per fm.; this has been reset to six men for the month, at 6*l*. 10s. per fm. The cross-eut referred to in my last report has been driven 1 fm. 1 ft., and is reset to four men to intersect the south lode, at 5*l*. per fm. The machinery, including the stamps, is all working satisfactorily at present, and I consider the result on the dressing-floors thus far attained is quite equal to our expectation.—W. GEORGE.

SOUTH CONDURROW (26th June.)—The lode in the 108 end west of Marshall's yields low quality tinstone. There is no new feature in the bottom of Marshall's shaft. The lode in the 50 end east of King's is worth 15*l*. per fm. We are badly off for water for dressing purposes, and are now driving a new adit from the lower part of the dressing floors to communicate with King's shaft, and re-pump this water to a higher level, which will help matters in this respect.—W. RICH, W. WILLIAMS, H. KING.

SOUTH DARREN (27th June).—The drivages in the 142 and 130 west are without change. The 110 end east continues worth 12 cwt. of silver-lead ore per fm. The cross-cut in the 100 west is not yet through the lode, which has been proved 21 ft. wide. The forebreast is still spotted with lead. There is no change in the other places. The surface hands have been clearing and repairing the watercourses, —J. MITCHELL.

TIN ERA (25th June).—The lode in the adit end east contiuues large and of a promising character, bnt no ehauge to call for remark since the date of my last report.—R. KNOTT,

VAN (27th June).—I am glad to say that the lode is again improved in the 135 south level; worth fully 70*l*. per fm.; looking quite up to valuation in the roof of level, and better in the sole, or bottom; no change elsewhere. We have sampled for sale next week 60 tons lead, and 60 tons blende.—W. H. WILLIAMS.

WEARDALE (22nd June).—Water very scarce. Ore raised for the week, 82 tons; ore dressed for the week, 62 tons; ore fume and slag smelted for the week, 142 tons, produeing 69 tons of pig lead.

WEST WHEAL GRENVILLE (25th June).—During past week the bearers referred to in our last report to carry drop lift have been completed, making a total depth of 8 fms. below the 100-fm. level. We find said level will need extensive repairs, at which work the men are now engaged, and will be completed as soon as circumstanees will admit. At Harvey's shaft, the skip-road to the back of the 90-fm. level, we suspeuded the work of putting in this skip-road for two or three days during past week, and put the men to take up water at the 90-fm. level west of Harvey's shaft, which has hitherto been going down in the mine.—T. HODGE, J. SKEAT, N. TEMBY.

FOREIGN MINING INTELLIGENCE.

ALMADA AND TIRITO (1st June).—Have driven 50-fm. level north 18 ft. 2.10 with four men and machine-drill; drivage barren; are now nearing the hanging-wall; ground is improving in looks. Drivage in 31-fm. level, winze No. 7 San José, 8 ft. 1.10. Metal has changed very suddenly from a large breast of lead and zinc ores to one of copper stains and petanque, or eopper glanee, scattered. Drivage cross-cut north-east from front 24-fm. level, 3 ft. 5.10. Have done uo work this week in 62-fm. level. Balvanera shaft: Blacksmiths occupied, and it was not possible to furnish me drills. That has been arranged, and in coming week am in hopes of doing good work. Timber expenses have been large, bnt I am using timbers only where absolutely necessary. As per Mr. Sanchez's instructions, am prospecting the old workings above the main adit and north of the Tirito shaft. Indications are good, and I believe we shall strike a good body of ore to the west. Main shaft and ladders in good order. Have put in ventilation tubes to the front of 50-fm. level, also in the 24-fm. level. Have carried tramway to the No. 7 winze 24-fm. level, which will reduce number of labourers. Will continue, as per Mr. Sanchez's instructions, to prospect various parts of the mine for ore bodies.—H. C. CLOUD.

ANDALUSIAN (22nd June).—The tributers at Saturno, Nos. 1 and 2 shafts, are doing well, though a day or two ago we were almost afraid the rain would again stop us. They are driving the level east of No. 2 shaft, and stoping the baeks. At No. 3 shaft the tributer is driving two intermediate levels east and west of shaft. We think we can reckon on 700 quintals of galena and 100 quintals of carbonates for this month. At the river adit the lode continues clearly defined in the lower part of the end, and carries a little galena mixed with iron pyrites. The adit is now 28 metres long.—H. A. HASELDEN.

ASIA MINOR (8th June).—62 men driving, 223 men stoping; value of stopes, 16 tons 10 cwt. Four men sinking, 12 men rising. The lode in the end west from No. 4 stope is 4 ft. wide, and has improved to 1 ton of silver-lead ore per fm., and having a promising appearance for further improvement. Number of men employed at the dressing floors, 75; production to June 14th, 5,314 tons crushed, yielded 704¼ tons rich silver-lead ore. Corresponding period last year, 5,173 tons crushed, yielded 667½ tons.

BALAGHAT-MYSORE.—Report for fortnight ending Junc 8th :—North engine shaft: In consequence of an accident to our pump-work, causing the bottom of this shaft to be under water for some days, we have only been able to sink 6 ins., or 8 ft. 6 ins. below the 410 ft. level. There is therefore no material change to uotiee here since last report. The 410 ft. level north has been driven 14 ft., or 117 ft. 6 ins. from the shaft. The lode is large, but at present poor. I am, however, looking forward to an early improvement at this level. The 330-ft. level north has been extended 25 ft., or 520 ft. from the shaft. The quartz is small, only about 6 ins., and assays 9 dwts. 3 grs. of gold per ton. The No. 2 wiuze in the bottom of this level has been sunk 4 ft. 3 ins., or 45 ft. 9 ins. below the level. The quartz is about 14 ins. wide, and assays 3 ozs. 8 dwts. 14 grs. of gold per ton. The stopes in the bottom of this level yield quartz of about 1 ft. wide, and assays 1 oz. 8 dwts. 17 grs. of gold per ton. The stopes in the back of this level produce quartz of about 15 ins. wide, and assay fully 22 ozs. of gold per ton. Comparatively but little has been done at the 270-ft. level south since last report. I, however, hope to resume its driving again next week. The No. 2 cross-cut west on the 270-ft. level north has been driven 2 ft., or 81 ft. from the level. The No. 2 cross-cut east has also been driven 2 ft., or 47 ft. from the level. The stopes in the back of this level yield quartz of about 15 ins. wide, and assays 1 oz. 6 dwts. 3 grs. of gold per ton. The 165-ft. level north has been advanced 5 ft., or 496 ft. 6 ins. from the shaft. The quartz is about 3 ft. wide, and assays 3 dwts. 21 grs. of gold per tou. The stopes in the bottom of this level produce quartz of about 1 ft. wide, and assays 16 dwts. 23 grs. of gold per ton.

Surface: I regret to say the building in of the new boiler has not advanced as rapidly as it ought to do. We have been greatly inconvenienced by the contractors failing to supply the necessary materials. I however hope to get it at work next week. The clean-up for last month was as follows: 150 tons of quartz, yielding 218 ozs. of gold.—Capt. PRYOR.

BRATSBERG.—Mining report for week ending 15th June.—Hoffnung Mine: Irregular and bunchy appears to be the character of the lode at No. 2 adit level for some days past; the lode has yielded fully 1 ton per fm., but for the present produces only saving stuff; the rise in the back of No. 2 produces 1 ton per fm. No. 3 adit level is apparently undergoing a change, but still yields 1 ton per fm. At No. 4 level the lode is 3 ft. wide, and worth ¾ ton per fm. No. 5 level east still retains a highly promising appearance; the lode is now 1½ ft. wide, well-defined, carrying saving stuff, and letting out water, hence all that can be desired as far as appearance is concerned. The mid-level at Murchison's is worth 1 ton per fm.; the stopes in the back of this level have just been holed with an advanced westerly part of the old "silver sink" workings, and we are now making special investigations as to the silver contents of the ore from this point, which we find to be higher than in other parts of the mine. The shallow level is worth ¾ ton per fm. Johannesi Mine: The level on Howard's lode is opening up very well indeed, at present worth 1½ tons per fm. Næsmark Mine: Barker's shaft has been sunk about 2 metres; since re-starting we observe little or no alteration in the lode. Surface work and remarks: Dressing work for the five working days during the week has progressed fairly well, and the transport of the ore to Skien is being done with regularity. We have secured Mary Owens, but she cannot arrive before the end of this month. Meantime, we hope to be able to get off a cargo by a vessel daily expected at Skieu with materials for the smelting company.—J. D. HOLMAN.

COLAR CENTRAL (31st May).—Central section: Trial shaft has been sunk 5 ft.; depth 60 ft.; quartz still about 2 ft. wide, and the water increasing. Eastern section, north division: No. 5 prospect shaft, sunk 6 ft.; total 33 ft.; we are now going to drift north-east to try and discover the lode lost in St. Stephen's shaft. St. Stephen's drift north, driven 6 ft.; total. 46 ft. from east cross-cut. We are still in the band of hard ground, and have been for the last 20 ft. of drivage. South divisiou: Marden's shaft, No. 2 lode, sunk 6 ft.; total depth, 96 ft.; quartz 3 ft. wide in the bottom, and worth 5 dwts. 6 grs. per ton. There is a little water in the bottom now, aud I think we shall be unable to sink much deeper without fixing pumps here. Drift north at 80 ft. level, driven 11 ft.; total distance, 25 ft.; quartz 2 ft. wide; worth 3¼ dwts. per ton. I hope the grade of ore here will soon improve. Williams' shaft, No. 2 lode, suuk 13 ft.; total, 53 ft.; quartz, 1 ft. wide, at present carrying a tracc of gold. No. I shaft north, No. 2 lode, sunk 13 ft.; total, 48 ft.; quartz, 4 ft. wide; worth 2 dwts. 7 grs. per ton. James' cross-cut east, at 100-ft. level, driven 3 ft. 6 ins.; total 59 ft. from shaft. Cross-cut here for No. 2 lode. No. 2 prospect north sunk 11 ft. 6 ins.; total 40 ft. 6 ins.—A. S. B. OAKLEY.

COLOMBIAN HYDRAULIC (15th May).—The following are the details of operations during the months of March and April:—Run No. 155: On the 21st of April a severe storm occurred, causing breaks on the upper Canterera and Medina ditches, leaving us with only 500 ins. of water. Fortunately I had almost completed the cleaning down process when this occurred, aud therefore decided to make an immediate clean up while the ditch repairs were going on. Thus, on the 3rd May, after a run of 1,015 hours, we cleaned up from the main sluice $18,076.35, which, with $370 purchased gold, gives a total of $18,446.35, the costs being—March, $4,192.60, and April, $3,610.30; total, $7,802.90. There remains a profit of $10,643.45, or about 2,130*l*. We commenced another run the following day (the ditches having been repaired meanwhile), so if we can keep free from further accidents, we shall get a good long ruu till the clean-up in June, which concludes the financial year. The face of the mine is still looking well, and the rich streak still holds out, and is being drifted. The drought: We have occasional showers now, but the drought does uot seem to have abaudoned us yet, therefore I have had to clean up at irregular intervals, because unless we have an ample water supply during the process of cleaning down, a great waste of time is the result. By thus making longer runs I hope to pull up by degrees until we equal, if we do not beat, last year's returns.—A. E. OAKES.

CORTEZ.—The directors have received the following report from Mr. Welsh, the superintendent at the mines, under date of June 9th. During the week endiug this date work at the mines has been as follows: Boss tunnel: Advanced 18 ft.: Main tunnel: East drift advanced 4 ft.; Center, stoped 2½ tons of ore, carrying 70 ozs. silver per ton. Middle tunnel: West drift, stoped 23 tons of ore, carrying 50 ozs. per ton. North-east upraise: Stoped 87 tons of ore, carrying 60 ozs. per ton. North-west upraise: Stoped 75 tons of ore, carrying 120 ozs. per ton. East drift advanced 4½ ft. Development tunnel: Advanced 32 ft. Ore hauled to mill, 168 tons. Ore treated at mill, 140 tons, averaging 56 ozs. Bullion shipped 15 bars, containing 14,000$\frac{99}{100}$ fine ozs. silver. The assays on the bullion are not yet completed, but the ounces given is about the amount in lot. The repairs on the furnaces are now completed.

DENVER (14th June).—The outlook at the mine continues prosperous, and mill shipmeuts are well maintained. 200 level west; Distance, 147 ft. This drift is again in good ore, the hard ground remarked in my last having, early in the week, given place to a more favourable condition of things, which promises continuity for this run of good ore. The lode in the end shows 18 ins. of rich ore. Stopes: The stopes, though supplying 10 stamps with a high-grade milling ore, do not, at their present state of development, show as good a width of vein in the backs as was met with in the drift. 1,050 level: The outlook in this part of the mine is considerably improved by the week's developments, though work has been much hampered by the defective ventilation of these workiugs. The lode in the western drift is takiug a more definite course, and is generally improved in appearauce. This point is 24½ ft. distant from the cross-cut (No. 2). The breast of the opposite drift, distant 20½ ft. from cross-cut, also shows a gradual and very perceptible improvement, and is yielding good ore for a width of 3 ft. A rise going up at the point of the lodes intersection by the cross-cut is opening up a fine lode. The bad condition of the air in these workings has made it necessary to resume work on the old drift (main lode) at this level (at a point 23 ft. from No. 1 cross-cut), in order to effect connection for a sufficient air current the more speedily between the main workings and the ground recently opened up by No. 2 cross-cut. This connection becomes the more indispensable with each day's advance. During the past few weeks the effects of recent heavy snowfalls has been felt in the large quantities of extra water that we have been forced to handle, bnt beyond the extra expense thereby incurred, this influx of water has not troubled us, and as it is now subsiding we apprehend uo difficulty in this conuection. From the general aspect of affairs underground I do not hesitate in predicting a considerably increased and more profitable output for the current month.—F. RICKARD.

DEVALA-MOYAR (31st May).—Winze No. 1: 5 ft. has been sunk, making a total depth of 58½ ft. below the deep tunnel. We are still following the footwall. Judging by the washings the lode is of little value, but the grains of gold are somewhat coarser of late. The grains of metal spoken of in my letter of 6th inst. I find to eousist mainly of copper on examining them. I hope soon to see an improvement in this winze, as during the week we have come across some small patches of pyrites, which lead me to hope for better things as we get down. Wine No. 2: Sinking has been carried on with one drill, and 7½ ft. has been sunk, making a total of 14 ft. A decided improvement has taken place in this winze, a good run of quartz and pyrites having been struck, and we will continue sinking this winze with all possible speed, as this will greatly improve the ventilation of the lower levels. Winze in 48 west: This winze has been sunk 5 ft., making a total of 33½ ft.; we are getting fair washings from this point. The ground here is right, and the speed is not so much as I should have wished. Drive west from cross-cut: We have driven on the lode at this point with one machine, and have extended this drive 4 ft.; total, 44 ft. Here, again, the lode has improved, and carries a fair quantity of pyrites, and washes middling well for gold; the lode is 4 ft. wide, and shows no sign of pinching; the stone from this point goes to the mill. East drive: We are still following the footwall of the lode; the grouud here is very hard, and progress is slow. This point shall be pushed forward when we get one of the drills at work here; the lode here at present is of no value. I shall watch this particular point with great interest.—R. B. JOHNSTON.

— (7th Juue.)—I am pleased to report that the end of the drive east, deep tunnel level, is improved in appearance, and now shows stringers of quartz, some of which are 4 and 5 ins. thick, and dipping same as lode. The end of drive west is looking well; the lode is as wide as the drive and carries some pyrites aud washes well. The pyrites winze is being sunk by three shifts, but there is no change to report. Winze No. 2 is being sunk by hand labour.—R. B. JOHNSTON.

EAGLEHAWK CONSOLIDATED.—The secretary sends us the following abstract of reports dated the 4th and 9th ulto. During the past fortnight the engine shaft has been sunk a further depth of 17 ft.; total from bottom plat 127 ft., aud from surface 677 ft. The sinking was done in nine days. On Easter Monday the men did not work, and for two days they have been timbering ground, which was not safe, to the extent of about 10 ft. I would recommeud that the plat be cut at the 650-ft. level before we proceed with the sinking of the shaft, this will be to the advantage of siuking the uext 100 ft. Plats cut at each 100 ft. are quite far enough apart to work with advantage.

FLAGSTAFF.—Extracts from the last three letters received from Hagen, the foreman in charge of the mine. Although an improvemeut has taken place in the Bonanza drift, and a few other points in the mine, the board consider the following the most interesting:—Level No. 7.—May 25th.—No. 2 west drift north is in 150 ft., and looks favourable. We are now following a wall ou one side of which there is a streak of mixed matter. I have knowu similar to lead to large bodies of rich ore, and I do not see why this should not be the same. June 1st.—There is now a regular wall which stands perpendicular, and prospects for ore are still better. The ground is a little harder to work. June 8th.—This cross-cut is now in 217 ft. The ground is a little improved, and there is iron in the seams. I do not thiuk there will be far to go before we shall have a remarkable change. Level No. 9.—May 25th.—North cross-cut is in 383 ft., and the grouud has improved a little. June 1st.—The ground is hard. I hope this week to make the connection with the black winze, so that I can start work on the iron I struck in this cross-cut. I believe that this iron will lead to a body of rich ore; there is every sign of it being so. It depends very much upon the water, which comes in very fast, but I will do my best to keep work going, as I am very anxious to explore this point. June 8th.—North cross-cut is in 398 ft., and there are now small bunches of iron in the face of it. I expect every half shift to connect with the black winze. I expect to begin sinking down on this body of iron on Monday. Although the water is coming in very fast I will do my best to keep the water out, as I am auxious to explore this place. May 25th.—Bonauza drift.—There is a streak of very bright silver-lead, and the rock is good for ore. June Ist.—This drift is now up 123 ft., and the streak coutinues the same, also the rock. June 8th.—This drift is now up 131 ft., and the rock is the saue. We find silver-lead every day. The bonanza drift west, which is now in 53 ft., is looking very well. There is a streak of copper stone, in which silver-lead continually appears.

GARFIELD (8th June).—Lincoln: 200-ft. level south has been suspended, and we are at present rising on the vein from this level, and are now up 7 ft. 9 ins., showing about 6 ins. of average ore. Have commenced driving to the south on east vein (200-ft. level); at present the vein here is broken up, showing some quartz. Tunnel No. 3 south on east vein has been extended 10 ft., and has exposed a fine-looking vein about 2½ ft. wide of good ore. This development is most encouraging, as it must be remembered that we are working in entirely virgin ground, and that this vein is as yet uuexplored above this level. Upraise on east vein from last-mentioned drift is now up 29 ft. 3 ins., and from which some fair ore is saved, usual amount of ore being extracted. The mill is at present shut down, but will start up again during the coming week.—HOOPER.

GRAVEL GOLD.—Advices have been received, dated 21st May, stating that a further extent of the preliminary work on the ditch has been completed, making 8,000 ft. in all, out of the 27,000 ft. required to the San José River. Mr. Griffith, the engineer in charge of the works, reports that a party of natives had been detected washing gold on the Hoyo Negro estate belonging to the compauy, and owned to three of them, having taken out in eight days $144 of gold.

HAMBLEY FREEHOLD.—Report for the week ending 15th June. No. 1 vein: The tunnel has been driven this week 18 ft.; total length

now driven 175 ft.; ground composed of hard mountain slates and bars of chert. I assume that we are within 30 ft. of the vein, assuming it to pursue the angle of dip that it does near the surface (45 degs. south). An open stope has been started on the eastern extremity of the vein, and it is proposed to extend this stope through the hill, not only for the purpose of determining its value, but more especially to obtain more definite information as to its position and character. At present it is most unconformable, broken and tilted in every direction. We occasionally meet with sections of very favourable-looking quartz, highly stained with the oxides of iron, and containing small spots of pyrites, and yielding very good results from pan tests. This vein, when it was observed on the eastern declivity of the hill, measured only 1 in. in thickness, but as we open it west it increases in size, and now measures 4 ft. At right angles with this vein are observed numerous small seams or veins of quartz, which communicate with the large vein. The vein throughout continues to yield occasionally colours of gold in the pan, but I am in hopes that it will become more uniform in character and more favourable in yield when beneath the present zone of disturbance and disorganisation. We have about 70 tons of quartz on the dump, but all very low grade. This work of prospecting will be pushed on as vigorously as possible with the view of discovering payable quartz.—E. B. C. HAMBLEY.

INDIAN CONSOLIDATED (31st May).—Colar section :—No. 5 shaft: The 360-ft. level driving north of shaft has advanced 14 ft. 6 ins., or 84 ft. 4 ins. from shaft. The reef during the past fortnight has been of a mixed character, but is showing better stone in the roof of the drive; this I expect to make down as we advance; reef 2 ft. wide, assaying 2 dwts. 15 grs. per ton stone. The stope in the bottom of the 360-ft. level south is carried on by a full gang of coolies; reef averages 2 ft. wide, assaying 2 dwts. 15 grs. per ton stone. The stope in the bottom of the 300-ft. level south is getting very small; reef short, about 9 ins. wide, assaying 2 dwts. 15 grs. per ton stone. The stope in the bottom of the 300-ft. level north continues as for some time past; reef ranging from 1 ft. to 3 ft. wide, and assaying 1 dwt. 18 grs. per ton stone. The 300-ft. level driving south of shaft has advanced 10 ft. 2 ins., or 80 ft. 9 ins. from shaft. In the forebreast at present we have no defined reef, but the trap is mixed throughout with small veins of quartz and reef matrix, which gives per assay 1 oz. 1 dwt. 5 grs. per ton stone. The 230-ft. level driving south of shaft has advanced 4 ft., or 94 ft. from shaft. The reef in this drive is also of a mixed character, small veins of quartz being mixed with the trap; assay value, 1 dwt. 7 grs. per ton stone. Air shaft: This shaft is now complete to the bottom, close timbered from 110 ft. to surface. Sinking will be commenced on Monday by a full gang of coolies; total depth of shaft, 130 ft. The 70-ft. level is being cleared by coolies; as early as convenient shall communicate this level with trial shaft No. 3. There is also a level at the 110 ft. drive north, but this is full of stuff. Surface: Gravitation battery in good order, and running well; all machinery and plant in good order. Health of camp good.—T. R. DAVEY.

JOSEPHINE—Superintendent's report for week ending 1st June:—The 400-ft. level east has been driven 25 ft.; total distance east of shaft, 375 ft. The 400-ft. level west has been driven 18 ft.; total distance, 201 ft.; the quartz continues about 20 ins. wide. The 400 east stopes look poor, but the west stopes are yielding some very fair quartz. The 300 west stopes continue very large. A small amount of stoping has been done in the 300 east been the two winzes. Raise No. 5 from the 220 has gone up 7 ft.; total, 37 ft.; without change.

MYSORE (1st June).—Mining operations: The 466-ft. level was driven north of Taylor's shaft in the month of May 58 ft., making a total of 706 ft. 3 ins.; the lode is 5 ft. wide, assaying 3 ozs. 5 dwts. 8 grs. The 296-ft. level north of Taylor's shaft was driven in the month of May 34 ft. 9 ins., making a total on the western branch of 45 ft. 6 ins.; on the eastern part the level was driven 652 ft. 10 ins. north of Taylor's shaft; both ends are poor. Driving the 236-ft. level north of Taylor's shaft, north of the north rise, 10 ft. were driven; distance from the north end to the rise, 29 ft.; the end is barren. The rise here mentioned is to be a continuation of Rowse's shaft. The western cross-cut in the bottom of Taylor's shaft was driven in the month of May 56 ft. 1 in.; total, 99 ft. 10 ins. The rock-drills did excellent duty, but no portion of the vein is to be seen. The 400-ft. level north of Taylor's shaft has been driven 622 ft. 2 ins.; it then became poor; branches of quartz have passed into the western side; these having been taken down there are small patches of quartz containing gold, but it is of no immediate value. The 236-ft. level south of Plummer's shaft, 10 ft. 9 ins. were cut, making a total of 246 ft. 4 ins.; there is an improvement; a hand of quartz has made its appearance, 1 ft. 6 ins. wide, assaying 18 dwts. 17 grs. Driving the 296-ft. level south of Plummer's shaft, north on the western lode, 12 ft. 8 ins. were cut; total distance driven 107 ft. 5 ins.; the lode is 4 ft. wide, assaying 13 dwts. 1 gr. The 173 ft. south of Williams' shaft, 8 ft. 8 ins. were cut; total, 225 ft. 6 ins.; there is no lode; it is suspended, and these men will be put to drive some branches in the eastern side to the south of Williams' shaft. The cross-cut in the 160 ft. south of Schaw's was driven 5 ft. 4 ins.; total, 101 ft. 10 ins.; there is no change. Stoping: The stopes throughout the mine are looking much the same as usual. The following stopes are to the north of Taylor's shaft:—The 466 ft.; the lode is 2 ft. wide, assaying 3 ozs. 5 dwts. 8 grs. The 466 ft. south of the cross-cut; the lode is 2 ft. 6 ins. wide, assaying 11 dwts. 18 grs. In the back of the 400 the lode is 4 ft. wide, assaying 2 ozs. 9 dwts. Below the 296 north of Taylor's shaft and south of the rise the lode has become poor, and the place suspended. In the bottom of the 296 north of the rise the lode is 5 ft. wide, assaying 3 ozs. 16 dwts. 16 grs. In the back of the 236 the lode is 3 ft. 6 ins. wide, worth about 2 ozs. to the ton. The following stopes are to the south of Taylor's shaft stoping in the bottom of the 296 south of Plummer's; the lode is 3 ft. wide, assaying 6 dwts. 12 grs. The lode in the back of the 400 south of Taylor's west side, the lode is 6 ft. wide, assaying 13 dwts. 1 gr. Stoping in the bottom of the 296 south of Taylor's and north of winze, there is a small but rich lode. Sinking: Sinking the incline below the 466-ft. level north of Taylor's shaft in the month of May, 36 ft. were cut, making a total of 123 ft 6 ins.; the lode is 2 ft. wide, assaying 1 oz. 6 dwts. 3 grs. Sinking Rowse's shaft: In the month of May 27 ft. 8 ins. were cut, making a total depth from the top of the shaft at surface of 153 ft. 8 ins. Though we are in rock that requiries blasting it has also to be closely timbered, and timbering takes up a good deal of time, and the speed is lessened in consequence. The 466-ft. level north of Taylor's shaft, sinking on the west lode, 10 ft. 6 ins.; total 42 ft. 6 ins.; the lode is 6 ft. wide, assaying 16 dwts. 7 grs. The lode in this instance has a quick slant to the north, and 42 ft. 6 ins. have been sunk. Below the 466 ft. on a slant not perpendicular. Schaw's shaft: A winze in the bottom of the 220 south of Schaw's shaft was sunk 13 ft. 6 ins. in the month of May; the total depth is 19 ft. 4 ins.; there is a lode 3 ft. wide, assaying 6 dwts. 12 grs. 28 ft. 8 ins. were sunk in the new shaft near Schaw's; the total depth is 52 ft. There is no vein. Schaw's shaft, sinking below the 220, 17 ft. 4 ins. were cut in the month of May, making a total of 109 ft. 8 ins. There is a lode of quartz 18 ins. wide, assaying 13 dwts. 1 gr. Weekly samples from the mills:—22nd May, 1 oz. 19 dwts. 4 grs.; New mill, sample, 29th May, 1 oz. 12 dwts. 16 grs. Old mill, sample, 29th May, 2 ozs. 3 dwts. 2 grs.—B. D. PLUMMER.

MYSORE REEFS (1st June).—Fortnightly report:—Harvey's shaft: The 320-ft. level south of east cross-cut has been advanced 1 ft. 6 ins., now 42 ft. 6 ins. south of cross-cut. As we are through the shoot of quartz and pyrites, and the forebreast shows only a few stringers of quartz, which are poor, this is suspended, and the sides of level blasted out to make room for tackle, and a winze commenced by hand labour below this level in about the centre of the shoot of quartz and pyrites. We are now 3 ft. 6 ins. below the level. A sample of the quartz and pyrites gave, according to assay, 6 dwts. 10 grs. of gold to the ton. Winze below the 250-ft. north level has been sunk by hand labour 2 ft. 9 ins., now 22 ft. 3 ins. below the level. This is slow work, but the rock is very hard, and there is a deal of water. I have suspended the sinking for the time and put the men to stope the ends of winze to lengthen it, whilst, on the other hand, they will be breaking quartz for the mill. The rock in the bottom is much poorer; a sample from it gave, according to assay, 5 dwts. 15 grs. of gold a ton. Cross-cut west of plat, 250-ft. level, has been extended 17 ft. 3 ins., now 242 ft. from plat; there is no change worthy of remark. Taylor's engine shaft has been sunk 3 ft. 3 ins., now 175 ft. 9 ins. from surface. We have commenced to drive east and west from the bottom to prove the formation. It has been rather tedious and slow work to commence with from the shaft, the difficulty being in fixing the the stretcher bars of the rock-drilling machines. We shall now get on much faster; 6 ft. have been driven west and 2 ft. east. Branches and large patches of quartz have been met with, which are poor, a sample of same giving a trace of gold. We have here a large formation, and it is advisable to cross-cut to find the eastern and western walls so as to be able to determine whether it will be necessary to continue the sinking of the shaft perpendicularly or break the underlie, and at what angle, so that the shaft may go down in the best or most promising part.—M. SCANLEBURY.

MYSORE WEST.—Report of the mining manager for the two weeks ended May 31st.—The 159 north of Walker's, driven 11 ft. 6 ins.; length of level, 474 ft.; Moplahs employed, 12; cost per foot, Rs-10; size of vein, 1 ft. The 225 north, driven 5 ft.; length of level, 162 ft. 5 ins.; Moplahs employed, 12; cost per foot, Rs-14; size of vein, 4 ft.; a good-looking lode of quartz. The 225 north-east reef, driven 1 ft. 4 ins.; length of level, 31 ft.; Moplahs employed, 12; cost per foot, Rs-15; vein now on fault. The 225 south-east reef, driven 8 ft.; length of level, 143 ft.; coolies employed, 10; cost per foot, Rs-20; size of vein, 4 ft.; a good-looking lode of quartz. The 300 north, driven 10 ft.; length of level, 106 ft. 6 ins.; two Italians and 19 coolies employed; cost per foot, Rs-18; size of vein, 4 ft.; a good-looking lode of quartz. The 300 cross-cut east, driven 9 ft. 6 ins.; length of level, 45 ft. 2 ins.; two Italians and 19 coolies employed; cost per foot, Rs-25. South shaft north, driven 6 ft.; depth of shaft, 6 ft.; coolies employed, 12; cost per foot, Rs-5; several branches of quartz. South shaft, south, driven 4 ft. 3 ins.; depth of shaft, 4 ft. 3 ins.; coolies employed, 12; cost per foot, Rs-5; several branches of quartz. No. 1 trial pit, sunk 14 ft. 9 ins.; depth of shaft, 36 ft. 9 ins.; coolies employed, 19; cost per foot, Rs-3; size of vein 1 ft. 6 ins. Costeaning pits, sunk cubic yds. 194, 20 ft. 10 ins.; cost per foot, 2½ annas for one month. Trial pits, sunk 78 ft. 3 ins.; depth of shaft, 78 ft. 3 ins.; cost per foot, Rs-1 for one month.

NEW EBERHARDT (9th June).—The mine manager reports as follows:—The mine at this time is yielding about 6 tons of ore per day. Battery samples show the same to be of an average value of $50 per ton.—The ore is found in small seams, varying from a few inches up to 2 or 3 ft. in thickness. Not a day passes but some change occurs; one day our ore seams look as though they would close up entirely, and the next day we have a showing, and I am almost led to believe that we have found the so-much desired ore body. Our prospects are, I consider, quite favourable, and I am still very hopeful of eventually coming upon something better. I am pushing onward with our development work as fast as possible, following the best and most favourable indications, and hoping to come upon something of more material value than we now have. Number of tons of high grade ore assorted and put on ore dump for the week 27 tons; assay value, $56 per ton; number of tons of a lower grade, 15; assay value, $31.57 per ton; total amount extracted and assorted for the week, 42 tons. Bullion shipment: Herewith enclosed, please find shipping receipt for two bars shipped; total, 3,398.13 ozs.; standard value, $2,684.25. I estimate the bullion yield for the present month at not less than $12,000; our bullion call, as per battery assay for the past week, is 3,797.36; from these figures I make my estimate that with our usual success our yield will not be less than the above amount.

NEW EMMA (1st June).—I have to report work carried on at the mine for the week ending to-day, as under:—Level No. 1, south-easterly, advanced 7 ft.; total, 303 ft. The rock in this level continues hard, though seamy, and very much saturated with iron; worked two men. Raise from No. 1 advanced 4 ft.; total, 72 ft. A slight improvement is noticeable; rock is becoming more mineral stained, and galena seam inclined to open, though still narrow; worked one man. Level No. 1, north-westerly: This level is still in the old caved workings, from which we are excavating material for concentrating; worked eight men full time. Level No. 3, south-easterly, advanced 15 ft.; total, 512 ft. Rock is a little softer, the seam of iron opening again; now 2 ins. wide; besides the rock on either side is also very much stained with oxide of iron; worked four men full time. Level No. 4, north-westerly: Attwood winze advanced 15 ft.; total, 132 ft. This level also shows a little improvement; the rock is not quite so hard, and the seam opening again filled with oxide of iron, clay and decomposed lime-stone; rock strongly saturated with iron; worked four men full time.—H. C. WALLACE.

NEW HOOVER HILL (11th June).—Briol's shaft: In driving north at the 230 the vein of quartz is about 6 ins. wide, pans just a few colours of gold. The winze below this level we have sunk 15 ft.;

there is a good deal of quartz in the bottom, but poor. I have taken the men from here and put them to sink further north, where there is better ore. There is no change to note in the stope from winze below the 170. There is no improvement in the ore below the No. 1 winze. The stope from No. 2 winze below the 130 is in good ore. In driving south it varies very much from day to day, is now showing a good deal of quartz, pans about $2 per ton. Mill and machinery working well. P.S.—The directors have sold through Messrs. Pixley and Abell the bullion obtained during the month of May, weighing 135 ozs., which realised 429*l.* 9s.

NORTH MEXICAN (7th June).—San Nicolas shaft is now 206 ft, to the bottom, and yesterday we found a seam in the lode which is 6 ins. wide, and the rock is changing, having now more quartz in the vein matter, which indicates we shall find very soon good ore.—R. S. CARLISLE.

NORTH TOLIMA (18th May).—As under, please find report of operations at the company's mines for the month of April ult.:—Returns, 12 tons silver ore; assay value, 407*l.* 13s. 10d.; cost, including mining work, erection of new machinery, foundations, transport, and realisation charges on mineral, &c., 720*l.* 14s. 2d.; excess of cost, 313*l.* 0s. 4d. Underground—Ground extracted for month: Productive, 138.6 ft.; unproductive, 67.4 ft.; total, 205.4 ft.—J. G. GREEN.

NUNDYDROOG (1st June).—Mining operations.—The new shaft near the north boundary: The engineer has not yet finished his work, and no sinking has been done. Webb's shaft is down for a total depth of 427 ft. 6 ins., and Taylor's shaft 385 ft.; there is no change in the rock, each continues to be very hard. The 370-ft. level north of Taylor's shaft has been driven a total distance of 78 ft. 9 ins.; there is no change in the appearance of the rock; it contains only traces of gold. The 370 cross-cut north of Webb's shaft has been driven west a total distance of 59 ft. 6 ins.; there is no appearance of any vein; the rock is of a lighter colour than we usually find associated with gold. The other places are looking much the same as they have done for some time past. The 370-ft. stope south of Webb's shaft is in a lode 3 ft. wide, assaying 1 oz. 17 dwts. 18 grs. The intermediate level: The quartz is 1 ft. 8 ins. wide, assaying 16 dwts. 12 grs. The stope in the bottom of this level shows quartz 2 ft. wide, of the same value as the end. The stope in the bottom of the 230 south of Webb's shaft: The lode is 1 ft. 8 ins. wide, assaying 2 ozs. 11 dwts. 6 grs. The middle level shows quartz 2 ft. wide, assaying 12 dwts. The stope in the bottom of the 166 ft. contains a lode 1 ft. 8 ins. wide, assaying 1 oz. 5 dwts. The 230 ft. north of Webb's shaft: The lode in the rise in the back is smaller than usual, and is 1 ft. wide, assaying 1 oz. 7 dwts. 6 grs. Assay of weekly samples from the mill: Rough, 2 ozs. 9 dwts.; smalls, 1 oz. 10 dwts. 12 grs.—B. D. PLUMMER.

— (8th June).—Mining operations:—New North shaft: It is expected that the engineer will get the pumping engine to work on Tuesday next, after which the sinking will be resumed. There is nothing new in the 370 cross-cut; it has been driven west 65 ft. 2 ins.; it is still in barren rock. The 370 north end has been driven from Webb's shaft 83 ft. 9 ins.; there is a band of slate and a little quartz 2 ft. wide giving traces of gold. Webb's shaft has not been measured this week; the men, however, appear to be getting on better with the rock-drills. The same remark will apply to Taylor's shaft; the rock in both continues hard and barren. Taylor's shaft, however, is now down below the level of the 370 north of Webb's, and the level is started for the purpose of communicating. The lode in the following places is 1 ft. 8 ins. wide:—Intermediate south of Webb's, the stope below the 230, the stope in the bottom of the 166, assaying respectively 2 ozs. 9 dwts., 1 oz. 9 dwts. 12 grs., and 9 dwts. 18 grs. The 370 stope south of Webb's shaft is in a lode 3 ft. wide, assaying 2 ozs. 18 dwts. 18 grs. The stope in the bottom of the intermediate level, the lode is 2 ft. wide, assaying 7 dwts. 12 grs. The middle level south of Webb's shaft is in a lode 2 ft. wide, assaying 16 dwts. 12 grs. The rise in the back of the 230 north of Webb's shaft is in a lode 1 ft. wide, assaying 2 ozs. 9 dwts. The men generally appear to get on better with the rock drills. Assay of weekly samples from the mill: Rough quartz, 2 ozs. 0 dwts. 12 grs.; smalls, 2 ozs. 8 dwts.—B. D. PLUMMER.

ORITA (17th May).—The following are the details of the operations during the month of April.—Mine: We continue drifting in the deep cut and ground sluice. The rock is very hard, and in parts we have no fissure to help. We have 24 men drifting here, and eight men carrying out rock that the water will not move. After about 10 days more drifting we may be able to start washing in the channel again, but if the branch sluice was more opened, or gravel in reach to work on, we could not do better than continue drifting in the deep cut for at least three weeks. When we start washing in the channel again, the first two days will be devoted to clearing the excavated rock out of the cut; after that we will work on the ridge of upper mine. And now we will be able, I hope, to take this bank to the bedrock, and by so doing, although it is the same gravel we had in the upper mine, I expect the results will be very different. Branch sluice: After re-blocking sluice we started washing here, but our work consisted of running off old Spanish tailings, clearing out roots of trees, pipeclay, &c. We have had very little gravel to work on, and where we have some it is not possible to work it till we first clear off the old works, which are very extensive and deep. The bedrock here has dipped considerably, and to follow the dip we have had to move the monitor three times, but now the bedrock is showing up in line of the dip, and at this point the Spaniards worked very low, and piled up an enormous amount of pipeclay, which leads me to hope we will find good gravel here when we get well under the old works. At this point of the mine things are not looking very promising for the immediate returns of gold, but as we have ahead of this work enough gravel for years washing we cannot complain if it takes a few months to get the cuts, &c., in shape to work the ground ahead at a small cost and to the best advantage. Remarks: I need hardly say I regret as much as any person to see washing stopped in the channel, and little prospect of returns at once from the branch, but must say the mine looks first-rate for future work, both in the branch and main, and although finding the bedrock low in both places prevents our continuing work as usual, it only makes a temporary stoppage to give a greater body of gravel for working later on.—H. J. PRENDER.

OSCAR (21st June).—Lode No. 3: No alteration to note since last report. The men are advancing about 2 metres weekly. Daw's lode: The shaft is producing more quartz and the men are making better progress. The 420-ft. level south: The quartz is about 8 ins. wide, and assays 6½ dwts. The 370-ft. level north: Quartz about 30 ins. wide; assays vary from 2½ dwts. to 3½ dwts. Other places no alteration.—J. DAW, jun.

OOREGUM (1st June).—Fortnightly report.—Main shaft: The 250-ft. level driving south on course of lode, 14 ft. have been done, or 291 ft. 3 ins. from cross-cut west; the lode is 3 ft. wide, and looks well, although the assay result this week is not as high, 2 ozs. 9 dwts. is still good. The 250-ft. level driving north, 19 ft. 3 ins. have been done, or 220 ft. 8 ins. from cross-cut west; the face of drift is still in barren rock; there is a branch of quartz coming in an inch wide, very regular in its underlie, and looks as if it will improve in size as we drive on it. The stope in back of the 250-ft. level south of cross-cut west, the lode is 3 ft. wide, and looks well. The sample from here this week gives an assay of 4 ozs. 7 dwts. 2 grs. of gold per ton of quartz; 383½ superficial ft. have been stoped here the past month. Driving on the branch in cross-cut west, south, only 6 ins. have been done, or 4 ft. 6 ins. from cross-cut; the branch is 3 ins. wide, and gives an assay of 3 dwts. 6 grs. of gold per ton of quartz. This drivage is let to another contractor, who, we hope, will do more work for us. Low's shaft: The water here is drained. This morning a party of men are cleaning up the shaft. We measured the work done in the 270-ft. level yesterday. The 270-ft. level driving north of shaft, 3 ft. have been done, or 99 ft. 5 ins. from shaft; the lode is 1 ft. wide and looks well. The 270-ft. level driving north, south of shaft, 2 ft. 9 ins. have been done, or 21 ft. 6 ins. from cross-cut west; the lode is 1 ft. wide and looks well. The 270-ft. level driving south, south of shaft, 3 ft. 6 ins. have been done, or 18 ft. 6 ins. from cross-cut west. The branch of quartz here is small; in consequence of the water being in, no samples were taken from the above three points the past week; these will be fully reported on in my next report. The 200-ft. level driving south, south of shaft, 3 ft. 8 ins. have been cut, or 199 ft. 3 ins. from cross-cut west; the lode is 6 ins. wide and looks as if it will soon widen out, and gives an assay of 2 dwts. 4 grs. of gold per ton of quartz. The winze No. 2 sinking in bottom of the 200-ft. level south of shaft, 2 ft. 8 ins. have been sunk, or 19 ft. 8 ins. below the level; the lode is 1 ft. 6 ins. wide, and gives an assay of 1 oz. 1 dwt. 19 grs. of gold per ton of quartz. Probyn's shaft: Sinking below the 300-ft. level, 2 ft. 6 ins. have been sunk, or 45 ft. 9 ins. below the level; the lode is 3 ft. 6 ins. wide, and gives an assay of 3 ozs. 8 dwts. 14 grs. of gold per ton of quartz. The 300-ft. level driving south on course of lode, 3 ft. 9 ins. have been cut, or 42 ft. 4 ins. from shaft; the lode is 5 ft. wide, and gives an assay of 5 ozs. 15 dwts. 9 grs. of gold per ton of quartz. The 300-ft. level driving north on course of lode, 4 ft. have been done, or 38 ft. 4 ins. from shaft; the lode carried is 4 ft. 6 ins. wide, and gives an assay of 1 oz. 1 dwt. 19 grs. of gold per ton of quartz. The blasting down of lode standing on the footwall side of the 300-ft. level, 100 superficial ft. have been cut. A sample taken from this gives an assay of 5 ozs. 8 dwts. 21 grs. of gold per ton of quartz. The 230-ft. level driving south on course of lode, 4 ft. 4 ins. have been done, or 116 ft. 11 ins. from shaft; the lode is 2 ft. wide, and gives an assay of 1 oz. 6 dwts. 2 grs. of gold per ton of quartz. The winze sinking in bottom of 230-ft. level south of shaft, 5 ft. have been sunk, or 47 ft. 3 ins. below the level; the lode is 3 ft. wide, and gives an assay of 1 oz. 6 dwts. 2 grs. of gold per ton of quartz. The 166-ft. level driving south on course of lode, 7 ft. have been done, or 244 ft. 3 ins. from shaft; the lode is 5 ft. wide, and gives an assay of 4 ozs. 13 grs. of gold per ton of quartz, and looks well. The No. 2 winze sinking in bottom of the 166-ft. level south of shaft, 3 ft. 2 ins. have been sunk, or 46 ft. 6 ins. below the level; the lode is 3 ft. wide, and gives an assay of 2 ozs. 14 dwts. 10 grs. of gold per ton of quartz. The No. 3 winze sinking in bottom of the 166-ft. level south of shaft, 6 ft. have been sunk; the lode is 4 ft. 6 ins. wide, and gives an assay of 3 ozs. 9 dwts. 16 grs. of gold per ton of quartz. The No. 2 rise in back of the 166-ft. level south of shaft is 12 ft. 10 ins. above the level; the lode is 2 ft. 6 ins. wide, and gives an assay of 2 ozs. 12 dwts. of gold per ton of quartz. The stope in bottom of the 166-ft. level north of shaft, 60¼ superficial ft. have been cut; the lode is 2 ft. wide, and gives an assay of 2 ozs. 3 dwts. 13 grs. of gold per ton of quartz. The stope in back of the 166-ft. level south of No. 2 rise, south of shaft, 63 superficial ft. have been cut; the lode is 2 ft. 9 ins. wide, and gives an assay of 2 ozs. 6 dwts. 19 grs. of gold per ton of quartz. Stamps: These are working well. The result of last month's crushing is again good. We anticipate to have about 100 ozs. more than the last returns for April. The old boiler is still holding out, and is doing well. All the machinery is working well, especially the new pumping engine at Low's shaft.—W. MARTIN.

REPORT OF MEETING.

THE NAMAQUA COPPER CO., LIMITED.

DIVIDEND OF 15 PER CENT.—PROFIT OF £29,844—HOW THE COMPANY HAS BEEN AFFECTED BY THE SYNDICATE—DIVIDENDS CAN BE PAID NOW—MR. WEIR SHOWS COPPER TO BE MORE HEALTHY.

THE first annual general meeting was held at the Cannon Street Hotel, yesterday—Charles Howard, Esq., chairman, presided.

Mr. C. LEWIS BENNETT (secretary) read the notice calling the meeting.

THE UNFORESEEN HAPPENS.

The CHAIRMAN: Gentlemen, you will hardly expect me to begin any address to you upon the subject of the business of this company without alluding at once to the difficulties we have encountered, and the diminution of profit we have sustained by the failure of our purchasers, the Société des Metaux. The last time I had the pleasure of addressing you, I expressed sanguine hopes that we should have considerable and increasing dividends. As if the unforeseen were already casting its shadow upon my mind, I cautioned you then, and said those brilliant expectations were subject to the unforeseen. That unforeseen arrived too soon. The Société des Metaux has failed, and it is a matter of very great importance, and its significance is plain to you all, inasmuch as we were receiving from them for our ore, a price equal in the metal to 63*l.* to 64*l.*, whereas the present market

price is 40*l*. to 41*l*. On the 2,229 tons, which we still had to deliver under our contract, the difference is no less a sum than 16,000*l*., or equal to a dividend of 8½ per cent. We have formulated a claim for actual and prospective loss under this violation of contract, but the result of it is extremely doubtful. I should say under a failure of such magnitude the assets would probably be very small indeed. The ore which we actually delivered to the company we received payment for in full, with the exception of a small balance, the actual loss upon the transactions of the current year for ore delivered being only some 250*l*. Whilst I am on the subject of drawbacks and misfortunes I may as well finish with them so as to be able to turn to the brighter side. The actual quantity of ore we obtained this year falls short by about 200 tons, of the quantity which we estimated to get, and our percentage of copper is slightly less than we expected. Both circumstances spring from the same cause, namely, abnormally heavy rains, during the summer. It was not possible to dry the ore on the floors in the sun, and unless dry, the action of our magnetic separating machinery becomes impeded. I think those are all the drawbacks of which I have to speak, but

I CAN POINT WITH CONSIDERABLE SATISFACTION TO THE COST OF PRODUCTION

being under 8*l*. 15s. per ton as against the original estimate of 9*l*. 10s., and this has been achieved without the use of the new tramway, which was not completed until April, 1889. Therefore the whole of 1888 had no benefit from the use of that tramway. I will mention also that the returns for the first four months of this year show an increased production. They show a production at the rate of 7,000 tons for the 12 months, and all the ore we have sold and purchased has been drawn from the Tweefontein Mine, which is opening up so satisfactorily, that the returns are greater at the end of the year than they were at the beginning. Capt. Phillips reports that the reserves laid open and at surface to be 11,663 tons. The work on the Wheal Julia Mine, the new mine on which we build considerable hopes, has been satisfactory as far as they have gone, but, perhaps, the future is a little too indefinite for us to speak upon with any certainty at the present moment.

COPPER BETTER.

As regards our prospects—Mr. T. K. Weir, one of our number, is in the copper trade, and he tells us that the market is good, that the reduction in price has led to a considerably enhanced demand, that the excessive stocks are diminishing, and that production is not increasing.

ACCOUNTS.

You are aware this company was re-constructed so as to make shares fully paid, and with a view to offering shareholders warrants to bearer. The paid up capital of 180,000*l*. of Namaqua United Copper Company remained the same under the re-construction, *i.e.*, the 30,000 shares of 7*l*. each, on which 6*l*. was paid, were converted into 90,000 shares of 2*l*. each fully paid. But as the nominal capital of the new company was 200,000*l*., there remained a balance of 10,000 of 2*l*. shares unissued, of these 4,331 were subsequently allotted or placed at a total premium of 4,944*l*., and this sum has been carred to the credit of reserve fund, 3,249*l*. appearing in this account, and 1,695*l*. to come into the 1889 account. Our total issue, therefore, consists of 94,331 shares, representing a paid up capital of 183,662*l*. You will see our gross receipts for ore were 80,145*l*. 14s., and after paying all mining costs, including cost of all dead work, such as shaft sinking and exploratory work (which, of course, add considerably to the value of the mine), also transit, freight, insurance, management, and depreciation, our nett balance of profit is 29,844*l*. 19s. 1d. out of this amount

WE HAVE PAID IN INTERIM DIVIDENDS 15 PER CENT.,

absorbing 28,084*l*., leaving a balance of 1,760*l*. 13s. 1d., which, with your sanction and approval, we propose carrying to the year 1889. You have a full and excellent report from our mining superintendent, Capt. Phillips, to which I will refer you, and after you have put any questions you wish to ask, and I have answered them, I will proceed to put the resolution :—"That the directors' report, together with the profit and loss account and balance-sheet at 31st December, 1888, be received and adopted."

POSITION OF THE COPPER TRADE.

Mr. T. K. Weir (Henry Bath and Son) : I beg to second the motion, and, may add to what the chairman has said that with regard to the present position of the copper trade. For the last two months we have been reducing visible stocks at the rate of 6,000 tons per month, and with only ordinary prudence on the part of the large owners of copper in the shape of warrants, and the large producing companies, I see no reason why the present price should not be the minimum, or why we should not look forward to a slight improvement. (Hear, hear.)

The report was then unanimously adopted.

Sir John Morris : I beg to propose "That Mr. Charles Howard be re-elected a director of this company." Mr. Howard retires by rotation, and being eligible offers himself for re-election. You are all probably aware that Mr. Howard has been a director of this company since its formation. His experience and ability have been of great value to the board, and on the two occasions on which a general meeting has been held he has presided, I think you will all say, with much success. We all hope his re-election will be carried unanimously.

Mr. Ellison seconded the motion, which was carried unanimously.

The Chairman : I thank you very much for the unanimous manner in which you have re-elected me, and my colleague for the too flattering terms in which he has spoken of me, which I think far beyond my deserts.

REASSURING STATEMENT.

Mr. Ellison : Do you think you can pay dividends on the present price of copper ?

The Chairman : I do not think there is any doubt about it. That is with copper at 40*l*. to 41*l*. We look forward to effecting considerable economies in production, but even with the present economies I think there is no doubt we shall be in a position to pay a dividend, though what it may be I must not prophesy.

Mr. Cunningham proposed the re-election of Messrs. Welton Jones and Co. as auditors, at a remuneration of 30 guineas.

Mr. Sinclair seconded the motion, which was carried unanimously, and the meeting closed with a vote of thanks to the chairman.

THE GUADALUPE (HONDURAS) GOLD AND SILVER MINING CO., LIMITED.

THE COMPANY DESCRIBED AS HAVING "A MASS OF ORE."

The statutory general meeting of this company was held at Winchester House, Old Broad Street, on Thursday—Mr. Herbert J. Waterlow in the chair.

The Secretary (Mr. F. S. Vincent) read the notice convening the meeting,

The Chairman : This meeting, gentlemen, is called in accordance with the provisions of the Companies Acts, which require every company to call a meeting of its shareholders within four months of its registration. The objects are not stated in the Act, and in some cases it is very difficult for a chairman to say anything to the shareholders on that occasion. But I will endeavour, as far as I can, to let you know

HOW THIS COMPANY STANDS

up to the present moment. The company was registered on the 28th of February last. This is, therefore, the last day on which we could have held our meeting. The nominal capital asked for was 130,000*l*., but it was arranged and agreed by the vendors, and they were to take, if called upon by the directors, 95,000*l*. in shares or in cash, as the case might be. Before settling the agreements, and before these figures were put down in the prospectus, I myself, together with the other directors, who were then interested in the matter, made careful enquiries as to what would be the necessary capital to work this property, in order that it might be a success, for, after all, the main object is to work it successfully. We were advised by those who have seen the properties that some 15,000*l*. would be ample in cash to work them for twelve months or eighteen months with no results at all. Well, I came to the conclusion that, if at the end of eighteen months we got no results, it would not matter very much whether we had 15,000*l*. or 50,000*l*., or even 150,000*l*., for the thing would be dead and gone, and, therefore, 15,000*l*. would be enough. At the same time I considered that we should have a margin. The reports we have had with regard to the property, apart from the official reports in the prospectus, were all of a very glowing description, and at that time, and previous to the issue of the prospectus, you may have perhaps noticed that there have been from time to time very gratifying reports with regard to mining properties in Honduras. Many of these are held by American companies, who are making very large returns, and the whole character of the country in that district seems to be

ONE MASS OF ORE.

Well, a good deal of it sounds like fable, but when I was asked to take the position of a director of this company I was asked to do so by the vendors, and one of them I have known personally for 16 years. The other gentleman I knew some little time before I took this up, and I was perfectly satisfied that it was a *bonâ fide* concern. Well, now, I will come to another point. Many shareholders have expressed dissatisfaction that there has not been an official quotation on the Stock Exchange. These complaints have mostly come from gentlemen who have not paid their calls. The conclusion I have, therefore, come to is that they applied for these shares hoping they would go to a premium, and sell their letters of allotment. Well, I am very glad they are let in. I do not approve of that sort of thing. No part of this capital was underwritten. I rather objected to it, unless the whole of it was underwritten. I did not consider it fair to intending subscribers that their money should be put into the company simply with the view of it going into the pockets of somebody else in the shape of commission. Well, no part of the capital was underwritten, and the result has been that up to the present time we have actually got subscribed and paid for 25,000*l*. in cash. The purchase price is to be 100,000*l*., payable 5,000*l*. in cash, and 95,000*l*. in shares. This, again, has been thought by some a very high price. I think if any of you, gentlemen, were familiar with the documents that have been before the board, you would say that this is

A LOW PRICE.

The vendors in Honduras are so satisfied with the good prospects of this concern, that they take nearly the whole of their interest—as far as we are concerned they take the whole of their interest—in shares, and the 5,000*l*., that we have had to pay in cash for this property, has all been expended in advertising and printing the prospectus, printing generally, and things of that sort ; so that the vendors of this company, as far as I can see, have not up to the present moment made anything out of the shareholders. Their sole interest will depend upon the good working of the company, and to my mind one element of the confidence we should feel in the company is that the vendors themselves have got such confidence in it that they do not ask the cash, but will run the racket of what the shares may bring them. I hoped to have been able to-day to have told you that the purshase was completed, but Honduras is a long way from England, and this part of it is not so easy to get at as some other parts of America. We have had, in the first instance, to arrange for the necessary miners, blacksmiths, and other people to be sent over, and medical certificates had to be got before we could send anybody. We did not think it advisable to send them in two lots, but that all should go together, and that our agent should go with them and be able to answer any questions here, independently of anybody appointed by the vendors. Under those circumstances the company having been registered on the 28th of February, we were able to send off Mr. Vincent, whom the directors appointed to go and represent them to Honduras on the 9th of April. He arrived at Amapala on the 7th of May. Along with him went Mr. Nicholls, who was appointed mining engineer to the company, and three Cornish miners, a blacksmith and foreman. They arrived, as I said, on the 7th of May, and Mr. Vincent made a very exhaustive examination of the property, and, what we consider of equal importance, the titles of the property. He, unfortunately for me, only returned yesterday. The information he gives us is of such a highly satisfactory character, that I can only congratulate the shareholders that we have really

A MOST VALUABLE PROPERTY.

That view is confirmed in one of the papers of the 3rd of June. I find it in a paragraph, which was not communicated by anybody connected with this mine. In speaking of the "Progress in Honduras,"

a letter from that country makes this statement: "There is unusual activityiu mining all over the country,and new machineryis being brought into it every day. The company formed in your city to work the Guadalupe de Potosi Gold and Silver Mine, situated in the district of Aramecina, in the department of Choluteca, have already commenced operations on their property, and it is believed in this country that they have acquired a valuable property." Well, coming from an indepeudent source, that, of course, was good news to us, but Mr. Vincent has certainly confirmed my view, and I think that of all the directors, that we have a very valuable property. (Hear, hear.) It might be advisable, perhaps, after I have finished my remarks, that Mr. Vincent should give you a little account of what he saw and what he did, because it will be interesting to you all here to know what you have got in the way of property, and how it is going to be dealt with. I can only tell you that as far as we have seen the documents they seem to be all in perfect order; the title to the property seems to me to be indisputable, and, as far as I can see and ascertain, the statements in the prospectus are more than carried out. Mr. Vincent states that he saw himself those two large mineral lodes which are mentioned in the prospectus, and that they measure from 20 to 25 ft., and are full of ore; in fact, the whole mountain seems to be a mass of ore. That seems also to be the general character of the country, and the question, of course, with the directors will be the cheapest method of turning this ore into marketable silver. We have had the benefit of the experience of Messrs. Bainbridge, Seymour, and Co., who have a good knowledge of mining work in that country, particularly in South America and Mexico. We hope to be able, before the end of this year, to give you some satisfactory result in the shape of

AN INTERIM DIVIDEND.

At present Mr. Nicholls is at work making the roads and getting the property into working order. Some machinery has gone, some is on the road, and, further, machinery will be sent as soon as we have got definite plans from Mr. Nicholls with regard to the situation of the mine, and how he wishes it laid. But he is at work, and the cable we had from him the other day stated that he was employing 50 men already. I think that is all the information I can give you to-day, gentlemen, but if there is anything I have omitted that you think of importance, and that we can tell you, I shall be very pleased to answer any questions with regard to it. Before you ask any questions. I should like you to hear a word or two from Mr. Vincent with regard to the property itself. and the means he took of securing it to our company. (Applause.)

REPORT.

Mr. F. S. VINCENT: Having only arrived from Honduras yesterday, it has been impossible for me to prepare the full report which I intend to submit to my board, but I have jotted down a few facts which I submitted to them this morning, and which I will now proceed to read to you:—"I left London on the 9th of April with Mr. Nicholls and three Cornish miners and blacksmith, the latter to act as foremen over native labour. Arrived at Amapala, the seaport of Honduras, at which the ocean s.s. call, on 7th May, and the same day left for the mainland, and having been occupied for several days with the preliminaries of the business, obtained mules and proceeded to mine. I inspected the outside of the mountain with Mr. Nicholls, and there found the two veins of quartz spoken of in the prospectus standing up boldly from the surrounding ground. I subsequently climbed to the entrance of the mine and descended into the workings made by the natives. These workings are of the rudest kind, and there is no regular tunnel. Though operations have been carried on for many years, very little ore has been extracted, indeed only sufficient to show something of the value and extent of the vein on which the work has been carried on. Notwithstanding the imperfect nature of the tunnel, very large quantities of ore are in sight. Following instructions received from the board of directors in London, I marked several places on the vein, and caused drills to be made. These were charged with dynamite in my presence, and subsequently the charges were exploded, and the rock obtained having been mixed, I caused a sample of between 400 lbs. and 500 lbs. to be packed up, and brought down to the coast for transmission to England, so that it may be treated here. The situation of the mine is most convenient for milling operations, being so placed that the ore can easily be deposited on the dump behind the mill-site. A river runs close by the mill-site, and has not been known to fail even in the driest seasons, but the surroundings are favourable for the erection of a dam, should the necessity for one arise. The tools and apparatus used by the natives are still at the mine, and on inspecting them it is easy to understaud the small quantity of ore worked. I am informed that the daily crushing was only 150 lbs., and yet out of this a good profit was made. The result of my visit to the mine is to emphatically confirm the statements made in the various reports in the prospectus as to the physical characteristics of the property; the only variation being that the veins show a considerably greater width than that which has been set down, in some places extending to over 20 ft. In the country surrounding the mine are almost everywhere to be seen indications of the presence of minerals in large quantities. The road from the seaport of Accituna is a good one for bullock carts, until about 5 or 6 miles from the mine, aud no great difficulty should be experienced in makiug this also practicable. This work is already being pushed forward. After inspecting the mine I returned to the town Nacaome where the vendor of the property resides, and occupied myself with the examination and trauslation of the title and transfer dceds of the property. The proper escrituras were theu prepared under my personal supervision, and executed in the Court of the district, where they were witnessed by the judge, and by him the company was entered in the Public Register of Mines of Honduras, as the proprietor of the Mine of Guadalupe de Potosi, and of the mineral zone of 4½ square miles in which it is included. I arrived in London yesterday, bringing with me the escrituras conveying the property to this company, together with the translations and the judge's certificate of entry in the Public Register of Mines.

The CHAIRMAN: I think you will agree with me that this report of Mr. Vincent is a very satisfactory one, and that the shareholders ought to pass a vote of thanks to him for the trouble and care which he has taken in looking after this matter. In asking him to go to Honduras, I had every confidence that he would do the best he could for the shareholders, and I feel that that confidence has been very well placed. (Applause.) I do not think there is auything further I can state to you to-day. We shall push on with matters as fast as we can, and we propose next week to do what is required to complete the absolute

PURCHASE OF THE PROPERTY.

Although to all intents and purposes it is now registered in our name in Honduras, and all we shall have to do will be to complete the allotment of the shares to the vendors. We shall then get the rest of the machinery as fast as we can, and continue our working; and, as I said before, I hope before the uext six months are over we shall have a substantial result, and I have every reason to think—I would almost say every reason to believe—that our shares, before we meet again, will be at a very large premium. (Applause.)

Mr. NEAL: I understand that Mr. Vincent has brought over some of the ore. Is that right?

The CHAIRMAN: That is so.

Mr. NEAL: Then, will the shareholders be able to learn at any time the result of the tests of those ores?

The CHAIRMAN: There is no objection of course to that, aud what we propose to do is to get Messrs. Vivian, of Swansea, to give us a report upon it. The directors consider they are as good people as we could get to deal with this class of ore. We have already had from several sources reports upon this ore, apart from the certificates that appear in the prospectus. A large quantity of it was brought over by Mr. Terrill, and we submitted it to a great many people, and everyone of the reports is satisfactory. Some of them showed a little more, and some a little less. I instructed Mr. Vincent to bring over with him a parcel of ore, so that we might have it treated independently.

Mr. NEAL: It is very important that the shareholders should be acquainted with the results of all the certificates—the tests that have been made already. At present you see we have only got the fact of the test put forward in the prospectus. It seems to me that the shareholders, in order to have a full knowledge of what is going ou, should have an opportunity of seeing those certificates and reports at the office of the company—not for general publication, but it is very important that they should know their position.

Mr. CARSTAIRS: I think it is a very small and simple matter, an I you could surely do it.

The CHAIRMAN: There is no objection to the shareholders seeing these things at the office, but what I understood you to ask was that we should communicate to all the shareholders the particulars of these certificates. The secretary's time is fully occupied as it is, aud if he has to give reports on every detail to each shareholder, I am afraid he will hardly get through his work. The directors have no desire to hide anything at all from the shareholders. The shareholders are quite at liberty to go and see anything we have got, and read all the minutes of the board and correspondence, and informatiou will be given to them at any time.

Mr. CARSTAIRS: But the expense will be a mere trifle—not over 5*l*.

The CHAIRMAN: With regard to this particular sample, I do not think the directors will find any difficulty in communicating a copy of the report to each shareholder. The ore has beeu brought over not only that we may see the value of the silver in it, but in order that we may ascertain definitely how it should be treated. Here is

AN INDEPENDENT CERTIFICATE

that Mr. Webber, one of our directors, obtained from Messrs. Christoe and Sons, Truro. It is dated May 11th:—"Below we have the pleasure to hand you our results of sample of stones of aug. and aur. ore: Silver, pro., 355 ozs. 8 dwts. 4 grs. net per ton; gold, 11 dwts. 16 grs. per ton." That is quite an independent certificate. Mr. Webber got it on his own account, as he thought he would like to satisfy himself.

Mr. NEAL: Might I make another suggestion? You say the sale has not yet been completed. There has been no transfer made, as I understand, but it is to be completed in a few days. Well, if it was announced to the shareholders that the transfer had been completed, at the same time as you gave us the result of these tests, it would be very satisfactory.

The CHAIRMAN: I am afraid we shall not be able to aunouuce them both simultaneously, for we are under an obligation now that Mr. Vincent has returned with the proper documents, to allot the shares to the vendors, and the ore we may probably not get for some days.

Mr. VINCENT: It will not arrive for several days.

The CHAIRMAN: It did not come overland with Mr. Vincent. It is coming by steamer.

Mr. NEAL: There is no anticipated hitch, I suppose, about the transfer?

The CHAIRMAN: Not at all; it is all completed. It only remains with us to allot the shares.

Genl. HUTCHINSON: I understood you to say that the vendors will receive 5,000*l*. in cash and the rest in shares. If so, that should give immense confidence to the shareholders. The vendors must have

UNLIMITED CONFIDENCE IN THE PROPERTY,

that they are willing to be paid in shares, rather than in money. But perhaps I misunderstood you.

The CHAIRMAN: The vendors will receive only 5,000*l*. in cash, and the balance in shares. (Applause). There is another evidence of the confidence that others have got in the property. Mr. Nicolls, the engineer, had arranged to receive 500*l*. in cash, but he has preferred, since the company has started, to take his fee in shares. (Applause.) He thinks they are more valuable. That coucludes the business, and I thank you for your attendance.

Mr. CARSTAIRS: I beg to move a vote of thanks to the chairman and the other directors for the care they have exercised in watching over our interests in the formation of the company.

Mr. NEAL: I beg to second that.

The motion was passed by acclamation.

The CHAIRMAN: On my own behalf, and on behalf of my colleagues, I am sure we are much obliged to you for this vote of confidence. We shall do the best we can in your interests, and to make this one of the most successful mines that has yet been put on the London market. (Applause.)

The meeting then separated.

Messrs. I. Thomson, T. Bonar, and Co. notify that the coupons for the third half-yearly dividend of the Guatemala Consolidated Four per Cent. Loan of 1888, due July 1st, will be paid on and after that date at their counting-house, Old Broad Street, E.C.

THOMAS THOMPSON,

STOCK AND SHARE DEALER,

8½, ANGEL COURT, LONDON, E.C.

Telegraphic Address:—"NOSMOTH," LONDON.
Telephone No. 509.

Bankers:—THE CITY BANK, LIMITED, and THE ROYAL EXCHANGE BANK, LIMITED.

Mr. THOMPSON transacts business in all classes of Securities, Bonds (Foreign and Colonial), Banks, Railways, Insurance, Telegraph, Tramway, Gas, Water, Mining, and all Miscellaneous Shares. Shares sold at special prices for Forward Delivery (One, Two, or Three Months) on Deposit of 20 per cent.

Orders by Letter or Telegram promptly attended to.

THE

Mining World & Engineering Record.

ESTABLISHED 1871.

Shareholders desiring FULL REPORTS of the MEETINGS of the Companies in which they are interested should Subscribe to and Read the Mining World—6d. weekly. One Guinea per annum, post free.

Half-year, 10/6; Quarter, 5/6. All subscriptions payable in advance. Subscriptions for the Continent, £1 3s. 6d.

Orders to be sent to

W. Dunbar Quinlan,

234, 235 & 236, Gresham House, Old Broad S tree London, E.C.

CONTINENTAL AGENCY,

at which the Mining World may be purchased every Saturday

PARIS	- - -	224, Rue de Rivoli.
NICE	- - -	15, Quai Massena.

Subscriptions will also be received at the same addresses.

NOTICE TO READERS.

Replies to Annual Subscribers will be sent by wire or letter, as may be necessary.

Non-Subscribers must send fee of 5s. 0d., in order to have their enquiries answered in "Mining World," or by wire or letter, as requested.

G. C.—You should sell La Velera. Never to be found.
Waller.—It has been promising for years, but so far is barren of tangible results.
W. D.—Hold New Emmas and Flagstaffs.
C. T.—Sell 3 and 4, but hold 1 and 2.
J. T. White (Notts).—Buy Gympie Great Easterns. Others very speculative.
Somerset.—Send a list of your holding, and we will advise.
W. C. Lane (Willesden).—The charge is correct. You must pay stamp and fee.
B. Parkinson (Sydney).—Yes. Power of attorney in your case would be the best way to get business done.
T. A. T.—Insist upon delivery. The time has expired, and you are within your rights.
T. H. (Windsor).—The mine is progressing. Purchase a few more, and average present holding.
C. G. W.—Insist on the delivery of your Yuruari and Emma shares.
G. B.—Keep your shares.
S.P. S.—Yes; the man has just returned from the Cape, but has not yet settled his debts.
Provincial (B. A.)—Our advice is to realise.
T. Bulton (Surrey).—Sell all these shares for what they will fetch.
Public (M. M. M.)—You might consult a solicitor.
M. R. Brown.—The market is very limited for the shares mentioned.
Morris M. (Isle of Man).—No business of importance. Meeting only formal.
Beginner (1, 2, 3.)—We advise you to hold on, as markets are expected to improve.
A. B. C. D.—Buy all mentioned for rise.
Operator (S. A.)—You are bound to pay, as far as we can gather, from the case you make out.

The Mining World.

LONDON: SATURDAY, 29th June, 1889.

The "Mining World" is not the property of a Mining Speculator nor under the control of any clique.

NEW MINES OF THE HALF-YEAR.

In our issue of January 5th we gave some interesting particulars of the new mining companies formed in 1888, from the annual statistical tables prepared by Mr. Edward Ashmead, F.C.A., and we now propose to continue the record for the past half-year, confining our attention to the companies which have appealed for public subscriptions by means of prospectuses and advertisements. The number of these is of course, much less than the number registered; but the mere registration of an undertaking means very little. Besides this we may point out that it is exceedingly difficult to get a complete list of the registrations within the United Kingdom, as, besides Somerset House, there are offices for the purpose in Cornwall, in Ireland and Scotland, in the Isle of Man and in the Channel Islands. But, after all, it is the number of invitations for public subscriptions which furnish the best evidence of the growth of mining enterprise, for promoters and vendors would not keep on spending money in preliminaries if their appeals to the general body of investors did not meet with considerable success. As a matter of fact we know that fully 80 per cent. of the new mining companies of the half-year have gone to allotment. In some cases, no doubt, it would have been better if the ventures had been strangled at their birth, for they are never likely to attain a healthy majority; while in many others the new undertakings have in them all the elements of success. We do not intend here, however, to go into the merits of the half-year's issues, for week by week as the companies have been announced we have laid before our readers an unbiassed opinion as to the claims of the new undertakings to their support. Where the company has seemed worthy of praise, we have not hesitated to say so, and we have been equally ready in expressing a contrary opinion if we have thought the enterprise deserved it.

For the purpose of comparison, we may remind our readers that in 1888 the number of mining companies which appealed to the public for subscriptions was 101, representing an aggregate nominal capital of 14,272,000*l.*, as against 89 companies with 16,003,000*l.* of nominal capital in the preceding year. In the past six months about 63 companies have made similar appeals, the aggregate nominal capital of these amounting to a little under 9,000,000*l.* Practically, therefore, the average capital sought to be raised in the half-year has been rather over 140,000*l.*, or about the same as last year, as against nearly 180,000*l.*, as the average in 1887. From this it will be seen that there has been a tendency to lessen the amounts asked for from the public which, speaking generally, may be taken as a move in the right direction, for there can be no doubt that a great deal of the non-success which does so much to depreciate the mining industry is due to the over capitalisation, which too often occurs. In the first three months of the current year great activity was apparent in the formation of new companies, for out of the 63 new issues over 50 had come out before the end of March. Then the business began to fall off rapidly, and in the present month only three new mining issues have been announced, and one of those was a Spanish Iron-ore Company, which is a little outside the scope of our observations. With regard to the situation of the properties, we may mention that the great majority of them are located in the Witwatersrandt district of the Transvaal and in the neighbouring territories. This was to have been expected, in view of the enormous speculation in Randt gold shares during the first three months of the year. India and the Colonies account for five new companies, the Straits Settlements for another five, the United States for four, the Republic of Colombia for two, Portuguese, South Africa for two, Honduras for two, and some of the other districts for one or two each. At home there has been no addition to the list of new companies, at all events, so far as appeals to the public are concerned.

Altogether, as we have said, the new mining issues represent an aggregate nominal capital of rather less than nine millions sterling. In addition to this there have been several re-constructions of pre-existing companies; but the total of these would probably add less than another million to the aggregate. This would bring the full amount up to something under ten millions for the half-year. Of this sum probably nearly three-fourths is represented by the purchase considerations, leaving, say, two and a-half millions for working capital. In too many cases the prices paid for properties have been excessive, especially among the South African concerns, where the success of a comparatively few locally-owned mines has enabled promoters and vendors to secure much larger prices than they would now be able to obtain, although in the interval the best of the Randt mines have shown substantial progress. The tendency to under-estimate the capital requirements of new undertakings cannot be too much deprecated, for in consequence of initial mistakes of the kind the development of many a valuable property has been delayed for so long a

time that the company has fallen an easy prey to the wreckers and resurrectionists, who are always on the *qui vive* for plunder. Just now there is quite a lull in the mining market, but sooner or later speculation will revive, and the list of companies will be added to once more. Then will be the time for those who have money to invest, to profit by the experience of the past few years, and refuse to take shares in any company in which the working of the property to be acquired is likely to be jeopardised by too large a proportion of the capital being paid away to the vendors and promoters.

YURUARI—FACTS AND FANCIES.

If you want to disturb a meeting of shareholders, and if you are not particular as to the methods you adopt, your plan of procedure is simple. You should collect from the pavement outside, or possibly from the nearest tavern, fellows of the baser sort, march them up in a body, and at a given signal overpower the doorkeeper and rush into the room. You should then distribute your forces judiciously over the room, and select as your spokesman a man whose lungs are of iron and whose face is of brass. These arrangements made, you should instruct your followers to keep up a constant volley of interruptions, and the well trained claque who shouts at the chairman and hounds down every respectable shareholder attempting to address the meeting should, with equal vigour, applaud every statement, however absurd, that may be made by their brazen-faced representative. Conduct of this sort sometimes succeeds with a weak chairman, but trying it on at the Yuruari meeting last Tuesday, the gentlemen of the pavement reckoned without their host, and certainly without their host's proxies. It was distinctly stated by Mr. Watt that persons had rushed past the doorkeeper into the room, and conduct of this kind must be reprobated by every respectable man. The Yuruari Company, like the early Christians, has come out of great tribulation, but the trials it has undergone are as nothing compared with those which would be its fate were it to fall into the hands of a coterie whose holding is in inverse ratio to the noise they make at the meetings. The difficulties of carrying on a mining enterprise in Venezuela are unusually great, and those who are successful deserve the utmost gratitude of shareholders. It is an open secret that when Mr. Watt first took office in connection with the company now called Yuruari the Government was of a very peculiar kind, and had to be taught the lesson that British interests were not to be trifled with. Mr. Watt has enemies—few men are without them—but not even the bitterest of them will deny that by constant agitation in Parliament he has made the authorities of Venezuela very careful as to how they attempt to deal unfairly with British capital employed in that country. Mr. Watt has been a good schoolmaster and the Venezuelan authorities apt pupils. The amount paid upon each of the original shares of the company, as he reminded the meeting, has been 1*l.* 5s. 6d. For the expenditure of 1*l.* of this, the first board rendered their accounts, and for several years, on the balance of 5s. 6d., with a small amount in premiums, the present board has kept the Yuruari Company on its legs, and has conducted an amount of development work, which has proved the value of the lodes, and brought affairs into a fairly prosperous condition. Considering the heavy expense of mining in Venezuela, the difficulties that have been experienced with the various managers, and the obstacles which nature placed in the company's path, we think that few boards in London could on such slender means have kept such a company so long in the land of the living, and in the place of hope.

The debenture debt of about 60,000*l.* has, however, presented to Mr. Watt and his colleagues a dilemma with two horns, upon one of which they must of necessity impale themselves. The one million shares now issued are 6d. paid. To wipe out the debentures a call of 2s. would be necessary, and we do not hesitate to say that many of the shareholders could not respond to it. Rejecting that idea, the board devised an alternative scheme—that of issuing 1,000,000 new shares, of 2s. 6d. each, calling up 6d. per share, and leaving them *pari passu* with the former million. These shares there is not the least doubt can be issued at a premium and the debenture debt—which was truly described as a millstone round the company's neck—paid off. When proxies were sent out to the shareholders the response was an all but unanimous acquiescence in the policy of the board. At the meeting Mr. Watt distinctly challenged the noisy section to try conclusions at a poll, but the invitation was not accepted, for the simple reason that the persons challenged knew the remark was about true that, "we can swamp you 50 times over." The mention of two million shares is certainly startling, but the capital represented—half-a-crown per share—is as nothing compared with that of numerous other companies quoted in our lists with considerably larger amounts, and infinitely less property to show for them. Thanks to the action of Mr. Watt in Parliament, the mine has now been brought within 30 miles of British territory, capital has been made secure, and already, we understand, active steps are being taken to construct a railway through the heart of the mining district. Should this be done, expenses of mining in Venezuela, already largely reduced, will undergo a still further diminution, and companies like Yuruari will be enabled to make a return to the shareholders. The prospects of the mines, judging from all the reports, are extremely encouraging, and the returns promise not only to increase but to become continuous. The board between them, are stated to hold 100,000 shares, and the proprietors have exercised a wise discretion in confiding their interests to persons with a substantial stake like this, rather than throwing themselves into the arms of people who have little to lose and all to gain.

THE TRANSVAAL GOLDFIELDS.

(From our Correspondent.)

The Knysna.

I now come to what are called "our own goldfields" in the Cape Colony. The division of Knysna is situated on the south coast of the colony, and lies between the sea and a range of lofty mountains called the Outeniqua, from which flows innumerable rivers and streams, affording an abundant supply of water, and flowing into the Knysna harbour, one of the finest on the coast. For several years past it has been asserted that gold reefs exist on these mountains, and alluvial gold in the creeks and gullies, and to show what has really been done, I will make a few extracts from a report made by the Civil Commissioner of the district towards the end of last year :—"During the past 10 years an impression existed that gold would be found in payable quantities in the division of the Knysna, but nothing was really done until 1885, when Mr. Osborne, the late Inspector of Roads in the division, and whose belief in the existence of a local goldfield remained unshaken, returned to the division from the Transvaal, and single-handed, and with slender means, set to work steadily to prospect the country between Knysna and Genge. After enduring many hardships and privations for several months, during which he prospected nearly the whole of the country lying between the Zwaart and Knysna Rivers, from the Outeniqua Mountains to the sea, finding in almost every hole sunk by him gold or its colour, Mr. Osborne was fortunate enough to discover in the innermost tributary of the Homtini river, the centre of the present Millwood digging, alluvial gold in such quantities as to justify his reporting the discovery of a payable goldfield."

The report then proceeds to state that in consequence of this discovery the Government was induced to announce that the whole of the Crown lands in the division were open to prospectors without license or taxation of any kind, on the understanding that they would acquire no legal rights to the lands by virtue of the permission given. Next we find that 500 or 600 persons were soon on the ground, who elected a Diggers' Committee for the maintenance of good order. In August, 1886, Mr. J. Courtney reported to the Civil Commissioner the finding of gold in reef visible to the naked eye. This discovery gave great impetus to reef prospecting, and in a short space of time upwards of 20 reefs, all more or less gold bearing, were discovered and pegged out for miles. The result was the proclamation of the Minerals Act as being in force in the Knysna division, with the exception of that area, which had been occupied and worked upon by the first prospectors, at what is now called the village of Millwood, which was reserved so as to avoid any injustice to persons who had spent money in working land to which they had as yet acquired no legal right. The next step was that the Government caused the Millwood Reserve to be proclaimed a digging and mining area on the 6th January, 1887, and a commission was sent to the spot to investigate and adjust all claims prior to the regular working of the fields under the Minerals Acts. This was followed by Mr. Courtney reporting on the 5th of the following April the striking of a valuable gold-bearing reef to the west of the Homtini River. The Civil Commissioner then goes on to say :—"It will be observed from the above that no security was afforded for the investment of capital in systematic operations until the proclamation of the Millwood Fields in 1887, and consequent on the necessary investigations of the Gold Commission, the fields cannot be considered as having been thrown open to the world until the 1st March, 1887. Hence, in fairness, the age of the Millwood Fields must be taken from that date only. . . . At the present time, although the population of Millwood is not so great as it was 12 months ago, on analysis it is found to consist of a more suitable description of persons for the industry contemplated. These persons—instead of being unsettled adventurers, drawn to the fields as individual diggers in search of immediate fortunes to be acquired with little labour, and less experience—are divided into classes, consisting of capitalists or their representatives, managers, labourers, and suppliers. Several strong companies have been established, namely, four alluvial, and 10 reef mining companies. These companies are actively engaged in preliminary works—the alluvial, in the construction of water-races for hydraulicing, and the reef, in the sinking of shafts, and the erection of batteries. The Oudtshoom Company has just commenced work with a 10-stamp battery at Millwood, and the Courtney-Pioneer will soon complete the erection of a 5-stamp battery on the Homtini. On the whole it may be safely averred that the Knysua Goldfields have never before given such substantial indications of health, and promises of success and prosperity as at the present time. It is generally believed that a real paying industry has been established, which will flourish for a great length of time."

A WORD WITH VISO SHAREHOLDERS.

The Directors of the Viso Tin Company, Limited, have proved that they have a valuable property, and the question remains—will the shareholders aid them in its development? A conclusion not to do so would thoroughly deserve to be called both lame and impotent

It would be like a man building a house, and at the last hesitating to go to the expense of a roof. The shareholders at the meeting the other day adopted the well-considered scheme of the directors, and those who were not present we feel sure will do so with equal cordiality when they read our full report of the proceedings. As the scheme is there so fully described we need not occupy space in dealing with it here. We would merely remark that this is a property about which there is a plethora of information. Two directors have made pilgrimages to it more than once, and one expert after another has also taken up his parable about it. In solo and in chorus alike all these gentlemen chant to the tune that Viso is a property of a more than ordinarily valuable character. The Germans have heard about it, and are developing some land immediately adjoining in the hope that the good things that will fall to Viso may not be denied by a hard fate to them. The alluvion yields a large profit, but enough of it cannot be raised to make it dependable as a sole source of revenue though as an adjunct to the returns from the lodes its importance is not to be denied. It is for deep sinking the directors want fresh funds, and the case they make out is so good that these, we feel sure, will not be withheld. Viso shares were 12s. to 13s. a short time ago, when the mines were not nearly so well proved as they are now. As a speculation, or as an investment, Viso, as the Americans would say, has "a good all-round look;" and the more we hear of it the more we feel disposed to recommend it. A street Arab was asked by a clergyman, fresh from Exeter Hall, what was his duty to his neighbour? He replied, "To keep my eye on him." This is the shareholders' duty to Viso, for their neglect would be the outsider's opportunity.

THE LOOK-OUT FOR MONTANA.

An important circular was issued by the board, dated the 25th, containing the announcement of a dividend of 6d. per share, contrasted with 4½d., which was the rate of the previous distribution. The reserves are about the same, and the exploratory work is being followed up with great activity. The hoisting machinery gives complete satisfaction, and Professor Clayton, who has paid an unofficial visit to the mine, is extremely gratified with the way it is opening up. The circular as a whole points to continued and even increased prosperity in the future.

NAMAQUA PROSPECTS.

The speech of the chairman at the Namaqua Copper Company's meeting yesterday was well diversified with lights and shades. The lights were, that at existing rates for copper the company can pay dividends, that the quality of the ore is improving, and the production increasing. The shades were all centred in the failure of the Paris Syndicate, and the loss of the anticipated profit which has been sustained. The syndicate paid for all copper delivered by the company to within the small amount of 250*l*., but when you are expecting 16,000*l*. profit in addition, the conviction is somewhat unpleasant, that it is altogether beyond your reach. Mr. Weir added a solid word of comfort when he said that heavy stocks are being cleared off at the rate of 6,000 tons a month, that the trade demand is increasing, and that some improvement may be expected upon present prices. But after all, Mr. Howard's remark, that even at present rates the company can pay profits is the one that will be fastened upon by the shareholders, for they behold in it the double consolation that they have skilful management and a most valuable property.

ST. JOHN DEL REY.

The activity of the directors of the St. John del Rey Company at home and of the management abroad was the theme of the shareholders' commendation at the meeting on Thursday. An enormous amount of work seems to have been done in a really incredibly short space of time. An aqueduct, 6 miles in length, has been completed, and what was truly described as the "masterly report" of Mr. Chalmers shows that the company is about to commence sinking. All probabilities point to this, that the time it will take to strike the lode will be less than that originally contemplated—a circumstance almost unique in mining or in any other description of work on a large scale. It is a certainty for which the shareholders are waiting, and this they are not likely to forget.

THE MONEY MARKET.

City, Friday Evening.

Like business generally the Money Market has this week been quiet and featureless. The occurrence of the Stock Exchange Settlement has made but little difference, but it may have checked any actual decline in rates, as the market has been firm. Discount has fluctuated between 1$\frac{3}{16}$ and 1$\frac{5}{16}$ per cent., and is now at the latter figure, while money for a day has been 1 per cent. and 1½ per cent. to cover the settlement, and for longer dates. For the fortnightly account money was available at 2 to 2¼ per cent, with also a rather harder tendency, the influx of bullion being diverted to the Continent, but the firmer tone has been mainly due to the close of the half-year. The Bank return shows little alteration in the reserve, and the proportion is only slightly better at 43¾ per cent., as, although there was an influx from abroad during the week of 174,000*l*., and there has been a return of 186,000*l*. in coin from circulation, this has been set off by an increased note circulation of 358,000*l*., or about the same amount. The liabilities under deposits have been lessened on balance, the private deposits having declined 470,000*l*, while the private securities have run off 170,000*l*.

This being pay-day at the Stock Exchange, the demand in the Money market was greater, and 2 per cent. was paid for loans till to-morrow, while 2½ per cent. was wanted until Monday. Bills were also firmer at 1$\frac{5}{16}$, ⅜ per cent. The French exchange has fallen 1½c. to 25.16½, and French gold to the value of 26,000*l*. has been withdrawn from the Bank. This looks as though the gold on the way from New York, estimated at a million and a half, will certainly go to Paris, and as the New York exchange is not so firm it is possible the supply from that quarter may cease, particularly as money will now be wanted for the crops in the Southern and Western States. Bar silver was unaltered.

The Stock markets this week have not been particularly active, but much of this was due to the disinclination of dealers to increase their commitments on the eve of the settlement, and to the usual realizations induced by the same cause. The markets experienced a sharp drop on the report of disturbances in Servia, but as prices from Vienna were firm, a disinclination to accept the report as true gradually spread, and the fall was almost recovered, and in the absence of any further adverse news prices still further advanced, so that the variations on the week are very trifling, and almost eveuly divided. The rates for "carrying over" speculative transactions until the next account, July 12th, ranged from 2 to 3 per cent. on Foreign Stocks, and from 3 to 4 per cent. on American Railway Securities. The Funds were hardly so firm; the fall on the week was not very important, but a decline of ¼ was noticeable in Indian Government Securities. In Foreign Government Securities the fall was led by Egyptian Issues on the decision of the French Government not to agree to the conversion of the Preference Debt. This means that several important works in connection with the Nile, and the relief in the taxation must be postponed to an idefinite period. The International section records a reduction of ¼ to ¾, and South American Bonds ½ to 1 per cent. Home Railways were also nearly all lower, in sympathy with the preceding market. The most serious decline (2¼ per cent.) has been in Brighton "A," which was affected by the closing of some weak bull accounts, and also on the grounds that the monthly statement was regarded by some as unsatisfactory. South Eastern "A," Metropolitan, and several others fell ¾ to 1 per cent. Great Western, however, was very firm. The traffic receipts were excellent, and a large increase isshown for the present half-year. American Railways were neglected, and beyond a decline of nearly 2 in Atlantic Firsts, on the "passing" of a cash dividend, the changes were slight. Grand Trunk Stocks were easier, but Mexican were stronger on some active buying. Merely fractional alterations were recorded in the Miscellaneous market.

The markets to-day opened firm, and although closing at an advance, in many instances, on yesterday's prices, the latest values were by no means the best; but, at the same time, the closing was steady. New Consols advanced $\frac{1}{16}$ for both money and the July account, and the Two-and-a-Half per cents. were ⅛ per cent. higher at 95⅝, ⅞. Foreign Government Bonds were irregular. Greek, Hungarian, Italian, Uruguay, and Suez Canal Shares were higher, while Egyptian were lower. Portuguese were also lower. South American issues were weaker on the advance in the gold premium to 71 per cent. There was some talk to-day of the Stock Exchange Committee withdrawing the quotation for Portuguese loans, until the Delagoa Bay Railway matter has been satisfactorily settled. A better tendency was noticeable in the Home Railway Market, and the heavy lines have risen ¼ to 1, and the other lines ¼ to ½, except Metropolitan, which fell ⅜, and the District, which receded ¼. Taff Vale also gave gave way 4, closing at 244, 248. Brighton "A" opened at 152¾, rose to 153⅛, reacted to 152½, and left off 152⅞. American Railways were weak, and prices dragged, showing an almost general decline of ¼ to ½. Grand Trunk Railway and Mexican Railway Stocks were both good markets, especially the Ordinary of the latter company, which rose ⅜. Delagoa Bay Railway Issues rose 2 on result of the meeting, when hopes were expressed that the Portuguese Government would withdraw the recent decree of their colonial minister. Salt Union shares were ½ lower on what was regarded as an unsatisfactory dividend announcement. Cable Stocks were firmer, and there was a fair demand for London and Westminster Bank shares. Other securities in the Miscellaneous department were quiet, without much alteration.

Mr. A. W. Wright has been declared a defaulter upon the Stock Exchange to-day. Further difficulties are talked of, but it is believed that they will be arranged.

Annexed are the final quotations to-day:—Consols Account, 98¼ 98⅜; Egyptian Preference, 103⅝, 103⅞; Egyptian Unified, 90$\frac{15}{16}$, 91$\frac{1}{16}$; French Four-and-a-Half per Cents., 103¼, 103¾; Hungarian, 86$\frac{1}{16}$, 86$\frac{3}{16}$; Italian, 96⅛, 96¼; Mexican 95¾, 96¼; Peru Five per Cents., 15, 15⅛; Peru Six per Cents., 16$\frac{1}{16}$, 16$\frac{15}{16}$; Russian, 1873, 101$\frac{3}{16}$, 101$\frac{5}{16}$; Portuguese, 67$\frac{7}{16}$, 67$\frac{11}{16}$; Spanish, 75$\frac{13}{16}$, 75$\frac{15}{16}$; Turkish, 1871, 91¼, 91⅜; Turkish Defence, 99¼, 99¾; Caledonian Railway, 119⅞, 120½; Great Eastern, 75⅞, 76⅛; Great Western, 160⅛, 160⅜; Brighton "A," 152⅛, 152⅞; North-Western, 184, 184½; Metropolitan, 86½, 87; Metropolitan District, 33, 33½; Midland, 144, 144¼; North British, 58⅛, 58⅜; North-Eastern, 173⅝, 173⅞; South-Eastern "A," 112½, 112¾; Hull and Barnsley, 34¼, 34⅜; Grand Trunk, 10⅛, 10¼; Ditto First Preference, 68½, 68¾; Ditto Second, 48⅝, 48⅞; Ditto Third, 24¾, 26; Canadian Pacific, 57, 57¼; Denver, 17⅜, 17⅝; Erie, 27$\frac{7}{16}$, 27$\frac{9}{16}$; Milwaukee, 72⅜, 72⅝; Lake Shore, 107½, 107¾; Louisville, 70⅝, 70⅞; Atlantic First, 29¾, 30; Ontario, 18, 18¼; Ohio, 23⅛, 23⅜; Norfolk and Western, 52⅝, 52⅞; Reading, 24⅜, 24⅝; Ditto Bonds, 84¼, 84¾; Union Pacific, 61⅝, 61⅞; Wabash Preference, 29⅞, 30⅛; Ottoman Bank, 10⅜, 10⅞; Anglo-Telegraph, 53¼, 53¾; United Telephone, 14⅜, 14⅝; Hudson's Bay, 20⅛, 20⅜; Suez Canal, 93, 93½; Guinness 32, 32¼; Allsopps' 8⅞, 9⅛; Bryant and May, 13¼, 13½; Delagoa Bay Railway, 7, 9; Ditto Debentures, 84, 87; Mexican, 52⅜, 52⅝; Ditto First Preference, 127⅝, 127⅞; Ditto Second, 87⅝, 87⅞.

The gross earnings of the Mexican Central Railway Co. for the third week in June were $105,616, showing an increase of $29,128 over 1888.

AFRICA.

LATEST FROM THE GOLD AND DIAMOND MINES.

THE TRANSVAAL LANDS CO.—The offices are now at 33, Cornhill.

STANDARD.—The directors have appointed Mr. G. H. Homan as their secretary in place of Mr. A. R. Ramsay, retired.

SHEBA.—Cablegram from Pretoria, received 24th inst.:—"All grants secured. Fever Creek to be given up when tailings treated."

SOUTH VOGELSTRUIS—Mr. H. Woodburn Kirby, of No. 19, Birchin Lane, E.C., has been appointed liquidator of the South Vogelstruis Gold Company, Limited.

PONDOLAND EXPLORATION.—The directors have received the following cablegram from the resident director in Pondoland, Mr. Gordon:—"Prospecting quietly; met with no opposition."

THE African Gold Share Investment Company, Limited, have been appointed London agents of the Chimes Reef Gold Mining Company, Limited, and the Metropolitan Gold Miuing Company.

SOUTH AFRICAN.—The following particulars relate to the week ending June 1st:—Blue ground hauled, 6,045 loads; blue ground washed, 4.768; loads; diamonds obtained, 1,548 carats; estimated value, 1,857*l.*

OTTO'S KOPJE DIAMOND.—The manager reports in his weekly return:—The driving at the foot of the 800 ft. level continues to progress satisfactorily, and the appearance of the blue brought to the surface continues to improve.

MONTROSE.—On the 28th inst. the directors of this company received the following cablegram from the mine manager: "Have made rich strike in the lowest level—Scott's reef." Cablegram from the mine manager, 26th June:—"Machiuery will be up towards end of August. Ore in high level No. 2 is averaging 2 ozs. per ton."

GORDON DIAMOND.—Return of work done at miue for week ending 22nd inst:—9,000 loads of blue hauled; 5,100 loads of blue washed; value of diamonds produced, 2,100*l.* The company announce that arrangements have been concluded for the purchase on satisfactory terms of an extensive area of grounds adjoining the existing claims of the company, and which has already been proved to contain upwards of 600 claims of virgin blue or diamondiferous soil to a great depth.

TRANSVAAL GOLD EXPLORATION AND LAND.—The following particulars are from manager's advice of May 27th:—Bullion: Shipment of 6 bars melted gold, weighing 534 ozs. 15 dwts., value 1,970*l.*, has been made through the Standard Bank. Mines: Theta vein: Ore extracted during week, 125 tons; value per assay, 2 ozs. 18 dwts. gold per ton. The ground proved in the drives referred to last week will be easily stripped. Beta vein: Ore extracted, 10 tons; assay value, 1 oz. 4 dwts. per ton. Ioata vein: This is the new vein on Columbian Hill, and from it 15 tons were extracted, assaying 1 oz. 10 dwts. per ton. Kappa vein is the name given to the new workings on Juhilee Hill. From No. 804, 20 tons were extracted, assaying 2 ozs. per ton, and from No. 807, 5 tons, assaying 13 ozs. 2 dwts. per ton. Brown's Hill Mill Battery: The battery was at work 44½ hours, and crushed 42 tons of Theta ore. Owing to want of sufficient transport the battery has been shut down temporarily to allow of a supply of ore being accumulated on the mill dump. Meantime the erection of the new pipe flume or aqueduct across the Blyde will be proceeded with, and various necessary repairs at the mill. Pans: These were at work 114 hours on Theta tailings, and treated 31 tons.

LONDON AND SOUTH AFRICAN EXPLORATION.—From advices received from South Africa, there is every reason to believe that the announcement of a discovery of extensive diamondiferous ground adjoining the Gordon Diamond Company's present claims is absolutely correct. The Gordon Compauy have issued a circular calling a special meeting of the shareholders for July 2nd, at which a proposal will be submitted to increase the capital by 200,000*l.* The company commenced business about three years ago on 50 claims of diamondiferous ground in the Dutoitspan Mine, South Africa. The property has since been considerably enlarged, and at the present time consists of 180 claims with a capital of 400,000*l.*, including 50,000*l.* working capital, and a complete equipment for the working of the whole area. Recent falls of reef have, it appears, disclosed the fact that what was always considered the outside limit of the mine is merely a wall of what is known as floating reef, and that the "blue" or diamondiferous soil extends for a considerable distance beyond the limits of the property. The extent, so far as ascertained, is about 600 claims. Satisfactory arrangements have been made with the proprietors of the soil (the London and South African Exploration Company) for the purchase of these claims at a price which will, it is stated, reduce the average of the company's claims to about 800*l.*, the average cost of the 180 claims being about 2,500*l.* per claim.

NEW AKANKOO.—The manager writes as follows:—Mine: The output has been slightly raised this week, the winze in the 30 ft. level north, 144 ft. from the prospect shaft, has been pushed on rapidly by night and day, and was holed through into the 60 ft. north three days ago. This will give us some fine stoping ground at the back of the 30-ft. north, and some miners will be put on over-hand stoping as soon as I can get them. The 40-ft. south is being cleared out, and a winze will be put down on to the 60-ft. south, where we have very good stone. In the 100-ft. south the reef is widening out, and is now 2 ft. 6 ins.; in the 100-ft. north, 6 ft. wide and exceedingly good. Water forked to the 100-ft. every day and night this month, and the pump working well. Mill: I am running 15 heads, and shall continue to do so for a little, as I want to keep five heads out to alter feed hoppers and water supply. Plenty of water now, and the pump working well. The directors also forward the subjoined report of Mr. C. J. Harvey, who returned from the coast recently:—Mine: The value of the mine is now established beyond all question, and I can assure you from the result of my examination, that the reef opens out even better than I expected, and so far as can be judged promises to increase in value in depth, since new shoots of ore have been found in the 60 and 100-ft. levels, which did not appear in the first workings. I must give unqualified praise to the late Mr. Ramsay for the manner in which he carried out the duties entrusted to him, and the result will be better seen by the accompanying sketch of the work already accomplished, and that projected as shown by the dotted lines. It is proposed to continue the No. 1 shaft to a depth of 180 ft., allowing 20 ft. for a sump, the present one being wholly inadequate, and to contiuue driving the levels at present open at 30, 60, and 100 ft., sinking winzes as required, which will lay open a large extent of ground for stoping. The reef has widened out considerably in a north-east direction, the south-west remaining the same, but of equally good quality; in fact, it is the steady quality of the reef which constitutes its great value. From the accessible position of the mine, I look forward to its proving a paying concern even on its present large capital. The main shaft has been fairly commenced, and will be pushed on with as fast possible, though progress is necessarily slower during the rainy season. I anticipate no trouble with water, as the Deane pump, at present working in No. 1 shaft, keeps the water down easily. Labour was very scarce in the early part of the year, or greater progress would have been made, and a good deal of time was lost by the collapse of the old water course, and the necessity of obtaining pipes from England for the new one. The mill will now be supplied from an adjacent lagoon in the wet season, and the river direct during the dry months. Machinery: This, I regret to say, is our weak point, but, fortunately, the only one. The stamps were originally erected without proper foundations, and these have at length rotted, as much from want of use as natural decay. When started working, I was apprehensive of an entire collape, and the greatest caution has had to be exercised. By moving the engine 6 ft. further back and re-erecting it on a bed of concrete, we have been able to run 15 heads in place of 10, and with less steam. After full consideration, I have decided that the sooner the stamps are taken down and re-erected on a sound foundation, the better it will be for the shareholders, as the risk of working in their present condition is too great to incur, and the quantity crushed much below the proper average. But as the company cannot afford to stand still while the change is being effected, I propose to take over from the Essaman Company a Huntingdon mill, which is not yet required by them, and partly lying on the Akankoo Wharf; erecting it alongside the stamps and working it while they are being re-erected. It should more than cover expenses and before long the output should be sufficient to keep both mills going. I was fortunate in being able to eugage the services of Mr. Henry after the death of Mr. Ramsay, and I feel assured that with his energy and ability the mill will be put in thorough order in two or three months after commencement. The old dump, respecting which so much has been said at various times, consisting of *débris* from the old native workings, mixed with a good deal of dirt and partly grass grown, now stands in the way of extension of the mill, and as its removal is neccssary I directed it to be passed through the mill whenever opportunities offer. The trial crushings yielded 5 to 6 dwts. per ton, and will leave a profit on working. While at Akankoo I had an interesting interview with his Excellency the Governor of the Gold Coast, who expressed himself much pleased with the immense value of the gold mining industry which he saw being developed in the district, and his astonishment at the energy displayed in overcoming all difficulties of transport. In conclusion I have no hesitation in saying that, with ordinary good management, the Akankoo Mine will prove one of the best on the Gold Coast. On and after Monday next, July 1st, the offices of the above company will be at 32, Great St. Helens, E.C.

CORRESPONDENCE.

[*We do not hold ourselves responsible for the Opinions or Statements of our Correspondents.*]

THE NEW CALIFORNIA CO., LIMITED.

To the Editor of the MINING WORLD AND ENGINEERING RECORD.

SIR,—In your last week's paper you have commented on the favourable turn which has occurred in the prospects of the New California Company, the particulars of which the shareholders will be able to discuss at the annual meeting to be held to-morrow. I regret not being able to attend, and to lose the opportunity of pointing out to the shareholders that the statements I made to them as chairman of the meeting last year, as to the results to be anticipated from the indications afforded during the progress of the developments, have been realised to an extent beyond the predictions I felt fully justified in making.

For several months past the mine has been making good profits, besides paying for the developments out of revenue.

It was not the fault of the mine that it did not do this long ago; but until the time of re-construction no working capital was available to do it justice; though the fact that its working yielded sufficient profit to pay for all the extensive developments carried out was such a proof of its capabilities as to constitute a standing reproach to its owners for neglecting to provide the means which would have ensured a dividend.

The chief cause for this apathy was doubtless due to the fact that the shares (22,000*l.*), reserved for working capital, were sold to pay for the Hidden Treasure property; aud as the ore in that and in the California dropped in grade for a time, the opportunity was afforded for a systematical crabbing of the property, and attacks on the policy of obtaining the Hidden Treasure Mine and its very valuable mill, additions which have saved the company from ruin and led up to its present bright prospects of future success.

My long study of the indications so continuously afforded throughout the workings left no doubt on my mind of the results to be reasonably expected from the application of the necessary working capital, without which very few miues can be managed successfully. If the shareholders refer to the reports of the meetings held since 1882, they will, I think, be satisfied that the views I so constantly expressed of the capabilities of the property to be fully borne out by its present state, or state which could have been reached long ago, but for the persistent refusal to supply the funds neccssary to obtain it.—I am, &c.,

JOHN ELLIOTT.

The Brighton Railway traffic return for the week ended June 22nd exhibits an increase of 3,028*l.*, and the South-Eastern an increase of 2,254*l.*

REPORTS OF MEETINGS.

THE TOLIMA MINING CO.

GREATLY IMPROVED PROSPECTS—THE REAL DE FRIAS PROPERTY TO BE DEVELOPED—SALE OF THE ALTO WORKINGS.

THE ordinary general meeting of the shareholders was held at the Offices, 18, Finsbury Circus, yesterday, under the presidency of Mr. B. Langdale Barrow (the chairman of the board).

Mr. WM. W. HOLMES (the secretary) read the notice convening the meeting.

The report and accounts were taken as read.

THE CHANGE OF CHAIRMAN.

The CHAIRMAN: Gentlemen, in another company, which I may designate the sister company to this, I alluded, a short time ago, to the fact that the chair, until then occupied by Mr. Herbert Tritton Sankey, had been vacated. I have also to say here that our former chairman has left us, for a cause which has nothing to do with the company, and I will content myself by saying that no one regrets his absence from this board more than myself. In his place my colleagues have appointed myself to the chair. I may say that I am painfully aware of my shortcomings, but I shall certainly do my best, and with the courtesy and kindness I have always received from every member and officer of this company, I feel that my task will be considerably lightened. I have felt that there were others far better fitted for the post than myself, but with your support and consideration I hope when the time comes for me to give up my place to somebody else, I may, at any rate, have given you satisfaction. (Hear, hear.)

THE REPORT AND ACCOUNTS.

With regard to the report, I may say that the report of the board, coupled with the voluminous and masterly report of our superintendent, are so full that there is very little left for me to say with regard to them. With regard to the balance-sheet, it will be perceived that the loss brought forward into the year 1888 from the year 1887 exceeds the same item in the previous balance-sheet by 986*l.* 17s. 5d., being 3,158*l.* 2s. 1d., as against 2,171*l.* 4s. 8d. This is due to three items, namely, 201*l.* 17s. 4d. for loss on exchange, and charges incurred in realising the Organos ore 207*l.* 3s. 11d., being the loss on the realisation of the Frias ore, and 578*l.* 6s. 2d. being transferred from the credit side of the 1887 profit and loss account to the credit of the debenture holders' account on the sums due on the 31st December, 1887, by the Organos Company, in conformity with the deed of trust executed in your favour, making a total of 986*l.* 17s. 5d. Of this amount, the largest sum, 578*l.* 6s. 2d., is only an apparent loss, as it forms part of the profit shown in the 1888 account, under the heading of "Profit, 1887 and 1888, on Organos royalty, mortgaged to debenture-holders," equalling 1,168*l.* 11s. 5d., which, but for the fact of its being mortgaged, would have gone in reduction of the loss of 4,307*l.* 5s. 7d., which clears that up. By a reference to the cost and product account, you will see that

THE OUTPUT OF THE FRIAS MINE

in 1888 exceeded that in 1887 by 100 tons of export ore, amounting to 347 tons 10 cwts., against 246 tons 19 cwt., a result obtained in spite of the drought obtained, which is stated to have been more severe than any experienced for the past 40 or 50 years. The rate of expenditure, in spite of the increased exploratory and unproductive work, is relatively lower at the mine, the extraction of 347 tons in 1888 costing proportionally less than in 1887, by over 2,000*l.* In other words, had the 347 tons been obtained in 1887, it would have cost you 2,000*l.* more than it has done. There has, therefore, been certainly an economy in the working. The cost of the transport of the ore from the mines to Swansea has been reduced from 13*l.* to 11*l.* per ton, and this reduction dates from April of last year. In

THE PROFIT AND LOSS ACCOUNT

the item of 805*l.* discount and interest may require explanation. This was incurred by advances made in the purchase of shares, and to meet such drafts against the company's ore as matured previous to its realisation.

THE WESTERN SECTION.

At the last and preceding meetings stress was laid upon the results likely to accrue from the prosecution of the exploratory works in the western section, and I am pleased to say that the 60-fm. level has by a rise been holed into the 20-fm. level, and has given ventilation and very much increased facilities of working this portion of the mine. From this rise levels have been driven east to meet the 40 and 50 levels, which have been driven also in a westerly direction, driving at both ends, in fact. The result of the work is that ore has been extracted averaging from 130 to 450 ozs. of silver per ton. The output began to tell upon the returns in July last and continued until December, and it shows a substantial improvement. Besides the ore extracted reserves have been opened up to the extent of 400 tons, rather over than otherwise, which is valued at 24,000*l.* Another point in the mine calling for attention is that at a point 312 ft. from the engine shaft, the 80-fm. level has been driven on two distinct lodes, both of a massive character, one of which is assumed to be a recurrence of the rich shoot of ore, which, until July, 1884, gave such substantial returns. The working of this section of the mine was progressing satisfactorily until July, when the drought commenced. To avoid the chance of any future catastrophe of a similar nature the directors have commenced

A DITCH OR AQUEDUCT FROM THE SANTA ROSA STREAM,

a distance of 4½ miles, and it is thought that this may possibly be completed within say four months. It may be more or less considerably longer; we cannot tell exactly.

THE REAL DE FRIAS MINE.

The surface adit, or extraction level, has struck a promising lode in the previously unexplored portion of the property, the real De Frias Mine, the name of which is possibly new to the shareholders. That is referred to in the report as being situated on the rising ground on the west side of the property on a ledge overhanging the Frias Mine. It is thought that if this mine can be reached by this extraction level and if there is ore sufficient to pay the cost of the drivage of this level, it will be the means of bringing large returns to this company.

THE ALTO MINE.

The board, I am pleased to say, has found a purchaser for the Alto Mine, as authorised by the members at the last general meeting. The purchase-money was 6,000*l.*, 4,000*l.* of which has been paid, and ample security has been given for the remaining 2,000*l.* Since the last general meeting the debenture issue has increased from 1,830*l.* to 2,530*l.* My colleagues and I propose to pay off 50 per cent. of this debt out of that 6,000*l.*, and to apply a portion of the proceeds of the sale of the Alto Mine for the completion of the ditch to the Santa Rosa stream, and also to carry out certain further improvements recommended by the superintendent. I have also to tell you that

ONE OF OUR BOARD IS ABOUT TO PROCEED TO THE MINE,

and I am further pleased to tell you that he is going there at his own cost. He is going to pay his expenses both there and back.

Mr. S. J. WILD: Which director is that?

The CHAIRMAN: Mr. Stuart Sankey. I am afraid, gentlemen, I have rather exhausted your patience. Our good ship has had a somewhat stormy passage of late. We have had to throw over a portion of our cargo, to the extent of some 20,000*l.*; but I believe now, just as I take the helm of this company, that we shall be sailing in pleasant waters, and we all hope very soon to reach the port in safety.

WHAT THE COMPANY HAS DONE.

There is a saying that history repeats itself, and I trust it may do so in this company. It may interest you to know that the company has extracted, up to the 31st December last, 2,786,641 ozs. of silver, and it has paid in dividends 82,457*l.* 12s. 1d. You may, therefore, understand that I, for one, have every confidence in the investment I have in this company. With those remarks I have to propose "That the report and balance-sheet for the year ending the 31st December last be and hereby is adopted. (Cheers.)

MR. ROGERS ENLARGES.

Mr. CHARLES O. ROGERS: I have very great pleasure in seconding the adoption of the report. We should have been in a very different position now had it not been for the extraordinary drought that has visited Colombia during the past year. It has prevented the sinking of the shaft a single foot; in fact, as the superintendent says, the bottom of the mine has not been seen for 11 months.

THE FUTURE OF THE FRIAS MINE.

Well, now, any shareholder who has watched the progress of the Frias Mine will agree with me that the future of the mine has always depended upon continuing the sinking of the shaft. So long as we have kept sinking the shaft we have always come upon mineral at the time when our bunches have cut out; so you may imagine that not having seen the bottom of the shaft for 11 months, there has been nothing done in the way of opening up ore below the levels that were being driven when we met last time. The only thing that has occurred is what the chairman has referred to, that the same occurrence seems to have taken place in the 80-fm. level as took place in the 50-fm. level when Mr. Gledhill was here some years ago. When I visited the mine, subsequently, an immense body of ore was cut, and we got about 200,000*l.* worth of ore out of it.

A LARGE BODY OF ORE HAS BEEN CUT

worth 4 or 5 tons to the fm. At first it was poor, not averaging more than 50 ozs. to the ton; but it has now increased to from 150 to 200 ozs., with every prospect of continuing to turn out ore as rich as the ore in the 50-fm. level was, where, you will recollect, it went to upwards of 900 ozs. to the ton. But as that is in the 80-fm. level we cannot get any benefit from it until the 90-fm. level is driven, and that is now 40 fms. behind.

Mr. WILD: Is that on account of the drainage?

Mr. ROGERS: Yes.

THE LATEST REPORT IS MOST IMPORTANT,

for it shows that they have now plenty of water. The superintendent, writing under date of the 18th ult., says, referring to the recent drought:—"In the beginning of the month we were short of water, but during the last eight days of same we had an abundant supply, which enabled us to make 4 tons more of export mineral than the preceding month." He goes on to state:—"I am very glad to say that the 90 was drained this morning. I had the pleasure of inspecting the 80 yesterday, after being under water for 11 months. The lode in the end is worth 2 tons of mineral per fm, the last assay giving 127 ozs. per ton, and I hope it will improve in this respect. We are making arrangements to push the 90-fm. level forward under this point with rock-drills and all the available resources." That is as to the eastern part of the mine. All the returns since we exhausted the bunch have come from the west, and we have still from 15,000*l.* to 20,000*l.* worth of stuff not taken out of the western part of the mine. We shall take away all that ore at about half the price it cost us before. But the stuff is not going to stop there: we are sure to have in the 90-fm. level similar ore to that which we have had in the 80, and there is every probability of the ore going down westward in the 20-fm. level.

THE REAL DE FRIAS MINE.

The Chairman referred to the Real de Frias Mine, and in the report you will see we say: "Another feature of the year's operations is the exploration of the Real de Frias, a mine formerly worked by the Spaniards, but abandoned presumably on account of their inability to contend with the water. Down to the water level the extent of the workings and the character of the *debris* indicate the existence of rich deposits, and justify the conclusion that at a greater depth valuable mineral will be found. The superintendent has been directed to give an estimate of the cost which the development of this mine will involve, and your directors propose, on its receipt, to take such steps regarding it as may, in their opinion, best conduce to the interests of this company." You will recollect that I have several times mentioned to you how our Frias Mine was discovered. I had something to do with it some 23 years ago. There was a tradition that a very rich mine existed in the district, which was then an impenetrable forest. My friend Mr. Welton was riding along one Sunday, when his mule fell into the entrance to an old adit, and that led to the discovery of the Frias Mine; but there is little doubt the mine he was in search of

was not the Frias Mine, but the mine referred to here, the Real de Frias. That belongs to the company, and you will see from the plan what a very important thing it will be for us to develop it. Mr. Rogers went on to point out, by the aid of a sectional plan, the mode of working proposed, which was to be conducted on the Frias Mine, and in the course of his remarks exhibited a piece of exceedingly rich ore, which has come from the Real de Frias part of the property. Mr. Rogers added that with the prospect of another Frias Mine, which could be worked at a very moderate cost, before them, their prospects could not but be considered as very good. The machinery at the mine was now in splendid condition, superior of its kind to anything in the country, and all that was required was mineral to treat.

A PERTINENT QUESTION.

Mr. WILD: Can you tell us, roughly speaking, how long the work you have referred to will take, and what will be the cost of driving the level to Real de Frias?

Mr. ROGERS: I should think we may be able to drive from 5 to 8 fms. a month; we have driven as much as 9 fms. per month. After we have got the shaft down we shall be able to drive the end to meet it. There would be no object in making a communication until we have sufficient ore to treat. The cost will be about $30 a fm.

Mr. C. H. MARCH: Is it the fact that the last report shows a loss?

Mr. ROGERS: Yes, a small loss; but I think we ought now to be making profits until we exhaust the western section, by which time we ought to have opened up some fresh ground.

Mr. MARCH: I suppose you have funds in haud sufficient to carry out all the necessary works?

Mr. ROGERS: Yes, we have.

The report and accounts were then unanimously adopted.

The CHAIRMAN moved "That Major A. G. Dickson, M.P., and Mr. C. O. Rogers be, and hereby are, re-elected directors of this company."

Mr. WILD seconded the motion, and it was carried.

Mr. MARCH moved the re-election of Mr. L. H. Evans and Mr. John Morgan, the auditors, at a joint fee of 30 guineas.

Mr. WILD seconded, and the motion was adopted.

A vote of thanks was passed to the chairman and directors, and the meeting then closed.

LAST REPORT.

Abstract of report :—Frias, April cost, 977*l.* 4s. 1d.; Frias, April returns, 607*l.* 17s. 11d.; loss for month, 369*l.* 6s. 2d. The underground agent reports 31 fms. 5 ft. 4 ins. of ground expended, of which 16 fms. 5 ft. 5 ins. were productive, leaving 14 fms. 5 ft. 11 ins. of unproductive ground. The superintendent, writing under date of the 18th ult., says, referring to the recent drought :—In the beginning of the month we were short of water, but during the last eight days of same we had an abundant supply, which enabled us to make 4 tons more of export mineral than the preceding month. He goes on to state :—I am very glad to say that the 90 was drained this morning. I had the pleasure of inspecting the 80 yesterday, after being under water for 11 months. The lode in the end is worth 2 tons of mineral per fm., the last assay giving 127 ozs. per ton, and I hope it will improve in this respect. We are making arrangements to put the 90-fm. level forward under this point with rock-drills and all the available resources.

THE MOUNT MORGAN EXTENDED GOLD MINING CO., LIMITED.

UNANIMITY OF THE SHAREHOLDERS—HOLDERS OF 260 SHARES ONLY DISSENT OUT OF 143,000—PEOPLE IN QUEENSLAND ANXIOUS TO GET THE PROPERTY.

AN extraordinary general meeting was held at the City Terminus Hotel yesterday, when the resolutions, which were passed at the meeting of the company, held on the 12th June, were submitted for confirmation as special resolutions—Henry Wilson, Esq., chairman of the company, presided.

Mr. G. L. S. MAGGIOLINI presided.

The CHAIRMAN: The business of the meeting is already stated in the notice convening it, and I have to move that the resolutions carried with all but unanimity (there was only one dissentient of the 12th June) receive our confirmation to-day. It perhaps will be convenient if I read an analysis of matters as they are now as regards the consenting power to this re-construction. Of all the shareholders on the list there are but three dissentients—one gentleman holding 20 shares, another 40, and another 200—in all 260 shares. Amongst the debenture-holders there is only one who dissents. He claims to be paid in full. I might mention that since last we had the pleasure of meeting you some of my friends have had an interview with a gentleman who recently came from Queensland—I believe an Australian bankrupt—and he seemed rather anxious that there might be some hitch in our proceedings. He gave us to understand that if anything of that sort did occur, the nucleus of a combination had already been formed and would be very glad indeed to take over the property. That is a subject with which we can only deal as a matter of report. The maps that we alluded to when we met you on the 12th have just been received. Some of our shareholders have paid us the compliment of coming to the office and looking over those maps, notably Mr. Peter Watson. We would have brought them here to-day, hut there are seven of them, and one is very large, so that it would be utterly impossible to make you understand to-day what they signify. We shall be very glad if any of you will favour us with a visit to the office, where we shall be very happy indeed to give you a demonstration to the best of our ability of what they convey. As you understand the object for which the meeting has been convened, I do not think I need make any further remarks, but will simply propose resolutions Nos. 1 and 2.

1. "That the Mount Morgan Extended Gold Mining Company, Limited, be wound up voluntarily, under the provisions of the Companies Acts, 1862 to 1867." 2. "That pursuant to sec. 161 of the Companies Act, 1862, the liquidators be, and they are hereby, authorised to sell and transfer (subject to due provision being made for dissentient shareholders, if any) all the property and assets of the company to a new company upon the terms of the scheme of re-construction now submitted to the meeting, and identified by the signature of the chairman, and to enter into all necessary agreements for that purpose."

The basis upon which those resolutions were claimed was discussed fully at the meeting of the 12th, and I hope you will see your way to confirm them with the same unanimity with which they were then passed.

Mr. JENKINS (director) seconded the motion.

Genl. GORDON: I do not think there will be any difficulty in confirming the resolutions. I know the directors have not drawn their salary, but will that form a liability of the new company—in whole or in part? In part, I suppose.

OUGHT DIRECTORS TO WORK FOR NOTHING?

The CHAIRMAN: You, Genl. Gordon, and any other shareholders, must be perfectly aware that in times such as those this company has passed through, the directors have been beset by many difficulties—in fact, had it not been for the prompt and judicious conduct of your affairs you would have been a derelict. We consider that we have more than earned the small amount of fees to which you now refer—the three or four months not paid. (Cheers.) We consider we are justly entitled to them, but if the shareholders of the company consider that we are not entitled to them, and express a desire that we should forego them, we will accept their decision, although their treatment of us would be very illiberal, seeing the enormous amount of anxiety and responsibility we have had on their behalf. Since we had the pleasure of meeting you before, my colleagues have been in communication with a large number of shareholders. They thought it desirable and imperatively necessary that the expenses iucidental to the London management should be reduced to 700*l.* a year.

GREAT REDUCTION OF EXPENSES.

We have done better than that because we propose to reduce them below that sum. The proposal is this that until the mine pays you dividends the directors shall be content to draw half their fees, and the secretary has agreed to give us the necessary accommodation, with his own services, and what clerical assistance may be required, the offices, etc., for a sum of 200*l.* a year, so that I think you will say we have applied voluntarily the pruning hook all round as far as it was possible to apply it, and I hardly think that we should now forego the whole of the small remuneration which we have fairly worked for and fairly earued. That is a proposition which I think beyond the limits of reason. (Cheers.)

TRANSFER WORK.

Mr. JENKINS (director): We have carried through the transfer work of this company in a manner unexcelled by any company in a manner unexcelled by any company in London. We have had 12,000 transfers, and the work has been done by one or two directors, and done in a prompt way though it carries serious responsibility. No transfer has ever been more than ten days in passing through the office.

Genl. GORDON: I thiuk your explanation is very satisfactory.

THE ALTERED SCHEME.

Mr. PETER WATSON: As the originator of the scheme for 5s. shares, I have had several shareholders call upou me to ask why I did not allow the matter to go through with a liability of 3s., with 17s. credited as paid up. Doctors differ, and so do solicitors and judges, and I think it much better for the benefit of the shareholders that their liability should be cut down. If hereafter it were considered there was a liahility of 17s. a share it would be very serious, so I thought that with a nominal amount of 1s. credited as paid up, and a liability of 4s.—even if the liability of 1s. were subsequently enforced it would not hurt us. We shall have 28,000*l.* to deal with as the capital of the company, and I am assured there are ample funds to pay off all the liabilities to the present time. I think it desirable the scheme should go forward in the form in which it was suggested by me, and I am very pleased to find there are only 260 shares out of 143,000 found to object, so that it is practically unanimous. The only duty that now remains is for the sbareholders to take up their capital, and have the mine developed in the proper way. Since the last meeting I have had an opportunity of going through the plans, and I think there are certain things which, if attended to by vigorous and practical management, on that side, will leave something yet to come out of this mine for the benefit of the shareholders. I would suggest that iu the formation of the new company two new directors should be added to the old board. I know what it is to have uphill work in such a company as this—(hear, hear)—but that addition would be the means of getting the necessary capital. The chairman said at the last meeting, "I am in a position to say that we will be only too glad to receive any persons nomi nated by the general body of the shareholders." I do not mention this in any hostile way, but I think that this suggestion is for the benefit of the shareholders.

Mr. DELANEY: I dissent from the new proposition, though I was prepared to agree to the first.

The CHAIRMAN: To any suggestion of Mr. Watson's we shall be happy to give favourable consideration. His proposition is that we should add two more members to the board. Now, we have been actuated by motives of economy. We have steered the ship safely through all the various crises that have overtaken it, and he now proposes to add two members to the board "with practical knowledge." (Laughter.) Now, gentlemen, the members of this board do not profess to be practical miners. Their duties have been pure administrative.

MINING EXPERTS ARE NOT WANTED ON THE BOARD.

(Hear, hear.) We have in the local management in Queensland gentlemen capable of carrying out all the mining details, although we do not intend that the local management shall control the board. I can hardly see the advisability of adding to the present number, seeing that you must make provision for them in the way of remuneration. Irrespective of that, there is an old adage which has been exalted to the dignity of a classic, "Too many cooks spoil the broth," and when you have six directors, it is difficult to get them to come to any definite conclusion on any one point. The present members of the board have the confidence of 15-16ths of the proprietors on the register, and it will be our duty to carry this enterprise to a successful issue, but if you are wanting in your confidence you have only to say so. I am perfectly prepared to give up my position if I have forfeited your confidence.

(Cries of "No.") It is impossible for Mr. Watson, or anyone here, to understand the terrible responsibility that has been resting upon us during the last five or six years. Of course, I understand that he has not made any reflections upon the board.

The resolution was carried with one dissentient.

LIQUIDATORS APPOINTED.

The CHAIRMAN, in introducing the subject of the appointment of liquidators, said there would be a great deal to do. It had been suggested that Mr. Jenkins and he should be liquidators, seeing that they were familiar with the accounts and all the business of the company, and that probably they could discharge the duty more promptly than any other gentlemen who might be appointed. However, in this, as in all other matters, they were perfectly content to leave themselves in the hands of the shareholders.

Mr. LLOYD proposed "That Mr. Henry Wilson and Mr. R. J. Jenkins be, and are hereby, appointed liquidators of the Mount Morgan Extended Gold Mining Company, Limited, at a joint remuneration of 50 guineas.

Genl. GORDON seconded the motion, which was carried unanimously.

The CHAIRMAN: I assure you that we shall take very great care to circulate through the medium of the Press, or even by a private circular, all the information we receive from time to time from the mine. Our object always has been, and is now (because we believe it the best guarantee for the success of any enterprise), to keep

A CLOSE AND SYMPATHETIC TOUCH WITH THE SHAREHOLDERS,

to let them know how their money is spent, and to let them know from time to time the results accruing from the expenditure of that money; and if the mine in the near future does not respond to the expectations we indulge regarding it, all I can say is I shall be grievously disappointed.

A vote of thanks to the chairman closed the meeting.

THE DISRAELI MINE SYNDICATE CO., LIMITED.

A POLICY OF ECONOMY—£3,000 WORTH OF GOLD TAKEN OUT OF THE MINE—FINCH-HATTON RETIRES.

THE ordinary general meeting of the shareholders of this compauy was held at Winchester House, on Wednesday last, June 26th, 1889—Mr. J. Oakley Maund (chairman) presiding.

The SECRETARY (Mr. A. McKinlay read the notice convening the meeting.

The CHAIRMAN: You have been in possession of the report and balance-sheet for the year, and probably you have all read it, so I think we may take it as read.

A SHAREHOLDER: It has not been sent to me, Mr. Chairman.

The CHAIRMAN: Have you changed your address?

The SHAREHOLDER: No.

Another SHAREHOLDER: I have had no report. I had a notice of the meeting.

The CHAIRMAN: It has been sent out to each shareholder; so the secretary says. Well, I will read the report; it is a very short one.

The SHAREHOLDER: No, no, I have got a copy of it now.

LAST YEAR'S WORK.

The CHAIRMAN: I should like you to notice that the balance-sheet is from the 1st January, 1888, to the 1st January, 1889, and we thought it advisable in the present condition of the mine to deal with it to the present date, or as near as we could, because you would then know the present condition of affairs. You will see by the balance-sheet that the amount actually expeuded up to the 1st January was 3,049*l*., and it looks something like a contradiction to say we have only spent a little over 800*l*., but that is up to the 1st June this year from the 1st June last year. At the last meeting the policy we agreed should be adopted was one of scrupulous economy, and that has been adopted by the board. As you see by the report, if you deduct the salary which is paid to our manager, who is a thoroughly able man—360*l*. a year—that leaves a net balance paid over for working the mine and development of something less than 500*l*. The work which has been done you will see by the report. We have extended the 790-ft. level 150 ft. east from the shaft, and the 930-ft. level has been extended 74 ft., bringing it to 200 ft. east of the shaft. You will see by the report that the amount of gold taken out of the mine is about 6,000*l*.

A SHAREHOLDER: During what time?

FINCH-HATTON RETIRES.

The CHAIRMAN: During the year. The way we were able to practise this rigid economy was with the assistance of our manager, Mr. Blamey, to get the tributers to work on the upper levels, and by that means we were able to develop, and we have developed considerably this year, and you know there are ups and downs in all mines. At the time we issued our circulars, asking for subscriptions to debentures, the mine was self-sustaining, and since that date we have been called upon for only 500*l*. during the six months, so that practically even now the mine is almost self-sustaining. In respect to the mine, you will see the amount of work done up to the 1st June, that is as far as our information goes; but from all we know, we think that since then the 790-ft. level has been driven 50 ft. further; and on the 11th June our manager, Mr. Blamey, who is not a hopeful man, telegraphs: "We have struck good ore 790 level. Letter sent explaining." We have not received the letter, and we thought it better not to telegraph, for telegrams are misleading, but to wait until we received the letter. Mr. Blamey reports that the mill and the whole of the plant are in good order, and I have no doubt that the plant and machinery are in good order, for only a few days ago a gentleman connected with mining in Queensland told me that he considered our mill and machinery were among the best in Queensland, and that they were waiting in hopes of getting it themselves. We do not, however, want that to occur. During the year Mr. Finch-Hatton has retired from the board—on the 24th of this month—since the notice was sent out, so I report that. At the same time Col. Francis Baring and Mr. Hamilton Smith retire by rotation, and I shall submit that they be re-elected. I must tell you that the position of a director in this company is not a very happy one. In the first place I tell you we have been working four or five years without a halfpenny of salary, and we have had a considerable amount of work to do. I retired from the chairmanship of the board, but upon Mr. Finch-Hatton's retirement I took it up again. I do not want to leave you in the lurch when the business is a difficult one. I shall propose then in order to get to the real business which I want to put before the board, "That the report and balance sheet, which have been submitted to the meeting, be received and adopted." Will anyone second that?

Mr. C. A. SCOTT MURRAY: I beg to second that.

The motion was put and carried unanimously.

DISCUSSION.

The CHAIRMAN: The next resolution is that Col. Francis Baring and Mr. Hamilton Smith, jun., who retire by rotation, be, and are hereby re-elected upon the committee of management for the ensuing year.

A SHAREHOLDER: Will you kindly state how many shares Col. Baring holds.

The CHAIRMAN: 500.

The SHAREHOLDER: He still holds that number?

The CHAIRMAN: He still holds 500 shares.

The motion was seconded, put, and agreed to.

The CHAIRMAN said the only other formal business was that Messrs. Whinney, Hurlbatt and Smith, the retiring auditors, be re-appointed, or the contrary.

Sir HENRY HOARE proposed the re-election of the auditors, and the resolution having been seconded was carried unanimously.

The CHAIRMAN: Then I wish to place before you the position of the mine, in order to show you that we had better take some steps in the matter at once. Already we have had some consultation with the largest shareholders, and they are unanimously of opinion that we had better go on with the mine. I need not tell you what most of you know, that we have now come to an end of our funds. We issued a circular inviting gentlemen to take up debentures, and we only received an answer from one gentleman who offered to take 50*l*. in debeutures. The directors were, therefore, compelled to abandon that scheme. It is now proposed to re-coustitute the company, and our reasons for it are these. We have got a position, and the mine is almost self supporting—the mine nearly supports itself. We know that there are several people who are anxious to purchase the mine, and if there are people anxious to purchase the mine it is good enough for us to go on with, and our idea is to re-constitute and re-construct the company, that is to say, we shall have to re-construct the old company, and we propose that these shares be paid up, 18s., and 2s. shall be due. We only propose to call up 6d. per share, because our working expenses being now only 800*l*. a year, we could certainly go on for a year or two without making any further call. I do not say this mine will be a success, but I am inclined to think the balance is in our favour. We have got the mine to be almost self-sustaining, and we have got the opinion of Mr. Blamey, our manager, who is not by any means a sanguine man, that there is still hope for the mine. We have spoken to many of the larger shareholders, and they are prepared to go on upon the basis I have mentioned.

A SHAREHOLDER: The report you have given us states that the product of the gold from the mine has been 6,000*l*., but it does not state in what time. You say also that the expenditure has been 2,500*l*., and, therefore, there is a large profit; and if there be a large profit why do you want more money?

The CHAIRMAN said the paragraph was not very clearly expressed. The amount of gold—6,000*l*.—had been taken out of the mine from the 1st May, 1888, to 31st March, 1889.

A SHAREHOLDER said they were left with a profit of 3,000*l*.

The CHAIRMAN: We do not get the whole of the 6,000*l*. What we acquired was 2,500*l*. The secretary would explain the exact figures.

EXPLANATION.

The SECRETARY explained that the tributers got 87½ per cent. of the gold they took out of the mine, and the company had 12½ per cent. This percentage, added to the gold stoped and milled by the company itself, and the 830*l*. remitted from London, brought the result to about 2,500*l*., being the total expenditure, in Queensland, for the time.

The CHAIRMAN: We say we have prospected the mine very considerably last year, and it has only cost 830*l*., including the amount of the manager's salary, and we have been enabled to do that by engaging tributers to work in addition to the gold we have got out of the mine. We are not practically in order in discussing the matter of re-construction, which is one for an extraordinary meeting, but we want to take the sense of the shareholders. We do not want our shares wiped off, at least I do not, and many of the large shareholders do not. We only want to ask for 6d. per share, and we do not propose to call up anything more for some time.

Sir HENRY HOARE said he thought before they re-constructed the company they should be satisfied of their position. The chairman had stated that there were parties anxious to take the mine.

The CHAIRMAN: I do not think you can sell the mine. I think it is very possible that a syudicate might buy us up at a fair price if we were in the position of sellers, but I am inclined to think—and I have increased my holding—that we are in a better position than we were ever in before.

Sir HENRY HOARE remarked that what appeared singular to him was that he had never heard any explanation as to the position of the mine at the beginning. They heard all sorts of reports. Of course nobody would believe that they were going to get 100 per cent.; that would be too much of an El Dorado, but there had certainly been a great drop from what was stated in the original prospectus.

The CHAIRMAN said he was not on the board at the time of the formation of the company.

Lieut.-Genl. FIELDING said that 12½ per cent. was a very small sum to get from tributers. He was chairman of a mine in which a great fuss would be made if they did not get more than 25 per cent. from tributers; 12½ per cent. was a very low figure indeed.

The CHAIRMAN remarked that in two cases tributers had lost money.

Major-Genl. FIELDING said he had been chairman of a mine for over 12 years, and he had never known the money received from tributers to be so small as 12 per cent.

A SHAREHOLDER: Is yours an Australian mine?

Major-Genl. FIELDING: It is an American silver mine.

A SHAREHOLDER: Oh, that is different.

The CHAIRMAN said they gave up driving because they could not get a sufficient amount of gold, and, therefore, they made an arrangement with the tributers. Winzes following the shoot of ore had been sunk from the 540 to the 640, and from the 640 to the 790-ft. levels. The work now being carried on was the extension of the 790-ft. level and also the 930-ft. level, in the hope of finding a larger body of payable ore. He was quite sure that the manager, Mr. Blamey, was doing the best he could for the company.

In reply to Sir Henry Hoare,

The CHAIRMAN said Mr. Blamey thought the ore shoot went further east—the best of the shoot. With that idea the board had instructed him to push on the 790-ft. level, and that had produced good ore. Mr. Blamey's idea was thatithe main shoot of ore was farther east than they had been working. The real question was, were the shareholders prepared to abandon the mine? The directors, who knew more about the mine than anyone else, through the letters and telegrams they received, advised that they should go on, and they were prepared to contribute to the taking up of further shares.

THE BOARD'S SCHEME SUPPORTED.

Sir HENRY HOARE said he should be prepared to support the scheme of the directors. He thought it more probable it would be successful than the debenture scheme.

A SHAREHOLDER: What is the expense of re-construction?

The CHAIRMAN: It is rather expensive. There is the registration fee 150*l*., and there are other expenses dependant upon it, which will bring it up to 200*l*. I suppose we should not get out of it under 400*l*.

In reply to Sir Henry Hoare.

The CHAIRMAN said, assuming they had 100,000 shares taken at 6d. each that would be 2,500*l*.

Sir HENRY HOARE: And, after all, there would be the other 1s. 6d. to be called up.

The CHAIRMAN: We should not require to call up the other 1s. 6d. for a considerable time, if at all.

In reply to a Shareholder,

The CHAIRMAN said the directors were placed in a very difficult position. A Queensland man, alluding to a company with which he was connected, had said to him in bombastic style that the labourer was worthy of his hire. Well, that company was now in liquidation. At any rate the shareholders of this company had the satisfaction of knowing that if the labourer was worthy of his hire, they had not paid them (the directors) anything.

Sir HENRY HOARE asked when it was proposed that the extraordinary meeting should be held.

The CHAIRMAN replied in about three weeks' time. They would call the extraordinary meeting for the 10th July, and they would require a confirmatory meeting to be held in another fortnight.

In answer to a shareholder,

The CHAIRMAN said, of course the letter which had been alluded to, would be submitted to them when it came to hand. He did not think there was anything further to state to the meeting. They would thrash the matter out at the extraordinary meeting on the 10th July, if that date was agreeable to them.

Sir HENRY HOARE: Will you put it to the vote?

The CHAIRMAN: We cannot do that; it is besides the business of a general meeting.

Lieut.-Genl. FIELDING: It would be better if you could make the time of meeting half an hour later.

The CHAIRMAN: Certainly; it is rather early.

The CHAIRMAN: Then on the 10th July we shall be prepared to propose a scheme for your adoption.

The proceedings closed with a vote of thanks to the chairman, proposed by Sir THOS. THORNHILL, and seconded by Sir HENRY HOARE.

CARPUAN MINE.

THE CHAIRMAN VISITS THE PROPERTY, AND FORMS A HIGH OPINION OF ITS VALUE.

A GENERAL MEETING of the adventurers was held at 10, Coleman Street, E.C., on Monday, 24th June, 1889, under the presidency of Mr. Alfred Thomas.

Mr. CUMMING read the notice convening the meeting.

Capt. Kuott's report was as follows:—

AGENT'S REPORT.

Since commenciug operations we have sunk a large shaft and well timbered same upon the south lode to a depth of 10 fms. The lode throughout has an average value of about 10*l*. per fm. for tin, and for a considerable part worth 20*l*., and the bottom is looking well. We have, however, met with water, so have commenced to drive an adit level from the side of the hill, and upon the course of the lode to intersect the shaft at its present depth. The prospects of the lode making rich in depth are so favourable that I advise the purchase and erection of a water wheel, aud when this is complete the shaft should be sunk another 10 fms. I am of opinion that at an early date we shall require a 12 head battery of stamps to make marketable the produce. We have already on surface about 50 tons good quality tin-stuff. You will probably remember that another lode was discovered and opened upon at surface, containing a rich branch of tin on the footwall, and this lode I then valued at 10*l*. per fm. In the absence of instructions I have done nothing further upon this.

The CHAIRMAN, in moving the adoption of the report and accounts, said this being the first general meeting of the company, and the mine having been only a short time at work, he had little or nothing to add to the report just read. He had recently visited the mine and made a thorough inspection of the operations that had been carried on, and had formed a high opinion of the value of the property.

The motion having been duly seconded, it was resolved "That the report and accounts submitted, showing an amount of 83*l*. 6s. 10d., against the adventurers be allowed and passed, and be printed and circulated among the shareholders." Resolved, "That a call of 3d. per share be made, payable on or before 16th July, 1889." "That Mr. R. Cumming be and he is hereby appointed secretary, at a salary of two guineas per month, to date from 1st March last."

The meeting terminated with a vote of thanks to the chairman.

LAST REPORT.

(25th June).—Satisfactory progress is being made with the adit level, and I am daily expecting to intersect the lode.—R. KNOTT.

THE SOUTH VOGELSTRUIS GOLD CO., LIMITED.

LAST SCENE OF ALL—WINDING-UP RESOLVED UPON, AND A LIQUIDATOR APPOINTED.

AN extraordinary general meeting of the members was held at the Cannon Street Hotel on Monday, for the purpose of considering, and, if thought fit, confirming, the subjoined resolutions, which were respectively passed at an extraordinary general meeting of the members of this company, held at the Cannon Street Hotel, on Thursday, the 6th inst.:—

(1.) "That the company be wound up voluntarily, under the provisions of the Companies Acts, 1862 and 1867;" or, in the alternative, (2) "That the directors be, and they are hereby requested to consent, on behalf of the company, to the petition for winding up the company, presented by Mr. Henry Doughty Browne, and now pending"; or, in the alternative, (3.) "That the directors be, and they are hereby requested to abstain from completing the purchase of the property agreed to be sold to the company, until a report upon the same has been made by an independent expert, approved of by the shareholders, and has been considered by the shareholders in general meeting, and until the shareholders in general meeting shall consent to the purchase being completed."—Mr. Percy Leith presided.

Mr. H. E. RODWELL (secretary) read the notice calling the meeting.

The CHAIRMAN called upon Mr. Browne to move the resolution, of which he had given notice.

THE RESOLUTION FOR WINDING UP.

Mr. BROWNE: Since the last meeting I have consulted with various leading shareholders in the company with a view to carrying out what we propose on the most economical scale, so as to spend as little money as possible. I shall move "That the company be wound up voluntarily," and in appointing a liquidator we have selected a gentleman who has consented to undertake the position—a man in whom we have entire confidence, on the terms that he shall be supervised or assisted by three shareholders in the company who shall fix his remuneration. That will get rid of what often frightens shareholders—the fear that a liquidator, whose powers are of course very large, should be appointed who might put the company to considerable expense. The shareholders that we propose to put on the committee are the gentlemen in whose names the proxies have been signed. We have only one object, and that is to do the best for the shareholders possible.

Mr. DE LA PENNA seconded the motion, which was carried.

THE APPOINTMENT OF LIQUIDATOR.

Mr. BROWNE proposed the second resolution, "That Mr. H. W. Kirby, of 19, Birchin Lane, chartered accountant, be, and is hereby, appointed liquidator for the purpose of such winding up."

Mr. DE LA PENNA seconded the motion.

A SHAREHOLDER: I think it would be well if you could induce the secretary to undertake this office. We know that professional gentlemen are very excessive in their charges, and we shall have to make composition with the secretary in any case. I do not think we ought to incur further charges without offering the liquidation to the secretary.

Mr. BROWNE: I thought I had forestalled this objection when I said the remuneration would be fixed by the committee. It is very desirable to have a gentleman who thoroughly understands these matters.

The SHAREHOLDER: The duties are very simple.

Mr. BROWNE: I am not so sure that they are simple. I know something of this gentleman, aud am sure we can thoroughly trust him. He has been willing to undertake the liquidation on terms which will practically involve us in no more expense than if we appointed the secretary, and I think there are obvious reasons why we should have an independent man.

The CHAIRMAN: Have you been advised that this resolution is legal?

The COMMITTEE'S SOLICITOR: Yes, we have taken counsel's opinion.

The motion was carried with one dissentient.

APPOINTMENT OF THE COMMITTEE.

Mr. MOORE proposed "That Messrs. H. D. Browne, Charles Cruse, aud Eugene De la Penna be appointed a committee to cousult with the liquidator in the winding-up."

The CHAIRMAN: You have also taken counsel's opinion upon this?

The COMMITTEE'S SOLICITOR: Yes.

Mr. COLEMAN seconded the motion, which was carried.

Mr. BROWNE proposed the fourth resolution:—"That the remuneration of the liquidator for his services be fixed by the committee."

Mr. MOORE seconded the motion, which was carried.

Mr. BROWNE proposed "That the company hereby approves of the petition of Mr. H. D. Brown now pending, and hereby resolves that the company do consent to a supervision order."

Mr. DE LA PENNA seconded the motion, which was carried.

Mr. BROWNE proposed, and Mr. DE LA PENNA seconded, a vote of thanks to the chairman.

The CHAIRMAN, in replying, said that his colleagues wished him to say that they would, if present, have supported the resolutions.

The proceedings then closed.

The letters of allotment and regret to applicants for shares in the Denver United Breweries have been posted.

VICTORY HILL.—Telegraphic advices state that the Government have granted the tramway concession applied for, and that the transfer of the property will now proceed as rapidly as possible.

MESSRS. DAVEY, PAXMAN'S EXHIBITS AT WINDSOR.

On visiting stand No. 332 at the Royal Agricultural Society's Show at Windsor, we found an exhibit from the well known firm of Davey, Paxman and Co., engineers, Colchester. This firm has achieved a world-wide reputation for the splendid performance of their engines in all quarters of the globe. Messrs. Davey, Paxman and Co. have taken the premier position in supplying motive power at all the principal exhibitions that have taken place within the last few years; notably among which we may mention the exhibitions held at South Kensington, London, namely: The Fisheries, 1883; Health, 1884: Inventions, 1885: and the Colonial and Indian Exhibition, 1886. Since then Davey, Paxman and Co., have carried off the only prizes offered, viz.: 200*l*. for the best Compound Portable Engine, and 100*l*. for the best Single Cylinder Portable Engiue offered by the Royal Agricultural Society of England at their Newcastle-on-Tyne Meeting in July, 1887. These competitive trials were open to all makers, and the awards were made to Davey, Paxman and Co. for great efficiency, extreme economy in fuel and steam and general excellence in design and workmanship. In 1888 Davey, Paxman and Co. supplied the steam engines and boilers for driving the electric light machinery at the Italian Exhibition held at Earl's Court. It is a most remarkable fact that at these exhibitions Davey, Paxman and Co.'s machinery ran from start to finish without a hitch of any kind.

At the great Exhibition now open in Paris, Davey, Paxman and Co. have been selected by the executive committee to supply the whole of the steam power required for driving the machinery in the British section, and also about 800 h.-p. for driving the electric light for the Electric Light Syndicate of the Exhibition. In addition to this the firm have a splendid collection of machinery at their stand at their Exhibition.

The following is a list of the machinery exhibited by this firm at Windsor :—

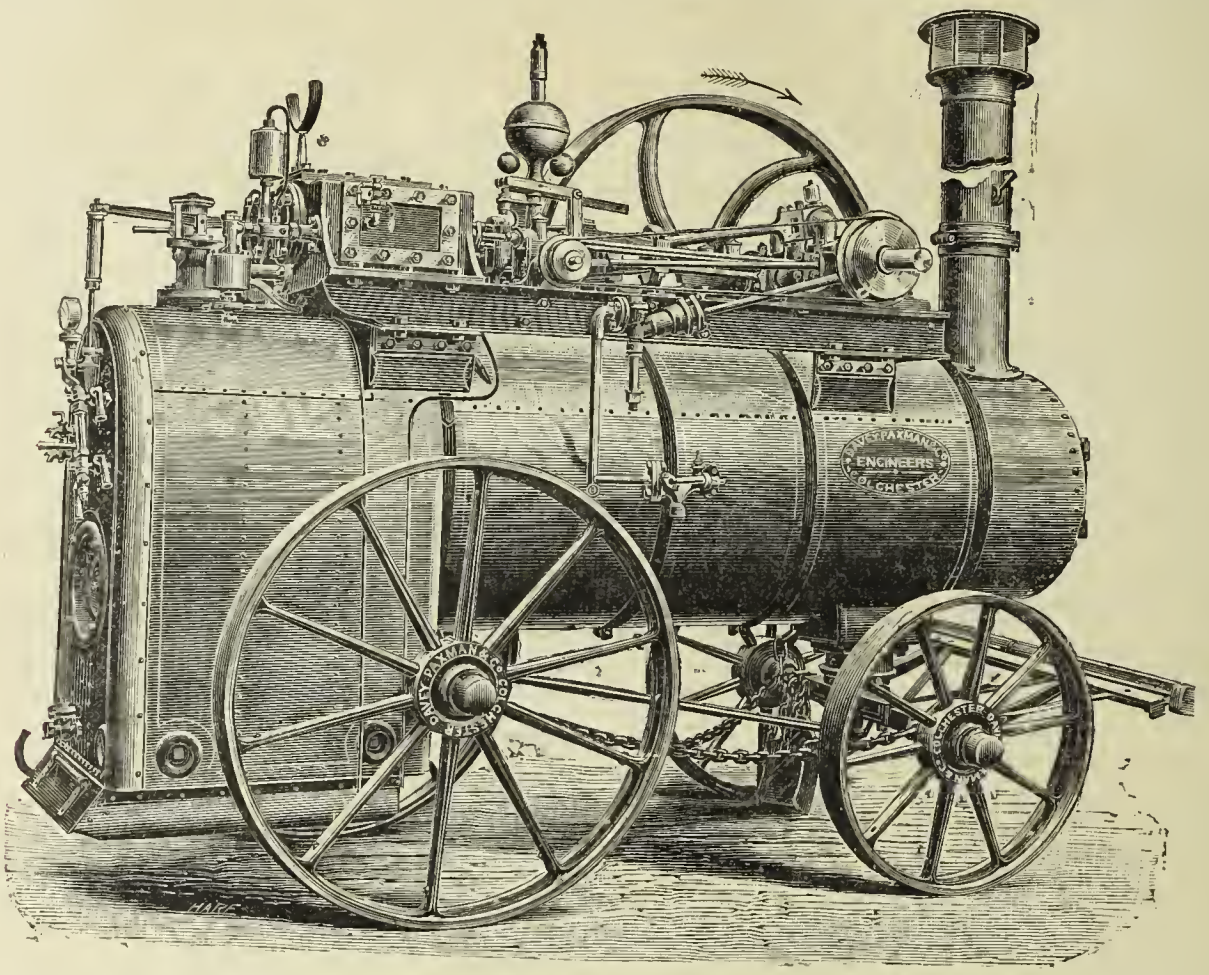
One 8 h.-p. Single Cylinder Improved Portable Steam Engine.—The cylinder is of large area, jacketted, and cast in one piece with the steam chest, and is covered with hair, felt, wood and sheet iron. The engine is fitted with Paxman's Patent Automatic Expansion Gear and Governors, and is precisely similar in design to their portable engine, which (after competitive trials open to all makers) was awarded the only prize (100*l*.) offered by the Royal Agricultural Society of England at their Newcastle-on-Tyne meeting in July, 1887 for the best Single Cylinder Portable Engine.

One 16 h.-p. New Undertype Compound Engine and Boiler, mounted on strong bedplate. The cylinders are made of hard, close grained cast iron. The piston and valve rods, joints, pins, &c., are of steel, all the wearing parts being case hardened. The engine is provided with Paxman's Patent Automatic Expansion Gear and Governors. The boiler is of the locomotive type, the firebox being made of very mild ductile steel. The engine is provided with all accessories.

One 8 h.-p. New Compound Portable Engine.—This engine is built entirely in channel iron frame, bolted to four wrought iron brackets, which are rivetted to, and project from the boiler. This departure from the usual practice is fully justified, because at the high working pressures, which these engines are designed for, it is indispensible for the life of the boiler that unnecessary strains should be avoided. The engine may be removed from the boiler by simply unscrewing a few nuts, and it can be used separately as a horizontal fixed engine. For export where the transit is difficult and expensive the packages can be considerably reduced in size and weight by this simple arrangement, and the saving this effected in freight alone enhances the values of these engines by fully 50 per cent. over that of engines constructed on the old principle. Each cylinder is jacketted, the jacket formed by forcing a truly turned and bored liner into the outer cylinder. The crank shaft is of steel. The engine is fitted with Paxman's Patent Automatic Expansion Gear, consisting of two slide valves, one main and one cut off, the latter deriving its motion from a link, each end of which is connected to one eccentric, the two eccentrics having a different travel. With this gear the point of cut off steam is varied automatically as required, from 0 to ⅞ of the stroke, thus ensuring great economy in the consumption of steam and fuel, as only the exact amount of steam required to do the work at each stroke of the piston is admitted to the cylinder. The governors are of Paxman's adjustible high speed type. The engine is similar in design to their compound portable engine. which (after competitive trials open to all makers) was awarded the only prize (200*l*.) offered by the Royal Agricultural Society of England, at their Newcastle-on-Tyne meeting in July, 1887, for the best compound portable engine.

One 6 h.-p. Horizontal Fixed Engine. Class A, mounted on strong cast iron bedplate, which the cyclinder does not overhang, which, in some instances, is a point of great importance. This engine is fitted with Paxman's patent automatic expansion gear aud governors, and is constructed with particular attention to economy, efficiency, and simplicity.

One 10 h.-p. Horizontal Fixed Girder Engine.—This engine is of the design now well known in association with the name of the firm. It is fitted with Paxman's Patent Automatic Expansion Gear, controlled by Paxman's Patent Governor, which has a rather peculiar adjusting gear, the projecting piece above being a screw capable of alteration by hand, and thus regulating the usual running speed of the engine. In some forms of it the feed pump is mounted between the steam chest and the expansion link. In this case the valve spindle is jointed to the pump plunger, and works in a stuffing box at the bottom of pump. The pump plunger is hollow, and is fixed on the rod by a nut. The rod connecting it with the eccentric is united to the plunger, and receives the same motion. Where the pump is not put on the engine a bracket is substituted to carry the governor and guide the valve spindle, but otherwise the pump forms its support, thus economising the cost, and reducing the number of parts. The engine is so made that either a bracket or the pump can be used at pleasure.

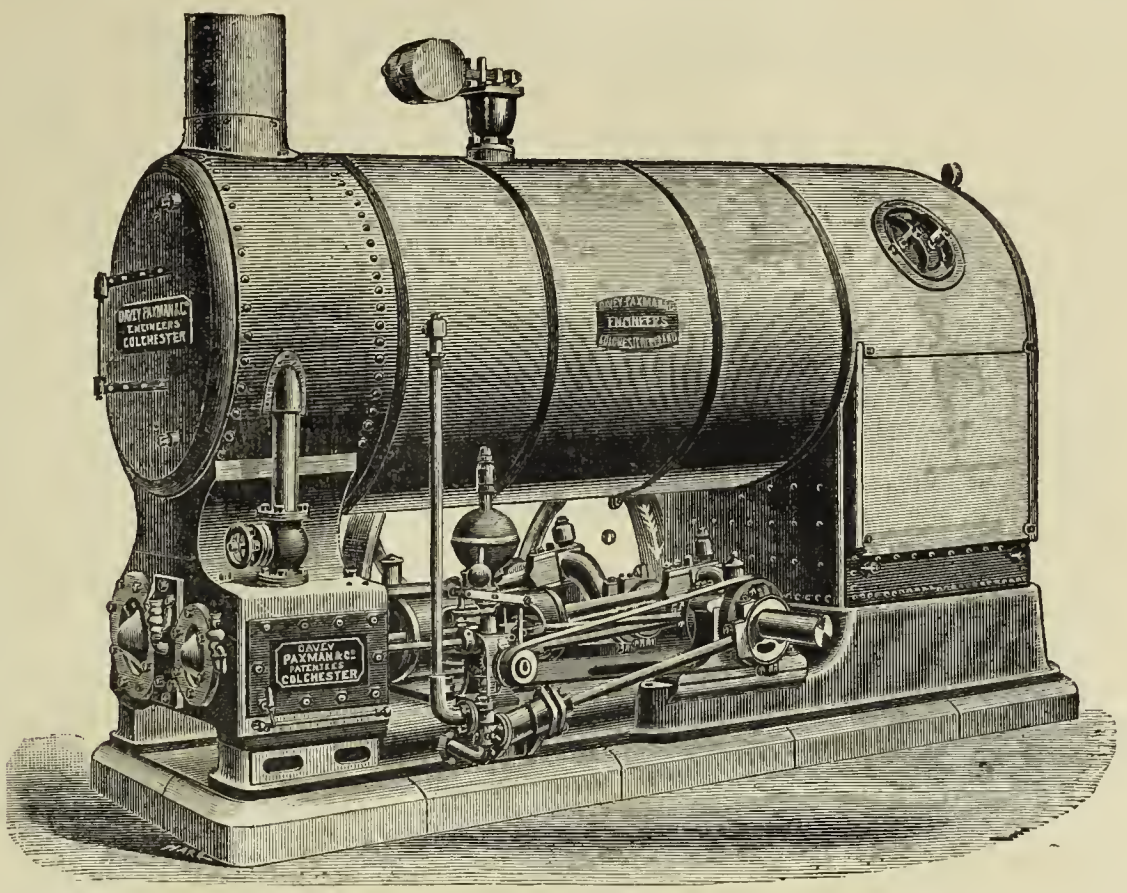


A Group of three "Essex Patent Vertical Boilers."—The Vertical boilers enables steam to be used where no other kind of generator could be profitably put down, and this "Essex" Vertical Boiler is one of the best yet brought out. A curved neck, secured to the firebars, conveys the products of combustion into a chamber to the left, where they are burnt. This chamber is of a triangular shape in places, and is fitted with door. It has an outer flange, by which it is rivetted to shell of boiler. An exactly similar chamber is in like manner secured at the right side, is fitted with door aud uptake, and coustitutes a smoke-box. These two chambers have a number of tubes of a somewhat semi-circular shape uuiting them, the curve being of greater radius than that of the boiler suiting it, so that the tube can be easily put in or withdrawn without removing either tube chambers. The chambers are made of fine steel, and are formed while hot by hydraulic pressing machinery, and are then annealed, so that the fine qualities of the steel are preserved. The shape of the flues causes a centrifugal action in the hot gases, which bring every portion of them in direct contact with the metal of the tube, so that the highest efficiency is secured from the heating surface, while, at the same time, full circulation of the water is secured, without those violent currents which are a defective feature of other

forms of vertical boilers, and produce priming, and wet steam. One 5 ft. Huntington Patent Centrifugal Roller Quartz Mill, as per enclosed description, and one Automatic Ore Feeder.

The steam engines exhibited are all fitted with Paxman's Patent Automatic Expansion Gear and Adjustable Governors. This gear is, without doubt, the best and most reliable gear in the market, and is one of the greatest modern improvements effected in the steam engine. As a proof of the perfection of this governor, it may be mentioned that at the Health Exhibition, London, in 1884, while one of Davey, Paxman and Co.'s engines was indicating upwards of 350 h.-p., the main driving belt broke, setting the engine absolutely free, but the governor at once took charge of the engine, and no variation in speed was perceptible. This happened on two occasions.

In the judges' report of the Newcastle trials they state that "the trial of Davey, Paxman and Co.'s engine was characterised by perfect smoothness of working and great regularity of speed, the governor having perfect control of the engine." Davey. Paxman, and Co.'s workmanship is unrivalled ; the durability of their machinery is proverbial ; and for economy, efficiency, steady, even, and permanent running, their engines are, probably not to be surpassed.



THE MONTANA CO., LIMITED.

25th June.—The directors having received from the resident director at the mine an approximate estimate of the company's financial position to the 30th June, are enabled to declare a further dividend for the current half-year of 6d. per share, free of income tax, payable on the 15th July, 1889, being at the rate of 10 per cent. per annum. Reserves : Mr. R. T. Bayliss cables that the tonnage of ore in reserve is approximately the same as when valued at the end of December last. Expenditure and returns : The matter of economising the expenditure, and judiciously increasing the returns, is one constantly before the directors. To maintain the undertaking at its present tonnage output necessitates a constant and considerable amount of exploratory work, which could not be curtailed without jeopardising the continuous success of the undertaking. It has been suggested that borrowing money to meet judicious and necessary expenditure ordinarily chargeable to capital account would enable the directors to devote a larger proportion of revenue to the payment of dividends. The prospect of obtaining increased dividends on any terms is doubtless attractive to some shareholders, but for a company now earning, over and above its ordinary working expenses, something like 10,000*l.* per month, and so well able to pay its way, to become a borrower for any such purpose would be a financial operation so pernicious in its character that your directors must decline to entertain the suggestion. New hoisting machinery : The new and powerful hoisting machinery, started in January last, continues to give complete satisfaction. Resident director's report : The following extracts from Mr. R. T. Bayliss's latest reports will be read with interest :— Prof. Clayton has been paying me a friendly visit, and made an unofficial inspection of the 800-ft. level, after which he informed me that he was exceedingly gratified to notice the developments, and that they confirmed him in the opinion expressed in his report that there was every reason to expect both large and valuable discoveries in the mine, as it was developed in depth. The No. 1 shaft—The 800-ft. level south : The drift in this level is still being advanced in the No. 1 shoot, and continues to present the most encouraging appearance. The ore body is from 8 to 9 ft. in width, and continues of a fair grade, and fit for the purposes of the 50-stamp mill. This shoot is now proved to a length of upwards of 200 ft., which is considerably larger than it has been proved to be at any point above. The 600-ft. level north : The Pixley No. 4 shoot in this level has been opened out into a very fine ore body, and shows a very marked improvement over the appearance which was noted in the same shoot on the 500-ft. level. It is about 18 ft. wide, and of a very good grade of ore. The north end of the 800-ft. level on the Castletown lode has been rapidly advanced during the past week, but has not developed into an ore body of any value. The quartz has a very improved appearance, and looks as though it might improve any minute, but at present it is not sufficiently rich for milling purposes. The No. 2 shaft—800-ft. level : The north end of this level is being advanced as rapidly as possible, double shifts being employed upon it in order to intersect the Sampson ore body. No work has yet been done upon the south end, as the air at the bottom of the shaft is not particularly good, and whilst we are working the drills on the north face, it would be almost impossible to operate the south end as well. The 600-ft. level : I am now re-starting the 600-ft. level south, in the hope of intersecting the ore body found in the 500-ft. level. The 700-ft. level south : The ore body which we have encountered appears to be about 8 ft. or 9 ft. wide, and is a very fair grade of high-grade rock. I am looking forward with great hope to adding to our ore reserves by this discovery a considerable quantity of high-grade ore between the 600-ft. and 700-ft. levels. The ore body in the face of this drift, referred to in my last report, is giving signs of weakening, and it is not improbable that we have reached the southern extremity of the No. 1 south shoot in this level. The 500-ft. level south : This drift has entered an ore body, which is about 9 ft. wide, and contains a streak of ore for about one-half of its width, which is of fair high grade ; and as this ore body has not been encountered above, we are entirely in the dark as to what may be in front of us ; but it has the appearance of having come to stay, and is the most important development which has been made in the mine for the last six months. The 500-ft. level south : This drift continues to be advanced in the ore body. An average sample taken from the face gives an assay value of $25, nearly all in gold, and the general character of the ore body gives the impression that it is going to be both a large and valuable discovery. The 500-ft. level south : This level still continues to be advanced in the ore body lying south of the Jubilee shoot, which has now been proved to a distance of 70 ft., and which not only makes a very substantial reserve, but holds out great promise for further development in the lower levels. All developments and works below and above ground are proceeding in a very satisfactory manner, and give promise of continued prosperity in the future.—T. NEAL, Secretary.

N.B.—The transfer books will be closed from Thursday, the 27th inst., to Wednesday, the 3rd July, both days inclusive.

GOLD MINING EXHIBITION AT THE ALEXANDRA PALACE.—Owing to the unexpected demands for space, and in deference to the urgent wishes of most exhibitors, it has been decided to postpone the opening until Monday, September 2nd, and the Exhibition will remain open until October 26th. Entries close August 3rd, as already announced. This will be an exhibition of the various appliances connected with the excavation, and subsequent treatment, of gold ore. It promises to be most successful.

HOLLOWAY'S PILLS.—The ills of life are increased tenfold by the mode of life so many have to lead ; most especially is this the case amongst the toilers in our factories and huge workshops of the manufacturing districts whose digestion becomes impaired and nervous systems debilitated by the protracted confinement and forced deprivation of healthy out-of-door exercise. The factory workers may almost be said to have diseases of their own, readily amenable, however, to treatment if not allowed to proceed unchecked. Holloway's Pills are the most effectual remedy ever discovered for the cure of liver and stomach complaints, as they act surely but gently, regulating the secretions without weakening the nerves or interfering with the daily work.

MINING MACHINERY AT THE ROYAL AGRICULTURAL SOCIETY'S EXHIBITION.

ALTHOUGH the Windsor Exhibition was one devoted ostensibly to agricultural appliances, it could claim to have a somewhat remarkable display of mining machinery. A still larger display of these appliances may be looked for at the Gold Mining Exhibition, which will be held at the Alexandra Palace in September and October, but that at Windsor merits all the attention we propose to give to it now and also next week.

Premising that last week we noticed the admirable exhibits made by Messrs. Robey and Co., we now proceed to refer to other appliances in the order in which the visitor could find them in the grounds at Windsor.

Messrs. Ransomes, Sims and Jefferies, Limited, Engineers, Orwell Works, Ipswich, have one of the most prominent and conspicuous stands in the show ground. It is the first one come to on the left hand side on entering the show yard, amougst the machinery in motion. In the front of a stand is a fair display of engines of various kinds, both portable and self-moving, horizontal and vertical, whilst under the high shedding two Steam Thrashing Machines are exhibited, one of which has been specially ordered for Her Majesty's Shaw Farm, at Windsor. There is a stacking machine at the back, and in the shedding is a large collection of all the most celebrated varieties of their prize and chilled ploughs, also patent horse-rakes and haymakers. In looking over the engines in detail we find in front of the stand a 16 h.-p. long stroke Stationary Engine, with patent automatic expansion gear. This is a fine specimeu of work, and is capable of driving machinery where high efficiency is required, and great regularity of speed. There is also a fine Double Cylinder Portable Engine of 16 h.-p. nominal, capable of developing about 50 h.-p., and suitable for contractors' work and other purposes. Also a good Vertical Engine of very simple construction, and a short stroke Horizontal Engine of the most approved madern design, suitable for use in dairy installations and other places where similar power is required. On the other side of the stand driving the two thrashing machines are an 8-horse Portable Engine, and a 6-horse Traction Engine. Messrs. Ransomes' Portable Engines are very simple iu design, strong and serviceable, with cylinder of large diameter, which is steam jacketted and lagged; the wrought iron brackets which carry the crank shaft are firmly rivetted to the boiler, so that no leakage can take place, and the bearings of the crank shaft have both vertical and lateral adjustments for taking up the wear. The governor is one of the high-speed class, very sensitive, and in direct communication with the double-beat piston valve. The boiler is large and capacious, with ample steam space; one great feature in this engine is the large amount of wearing surface in the brasses and other wearing parts. The traction engine has large wrought-iron driving wheels, which are fitted with compeusating motion on the driving shaft. All the gearing is steel. The governor is similar to the one on the portable engine—light and sensitive—and the boiler is of extra strength, so that it may be safely worked at a pressure of 120 lbs. Many of these engines are at work driving steam thrashing machines, and are giving great satisfaction from their simplicity, and the case with which they can be managed.

The Blake-Marsden Stone Breaker and Ore Crusher is also to the fore, and has taken the only gold medal awarded for stone breakers at the Paris International Exhibition, 1886, and the only gold medal awarded for stone breakers at the Inveutions Exhibition. The Blake Stone Breaker is an old and well-known machine, but it has been so improved in details than in its present form the stone breaker only resembles the original machine by adherence to the broad fundamental principles on which its construction was based. The stone breaker is driven in the usual way by a pulley upon a crank instead of an eccentric shaft. Upon this shaft a connecting rod is attached, and at the other lower end of the connecting rod is spindled one end of a solid crucible-steel lever, the other end of which is fulcrumed to the main frame. As the connecting rod lifts up and down it actuates the lever in such a manner that the toggles give the necessary motion to the swinging jaw for breaking or crushing the material uuder treatment. One of the great advantages of this machine lies in the fact of there being a false back, accurately planed and fixed to the frame itself, against which the three fixed jaw faces readily bed, thus avoiding any degree of concussion, and also providing a means whereby these faces can be renewed and reversed in position in a few minutes, at any time, without the use of white metal for running up. These faces are fitted with surface strips on the backs, which also facilitate a dead bearing. By an ingenious contrivance, a positive draw-back motion, is imparted to the swing jaw, which takes no power to work, and which entirely dispenses with the old steel-embedded india-rubber spring. This one advantage can hardly be over-estimated, as the full power of the engine is employed in the reduction of the material. The frictional parts in this machine are greatly reduced. The adaptation of the parts is such as greatly to relieve the strain upon the machine, and the leverage gained has reduced the power required to drive about one-half. The whole of the shafts and axles are made of best hammered steel. These machines are made in sizes varying from 4 ins. by 2 ins. up to 30 ins. by 24 ins. at the mouth, and these are the sizes of material each machine will take in. A further evidence of the little power this new type takes to drive is shown in the 8 ins. by 6 ins. being capable of being worked by hand-power. When we were there the machine was crushing stone from the Clee Hill Quarries, near Ludlow (which is about the hardest that is known), at the rate of 11 tons per hour. It is a noteworthy fact that the whole of the machinery in this exhibit has been sold. The Municipality of Buenos Ayres has bought the 15 by 10 stone breaker, with all latest improvemeuts, and there has been sold, to the Newfoundland Copper Mining Company, the 20 by 10 Double Toggle Lever Machine.

R. Horusby and Sons, Limited, had on view (1.) A 6 h.-p. Traction Engine. The boiler is of ample size and strength, and constructed for a working pressure of 120 lbs. per square inch. The gearing throughout is of the best crucible cast steel. The engine is fitted with link motion reversing gear, and all the usual appliances for haulage as well as for driving fixed or portable machinery. It has a winding drum with 50 yards of steel wire rope, and a water lifter with india rubber suction hose for fittiug the tank. (2.) An 8 h.-p., Portable Engine with second lock up safety valve, feed pump, and equilibrium throttle valve. (3.) A 10 h.-p., Underneath High Pressure Engine, the boiler being of locomotive type. These engines are largely used where space is limited, and where keeping the crank sbaft low down is an advantage. They require very little foundation, and are easily removed. (4.) A 4 h.-p. Vertical Hoisting Engine, specially designed for great variety of work, as it can be used for winding, pumping, or driving fixed or portable machinery. There is a pump crank fitted on the end of the drum shaft, which can be used for driving pumps for raising water in mining operations where required. The construction avoids all chance of breakage, even when roughly handled, and the framing and winding drum are of wrought iron. The engine is also very compact, and takes up but little room; it is mouuted on wrought iron axles and wrought iron travelling wheels for easy removal from place to place. It can, however, be at any time taken off its wheels, and bolted down either temporarily or permanently. This class of engine has been in large demand in all parts of the world, especially for mining purposes. (5.) A 4 h.-p. Vertical Steam Engine, suitable for any purpose where high speed and great power in small space are required.

Crossley Bros., Limited, Manchester, show the Otto Gas Engine, of which over 31,000 have been sold. It is in sizes from 2-man power to 100 h.-p., with important improvements, new designs and later patents, It has gained 100 gold medals and awards, including gold medal, Society of Arts, Motor Trial, 1888; and highest awards, 1888—Melbourne, Barcelona, Brussels, St. Petersburg, &c., &c.

Priestman's Oil Engine, illustrating what is termed the latest motive power, and which received a silver medal at the Royal Agricultural Show, Nottingham, attracted numerous visitors.

Messrs. Aveliug and Porter show their well-known New Road Locomotive Steam Engine, of which, it is said that the working expenses, including wear and tear with interest on capital, vary from 1½d. per ton per mile for continuous work under favourable conditions of road and load to 3d. per ton per mile for short distances, with return journey unloaded. Several improvements have been introduced siuce last we noticed this favourite appliance.

Messrs. Clayton and Shuttleworth (Lincoln) exhibited some Combined Fixed Engines and Locomotive Boilers. For the "Undertype" engine it is claimed that it has a minimum weight with perfect stability. The engine frame, of wrought iron plate, is firmly held in position by the weight of the boiler; the rigidity of the crank shaft pedestals is secured by their being let into the sides of the frame. The floor space for both engine and boiler is little more than that required for an ordinary fixed engine alone. It requires only to be placed on a firm wood or ordinary floor, the cost of special brick or stone foundation is entirely saved. These engines can be fitted with link motion reversing gear (as shown), automatic or ordinary expansion gear. To many of the purposes of mining they are well adapted.

Messrs. Hathorn, Davey and Co., engineers, Leeds, had an admirable exhibit of their pumping appliances, which our readers will scarcely need to be informed, are frequently employed in mining operations, the chief amongst them was "The Davey Safety Motor." It is perfectly safe and no renewable parts or special lubricants are required. It is perfectly noiseless and there is no escape of burnt oil or noxious odours. It requires no engineer and needs no special packing, nor any special care to prevent damage to the engine or generator.

John Fowler and Co. (Leeds), Limited, Leeds, have as their principal mining exhibit, their Compound Horizontal Engine. This engine is of 25 nominal h.-p. The high pressure cylinder is 10 ins., and the low pressure 16 ins. diameter by 20 ins. stroke, and the speed is 120 revolutions per miuute. Both cylinders are fitted with automatic expansion gear (Hartnell's patent, 1883), controlled by one governor. The flywheel is grooved for five 1¼-in. ropes, and is 10 ft. in diameter. This engine is specially constructed for long runs, and has drop sight lubricators to all the bearings, and sight feed lubricators on both steam chests. This engine has been made specially for Col. North, to drive the electric-light installation at his mansion at Eltham, Kent.

Messrs. Gibbons and Robinson, of Wantage, Berks, and 89, Cannon Street, London, E.C., exhibit at Stand 326 type machines of their various specialities in motion. These comprise the "Simplissima" Thrasher, which is without doubt the most durable and simple thrashing machine now before the public. Also a 6 h.-p. Portable Engine of the now well-known "Speeial" type, and this design strikes one as being both powerful and economieal. The Horizontal Engine which they exhibit, also in motion, is of 10-h.p., aud attracted a great deal of attention from many visitors to the show—the number of working parts being reduced to a minimum with the least amount of friction, the greatest degree of steadiness and efficiency is insured. Their other most striking exhibit was a high-class Traction Engine, designed for a working pressure of 150 lbs. to the square in, and this engine has a large number of good points about it. Perfect governing is in all their engines a great feature, and they thereby insure great regularity of speed under varying loads, and eeonomy of fuel.

Gilbert Gilkes and Co. (late Williamson Brothers), of the Canal Iron Works, Kendal, show their Vortex Water Wheel. Thev have been engaged for many years in the manufacture of the Vortex Water Wheel or Turbine invented by Prof. James Thomson, C.E., L.D., F.R.S., &c., and during this time it has been brought iuto extensive use for a great variety of purposes in all parts of this country and abroad. It has been applied on falls ranging from 3 ft. to 500 ft. As a meaus of applying water-power its utility has been generally recognised by those who have had experience of its working. The construction of the Vortex and the mode in which the water is applied in it, consists of a moveable wheel with radiating vanes, which revolves upon a pivot, and is surrounded by an annular case, closed externally, but having towards its external circumference four curved guide-passages. The water is admitted by one or more pipes to this case, and issuing through the guide-passages acts against the vanes of the wheel, which is thus driven round at a velocity depending upon the height of the fall. The water having expended its force, passes out at the centre both above and below the case. The Vortex with moveable guide-blades is described as the most complete form of the Vortex; "it is the best means of apply-

iug water-power in almost all situations, although circumstances occasionally arise in which a cheaper form of wheel may suitably be applied." The Turhine of this firm is also shown. Turbines have long been extensively employed on the continent, and more recently in the United States of America, and have been constructed in a great variety of forms ; some of them being so designed as to attain a high efficiency, whilst others are altogether unsuited for use where economy in the consumption of water is desired. When properly constructed, the turbine cannot be excelled as a means of applying water-power, and it possesses many important advantages over the ordinary water-wheel. From its small size, it can be employed in many situations where the cumbrous vertical wheel si not available, as frequently is the case in mining districts, &c. The Whirlpool Centrifugal Pump is also manufactured by Messrs. Gilbert Gilkes and Co.

FOREIGN MINING INTELLIGENCE.

Continued from page 1093.

POTOSI (28th May).—My last report was dated 16th iust., since which we have made satisfactory progress in development of the miniug department, as the following will show :—New lode : No. 3 tunnel which has been extended through the hill upon the course of this lode, has since my last beeu completed, and the total length of same is 234 ft., in addition to which there is some 30 ft. of open cutting thereon. In thc course of a few days we shall commence sinking a winze below this point in a lode 2½ ft. wide, of solid quartz of good description, and showing strong colours. No. 2 lode : The deep tunnel has been driven north since my last another 17 ft., and we continue to carry only a small portion of the lode, which has become very hard, but looks thoroughly healthy. No. 3 Prospect shaft has been sunk to the required depth to commuuicate with this level, and so serve as an air shaft. As soon as the required ventilation has been effected we shall at once commence cross-cutting the lode here as well as sinking below same. Should the present rate of progress continue, I hope in my next to be able to report that these two points have been holed. Potosi Viejo, Zeiler's shaft : No. 2 level has been driven east of shaft 8 ft. since last report, and the winze sinking below No. 1 level has been sunk another 13 ft., which makes the total depth of same 55½ ft., and we are daily expecting to communicate same. The lode at each point is 2½ ft. wide, of good quality quartz. The winze sinking below No. 1 level west of shaft is now down 22 ft., aud the lode therein is 12 ft. wide of very good quality quartz. No. 1 level has been driven west of shaft since my last 11 ft., and the lode, which is also 2 ft. wide, is producing good milliug ore. We have cleared and secured for a distance of 70 ft. one of the old levels west of shaft with the object of ventilating our workings in that direction as well as to render available some productive ground which we find to be making up in the back of No. 1 level. Socorro lode : The deep tunnel has been driven south another 9 ft., and then temporarily suspended on account of want of ventilation. The lode in the present end of this drive I have never seen looking so well as it does now. It is 3½ ft. wide, of good quality ore. The men have been taken from this point aud put to rise in the back of the level so as to communicate with the winze being sunk from the level above. The rise is already up 20 ft., aud the lode therein is 2 ft. wide, of good milling quartz, and the lode in the winze is of the same size and description. The latter (winze) has been sunk since my last 20½ ft., which makes the total depth of same 66½ ft. I hope in my next to be able to report the communication of these two points, which will again afford good ventilation. In the winze sinking below No. 3 level (the deep tunnel) we have sunk another 20 ft., which makes the present depth of same 31 ft. The lode is 2½ ft. wide, of good quality quartz. From the foregoing it will be seen that our explorations continue to open up favourably, and we have never felt so much encouraged as to future prospects as at the present time.—J. Pryor.

RUBY AND DUNDERBERG CONSOLIDATED (2nd June).—Dunderberg : Amount of ore shipped during the week 10 tons, and about 35 tons broken in the mine ready for shipment. In the Eagle's drift we have raised 7 ft. during the week, making a total of 238 ft. driven ; the ground is not quite so hard as it has been. We have six contractors and 16 tributers at work here. Lord Byron : This mine is not looking quite so well as it did a week or two ago, and several tributers have left. We have now eight tributers at work here. Slag Heap : We have four men separating out the iron and matte.

— Telegram received 25th June from Eureka :—"8 tons tribute ore shipped ; 17 tons tribute ore sold for smelting, producing to company $57."

UNITED STATES GOLD PLACERS (3rd June).—I have so far this spring done a great deal of work that you, gentlemen, know but little about (although I have reported every month), and this without any direct orders from the directors or company—but I felt I knew what should be done and made a desperate effort to put it through and have done so successfully, so that now I can report everything in perfect working order. We were able to turn water in the ditch and flume on the 12th of last month, but owing to the fact of no water being in the flume all spring, we had to be careful in filling it, and it was only about the 20th that we turned the nozzles on the bank, since which time we have been running all the day light we have had. I fell short of lumber to fully complete the flume in all the ditch, but I got the worst part of it covered however, and so far everything is running splendidly. Were you here now you would be delighted to see the gravel move in the sluice-boxes in the bottom of that open cut which was in the claim. We cut down 30 ft. before putting in the sluices, and I can now tell you that it is the best plant over the ground to-day in this country, or any other for the size of it. —W. J. Madden.

VICTORY (27th May).—I have had to stop milling through being short of water. We are commencing to erect the other head of stamps. We shall sink a water shaft, and then we shall be able to keep the mill going.—Nicholls.

WEST ARGENTINE GOLD CO., LIMITED.

(In Liquidation.)

CIRCULAR TO THE SHAREHOLDERS.

19th June.—As liquidators of the company duly appointed by the shareholders to carry out the special resolutions passed at the extraordinary general meeting of the company, held on the 31st ult., and duly confirmed at the second extraordinary geueral meeting, held on the 18ih inst., we beg to hand you herewith three forms of application for shares in the new company. Form No. 1 is filled up with the number of shares to which you are entitled with 15s. 6d. per share credited in virtue of your holding in the West Argentine Gold Company, Limited. This form signed by you and accompanied by cheque for the amount payablc on application, must be forwarded to the bankers, the London and County Banking Company, 21, Lombard Street, not later than 9th July next, otherwise it will be assumed that the offer now madc to you is declined. Form No. 2 : Application for extra shares. You arc entitled to tender upon this form for any shares not taken up under Form No. 1, stating the sum you are willing to pay in addition to the 6d. per share on application, remitting the same with your application. The highest tenders will be allotted iu full so long as any shares are available. Form No. 3 : Applications for extra shares with 15s. 6d. credited at par. Should there still remain any shares unallotted after the applications under forms Nos. 1 and 2 have been dealt with, these applications as above will be considered, and shares will be allotted *pro rata* according to the numbers applied for respectively. Whatever shares, if any, may remain unappropriated on the 9th July next, must be allotted to the syndicate, by whom the new company has been formed, uuder terms of agreeuent, dated 31st May, 1889 ; early attention to this notice is therefore necessary. (These forms may be had as under.)—S. L. Howard, W. P. Owen, Liquidators.

It is notified that the Bank of New Sonth Wales will pay the interest, due on July 1st, on the bonds of the town of Brunswick (Victoria, Australia) Loan No. 2 for 28,000*l*.

The Trustees, Executors and Securities Insurance Corporation give noticc that, on and after Thursday, the 27th inst., they will be prepared to receive for examination the coupons of the Boston United Gas scrip, due on July 1st.

DUNCAN'S TRAMWAY MANUAL FOR 1889.
(TWELFTH EDITION.)

Now Ready, Price 5s., Post Free,

This Book contains every needful information relating to all the Tramway Companies in the kingdom, as well as those abroad the capital of which is held in this country. It is the acknowledged authority on all matters relating to Tramways.

It gives an Analysis of the Accounts of each Company for the two past half-years, and the Traffic Tables of all the larger Companies.

It shows the exact financial position of each Company, and gives the names of those connected with its administration and management.

Mr. Duncan has endeavoured to make it a safe guide to Tramway investors, as it deals solely with actual facts, from which the intelligent Shareholder can, at a glance, form his own opinion.

It is an invaluable Book of Reference, and both large and small investors may save themselves from serious loss by having it at hand to consult.

EDITED BY MR. W. W. DUNCAN, TELEGRAPH STREET, LONDON, E.C.

Published by Messrs. Effingham Wilson and Co., Royal Exchange, E.C.

CAPT. FRANCIS RULE, Manager of the Santa Gertrudis and other Mexican Mines, and formerly Manager of the Real del Monte Company's Mines in Pachuca, and having a Mining Experience of 30 years in that country, Offers his Services to Inspect, Survey or Report on any Mining Properties in Mexico.

ESTABLISHED 1871.] SATURDAY, JUNE 29, 1889. [ESTABLISHED 1871.

REPORTS OF MEETINGS.

THE YURUARI CO., LIMITED.

POLICY OF THE BOARD ENDORSED BY THE SHAREHOLDERS—A SHARP DISCUSSION ENDS IN A VICTORY FOR MR. HUGH WATT—POSITION AND PROSPECTS OF THE COMPANY.

AN extraordinary general meeting was held at Cannon Street Hotel, on Monday, when the subjoined resolution was proposed :—

"That the following article do form part of the articles of association of the company, *videlicet*, that the capital of the company be increased by the sum of 125,000*l*., divided into 1,000,000 shares of 2s. 6d. each, such share to rank *pari passu* with the present share capital of the company, and that the board of the company be and they are hereby empowered to issue such shares in every respect as if such shares had formed part of the original capital of the company, for such consideration and upon such terms in every respect as the board shall think fit."

Hugh Watt, Esq., M.P., chairman of the company, presided.

Mr. FRANCIS REGINALD ROBIN (secretary) read the notice calling the meeting.

ACTUAL POSITION.

The CHAIRMAN, who was cheered on rising, said : Gentlemen, in moving the resolution, which has been read by the secretary, I shall not detain you longer than is absolutely necessary. In proposiug to double the capital of the company, I may say that proposal has not in the first instance emanated from the board, though in one sense it has, but it has been suggested by innumerable letters we have received from the shareholders of the company, begging almost the directors not, if possible, to make any call upon the shares. Those of you who were members of the old company are well aware that in taking over the assets of the New Chile Company, excluding the Eureka property, that we did so subject to the debts, notably the debenture debt. Those who were shareholders in the original company are, unfortunately, too well aware of the fact that they have had to pay 1*l*. 5s. 6d. upon each of their shares. It is unnecessary, therefore, to add that the directors considered it a primary object and duty, provided some scheme could be devised cousistent with the interests of the general body of the shareholders, to relieve the old members from any further call. I am pleased to say, gentlemen, that in relation to the proposal which we now submit to you, that we have been supported by, as far as I am aware, almost the eutire body of the shareholders. (Cheers.)

APPROXIMATE FIGURES.

I do not wish to detain you with a view of the situatiou as we found it iu the April of last year, but it may not be inopportune if I say that in plaee of the debts of the company being then, as estimated, 20,000*l*., 30,000*l*. would more nearly approximate to the figure when the two liquidations in Venezuela and in England have been concluded. Of course, it is impossible for me to do more than quote approximately the figures which may ultimately be arrived at, because these liquidations are not closed. As far as England is concerned, they will be closed shortly, but in Venezuela they are entirely beyoud our control. Several enquiries have reached me with regard to the disposal of the money which was paid into this company, or was due. It amounted to about 32,000*l*.—that is from the 6d. per share and the premium added. As to the disposal of that money, there has been remitted by the board to the mines in relation to the old debts and other pressing matters, which had to be paid in this country, a sum of 23,000*l*. With regard to the maehinery expenditure, some shareholders have with perfect fairness written to us as to the very large expenditure in connection with machinery.

MINING EXPENSES.

I will only ask you to remember that the mines are situated in a tropieal country, and I see certain gentlemen present who are conversant with the fact that expenses in Venezuela are in excess of any other mining region of the globe. That, I regret to say, is an undoubted fact, but in regard to the expenditure with maehinery (2,500*l*.) during the old *regime*, aud before my present colleagues took office, the expenditure, including transit and all outlay of the mines was estimated to amount to 10 to one in eomparison with the costs incurred iu the original purchase in this country. I am pleased to say that civilisation has so far advanced out there that we have been enabled to estimate the cost of that machinery, including all expenses, at four times the original cost, as against 10 times in former periods. (Cheers.) If you will add these two items you will find that they exceed the total amount we have called from you, the old shareholders, viz., 6d. per share. In passing to the question of bullion, it is somewhat unusual to ask a chairman to give you full particulars with regard to accounts which have not yet been received here, so that you will be good enough to undefstand the figures I submit to you are only approximate and subject to such fluctuations as we may be unable to acco[illegible]or, but I think, generally speaking, these figures may be accepted as [illegible]erably aecurate. We have during the past year been compelled to make very extensive development operations on the property, and without going back into the past (because I wish in moving this resolution to confine myself, as far as possible, to the financial aspect of the question raised by the resolution) I would say simply this, that the New Chile Company during the latter part of its career found itself hampered, because shareholders voted against a resolution unofficially submitted as to the desirability of eutting the capital to the actual amount paid into the New Chile Company, namely, 5s. per share. Those of you who were shareholders in the old company know that owing to circumstances that occurred, it was found that those shares had been issued at a discount, or, at all events, they were amenable to be considered so in the event of liquidation. The concensus of opinion seemed to be that that would have a detrimental effect upon the market, and I did not, therefore, press the matter upon the shareholders, particularly as the board are always anxious to meet the wishes of the shareholders as far as they can. (Hear, hear.) Had the capital been so cut the present company would have had no existence and the reserve of capital by unissued stock, which was then selling at over par, would have been 60,000*l*., or nearly twice the amount of capital, which so far has sufficed to finance the company. Passing on to speak of bullion, while we have not the total figures, yet basing our estimate upon results in the New Chile Company, I estimate the balance after the payment of working expenses for the year at 5,000*l*. That 5,000*l*. has been devoted towards developments which have cost from 8,000*l*. to 10,000*l*., the balance having been provided by the premium obtained upon the shares issued to shareholders and others by the present board. The question now must suggest itself to you as to how we have succeeded in financing the company upon a sum of 32,000*l*. during 12 months commencing from 30th April of last year. We thought, with our reserve capital, we could finance the company by bank loans without calling upon the shareholders to pay more than 6d. per share. Here I may be allowed to state that I express the opinion when I suggested the formation of a new company, that owing to legal decisions and conflicting judgments shares issued without a property consideration are amenable to a full payment, and acting on this idea we were very careful in the formation of this company. When we endeavoured to arrange the loans with the banks, we found the debenture debt an insuperable obstacle, eonstituting, as it did, a first mortgage upon the property. The result has been that it has been necessary for me to make advances to the company to a large extent to prevent ealls being made. It is absolutely necessary to say this, though I always dcpreeate the introduction of personal matters in dealing with corporate interests. I have said shareholders have paid 1*l*. 5s. 6d. upon each of their shares, that is 1*l*. to the old administration, 5s. on the re-construction, and 6d. to the present board, and our correspondence has been to the effect that we should resort to every means rather than make a call. Well, gentlemen, in proposing that we should have a reserve capital of 100,000*l*., and that the capital should be doubled, of course it is necessary that the directors should show cause, outside what I have stated, for adopting a course which may be unique, but which, uevertheless, I venture to assert is not detrimental to the interests of any honourable proprietor, but which is calculated to raise the necessary capital without resorting to a call.

THE OUTLOOK.

The position of the company to-day and prospectively is this :—The debenture debt, roundly speaking, is 60,000*l*., and the date for payment has been delayed until October 1st. (Cheers.) The amount due to traders, being the difference between the sum remitted to the mines and the total amount due by the old company would come to something like 10,000*l*. The amount due in this country is *nil*. With regard to the Water shaft, the estimate of the mauager is that 5,000*l*. at least will be necessary to sink it to a distance of 200 ft. and run levels east and west. I am not going into ancient history, but the question may be asked, how is it this work was not undertaken by the former company ? When we came into office on January 1st, 1885, we found that the working expenses amounted to over 10,000*l*. per month. I mention that to show that the New Chile Company could not possibly have gone on with operations in two shafts at the rate at which working expenses were then conducted, so that if we find the property is not developed to that extent which some of the old shareholders might expect, it was largely upon the ground of working expenses. Operations were suspended because their continuance would have run the company into difficulties—having regard to the fact that the old Chile Company's obligations came to nearly twice the amount estimated by the former secretary when the board took office. A map showing the operations since conducted has just been received, and any *bonâ fide* shareholder can see it. I am willing to give every information consistent with the interests of the company which any shareholder has a desire to ask for. With regard to the financial question, my estimate of the expenses of the Water shaft so

as to open up the old rich mine, most of which belonged to the Potosi Company, and which, when it was owned by the firm of Mr. Somes, yielded the largest return, not excluding El Callao, that had ever been produced in Venezuela—the Water Shaft will give us access to that. The total will come to a sum approximating to the present issue of capital. I need hardly trouble you with the fact that most persons conversant with mining companies are aware that managers are exaggerated in their ideas as to what is requisite. Our manager has written with regard to a new mill, houses, and other things, which, of course, the directors have no intention to entertain at present.

COMPREHENSIVE PLANS.

I do not think it at all boastful to say, having regard to the figures, that no company starting with a debt almost commensurate, with the total capital that has been raised in 14 months has ever carried on its business with a less sum of money. (Cheers.)

THE DEBENTURE MILLSTONE.

You may say to me, there are other means of raising this money. I think the board have resorted to every other available means. They first of all asked existing debenture-holders to continue their debentures for five years, but the response was not equal to 20 per cent. of the entire amount. Then they issued a circular to the shareholders, asking them to step into the position of the debenture-holders, but a serious question arose. For the debentures were issued upon the understanding that the uncalled capital was to be reserved for them, and thus the company would have been practically left without working resources. Our experience with regard to this debenture debt has been that it has been an almost insupportable millstone about our neck. The debentures were to be repayable according to the original arrangement in four annual instalments at the end of each year, but I induced the trustees to forego this, after we had paid them interest, and otherwise 40,000*l*. or 50,000*l*. Without saying more upon that head, there is the question of preference shares, which I should be extremely reluctant to issue. I think that to do so would be an act of injustice to the other shareholders. Then I came to consider this proposal, and in view of the innumerable letters which we have received from the old shareholders, I could devise no scheme which would have the effect of preventing a further call being made upon the existing shareholders without having recourse to the plan I now suggest of raising 125,000*l*. The proposal simply amounts to this—providing you sanction this scheme, and do not apply for the shares, existing shareholders will have to pay if my estimate, based upon prospective contingencies, is correct, 2s. per share.

QUESTIONS IN FINANCE.

What is the position to-day? The share upon which you have paid 6d. is worth 1s. 6d. (No.) I am sorry you say that, because I bought a good many on Saturday, and the price I paid was 1s. 3d., but assuming, for the sake of argument, that the price was 1s. 6d.,then, if you paid 2s., the price ought to be 7s. 6d. Supposing at the end of the year you find yourselves in the position I have named, would your 2s. 6d. fully-paid share be worth 7s. 6d. I look at it from an interested point of view, because at the beginning of 1887 in place of reducing my holding I steadily increased it, and in view of a report which we received on Saturday I am quite content to retain my holding until I see them at 10s., and then I shall see something like my money back. (Cheers.) I have every faith in the property, and I think after this resolution is passed, I can satisfactorily explain the smallness of the returns we have received during this year, I think that I can show that it is owing to the position of the mine when we took it over, and to the financial difficulties of the former company about the time of the re-construction. If you pay 1s. upon 2,000,000 shares, or 2s. upon 1,000,000—looking at it from the point of view of the market value—I ask anyone here who is conversant with financial matters to say whether two shares 1s. paid are not likely to be more valuable than one share with 2s. paid. I think there can be no doubt as to the answer to that question; the board at all events have done their duty to the shareholders, who came into this company in making a proposal, which, if carried out, will have the effect of preventing a further call upon the shares. I do not suppose that 1,000,000 will be subscribed by the shareholders. I have stated October as the date for the debentures to fall due, but there is no immediate hurry for the issue of these shares, and you may rest assured that the present directors, who between them hold nearly 100,000—(hear, hear)—are not likely to damage this company, as a gentleman said in some newspaper by watering the stock. How can you water the stock when you propose that there shall be 2,000,000 shares at 1s. as compared with 1,000,000 at 2s. You have a liability which you must meet, and this scheme has the support of the solicitors to the trustees for the debenture-holders.

"AN EXCELLENT SCHEME."

He says that in his opinion it is undoubtedly an excellent scheme. I cannot say it has the support of the trustees, because one of them is away, but the debenture-holders must have their money in any case. I think the debenture-holders have met us fairly, and had it not been for a drought in Venezuela we would be having returns which would have made the position of the company very different from what it is, and I think that by the time stipulated for paying off the debentures the shares will be at such a value that we shall be able to raise more than the necessary capital without issuing anything like the 1,000,000 of shares.

SCHEME WELL SUPPORTED.

It is not the interest of the directors to water the shares, or to issue one more than they think is essential in the interests of the general body. We have no wish to do so, and I may say that, with the exception of three letters adverse to the scheme, which, when answered, brought proxies, and two letters from shareholders from whom I have had no reply, we have not had a single objection to this scheme, but have received in connection with it proxies of a larger amount, approaching a quarter of a million, than we have ever received in connection with any other plan since the present administration took office. (Cheers.) I will now, without further comment, propose the resolutions for, which this meeting has been convened.

CHAIRMAN'S VIEWS CONFIRMED.'

Gen. BARWELL: I most heartily second the resolution. There is one thing that struck me about it at the first, that it puts us in a financially strong position. To carry on the business far away from England is perfectly impossible unless you have ample means. The mine wants money, because there is a drought, but there has been hanging round our necks this debenture debt. The debenture-holders must be paid or the mine goes from us—(hear, hear)—and if you do not carry this scheme we shall have to call up the 2s. per share, and when we have paid the debenture-holders we shall not have very much left. You have a splendid mine and magnificent machinery, but you have not much cash. As to its making any difference in the market value of the shares—I do not believe it for a moment. On the contrary, I am sure that if you have a mine in a strong financial position instead of with a debenture debt, it does not matter whether your capital is called 250,000*l*. or 125,000*l*.

QUESTIONS.

Mr. SNELL: There are a few questions I should like to ask. At what price were the shares not taken up by the shareholders of the old company issued? There has been clearly an issue of these shares, and it is materially to know the price at which they were issued, because that will also let us know what the directors will adopt in issuing the ballots? What amount has the chairman advanced, at what interest and what amount is now due if any? What is the total indebtedness in this country and abroad? What is the number of shares now held by the board and each individual member? What is estimated by the board to be the monthly expenditure of the mines and in this country, and what have been the returns for the last six months? When do the debentures fall due?

A SHAREHOLDER: That has been answered.

UPROARIOUS PROCEEDINGS.

A gentleman in the body of the room here made a vigorous attempt to address the meeting, but was not allowed to do so. When the CHAIRMAN stated he was not on the register, the individual in question stated that the company had refused to place his name on the register.

The CHAIRMAN said that this gentleman had sent in a transfer for 50 shares, which was submitted to the board, but the board refused to pass it, so that he had no shares in the company.

Mr. JOHN CHINOWETH proposed that this gentleman be not heard.

Lord FRANCIS GODOLPHIN OSBORNE seconded the motion, which was carried.

Mr. John Newton rose to address the meeting.

The CHAIRMAN: You have not any shares in the company. I must explain to the meeting that some five or six men have forced their way into the meeting who have no right to be here.

Mr. NEWTON: I am a shareholder in this company.

The CHAIRMAN: This gentleman's name is John Newton, and he has not a share in the company. Mr. McAllister, who has interrupted so frequently, will, if he knows anything about business, know that a gentleman who has no shares in the company has no right to be here. We have also here a small faction who hold a few shares between them.

A SHAREHOLDER (speaking indignantly to the opposition): Why should you come here to try and ruin other people's property? (Hear, hear.)

Mr. JOHN NEWTON: I have a substantial interest in this company.

The SOLICITOR: This gentleman says he has 10 shares.

The CHAIRMAN: Mr. Snell has pointed out that if a person has no shares he cannot speak, and that gentleman will also know that directors have a right to refuse to register the transfer of a person to whom they may have objection. His firm wrote a letter to us on the subject.

Mr. SNELL: I did not write to you.

PERSONS WHO RUSH INTO THE ROOM.

The CHAIRMAN: Your firm did, and tried to thrust a shareholder upon us whom we considered objectionable, as we have a perfect right to do under article 24 clause 3. Mr. Snell was satisfied with this explanation, and took no further action for five months. Another application was made by Messrs. Gresham, Davies and Co., to whom we replied, and we have heard nothing from them since. I appeal to you whether a gentleman (referring to the first speaker) thrusting himself on a meeting ought to be tolerated by the shareholders. It is impossible for me to believe that men of any respectability would be guilty of such conduct. I will now reply to Mr. Snell's questions. The premium is 7,000*l*.; the chairman's loan is about 10,000*l*.; the indebtedness of the company in Venezuela is about 10,000*l*., but those are the ordinary trading debts which are, of course, not immediately required, and we estimate for the Water shaft, and its probable requirements during the present year 10,000*l*., and, therefore, I say that to place ourselves in a strong position we must have a reserve of capital.

BOUNDARY QUESTION.

I have taken a very deep interest in relation to the question of whether we are in British territory or not, and also in the matter of railway communication—(cheers)—for if we had had railway communication our expenses would have been immensely reduced. For the last few years I have been in communication with the Government, with every prospect of a successful issue, and through my efforts, to a large extent, we have British Guayana extended to within 30 miles of our mine. I have shown cause why our mines ought to be in British territory; if they were, what would be the result you can readily imagine. It would not be troublesome for me to show you that the action of Mr. Snell has cost this company thousands of pounds. He opposed us in the liquidation. I had a gentleman prepared to liquidate the company for 100*l*., but the liquidation forced upon us by his affidavit full of misstatements led to the appointment of a liquidator by the Court, which may cost the company thousands of pounds. Mr. Snell, holding his 10 shares—would any man with such a holding make the statements he has done when he is already solicitor or chairman of some 30 companies?

A BIG INTEREST.

The CHAIRMAN: I want the shareholders to know the truth, and I challenge Mr. Snell to rise and contradict me. My interest in the company is about 60,000 shares; when it was re-constructed it was 40,000*l*. Owing to the loans I had advanced I could have got the whole

of the property into my hands, and it was my interest not to form the Yuruari Company, but I formed it, and the action I have taken throughout has so convinced the debenture-holders that they have agreed to postpone the payment until October 1st, although a clause in the debenture deed gave them the power to foreclose. Will any man for a moment assert that it is not in the interest of this company to give the present directors power they ask, when in 14 months they have only drawn from you a sum little more than equivalent to the debts of the whole company, and when they have worked in your interest night and day. For the last 12 months I have done little else than attend to the affairs of this company, and if you allow me to leave in time I am going in my place in Parliament to press the Government with regard to recent riots in Venezuela, though happily not near the mines, and I pledge my word to you that I will do everything I possibly can to make a success of this company. I believe with your assistance that I can make it a success, and if you will allow me after this meeting I intend to make a statement, and I will answer every question of a pertinent and relevant character which any *bonâ fide* shareholder may ask, but I do not consider the man a *bonâ fide* shareholder who takes five shares for the purpose of making a row at a meeting. (Cheers.)

HOW MR. WATT BECAME CONNECTED WITH THE COMPANY.

I think an English audience always gives fair play to a *bona fide* shareholder, particularly if he is in a position of responsibility as I am, and if his holding has entailed upon him an expenditure of over 40,000*l*. It would have been a very good day for me if I had never seen the company. I was first brought into it through my firm having shipped the machinery. I then induced friends to join it, and they came to me later on and said, "You must take up our cause and fight it, or our money is lost." I did take it up, and within three days raised over 100,000*l*. The only matter I did not submit to your arbitrament before submitting the scheme was that of Yuruari. That scheme was opposed by Mr. Snell, but was carried by about 900 to 10, and subsequently Mr. Snell thought so highly of it that he re-constructed the Oscar Company upon the same basis.

Mr. SNELL: I assure you I never in my life had anything to do with the Oscar Company, and never attended one of its meetings. (Laughter.)

A TRIBUTE TO COLLEAGUES.

The CHAIRMAN: Mr. Snell says he wants to know the individual holdings of the directors. He can go to the register and see our names, but I hold in all about 60,000 shares. I have run the company with the assistance of the gentlemen around me, who have most cordially and loyally supported me, and who have advanced thousands; but I find myself opposed by people who have never taken 1,000*l*. worth of stock in anything. I again move the resolution, but any contrary motion can be put. If none is forthcomiug, I will ask your vote.

A BACCHANALIAN SIMILE.

Mr. DARVALL: I hold 1,000 shares, and move as an amendment, "That instead of issuing this extra capital, a call be made of 2s. per shares on the existing 1,000,000 shares"; aud I, as a holder of 1,000 shares, am willing to pay, and am certain there are those who are the same. I know other mines where certain shareholders cannot pay the calls, and the directors are not able to force them. If you issue this other million shares your reputation will not be worth two penny-worth of cold gin. (Laughter.)

The CHAIRMAN: Under the articles we have no power to make a call of more than 1s. at a time.

Mr. DARVALL proposed as an amendment upon his amendment that 1s. should be called up now, and another shilling according to the articles.

Mr. MCALLISTER said he was led into this company by the chairman, and he held 1,650 shares. (The CHAIRMAN: I never spoke to this man in my life.) He would second the amendment, because he predicted that the attempt to float one million shares would be attended with utter failure. The shareholders in his opinion would sooner pay up the 2s. a share. (No, no.) What was the reason of the chairman's faith in this company?

A SUBSTANTIAL REASON.

The CHAIRMAN: My reason for the faith which is in me is shown by the fact that I have increased my holding, and have about 60,000 shares.

Mr. STEWART: I am an original shareholder in this company. Is it necessary to double the capital? If the chairman can issue the shares at a premium I would say that a million of them is out of the question.

The CHAIRMAN: It is only taking power to issue a million. (Hear, hear.)

Mr. STEWART: I rather object to giving such power. I would make a call of 1s. a share and take power to issue a smaller number.

Mr. PEELE: You want certain money to pay off the debentures, but what do you propose to do with the balance?

The CHAIRMAN: The shares are to rank *pari passu* with the old ones, and the first call will be 6d. In response to what Mr. Peel said last year, I stated that the board would undertake to reserve sufficient capital to pay the debenture-holders. The solicitor for the trustees says that, in the event of this resolution being passed, he is willing to recommend to the trustees of the debenture-holders that the amount be reserved.

Mr. PEELE: In what form is the security given for payment?

The CHAIRMAN: By an agreement duly executed.

Mr. PEELE: How does it happen that you have made so many mistakes with regard to your indebtedness? Every man is liable to mistakes, but the chairman should be the last person liable to them with the information he has at hand.

The CHAIRMAN: I think everyone knows that when it is necessary for a company to go into liquidation the expenses are usually an increase upon any estimate that is formed. You may rest assured that no directors of any mining company in Venezuela have exercised more care in relation to the expenditure of every penny. The only point in conflict with the management has been this—that they have wanted more money than we could give them.

VIEWS OF MR. SNELL.

Mr. SNELL: I rise for the purpose of opposing the motion of the chairman, and supporting the amendment. I do not propose to follow his example, and enter into personal matters. It is true I hold only 10 shares, but I have a perfect right to be here, and take what steps I think proper to protect that interest and the very much larger interest of other shareholders who are not present. You are told by Mr. Watt that the whole of this 125,000*l*. capital will be at once appropriated towards the debenture debt, the debt due to himself, and other liabilities. So that supposing the whole amount is raised by this proposed issue it would only be 125,000*l*.

The CHAIRMAN: Sixpence per share only would be called.

Mr. SNELL: How far will that go towards paying the debenture debt and working this mine? We have now a little information, that the shares will be 6d. paid and at 1s. premium. What is to prevent you from having a call directly after this issue, if it is not fully subscribed. You will not get rid of the shares so easily as you did before.

CARCASE *v.* EAGLES.

Mr. COOPER: "Wheresoever the carcase is, there will the eagles be gathered together," and wherever there is a company that might be cut up and sold as keg-meg, there we read the name of a certain solicitor. (Laughter.) I do not think there is a carcase here, but that we are alive and kicking. (Laughter.) It is a living body, and not a dead carcase. I hold 200 shares, and have held them a very long time. I hope the resolution of the chairman will be carried.

Mr. JOHN NEWTON: I represent 500 shares bought by my brother in the original company. The present issue is an issue of voting power to the directors, who are not entitled to the confidence of the shareholders.

Mr. NEWTON made many efforts to proceed with his address, but could not obtain a hearing.

THE AMENDMENT DECLARED LOST.

The CHAIRMAN: I will put the amendment first. 42 hands are in its favour—those against. I declare the amendment lost.

Mr. DARVALL: I demand a poll.

The CHAIRMAN: That is what we challenge. Most of those who voted had no right to do so. One hundred shares are necessary to enable a person to vote, aud I declare the resolution carried by the requisite majority.

The SOLICITOR: By the 58th article, "Unless a poll is demanded in writing by at least 10 members, the declaration by the chairman that the resolution has been carried shall be proof to that effect."

Mr. SNELL: I intend proposing the adjourument of the meeting, because we all seem to have got too warm.

THE ORIGINAL RESOLUTION DECLARED CARRIED.

The CHAIRMAN: I declare the amendment lost, and I will now put the origiual resolution. Those in favour, including proxies, 405; those against, 42. I declare the original resolution carried. (Cheers and counter cheers.) I now speak to Mr. Darvall, who has moved for a poll. That request must be signed by 10 members. I have already pointed out that a large number of persons have rushed into the room who have no *locus standi* here, and how can you take a vote from persons guilty of such disreputable conduct. (Cheers.) We have proxies sufficient to swamp them 50 times over. They know that, and therefore do not go for a poll. If they do not demand a poll, then my motion is definitely carried. I challenge them in the presence of this meeting to demand a poll. (Cheers.) If they do let me tell them that they will be only wasting time, because with those present, and with a lady who has just come into the room holding 5,000 shares, we can carry the resolution by 100 to 1. (Loud cheers.) The dissentients are a mere bagatelle, and the noisy persons are mere adventurers, whose holding is not worthy of consideration. I intend, in my place in Parliament, in connection with the Joint Stock Limited Amendmeut Bill, to move motions in relation to solicitors and others who upset these meetings, which I think will snuff out some people who are nuisances in the City. As you do not demand a poll in writing I declare the motion definitely carried, and I also declare the meeting over. (Cheers.)

Lord OSBORNE: I beg to propose a hearty vote of thanks to the chairman for presiding at this meeting. I can safely say that I have never heard a chairman conduct a meeting with more business tact, and in a quieter, more gentlemanly, and more self-possessed manner. From the bottom of my heart I propose this vote of thanks. (Cheers.)

Mr. SYKES: I second it.

The CHAIRMAN: I beg to thank you very much.

The proceedings then closed.

LATEST REPORT.

The secretary advises receipt of the mail from the mines, dated Chile, 28th May, in which the manager reports as follows:—"I regret to inform you that the drought still continues, and the rains which fell last month have not been sufficient to enable us to re-start the mill. Our chutes on surface are now full of quartz from different parts of the mine, and our wood contractor is unable to supply a single cord, being without pasture for his animals. I am very anxious to get the mill at work again, so as to clear the chutes, as the quartz now on surface is relatively poor and mixed with bluestone. Still, our expenses being much reduced, I have no doubt that it will more than pay milling expenses. It is also advisable to put through the mill a quantity of the poorer rock, so as to amalgamate the tables. I am pleased to inform you that good progress is being made with the levels. In Cenicero No. 10 west we have a strong lode; quartz of very good appearance, but no visible gold at present. No. 9 west: The lode still continues broken up. No. 8 west: The lode of late has been rather mixed, but now quartz is coming in again, and visible gold has been seen during the past week. In the Water shaft, the lode in both Nos. 4 and 5 east is looking very well. No. 4 quartz has, however, the best appearance, and still continues to show visible gold. I had hoped to be able to inform you by this mail that we had started the rock-drills in No. 8 west and No. 8 drift west, but, unfortunately, on account of the drought, firewood has been very slow in coming in, and until we can get sufficient for a week's run in the yard we do not think it desirable to start the compressor. I am hurrying up the contractor as much as possible, and hope that we shall be able to start on Thursday next. I am pleased to say that I have now a sufficient supply of dynamite in hand."

VISO TIN, LIMITED.

SHAREHOLDERS RESOLVE TO EXPLORE THE LODES IN DEPTH, AND TO RAISE CAPITAL FOR THE PURPOSE—ENCOURAGING VIEWS OF DIRECTORS AND EXPERTS WHO HAVE SEEN THE MINES—CAREFUL PLANS AND ESTIMATES.

AN extraordinary general meeting of this company was held at the Great Eastern Hotel, Liverpool Street, London, on Saturday, for the purpose of considering, and if so determined, of passing the following special resolutions or modifications thereof, or other resolutions to the like effect:—

(1.) "That the Viso Tin, Limited, be wound-up voluntarily." (2.) "That the liquidator be, and he is hereby authorised, to sell and transfer to a new company to be incorporated with limited liability under the Companies Acts, 1862-1886, the lands, mines, mining and other rights, buildings, plant, machinery, stores, ores at surface or underground, debts due to, and all other property and effects of this company, of every description whatsoever, upon the following terms and conditions. (*a.*) The name of the new company shall be such as the liquidator may approve and the nominal capital thereof shall be 96,000*l.* in 192,000 shares of 10s. each. The memorandum and articles of association of the new company shall also be subject to the approval of the liquidator. (*b.*) The consideration for the said sale and transfer shall be—(1.) The payment of the sum of 87,000*l.* by the allotment to the liquidator, or his nominees, of 180,000 shares of 10s. each in the new company, credited with 9s. paid thereon, and having a liability of 1s. per share and no more, and 12,000 shares of 10s. credited with the full amount as paid up thereon. (2.) The payment in cash at par of the amount due upon the debentures issued by the company, with the option to the holders of the debentures to accept in lieu of cash debentures in the new company bearing interest at and after the rate of 7 per cent. per annum, or to exchange their debentures for shares in the new company at the rate of 25 shares of 10s. each, credited with the full amount as paid up thereon, for each debenture of 5*l.* the shares to which any debenture-holder shall be entitled shall be paid out of the fully-paid shares, part of the purchase-money. (3.) The payment and satisfaction by the new company of the debts and liabilites of this company also any moneys which may have to be paid to dissentient shareholders, so far as the same shall not be satisfied by the liquidator out of any moneys in his hands. (4.) The payment of the costs of and incidental to the winding up of this company, and of and incidental to the formation and registration of the new compauy." (3.) "That the liquidator procure to be allotted out of the shares to be paid as part cousideration for the purchase to every member of this company requiring the same as his nominee under the contract hereinafter mentioned, three shares in the new company, each with 9s. credited as paid thereon for and in respect of every share held by him in this company. To entitle the members of this company to an allotment of such new shares, application must be made for the same iu writing, accompanied by a payment of 3d. per share on the number of shares applied for, within 10 days next after notice requiring him to apply for the same shall have been given." (4.) "That the liquidator be at liberty to continue the work and business of this company, pending the completion of the sale to such new company, and to pay the costs and expenses thereof out of the assets of this company." (5.) "That the liquidator be authorised to enter into a contract similar in form to that now submited to the meeting, but with power to concur with the new company in any modification of the same which he, or they, may consider necessary, or expedient, for carrying into effect the arrangement embodied in the aforesaid resolutions."

James Judd, Esq., J.P., chairman of the company, presided.

Mr. N. GOLDMAN (secretary) read the notice calling the meeting.

DIRECTORS WHO VISIT THE PROPERTY.

The CHAIRMAN: Ladies and Gentlemen, the notice calling the meeting has been read by the secretary, and it is well that it should have been done in full, because it will have enabled you to understand what we wish, what is the business before us to-day, and the means by which we propose to obtain capital to continue the working of this concern. The method is apparently somewhat cumbrous, but we are advised by the solicitor that it is the form in which it will be necessary that the needful alterations will have to be carried out, and that being so, we have only to present ourselves to you, and ask you whether you will agree to that which we think advisable in the interests of the company. We are in this somewhat happy position that two at least of the directors have been to the mines several times, and they will, therefore, be able to tell you what they themselves have seen, and what they think of the future probabilities of the mines. You know, of course, that all mining is more or less speculative. All that you have a right to expect is that the best advice shall be given according to the facts and circumstances as they exist, and that then it shall be energetically followed. That, the directors of this company pledge themselves, is the case. They believe that there is still a great future for the company, and are encouraged in that belief from the inferential circumstance that German and other capitalists are acquiring and working other parts of this undoubtedly rich tin regiou.

WHAT OTHERS ARE DOING.

They have lately been purchasing land and entering into contracts for the development of land similar in every respect to yours, only that we believe it is not so valuable and not so promising as that of which we are possessed. That being the case, it has led us anxiously to consider the nature of the advice we have received, and whether we see in the future a greater success than has attended what we have done in the past. A few uotes have been prepared in order that I may tell you with perfect accuracy upon what we are basing our calculations, and why it is that we are asking you to help us in the particular form we are doing. We felt it very important that you should have all the information we possess, and so we requested the manager to come over, that he might be able to tell you the results of his own practical experience, which has now extended over a very long period. He has unfortunately, however, met with an accident by falling down a precipice some 40 or 50 ft. and has broken his arm, so that he is quite unable to be here to-day. We have, under date of 10th May, a communication from him, and in passing I may say that we have every confidence in him. He is a man of great practical experience, aud everything we knew of him previovsly, and everything we have seen of him siuce he has been in our employment, makes us more than satisfied that we have a conscientious man, who, in what he writes or says, always tells us what he believes.

VIEWS OF THE MANAGER.

This is a quotation from his letter:—

"10th May.—We have this morning made a very cheering little discovery. It is situate in altogether new ground on the top of the hill, or rather as it begins to slope towards the Escudeiras side. You will remember the strong back of the lode which we uncovered around the big rock of quartz, and my saying that the main lode in Californuia is crossing it about that place. Well, since you left I have been opeuing a long trench from the big rock in an easterly direction, and found nothing worthy of note till to-day, when we struck a comparatively small quartz vein, which is evidently a flier from the north and south lode, and which is yielding good tin. I calculate that we got out this morning fully 50 lbs. of tin, mostly iu nice stones about the size of eggs, and we washed two bateas, say 50 lbs., of the stuff around the vein, which gave the best yield of any general sample I have seen in the place. I may safely say that from the 50 lbs. of stuff we got nearly 2 lbs. of clean tin (*i.e.*, at the rate of 80 lbs. of black tin to the ton of ore), and when I left the brauch still continued quite hard, firm, and rich. I will send you a little stoue by this post that you may see its nature."

Again on the 11th May he wrote the following:—

"11th May.—I am just come in from the mine and examining the little discovery we made yesterday, and am pleased to be able to say it continues to look satisfactory. The tin holds on, and the branch is getting bigger, and the stuff around it looking 'lodey' and nice. Yesterday the branch, where intersected, was nearly horizontal, hut in following it we find it is now dipping down tolerably fast towards the north, which is a favourable indication; in fact, as far as yet seen, it looks very kindly in every respect, and certainly there is not the slightest reason why it should not lead to something good and permanent. The men say they took out 7 arrobas, or 175 lbs., of tin yesterday, but I call it about a hundredweight, a considerable part of it nice, hard, solid, tin, like the stone I sent you yesterday."

These discoveries resulted from a few trials made on the "backs," or outcrops of the lodes by order of Mr. Davey. Several other discoveries have also been made, and the directors are advised by various experts that these tin lodes should be systematically and energetically developed, but to do so it is necessary the company should raise some fresh capital, and it is for the purpose of providing it that this meeting is summoned. In addition to the opinion of our manager we have that of two of the directors who have visited the mines, and still more we have

THE WRITTEN OPINION OF CAPT. CHARLES THOMAS,

of the well-known Cook's Kitchen Tin Mine. The gentlemen present who are connected with other mines will probably know the character Capt. Charles Thomas bears in the mining world as an expert and a man who is conscientious in the judgunent he tenders to those who employ him. I think the questions as to the working of the mines will be better answered by those who have been there, but I may read you now what Capt. Charles Thomas says:—

"The existence of lodes in the property is plainly demonstrated by the outcrops at surface. The direction of the lodes is about 30 degs. north of east, and their width so far as seen is generally from 5 ft. to 8 ft. The lodes contain tin and a little arsenical pyrites in matrix of quartz, presenting a very kindly appearance on the whole, and I am decidedly of the opinion that arrangements should be made for a thorough trial of these lodes in the 'country' rock. My own opinion is that you must look to the future development of your lodes for profits, rather than to your alluvial deposits, and it is for this reason that I would advise you to make a thorough trial of the lodes as soon as the plant uow being erected is complete. My decided impression, after a most careful inspection of your property, is that it is well worthy of a thorough and complete trial."

That is a strong recommendation from a leading practical English tin miuer, who is one of the best judges of tin property in the county of Cornwall. The alluvial deposits have not been found in all parts as productive as we had hoped and believed, yet it was esseutial that they should be cleared away before we could get to know the more valuable character of the lodes beneath, from which we expect greater profits. As far as anything in mining can be made demonstratable, we have demonstrated by investigation, the value of these lodes respecting which I will give you some further information later on. In addition to what I have read, we have received some equally strong recommendations in

A REPORT PROM MR. F. KENSINGTON, C.E.

We feel so seriously the responsibility of advising you to make a further investment in this concern, that, until we had satisfied our minds of the real advisability of it, we resolved we would not ask for this money. You may perhaps think we have taken too much advice, but we wished to have our minds thoroughly decided before proceeding further. Mr. Kensington says:—

"I consider the lodes constitute by far the more valuable part of the company's property, and I am surprised that no effort has been hitherto made to develop these in a systematic manner. A very superficial survey has proved the existence of at least eight strong lodes running right through your property, aud I feel no doubt whatever that others will be found, in addition to numerous cross-courses similar to that where a very promising discovery has just been made on the top of the mountain at San Guillermo, near the big outcrop. There is no tin property that I have visited that possesses more natural advantages for economical mining than Viso; no expense for pumping need under any circumstances be iucurred, and the veins can be worked from adits. The compauy already possesses a well-equipped tramroad for conveyance of the lodestuff to the dressing-floors; the water power is ample to drive the whole of the machinery at all seasons of the year, and little or no fresh outlay for plant will be required, except for a crusher or stamps. My opinion is that 6,000*l.* or 8,000*l.*, judiciously expended on working the lodes, will be sufficient to thoroughly develop the property, and prove that the company possesses a very rich tin mine."

WHAT A SHAREHOLDER HAS DONE AND IS DOING.

In addition, one of our own members went to Spain on his own account, and the result has been, not only that he has purchased

more shares, but so struck was he with the metallic wealth of the district that he has settled down permanently to tin mining on his own account. I here refer to Mr. George Brown who was present at one of our previous meetings. These are the facts in connection with the matter; and we have still further a report from the manager who writes to say that he had picked out 3 cwt. of black tin by hand from the new discovery, which will show that this is in a rich vein. There is, he says, a large and promising vein which crops up to surface. The alluvial, I may explain, is the result of the attrition of these lodes, and also an indication of their value. These are the reasons which have led us to ask you to help us in the re-arrangement of the company.

WHAT THE BOARD PROPOSE.

In reference to that re-arrangement, which is apparently so involved that there may be some misapprehension as to its real purpose, we are following out the advice of our solicitor, and I will explain in effect what it comes to:—The liability will be that whilst you will receive in the new company three shares of 10s. each for every 1*l*. share you at present hold, you will be subject to a liability of 1s. on each share—in other words 3s., which we propose to call up in sums of 3d. per share at fixed periods in accordance with the requirements of the mine. The various amounts of 3d. per share will be called up at intervals of not less than three months. We are in fact asking you to help us by taking three shares instead of each one you now hold, subject to a liability of 1s. per share, to be called up as stated. We believe that this step is advisable, and it is certainly necessary if the mine is to be worked. We feel satisfied that we have a valuable property, and we ask you to support the directors in the way they have indicated in their circular. I now beg to move the first resolution.

Mr. HENRY DAVEY (director) seconded the motion.

SHAREHOLDERS EXPRESS OPINIONS, AND INQUIRE INTO FACTS.

Col. HERSCHELL: What will be the position of the dissentients? You spoke of some gentlemen who have been to the mine who could give us information, and we should be glad to hear them before we prematurely pass the resolution. I am much dissatisfied with the way things have been carried on. Promises and expectations have been continually held out with regard to the alluvial soil, but this is being now put aside, and we are to explore lodes.

Mr. QUICK: The company must be wound up in the first instance.

The CHAIRMAN: In reference to the first resolution I would say, let the discussion now take place and consider that the whole matter is before you. Do not imagine we are not going to work the alluvion, for that is part of our plan. There are some parts of it that will pay very well, but we want also to work the lodes, and to do so has always been a part of our programme. We are working the alluvial still, and sending excellent tin to market, and, in fact, there is a parcel now on its way.

A SHAREHOLDER: What has been the relative difference between the returns and the expenses hitherto?

PAST EXPENSES.

The CHAIRMAN: That is a difficult question to answer, because it involves necessarily the original expenses connected with the development of the mine. The hulk of our money has been spent in plant, and permanent works of various kinds that were indispensably necesssary. The tin has averaged a return of 42*l*. per ton, and the cost of getting it, I suppose, will be from 25*l*. to 27*l*., so that we have a margin of profit upon every ton we obtain, but the number of tons has hitherto been so few that the profit has been insufficient to pay expenses.

A SHAREHOLDER: Are we in debt through the past working of the company?

The CHAIRMAN: We owe very little. We can pay our way, but cannot proceed as actively as we desire.

Mr. KERLY, of Messrs. Kerly, Son and Verden, the company's solicitor, in reply to the question put by Col. Herschell, as to the position of dissentient shareholders, said: A dissentient shareholder can give notice within seven days after the passing of the resolution to re-construct, and then he is entitled to have the value of his shares assessed. As an ultimate means of getting at the value, application is made to the Board of Trade, and they appoint someone to value the shares; but practically it comes to this, that the shares are valueless unless the company is re-constructed successfully, and, therefore, it often happens that dissentients get little or nothing for their shares.

A DIRECTOR WHO HAS INSPECTED THE PROPERTY.

Col. ROSS (director): About a year ago I was aked to go to this mine, and inspect it thoroughly at the request of the board, and I did so. First of all, I should like to set Col. Herschell right with regard to the alluvion, which he says is worth nothing.

Col. HERSCHELL: I only repeated in substance what the chairman had said.

The CHAIRMAN: It was a matter of misunderstanding what I said. I was comparing the lodes with the alluvion.

Col. ROSS: I did not for a moment suppose anyone, much less a director, would say that the alluvion was valueless. I was going on to explain the difficulties inherent in the dressing of this alluvion. I sampled the property in all directions with a batea. By a careful process of washing, you, with this implement, extract almost the whole of the grosser particles and leave behind the metal. I have not the least doubt that this—holding up some specimens—has been obtained in the same way, and in the hands of an expert at the use of the batea you will get almost all the tin, fine as well as coarse. When you come to wash this metalliferous earth in the jigging machines much of the fine tin escapes, and no process that has yet been discovered will keep it back. The fine tin passes off into the slimes, and there you see it speckled all over the floors like black pepper. I took samples of the slimes, and had them washed, and there was the tin in them. A vast quantity of fine tin has thus been lost which it has been impossible to save. That is the reason we have not met with the expected success in regard to the alluvion. We have now had possession for short a time of the San Guillermo property, which we have been endeavouring to obtain for about two years past. Those acquainted with Spain will know that two years with them means about two weeks with us. We have only lately secured that property, and you will see from the last report that the manager refers to these very discoveries which have been made on this property, which we have only just got hold of. In the report sent preliminary to the notice calling the meeting, if you read what Mr. Davey says, you will see that he speaks in the highest terms of the tin to be got from the new property. He has lately visited the property, and you may entirely rely upon him, because he has a very considerable knowledge of mines, and also a very good knowledge of business. I know there is better tin there than anywhere, for all the time I was looking at this alluvion I was struck with the lodes, but the best of them we could not get at. I stood at the very top of the lode where the specimens shown here came from, and wished we could develop it, but we could not. Coming down the river one day—it is an uncommonly dangerous place—I came upon a lode which was very promising, but quite close to the river. That lode dips to the north and upheaves to the south. If you were to follow that lode up you must come to its outcrop, and that particular outcrop must have good tin upon it, otherwise, how does tin find itself in the alluvion? It must come from above. What we find at the bottom we are very likely to find at the top; or are we to suppose that the riches there are all stored below, and that there are none above. I had a piece knocked off from the outcrop of the lode, and if anybody knows anything about tin they will say this piece—holding it up—is as full of tin as it can hold. We have been working the alluvion to the present time, because it was necessary to uncover some of the lodes, and we were waiting to get this property, which we believed to be rich. The tramways are in excellent condition and well laid down, and the work is excellently done as far as it goes. We want sufficient money to get machinery to crush these lodes, which we believe will lead to a most excellent result. (Cheers.)

Mr. QUICK: Is the money now being asked for sufficient to bring the company into a proper state of working. We have a valuable property, but have the board assured themselves that with 3s. they have enough?

The CHAIRMAN: We have so assured ourselves as far as we can do.

Mr. QUICK: If not the result will be that we shall have to go through the same process again.

AMPLE RESOURCES.

The CHAIRMAN: 7,000*l*., we are advised, will be sufficient, but 9,000*l*. is what we have provided. We have no doubt whatever that that will enable us to get the machinery, and all that is essential to us. We have a detailed estimate. Everything has been gone into with the greatest possible care. 6,790*l*. is the estimate, including an ample margin for the unknown. The arrangement with reference to the debentures will reduce our expenses considerably.

Mr. F. KENSINGTON: My estimate was originally 5,000*l*. This includes 3,000*l*. for sinking and driving, and 1,000*l*. for machinery, and 1,000*l*. for other work. That does not include the cost of management.

Mr. ROSS: What do you estimate the cost of sinking per fm.?

Mr. KENSINGTON: The ground differs considerably. In some places it is so soft that you can do it for 26s., and in other places it would cost you a considerable amount. I think it might cost 7*l*. per fm., and that is below the average of Cornish mining. With soft ground and good timbermen you can run the drive in in a very short time.

Mr. ROSS: Your supplies have to come from England, have they not?

Mr. KENSINGTON: Yes, mainly.

The CHAIRMAN: The estimate includes the cost of a 10-head revolving stamp mill and crusher—720*l*.

Mr. QUICK: I wanted to ask a question on the second paragraph of the report. I am as dissatisfied as Col. Herschell that past promises have remained unfulfilled. At the same time I am very sorry that the manager has fallen down a precipice, though I cannot help thinking the company has been almost equally unfortunate. I would like to ask if the report of Mr. Davey was made on heresay evidence, or was it made upon what he himself saw? I think we must make every effort to save ourselves from the hands of the wreckers. I think the manager ought to have told us earlier that his views as to the alluvion were mistaken, and that we should require more capital to explore the lodes.

VIEWS OF ANOTHER DIRECTOR WHO HAS SEEN THE MINE.

Mr. DAVEY: I stayed at the mine about a fortnight, and the statements in my report are based entirely upon experiments conducted under my own supervision. I was busy on and in the mines every day whilst I was there, and had many new trials made on the various lodes. This discovery that is now spoken of was the result of a pit I directed to be sunk on the vein of San Guillermo. I am strongly of opinion that on proper development several of the lodes will prove to be very rich in tin, and until the company has opened them out, the property cannot be said to have had a fair trial. As to the delay in getting possession of the San Guillermo property, we only finally secured it in the middle of last April, and so we could not work it earlier, but the moment we commenced work we made this discovery.

A MOLLIFIED SHAREHOLDER.

Mr. QUICK: After the explanation of the directors I must confess that I do not feel at all so bitter about the matter as I did when I entered the room.

Col. HERSHELL: Will the ore be treated there or will it be sent home?

Mr. DAVEY: It will be crushed on the spot, and that is what the machinery is wanted for. We shall continue to work the alluvion, as hitherto there has been a profit upon that. There is no doubt that if we had had possession of San Guillermo before we should have returned much more tin, even from the alluvion, than we have done.

THE REAL QUESTION.

The CHAIRMAN: The question before us is this—is it worth while to put more money into this concern? You have now heard all the explanations that we can give you, and also the views of three gentlemen who have visited the mine. (Hear, hear.)

A SHAREHOLDER urged that his brother shareholders should go into this matter with all heartiness.

The CHAIRMAN: The liquidation will be done in the office by the secretary, and there will be no expense worth speaking of. (Hear, hear.)

The resolution was then put to the meeting, and carried unanimously.

The CHAIRMAN moved the remainder of the resolutions *en bloc*, stating that the shareholders in the company were numerous, between 600 and 700, and they had strongly supported the board, upwards of 25,000 shares being represented in the room. Many shareholders had

already sent in applications for shares in the new company and paid the deposits thereon, although the formal proposals for subscriptions had not yet been circulated. Judging from all the indications, he expected that the re-construction of the company would be very rapidly and satisfactorily accomplished.

Mr. DAVEY seconded the motion, after the SOLICITOR had read the agreement, and after the CHAIRMAN had undertaken that fortnightly reports should be sent from the mine, and published in the mining papers.

The resolutions were carried unanimously.

The proceedings were brought to a close with a cordial vote of thanks to the chairman for presiding.

BURMA RUBY MINES, LIMITED.

TEMPORARY DIFFICULTY OF GETTING THE MACHINERY TO THE MINES – THE ROAD HAS TO BE COMPLETED – COUNTRY STILL DISTURBED—NATIVE SMUGGLING.

THE first (statutory) general meeting of the Burma Ruby Mines, Limited, was held on Monday at the Cannon Street Hotel, under the presidency of Sir Lepel H. Griffin, K.C.S.I.

Mr. MONTAGU J. BATTYE (secretary) read the notice conveuing the meeting.

THE RUSH FOR SHARES.

The CHAIRMAN, after a few preliminary remarks, said: The company was registered on the 26th February of this year, when 200,000 ordinary shares were offered to the public. Although the list was obliged, owing to reasons which are notorious, to be closed very quickly, yet the number of shares applied for by the public was 2,762,122—the subscription in a few hours being 14 times covered. I think that you all acknowledge that the gentlemen who had the disposition of the shares arranged them in a most impartial manner. (Hear, hear.) Almost every person who applied got shares in a fair proportion, and there were about 4,000 ordinary shareholders on the register. I wish you to understand exactly what is the position of the company, and the difficulties which we as directors, and you as shareholders, have to face. I have no desire to influence the stock market, but I wish you to receive a little of that confideuce in the future of the company which I feel strongly myself. You will remember that the initiation of this company was due to the energy of Mr. Streeter, and other gentlemen with whom he was associated, and the concession from the Governmeut was obtained for them chiefly by the ability and euergy of Major Aubrey Patton.

PRELIMINARY DIFFICULTIES.

The difficulties before us you must first allow me to dwell upon. The most important of these, because the most difficult to be overcome, and one which is entirely outside the operations of this company, is the disturbed state of the Province of Burmah. You must not—and I speak with a good deal of experience on this particular subject — believe as gospel everything that you read in telegrams regarding the state of Burmah. There is no doubt that the country is, and will remain for some tiue, in a disturbed state, but I am confident that the Government is acting with ability and energy, and that in a short space of time Burmah will settle down into that state of order and peace which reigns in every other part of Her Majesty's dominions. So long as Upper Burmah is troubled with robbers, called Dacoits, our operations are necessarily exposed to some inconvenience and interruption. This is a difficulty for which you must fairly make allowance in the commencement of our operations. The next thing I would speak of is the matter of communications. The Burma mines are situate in the heart of a mountainous country. The direct road leading to them—not from Mandalay, the capital of Upper Burmah, but from the nearest point on the great river which is the highway of Burmah—is about 64 miles. On leaving the river you ascend a mountain, and between the river and Mogok, which is the head of the Burma Ruby Mine district, there is nothiug but roads, and the road which is uow under construction is a mountain road. It is to me a matter of great satisfaction that within the last two hours I have received the first official report from our superintending engineer on the subject of this road, which I will read presently. They have been mining for rubies in Burmah from time immemorial, but they have never mined with any scientific skill, and if we are to return to you investors the money which you hope, and expect, to get, we must mine in a scientific manner, and have on the spot the best machinery which is known in South Africa or California, and must take up on a large scale the best machinery in the London or New York market. We cannot take this machinery to Mogok uutil the road is made, and this mountain road, in a country infested by banditti, is not au easy thing to make. Our lease commences on the 1st November next. Before that time we have the privilege—aud we are using it—of buying from the natives, giving the Government a fair share of our profit, or working ourselves upon the same terms under a sub-lease. Until to-day I did not believe that this road, without which our machinery cannot reach the miues, could possibly be finished before January next; but you will see by this letter from our superintending engineer that our prospects are far more favourable than the board of directors considered at their last meeting :—

SUPERINTENDENT'S REPORT.

"I beg to report that while in Mandalay I called on Mr. Robert Ring, superintending engineer of this circle, and was assured by him that every possible effort was being made to complete the road to Mogok. His personal assistant, Lieut. Capper, R.E., had been sent up to report to him on the precise state of the work, and in the meantime the whole of the available force at the disposal of the executive engineer was to be withdrawn from the Bernard Myo section, and concentrated on the portion now most important to us—Khabain-Kyatpyeu and Kyatpyen-Mogok. From Thabeitkin to Khabain, a distance of 44 miles, the road is open for use, though not yet metalled. The sections Khabain-Kyatpyen, 12 miles, and Kyatpyen-Mogok 8 miles are now under constructiou, and may be said to be advancing satisfactory. Mr. Capper and Mr. Baxter, the executive engineer, were on the road as I came through. They put up with us at our Khabain go-down, and a few days later came on here and were our guests for two nights, so that we were able to talk the question of the possibility of carts getting into Mogok this season over very fully. With the force now on the road, the engineer holds out every hope that within a month from the present time carts will be able to get as far as Kyatpyen, and no pains will be spared to open up through traffic with Mogok. The earthwork as far as Kyatpyen is completed, aud removal of rocks and construction of bridges is being pushed forward with all vigour. On the Kyatpyen-Mogok section the earthwork is well advanced, and by means of temporary works and diversions it is hoped to get the road open within a couple of months. On this point Mr. Colquhoun, the deputy-commissioner, is assisting Mr. Baxter by putting pressure on villagers, and exerting his authority to enforce labour. Even when the road is cut through, and we are able to use it, we shall, in all probability, have trouble from time to time during the rains. There will be landslips, trees will fall across the track, bridges may get carried away, carts will get stuck iu the soft soil, the cartmen will ofteu be down with fever, and, of course, there will be the usual danger of Dacoits. All these matters will improve steadily with time, and it is my intention to establish go-downs at easy stages along the road, where relays of bullocks may be kept, and the journey accomplished with greater speed an less strain. I am also making inquiries for light-wheeled vehicles, which may be driven through with ponies or mules, so that the distance between this place and Thabeitkin may be accomplished by members of our staff, with their personal baggage, with much less fatigue and loss of time than at present. With the completion of the road all these things will becoue possible, and in the meantime the authorities are doing everything they can to help us, and the prospects for the cold weather are good.—W. S. LOCKHART, Engineer-in-Chief and General Superintendeut of the Mines.

The road is more important to us than the Dacoits, because we can shoot the latter, but without the road we cannot get our machinery up. Here I would say one word in acknowledgment of the exceeding courtesy, both of the Home Goverument, the Secretary of State, and the Chief Commissioner of Burmah and his assistants. The Deputy Commissioner of the Ruby Mine district is a friend of my own, and the Deputy Commissioner of Mandalay is a political officer who has long served under me, and I do not think that that will do any damage to the interests of the company—that our relations with them are of so iutimate and friendly a character.

THE QUESTION OF SMUGGLING.

Another difficulty which I should like you to understand is the question of smuggling. The Burmah Ruby Mines have for a long time been worked by native miners who have hereditary rights to dig, and of course when a great English company comes into the way, the interests of these people are to a certain extent pushed aside, and we have to deal with them with very great kindness and consideration in order uot to make them hostile to us, which would be fatal to our enterprise. You can well understand that with rival persons searching for rubies, we having compulsory power of purchase, the question of smuggling presents great difficulties, which we will have to face, and I trust with the help of the Government we may be able to make some arrangements with the natives. No efforts will be wanting on our part to do so. I presume you would like to know what we have done up to the present. We have held constant meetings, and have done all that we considered could be done until we received the full reports of our superintending engineer, the first of which came to hand to-day.

AN ENTIRELY NEW EXPERIMENT.

I can quite understaud that investors wish for as speedy a return as possible—(cheers)—and we entirely sympathise with that wish; but, at the same time, in an experiment, which is altogether new—because the diamond mines of South Africa bear very little resemblance to those of Burmah; the conditions are altogether different—there is no use in throwing your money away. We must wait and see that it can be laid out to advantage. We have sent out the best superintending engiueer we could find in London—Mr. Wm. Lockhart—and we have every reason to believe in his ability to carry on the work of the company. We have appointed, on a very reasonable retaining fee, Mr. Robert Gordon, who is acquainted with Burmah, and bears an honoured name both for ability and integrity. With the help of Mr. Hamilton Smith, whose experience is well known to you, we have obtained from California the assistance of the best man there, who was acquainted with hydraulic engineering, because we felt convinced that we must in Burmah apply some of the lessous which have been learned in California, and unless we treat our mines upon the hydraulic system we shall be very little in advance of the native miners, who have been digging out of the soil with their hands for the last 500 years. These three officers will be the heads of what will be our departments when we get detailed reports, and know what subordinates to send them. For the present, and for a short time to come, they will be sufficient, because the rains are now beginning, and

THE COUNTRY IS EXCEEDINGLY FEVERISH

in July, and we think it better that the young men we send out should arrive when it is certain they will not be immediately struck down by fever. In the matter of machinery we have not been at all idle. A certain amount—which may be variously estimated at from 4,000*l.* to 8,000*l.*, according to whether you take the price here or at the mines—was taken over from Mr. Streeter's syndicate, and although that has not yet reached the mines, it is on the way, and a great portion of it is within 20 miles of Mogok. With regard to the sale of rubies in this country, no arrangement has yet beeu made by the board. Although we have taken tenders from some of the highest firms in the City of London, we desire that the company shall be absolutely independent of agents, and we shall make such arrangements from time to time as may best suit the interests of the shareholders. I may say that the prospects of the company are not only as good, but they are distinctly better, than they were when you all rushed in for shares in New Court. (Laughter.) Nothing since that day has happened to shake my confidence, and I think I may speak for all the members of the board, in the future success of this enterprise.

THE LEASE PRACTICALLY UNLIMITED.

Investors in this company must have a little patience. Our lease is, it is true, for seven years; but we have the moral certainty that no Government can possibly take from us our lease so long as we conform to the conditions that have been laid down, and work honestly with

them, paying the rent they can fairly demand. We do not practically begin operations until the cold weather. Then we shall hope for early results, and that every year our prospects will increase—first, by the settling down of the country; secondly, by the completion of communications; thirdly, by the arrival of our machinery, by the experience that we shall aequire, and by developing the whole resources of this great and almost unknown track. I think you may have full and reasonable confidence in the future suecess of this undertaking, and speaking on behalf of the board of directors, I may say that we are all unanimous in this opinion. Thanking you for the exceeding attention which you have accorded me, I will now sit down.

AN IMPORTANT QUESTION.

A SHAREHOLDER asked what would be their position as shareholders at the expiration of the seven years, provided the lease was not renewed.

The CHAIRMAN said that in that case they would receive from the Government the whole value of their plant, &c., and would have whatever material they chose to collect and work by that time. They would lose nothing, except the power of going on; and there was every prospect that there would be such funds in the hands of the company at that time as would reimburse the shareholders for the practically small capital compared with the magnitude of the undertaking. They had not, however, considered that question very deeply, for the reason that the moral obligation on the Government to continue the lease to people who were working it properly, who had their plant on the ground, and who were paying them rent for the land, was such that he did not think any Government, with a House of Commons behind them, would venture to turn them out. (Laughter.) Possibly if the Government saw the company was making a good thing out of it they would ask a higher rent, but they could not give the lease to anybody else if the company was willing to accept the terms offered.

HOW ABOUT THE NATIVE WORKERS?

A SHAREHOLDER asked what arrangements had been made with the natives who were at present working on the property.

The CHAIRMAN said there were a certain number of diggers who held leases which had come down to them from the time of the late King Thebaw. These were allowed by the Government annual licenses, which were renewable, but there was a clause in the Upper Burmah regulation which provided that no leases should be given to any new persons. The company could not buy them out, but he thought it might be possible to get these license-holders to work for the company and not for themselves. If some such arrangement could not be made it would be a very difficult matter to keep them under control.

TIME IS SHORT.

Major AUBREY PATTON, in the course of a long speech, advocated strongly a policy of immediate action. The lease being only for seven years, no reasonable expense or energy should be spared in utilising the time at their disposal to the utmost extent. He expressed the utmost confidence in the brilliant prospects of the future.

In reply to a Shareholder,

The CHAIRMAN said that 500*l.* or 600*l.* worth of rubies were in hand in London, and other considerable coniguments are in Burmah.

On the motion of Mr. ONGAR, a vote of thanks to the chairman was passed, aud the proceedings then termiuated.

THE ENGLISH CROWN SPELTER CO., LIMITED.

THE ordinary general meeting of the above company was held at Winchester House, Old Broad Street, E.C., on Tuesday last—E. A. Pontifex, Esq., chairman of the company, presided.

Mr. J. MORRIS BOWEN (the secretary) read the notice calliug the meeting.

The report from the directors, which was taken as read, stated:—"The sum of 2,619*l.* 11s. 10d. was carried forward from last year's accounts, and after paying an interim dividend of 2,100*l.* on the 1st December, there remained ou the transactions of the year a balance of 1,065*l.* 8s. 9d. to be carried forward to the next year's accounts. The amount which would have appeared to the credit of the profit and loss account has been considerably diminished, owing to the much larger amount of exploratory work that has been performed at the mines, and to the high prices which have ruled for blende, zinc ashes, &c., which have had to be purchased as a smelting mixture."

The CHAIRMAN: Gentlemen, the operatious for the year 1888 have resulted less successfully than did those of 1887, notwithstanding that a better price has ruled for spelter; but they are still considerably better than in any other year since the company was incorporated. The average price obtained for our spelter in the year 1888 was 17*l.* 14s. 4d. per ton, whereas in the year 1887 it was 15*l.* 17s. 9d. per ton, a difference in favour of the former year of 1*l.* 16s. 7d. This improvemeut in price has, however, been more than couuterbalanced by the increased cost of mining, which has cost 19s. per ton of ore more in 1888 than in 1887. As it takes 2 tons 12 cwt. of ore of this description to make a ton of metal, this is equivalent to an increase of 2*l.* 9s. 5d. in the cwt. of a ton of spelter, or to 12s. 10d. per ton more which we have lost in cost than we have gained in price.

EXPLORATORY WORK COSTS MONEY BUT RESULTS IN GOOD DISCOVERIES.

This increased cost of raising the ore was chiefly due to the larger amount of exploratory work which has been performed during the year, which has resulted in discoveries of some importance, the benefit of which will be felt in the present and succeeding years. As I have before explained, these calamine deposits are found in pockets or bunches, scattered over the hillside, having very little connection one with the other. And as those which are in work become exhausted others must be fouud to take their place, and the seeking of these others may be more or less successful, and may entail more or less expense in one year than in another. In the past year it became necessary to perform heavier exploratory operations than usual, as it has been manifest that most of the ground towards the top of the main hill, on which we have been working, was becoming exhausted, and it became necessary to open out entirely new ground in another direction. This has been done with considerable suecess, as will be found from the extracts from Signor Fey's monthly reports, which are set out in the anuual report of the directors. Although the costs for 1888 have been higher than for the previous year, they still compare favourably with those of the first three years of the company's operations, during which time we worked to a considerable loss, although the shareholders received substantial divideuds from the vendors, under the terms of the contract with them for the sale and purchase of the mines. The costs of raising our ore in 1888 were 5s. 6d. per ton less than in 1883, 19s. 6d. per ton less than in 1884, and 15s. 6d. less than in 1885.

THE QUESTION OF FREIGHTS.

The high rate of freights which prevailed during most of the past year has also operated greatly to the prejudice of the profit which we otherwise should have made. The large shipment of ore per steamer, which is referred to in the report, was carried at a rate of freight which was equal to an addition of nearly 1*l.* per ton to the cost of the metal produced from it. The boom in the shipping trade, which produced this state of things, seems, however, to have nearly spent itself, and we hope to be able to obtain more reasonable rates of freight in future. The quantity of metal turned out in the smelting works has been larger than in any previous year. Our make has beeu 4,658 tons in 1884; 3,496 tons in 1885; 3,296 in 1886; 4,071 in 1887; and 4,906 tons in 1888. The operations at the smelting works have not been conducted altogether so successfully as we expected—or, as we think they might have been; for, notwithstanding that the costs of working have been diminished by the improved appliances which we have supplied, yet the resulting profit has beeu cut down by a somewhat increased loss of weight in the process of smeltiug. This loss of weight is one of the most difficult matters which the zinc smelter has to contend with. The metal oxidizes so readily and sublimes over at so low a temperature, that it is not easy to control the loss. Part of the loss iu weight may be due to the fact that in changing our system of working from the old to the uew construction of furnace, our workmen have been at a disadvantage in not having the necessary experience of the altered system, and have not been at first fully conversant with the method of working the gas furnace instead of by the old Welsh furnace, and although that improvement has been made, yet I think it is a little difficult for workmen learned in one system, without previous experience, to get conversant with another mode of treatment.

BETTER NEWS AS TO WORKING COST.

At first the furnaces did not act so well as they are now doing, but now there is a great improvement, and we are reaping the benefits of it. The cost sheets we received this morning show that for the last month's working this loss of metal which we have had to deplore has been very much diminished. We have made very earnest representations to those in charge of our smelting works to exercise the greatest care in this respect, and I have no doubt that these representations will not be without effect. Probably the high price which we have had to give for the blende, zinc ashes, and other raw materials, for which we have had to buy to mix with our calamine, has operated as adversely as any other cause. But we have to give these high prices to meet the keen competition to which we are subjected by foreign as well as English buyers.

THE ENGLISH PRODUCTION OF SPELTER.

As pointed out in the report, the production of spelter in England is only about one-tenth of the total European production, and the reason that we make so little of the metal here is because the productive mines are chiefly in the hands of the foreign smelters, and the competition for the raw material is daily becoming keener, and the supply is likely to be further curtailed. A very favourable braud of English, or, more accurately, of Welsh blende, has hitherto been that of the Minera Mining Company, the quality of which has been exceptionally good, and its supply hitherto one of the most abundant. The quantity the mine produced became, however, sufficiently importaut for the directors of the company to resolve to erect smelting works of their own, and thus to diminish the already limited supply of blende obtainable by other smelters.

AN INTEREST IN MESSRS. JOHN TAYLOR AND SONS' COMPANY.

In these circumstances we were fortunate in being able to obtain, in conjunction with the Messrs. Vivians, an interest in the company which has been formed by Messrs. John Taylor and Sons, to work a continuation of the Minera lode. The Miuera Miue was originally chiefly a lead mine—but the lead ore gave place in depth to blende—and especially so at the end of their sett, their western ground, I think it is, which marches with the adjoining ground that has been acquired by the new Minera Company. We are sinking a shaft in a position so as that the zinc lode at an estimated depth of 300 yds.; but it is proposed to cross-cut to the lode at a depth of about 250 yds. Of this depth 230 yds. have already been sunk, and, as they are sinking at the rate of 5 yds. per week, we may expect to begin to cross-cut to the lode in a month or so. I anticipate very considerable benefit to this company, not only by the much wanted supply of good blende at a fair price, but by the profit which we as shareholders will obtain in what I feel much confidence will prove a very lucrative investment. I may mention, as a proof of my own confidence in it, that I have taken shares in it—as have some others of my colleagues—and that the shares were eagerly sought after by those resident in the neighbourhood, and who were in the best position to know something of the prospects of the mine.

THE CHAIRMAN HAS HOPES OF BETTER DIVIDENDS FOR 1889.

By the discovery of the new ground at our own miues, by this better source of supply of blende ore, together with the more careful watching of our smelting operations which we have enjoined, I am in hopes that we shall earn a better dividend in 1889 than the somewhat meagre one which we have been able to pay in the past year. In conclusion, he formally moved the adoption of the report and accounts.

Mr. BRABY (a shareholder) had great pleasure in seconding the resolution, aud beiug able to congratulate the directors upon the very able report. He was of the opinion that the high prices which had ruled for blende, zinc ashes, &c., were not detrimental to the company's interests, because if the materials from which spelter was made were high, they were only high in consequence of spelter being at a high price. There had also been, as the chairman had stated, an unusually heavy expenditure from revenue for exploratory work at

the mines, but it appeared that those new works were very extensive, and he hoped the benefit of that would be felt in the present year.

"ROBUST CONDUCT."

He congratulated the directors on their robust conduct in charging those things to revenue instead of to capital. He observed by the report that the total amount of English-made spelter was one-tenth of the European production of that article, but no doubt one reason of that was the cost of cheap labour on the Continent, which was about one-third of what it was in this country.

DISCUSSION.

Mr. LACY thought that it might have been more in the interest of the shareholders had they been consulted on the purchase of the New Minera Company's shares, still he had no doubt that under the articles of association the directors had full power and authority for what they had done. He regretted that he could not re-echo the remarks of satisfaction expressed by Mr. Braby on the report. He did not think the results achieved fulfilled the prospects held out to them when the company started, that upon a basis of 18*l.* per ton for spelter they would make a profit of 10 per cent.

MR. LACY EXPECTED 10 PER CENT.

When he saw the price of spelter steadily rising he had naturally expected that the English Crown Spelter Company would pay a 10 per cent. dividend for 1888. The shareholders were informed in the report that the price obtained—the average price—for the spelter sold in 1888 was 17*l.* 4s. 4d. per ton, but the average price given by Messrs. Merton and Co. for spelter was 18*l.* 1s. 6d., that was not delivered at Swansea, but ex ship. He thought, therefore, that there must be something rather unsatisfactory as regarded the sale, and he wished the directors to give the closest possible attention to the realisation of the metal in the future.

After remarks from Mr. BARBER and other shareholders, going into various items of account, and asking for information as to the stores at the mine, and the office expenses, and as to how the 5,000 New Minera Company's shares were paid for,

THE CHAIRMAN REPLIES.

The CHAIRMAN, in reply, said that the New Minera shares were paid for out of revenue. He assured the shareholders that the directors sympathised most thoroughly with the disappointment that the shareholders must naturally feel at the smallness of the dividend, but he thought that the difficulties they had had to encounter, and the other matters that he had fully explained in his opening speech, would have given ample reason to this meagre return. The extra amount paid for wages and stores was accounted for by the larger amount of business done, although the profit had not expanded in proportion. He had, he said, explained how the larger expenses had been caused; a much larger quantity of work had been done, there had been an increase in the cost of mining, there had been a considerable advance in freights, and labour had been slightly more expensive. As regarded the average price obtained for the metal, it was very difficult to compare averages; much depended on the time when the sales were effected. He was convinced that their brokers got the best price they could for the company.

The resolution was then put and carried unanimously.

FORMAL BUSINESS.

Mr. LOVERIDGE then moved the re-election of the retiring directors, Messrs. E. A. Pontifex and J. C. Richardson. He spoke in high eulogy of the efforts of both these gentlemen on behalf of the company, and stated that Mr. Pontifex was frequently at Swansea looking after their affairs.

Mr. LACY seconded.

The motion was carried.

The CHAIRMAN briefly responded.

The auditors, Messrs. Spain Bros. and Co., were re-elected at a remuneration of 50 guineas.

The business of the ordinary meeting having thus been concluded,

SPECIAL MEETING.

An extraordinary general meeting was held in order that the subjoined resolution might be proposed. The notice stated that should the resolution be passed by the required majority it will be submitted for confirmation as a special resolution to a second extraordinary meeting which will be subsequently convened.

RESOLUTION.

(1.) "That in pursuance of article 38, the capital of the company shall be increased by the issue of 16,000*l.* in 16,000 shares of 1*l.* each; such shares to be issued at the times and in the manner determined by the directors." (2.) "That in pursuance of article 43, and of section 21 of the Companies' Act, 1867, the present capital of the company, viz., 84,000*l.*, divided into 21,000 shares of 4*l.* each, shall be sub-divided into 84,000 shares of 1*l.* each."

The CHAIRMAN formally moved the resolution, as given above, and said that it had been represented to the board by several shareholders that the division of their shares was not a popular one, the fashion on the Stock Exchange being to have shares of 1*l.* each, and dealers fought shy of a larger sum except under special circumstances. It was not, however, a matter about which the board cared very much, and they wished the shareholders to decide the matter and make the alteration if they liked. They were taking powers in the resolution to issue the additional 16,000*l.* in order to make up their capital to the round sum of 100,000*l.*, but they did not propose to issue the shares at present.

After a brief discussion on the advisability or not of making the alteration, Mr. BRABY objecting to it,

The CHAIRMAN, in reply to questions, said that the object of the proposed resolution was to increase the value of their property, and to render the shares more marketable, and

NOT TO PLEASE THE STOCK EXCHANGE.

He did not see how it could possibly do any harm.

The motion was then put and carried.

THANKS.

Mr. ROBERTSON moved a vote of thanks to the chairman and directors.

A SHAREHOLDER seconded.

The motion was carried.

The CHAIRMAN briefly responded.

The meeting then separated.

NO. 2 QUEEN GOLD MINING CO., LIMITED.

RESOLUTIONS CONFIRMED.

AN extraordinary general meeting of the shareholders of this company took place, on Monday, at Winchester House—Mr. Robert Milburn presided.

Mr. J. DURIE PATTULLO (the secretary) having read the notice convening the meeting,

The CHAIRMAN said: Gentlemen, we shall not detain you very long to-day, because we have met together merely for the formal purpose of confirming, if you think fit, the resolutions which were passed unanimously on the 5th June. I will, therefore, now move the first resolution, which is as follows:—"That it is desirable to re-construct the company, and that with a view thereto the company be wound up voluntarily, and that Mr. James Durie Pattullo be, and he is hereby, appointed liquidator, for the purpose of such winding up."

Sir CHARLES W. F. CRAUFURD, Bart., seconded the motion, which was carried.

The CHAIRMAN then proposed, "That the said liquidator be and he is hereby authorised to consent to the registration of a new company, to be named 'The Queen Gold Mining Company, Limited,' with a memorandum and articles of association, which have already been prepared with the privity and approval of the directors of this company."

Mr. J. WALLACE seconded the motion, which was carried.

OBJECT OF THE MEETING.

The CHAIRMAN moved the following resolution:—"That the draft agreement submitted to this meeting, and made between this company and its liquidator of the one part, and the Queen Gold Mining Company, Limited, of the other part, be and the same is hereby approved, and that the said liquidator be and he is hereby authorised, pursuant to section 161 of the Companies Act, 1862, to enter into an agreement with such new company (when incorporated) in the terms of the said draft, with such (if any) modifications as the said liquidator may approve, and to carry the same into effect."

Mr. STRAUSS seconded, and it was carried.

The CHAIRMAN moved, "That the remuneration of the liquidator be and is hereby fixed at 75 guineas."

Mr. R. WALLACE seconded the resolution, which was passed.

The CHAIRMAN: I am glad to say we have carried all the resolutions unanimously, and I can only express the hope that our company, as re-constructed, will be able to achieve its object, and that we shall find ourselves in a somewhat better position very soon. We hope, as you know, to soon cut the Victory reef. I have not much more to say, but as possibly there are some shareholders present who were not here at the last meeting, I should tell you that at that meeting certain directors were nominated to serve upon the new company. Their names were Mr. Sykes, Mr. Chemery, Mr. R. Wallace, Mr. Robinson, and myself. You will observe that makes three members of the shareholders as against two members of the old board. Well, gentlemen, I frankly say to you that, in the opinion of the present board, we thought there should have been a more even distribution of the directors, and that it would have been better if three members of the old board had been elected upon the new one. There were a great many matters which had to be cleared up, and, naturally, the present board were better acquainted with the details of the business than the new members could possibly be. We do not wish to raise that question now, but I have thought it right to mention it, as from now the five gentlemen will form the board.

DIRECTORS COMPLIMENTED.

A SHAREHOLDER thought it was very undesirable that they should attempt to swop horses whilst they were crossing the stream. (Hear, hear.) He was very glad to hear that two of the old directors were to remain, but he thought it a pity that the number was not three, so as to make the balance even. He would propose a resolution to that effect. It was very desirable that they should have the services of tried men, who knew the business well. He would propose that Sir Charles Craufurd be added. He was a most admirable man, and knew his work thoroughly well. He did not know that gentleman individually, but he thought it would be a great loss to the board if his services were not retained.

Mr. BARTON said he had not an opportunity to be present at the last meeting, but he held in his hand a report of the proceedings. He observed that the chairman and Mr. Wallace stated that they would not serve. He (the speaker) wished to know the reason why they had changed their minds.

The CHAIRMAN said it was their intention to resign, but strong pressure had been put upon them to retain their position, and they had agreed to do so.

Mr. STRAUSS seconded the resolution, observing that he thought it better for the business of the company to be in old hands than in entirely new.

The CHAIRMAN: Well, I hope you understand, gentlemen, that this matter is entirely in your hands. I will put the resolution to the meeting.

VOTING.

This was done, and the CHAIRMAN stated that there were 12 for and 9 against the motion.

The CHAIRMAN: Of course, gentlemen, this is merely an expression of your views, and as that we shall take it. I therefore declare Sir Charles Craufurd elected as a director.

Mr. CHEMERY: I must ask the chairman to take my name off the directorate. I decline to serve.

A VOICE: You will give your reasons. (Hear, hear.)

Mr. CHEMERY: Yes, I will do so. At the last meeting it was clearly understood that the new blood should have a preponderating influence upon the board, and I must decline to be a member of the board if the new blood is to be in a minority.

The CHAIRMAN: You will not be in a minority.

Mr. CHEMERY: Pardon me, we shall.

Mr. ROSS ROBINSON: I am sorry to say that I consider the directors have sprung a mine upon the shareholders. (Hear, hear.) And I, for one, am

NOT SATISFIED TO SIT UNDER IT.

I therefore must decline to sit upon the board. An agreement was come to to allow things to remain as they were, but in spite of this

someone has been brought here to propose a resolution of which no notice whatever has been given.

The CHAIRMAN : I hope I need not point out to you that there is some extraordinary hallucination in Mr. Robinson's mind. At the last meeting the directors were recruited by a section of the shareholders, and the board made no objection. But the nomination was informal, the same as it has been to-day. If, therefore, the wishes of one meeting are to be taken into consideration, so also ought the wishes of this one.

A SHAREHOLDER : No notice was given of the resolution to-day.

The CHAIRMAN : Neither was there of the last meeting.

Mr. SYKES : Under the circumstances I must refuse to remain upon the board. The very object of the resolution which has been passed is to frustrate the objects of the new directors towards retrenchment. The old board have got through 40,000*l*., and have not succeeded in sinking even a shaft, and have had to come to a re-construction in order to draw the money necessary for developments. We have said as little as possible about the mismanagement of the board and the extravagance which has prevailed. It was the wish of the shareholders at the last meeting that there should be a preponderance of the new members.

A SHAREHOLDER, who said he rose to

POUR OIL UPON THE TROUBLED WATERS,

moved "That a committee of five of the largest shareholders, or even 10, be appointed to select the members of the board."

The CHAIRMAN said he was rather afraid that the board would not agree to that.

Major COTTON thought it was a pity that they should be having differences just at the time they ought to be united. He supported the suggestion that a committee be appointed.

The CHAIRMAN : The directors have nothing to do with the question of the election of an additional member. It was very easy for charges of extravagance to be made, but it would be far better if a definite statement was made as to where the extravagance had been. He suggested that the whole of the directors should resign at the statutory meeting, and the shareholders could then return whom they liked.

Mr. SYKES : The present board have brought the company to ruin. They have spent, I was going to say wasted, 40,000*l*. Your chairman said that you wished to retire, and yet here we have another of the old directors forced upon us.

A SHAREHOLDER said there was no charge of anything wrong against the directors, but they have spent money, and work has not been done. (Cries of "That's just it.") I am not taking the part of the directors—I have not been in communication with anyone of them.

Mr. SYKES : If it had not been for your resolution everything would have been amicably settled.

Mr. CHEMERY said he had felt all along that there was no necessity for five directors to be appointed. It was absurd to suppose that five London directors were required to manage this mine. They only wanted three directors, and why should they throw their money away upon five if they wanted all their money to develop the mine? (Applause.) Mr. Chemery then detailed the circumstances of the arrangement that there should be three new directors and two of the old board, and the proposition to alter that number had been sprung upon the shareholders in a very peculiar way. The gentlemen on the board could not say they had cut down the expenses.

The CHAIRMAN : We say we have. (No, no.)

Mr. CHEMERY : The money has been squandered; squandered shamefully. I say the way the money of the No. 2 Queen has been squandered would be shameful to any board.

The CHAIRMAN : We have no wish to push this question.

NOT COURTEOUS.

A SHAREHOLDER : Nonsense.

The CHAIRMAN : The resolution was proposed by a shareholder, and there was no other course for me but to declare it carried. The directors have no right to serve. And I say that before we are charged with extravagance, the shareholder should put his hand upon some particular item. We could then reply to it; but I may say this : that we have examined into the expenses of several well-known companies, and none of them are worked so cheaply as our own. I have suggested that we all should resign at the statutory meeting. Not one of us wishes to remain, unless it is the wish of the shareholders.

Mr. ROBINSON regretted that the chairman had let the shareholders know that this matter was to be brought forward before the resolutions were brought before the meeting. He thought it was unfair, and he had not done so. The board were so persistent in getting a majority, that he could not help thinking that there was something behind the scenes. If the new members were appointed the old board would have a majority.

The CHAIRMAN : You ought to know that the chairman of a board never exercises his casting vote unless it is on some very important point.

Mr. RIDLEY SMITH said at the last meeting a resolution was passed, and he was under the impression that had definitely settled the question. He had no hesitation in telling the chairman to his face that if he allowed the board to be altered he would commit an action that he (the speaker) could not have believed him capable of. (Laughter.) He appealed to the chairman to come to some arrangement with the new directors, either by pledging himself not to use his casting vote, or in some way that would be acceptable. He felt that it would be a crying outrage if the new directors did not serve upon the board.

The CHAIRMAN said he was quite willing to pledge himself not to use his casting vote. He hoped that the three gentlemen would be satisfied with that, and in spite of the little unpleasantness which had occurred, they would all work very well together.

Mr. SYKES : I say that it is extremely unfair that the resolutions for the re-construction of the company should have been put first. I would not have voted for it.

The CHAIRMAN said something had been said about five directors being to large. If that were so, let the number be reduced to four—two of each side.

Mr. CHEMERY said they declined to sit.

CONFERENCE.

A conference then took place between the directors, and

The CHAIRMAN said : I have been speaking to Sir Charles, and he does not like to be a "bone of contention," and, therefore, if the mover and seconder will withdraw the motion, I will ask the permission of the meeting that the motion should be withdrawn.

This was agreed to, and

The meeting then terminated with a vote of thanks to the chairman.

THE SYDNEY AND LOUISBURG COAL AND RAILWAY CO., LIMITED.

GREATLY IMPROVED POSITION—PROFITS INSTEAD OF LOSSES —STRATEGETICAL POSITION OF THE RAILWAY—GREAT PROSPECTIVE VALUE.

THE tenth ordinary general meeting was held at the City Terminus Hotel on Monday—G. W. Medley, Esq., chairman of the company, presiding.

The notice calling the meeting was read by the SECRETARY (Mr. Wm. Rowland Hart), and the report of the directors was taken as read.

THE SYNDICATE OPTION.

The CHAIRMAN : Gentlemen, we are a little late this year, but that has arisen from this circumstance, that we wished to be able to tell you one way or another how the option which was given by the shareholders of this company to the American syndicate has gone. As you have been informed in the report, that option has not been exercised. The next thing I have to do is to congratulate the company upon the improved position which the year's accounts reveal. You will see that the coal which was consumed at the mines and in working the railway was 124,050 tons, against 88,850 tons in 1887, and that the sales were 119,194 tons, against 86,569 in 1887. That has resulted in a

PROFIT FOR THE YEAR OF £4,294 10S. 2D.,

as against 1,033*l*. 14s. 9d. in 1887, and a loss of 139*l*. 7s. 10d. in 1886. So far that is very satisfactory. This result, when an amount standing as a deficit in former years is taken off, leaves a balance of 2,720*l*. 7s., which remains to the credit of profit and loss account, and which would be available under ordinary circumstances. The directors, however, as you see in the report, were against dividing that sum for the present, because reasons of prudence counselled them to this. You will see, as is stated in the report, that for the last two or three years, owing to the depression, only very urgent repairs to the rolling stock were made, and certainly funds are required to put that in order. Owing, moreover, to the state of affairs in Cape Breton as to railway extension, much uncertainty exists as to the nature and extent of renewals that may have to be made, and until this uncertainty is removed the directors think it right to husband as much as possible the company's resources. The directors are confirmed in this view by the letter received only this mail in which Mr. Kennelly says, "I have carefully considered what you wrote under this head (balance-sheet), and am of opinion that no dividend should be declared, although I arrive at the conclusion with considerable regret." I do not think I need say any more, except that much will depend upon the course of business during the year. If the company continues prosperous, as it has been in the last year, and as it is at present, for we are going on very fairly, there is not much doubt that

WE SHALL BE ABLE TO DECLARE A DIVIDEND LATER ON IN THE YEAR,

in the shape of an interim dividend, but the amount of it the directors are not able to foreshadow. There are also two things which may happen to the company's benefit during the year and which may add very considerably to our receipts—that is, certain sums may be coming to us from two sources, a reference to which I will make presently. With regard to the course of business in the current year, you will be pleased to hear that the shipments up to the present time are about 13,000 tons, against 9,700 tons last year, showing increased shipments as far as we have gone of about 4,200 tons. Business began earlier this year, and that is a circumstance in our favour. With regard to the contracts, possible and actual, this year there were possible 91,000 tons. Up to the 29th May

CONTRACTS FOR 64,000 TONS HAD BEEN MADE

out of the 91,000, and that is also satisfactory. The prices too thi year are a little better than last year, but on the other hand we ar paying a little more for freight. How the year will come ou eventually it is impossible for anyone to foretell. Barring accidents there should be a good showing, but accidents are always happening and we have experienced a small one which has caused us great inconvenience and some little loss, for a ship called the

"BESSIE MORRIS"

which we had chartered, in coming back from Montreal, on the return voyage got ashore, and Mr. Kennelly had to get tugs to draw her off. It only means this, that one of our means of conveying coal to Montreal was crippled, and that we had to replace it. Mr. Kennelly has obtained other vessels, and, curiously enough, at a lower rate than he paid for the Bessie Morris, rates having fallen. This is one of the accidents we must look for occasionally. Another subject in which we are interested is the Government railway. They do not seem to be getting on very fast with it, and the letter from which I previously quoted states that the manager does not think it will be opened this year. I now come to points in which I am sure you will feel interested —first, the negotiations for the purchase of our shares ; and next, the matter of our late manager, Mr. Kimber. As regards the negotiations for the purchase of our shares, the offer, which seems to have been made in perfect good faith, was, from what I can gather from the materials that have come to hand, and they are but fragmentary, were dependent for their being carried out upon certain conditions being fulfilled. It is a long story to go into, and I would rather say as little about it as possible, because there are so many things connected with local politics, that whatever I might say might offend one party or the other, but, I think I may say this without offending anybody, that the syndicate, no doubt, had in view

A GREAT COMBINATION,

into which was to be worked all the coal mines, and there was to be a re-constitution of our line on the receipt of subsidies from the Central and Provincial Governments. The difficulties in carrying this out were not surmounted. As far as this company is concerned it was

not, and is not, in a position to undertake any responsibility with the Government as regards re-gauging the line, or renewing its rolling stock, except any engagement which might be purely ministerial, but the Government would not accept any assurances from anyone except ourselves. They would not accept them from any third parties. That was the great difficulty, and so the business appears to have fallen through. This, of course, is to be regretted, for it might have turned out, and I hope some day will turn out, very much to the company's benefit that its railway should be worked as part of an inter-colonial system. If that were to come to pass it could not but benefit the company, and, besides, do a great deal for Cape Breton generally; but, as I said before, this company is not in a position to undertake any such fresh enterprise as would be involved in making a contract with the Government, to re-gauge its line, and renew its rolling stock on the broad gauge system —to receive subsidies on the one hand, and on the other to contract to run trains at fixed times and fixed fares. I speak for myself, and I think I do so for almost every shareholder in the company, that that is an undertaking we could not view with complacency. At the same time they would be right to hand over the whole line on fair terms to any company that would undertake to carry that out on its own responsibility.

THE LATE MANAGER.

Mr. F. C. Kimber ceased to be the company's agent and superintendent on the 1st December last, and Mr. D. J. Kennelly has since that time acted in that capacity. The truth is that the company had very grave cause of complaint against Mr. Kimber, and you will see on turning to the balance-sheet that there is an "unassessed claim against an official of the company," the amount of which is not yet ascertained. As the matter is *sub judice*, the least said about it at this stage of the proceedings the better. Meanwhile Mr. Kennelly is acting as agent and superintendent. As regards the company's claim against Mr. Kimber, that is one of the resources in the way of the receipt of money that may be available to us as the year goes on. The other item is the possible receipt on account of the company's

CLAIM AGAINST THE CAPE BRETON RAILWAY COMPANY

for the right of way underneath our bridge, their railway crossing ours at right angles on its way to Barrack Point, in respect of which we claim $3,000. Our claim against Mr. Kimber is a good deal more. Early in the year we had some estimates by Mr. Kennelly of what it would require for repairs generally. The total amounts to less than 2,000*l.*; but little has been done as far as the pier is concerned, because, in consequence of there being no snow in the island no timber could be conveyed, and, therefore, repairs could not be made, except of a pressing character.

MR. KENNELLY IS ACTING WITH GREAT DECISION AND VERY ENERGETICALLY

in the company's service, for which the board feel very grateful to him. The only other point is that when I have moved the reception and adoption of the report and accounts, I will ask you to pass a resolution sanctioning the payment by the directors of the expenses connected with the negotiations for the purchase of the company's shares. I am very pleased that the report we have to lay before you is in such striking contrast to what was the case during the last few years. I hope the revival in trade may confirm our prosperity, and that we shall go on from good to better.

Mr. BRYDONE: The circumstances which are told to us in the report, and more fully in your speech are to me very satisfactory. I was never in favour of the sale to the syndicate, although nominally a consenting party. I am glad it fell through. I think the property is improving, and with the railway made by the Dominion Government up to Louisburg it cannot do otherwise than gain advantages which a few months ago seemed quite impossible. Therefore, I am glad there is no obligation upon us now to sell. I hope, sir, you will, as you have persistently and perseveringly done, stick to the concern for a few years more, and you will make it a great success.

I HIGHLY APPROVE OF YOUR POLICY

of allowing the dividend to stand over in order that you may be armed with funds in any emergency. (Hear, hear.) I am in favour of holding the property until the arrival of better times. If it had continued to be the miserable business it was before, we could scarcely have asked you to retain your position, but with its returning prosperity, I do not think you need be in a hurry to dispose of it. I am very much pleased with the report you have given us. In regard to the Gut of Canso, can you tell me if it is navigable, or what can be done with it?

Mr. HODGE: You told us at one of the special meetings that if the business fell through a sum of money would be paid to the company. Has that amount been paid?

The CHAIRMAN: The Gut of Canso is 2 miles wide, and is a part of the sea. It is tidal, and deep. It has a steam ferry at work. With regard to the syndicate money—it was to be paid only if they accepted the option, but they did not. We wish to keep the money in hand that we have, so as to avoid the necessity of having to make a call. We will avoid a call if we can possibly do so.

Mr. BRYDONE: In the Canadian Pacific report the map puts this line as if it were a part of the main system. I think the steamers will finally call.

The CHAIRMAN: In a few years our line may become a necessity.

Mr. BRYDONE: I am sure the sound policy is one of waiting.

The CHAIRMAN said coal had a tendency to rise, which was in their favour.

NO UNPLEASANT QUESTIONS.

Mr. SATTERTHWAITE: It is a rather pleasant thing to attend a meeting at which there are no unpleasant questions to ask. I rise to congratulate the directors and the shareholders upon the improved state of affairs. I think the skill of the board in the management has been very great, for I well remember the time when our position was far less rosy than it is now.

Mr. C. J. RUSSELL seconded the motion for the adoption of the report, which was carried unanimously.

The CHAIRMAN moved the next resolution :—"That the directors be empowered to defray the legal and other expenses connected with the negotiations for the purchase of a majority of shares in this company by an American syndicate, amounting to 55*l.* 16s. 8d."

Mr. C. J. RUSSELL seconded it, and it was carried.

The CHAIRMAN proposed, and Mr. RUSSELL seconded, the re-election of Mr. Schroder as a director, and the motion was agreed to.

The CHAIRMAN moved, and Mr. MILLS seconded, the re-election of Mr. Russell as a director, and it was agreed to.

Mr. BRYDONE proposed, and Adml. STODDART seconded :—"That Mr. John Paterson be and is hereby re-elected auditor of the company, and that his remuneration be 21*l.*" which was agreed to.

On the motion of Mr. SATTERTHWAITE the proceedings closed with a cordial vote of thanks to Mr. Medley for presiding.

ST. JOHN DEL REY MINING CO., LIMITED.

ACTIVE WORK—GRATIFYING PROGRESS—QUESTIONS SATISFACTORILY ANSWERED—MANAGEMENT COMPLIMENTED AND THANKED.

THE annual general meeting of the proprietors was held at the City Terminus Hotel, on Thursday—John Hockin, Esq., chairman and managing director, presided.

Mr. C. F. POOLE read the notice calling the meeting, and the report of the directors was taken as read.

ACTIVE PROCEEDINGS.

The CHAIRMAN said: Gentlemen, we have endeavoured in the report to give you concise information on all points of interest connected with the company's operations, both at home and abroad. We were able to despatch the men selected to commence the work of driving the level to and sinking the shafts by the middle of March, which was as early as they could have been safely sent with a certainty that the machinery they had to commence the work with, and other necessary arrangements, would be ready for their use by the time of their arrival. Before beginning to drive the level, or adit, a body of ground about 30 ft. by 30 ft. had to be removed to form a firm adit's mouth, and for other reasons. The work of driving you will have seen was commenced on the 13th April, and up to the end of that month 20 fms. had been driven; for the month of May there were driven 27 fms. 1 ft., which may be deemed a highly satisfactory rate of progress, considering the size of the adit, 10 ft. by 9 ft. The ground, as might be expected so close to the surface, was mostly soft, disturbed, slatey matter, with hard, stratified clay, so that, of the first 20 fms. driven, only about 6 fms. would stand without timber, but the ground was getting harder; and as the overlying ground rises rapidly from the adit's mouth to the shafts, they would, in all probability, soon get into firm ground, for already the floor of the adit was rock, though the roof and part of the sides remained soft. Hard rock, requiring no timbering, would, on the whole, be more favourable than soft ground, which would require to be supported by timber, and ultimately bricked. The progress would be slower, but the expense less. You will find this adit marked as 100 fms. in length in the small sketch plan sent you with the superintendent's report on re-opening.

ALTERATION OF PLAN.

When the whole plan of re-opening came to be more maturely considered, it was for many reasons thought more safe to sink the vertical shafts to the horizon of the lode, which you will remember dips at an angle of 45 degs. at the bottom of what I will call the first chamber, to be opened instead of to its upper horizon, by which arrangement the underlie shaft would not commence until the first chamber had been worked out—probably three or four years after it had been struck. This involved the removal of the site of these new shafts D and E further east, and in consequence the lengthening of the adit, which will now be 165½ fms. from its mouth to the shaft E, the most eastern. The height from the surface will also be increased to 54½ fms. The D shaft was commenced on the 13th May, and sunk 6 fms. 16 ft. 10 ins. in diameter—awaiting a good supply of bricks. On this subject the superintendent writes under date 1st June:—

"You will have understood the reason for the delay in the manufacture of bricks. The machine, to take the place of animals that proved incapable of working the brick machine in the hot sun, will be ready to-day, and to-morrow, or the day after, I hope to have fairly commencing making bricks at the rate of 7,000 a day; as a matter of fact no loss of time has occurred through the want of bricks, as the sinkers have been employed in driving the adit, work equally as urgent as the shaft. It is satisfactory to note the good progress they have made in this last driving from the 1st April to this date; the distance driven amounts to no less than 283 ft., averaging just 13 yds. a week."

THE AQUEDUCT.

The work of constructing the new rego or aqueduct I need hardly say has been one of considerable magnitude, but considering how unequal the water power was becoming for pumping, hauling, and driving the other machinery of late years, as the mine became deeper, it was deemed indispensable for working the new system efficiently. It involved a considerable amount of surveying over a difficult country covered for the most part with matte or jungle, which was ably carried out by the company's engineer, Mr. Hinton. In the construction the superintendent adopted a novel plan, which was found to answer admirably. He put up huts on the line of the rego, and supplied the men with rations, cooked on the spot, thereby economising their time and providing them with better food than they would have provided themselves with. They were thus much better able to stand the fatigue of the work, entirely exposed as they were to the heat of an unusually hot Brazilian season, and the work was completed much more rapidly, and at less expense than it would otherwise have been done.

VIEWS OF SUPERINTENDENT.

I will give the result in the superintendent's own words as given in his letter of 1st June already referred to: "I am pleased to state the new rego is complete, with the exception of one piece of masonry.

I consider it to be the most satisfactory piece of work performed since I have been here. Although the gang has consisted of a mixture of Italians, Chinese, blacks (lately emancipated slaves) and Brazilians—over 100 in all—there has not been one single case of drunkenness or stealing. I consider the good order due to the men having been thoroughly well fed by the company, and the splendid way the foremen have managed these men. The length of the rego is over 6 miles; the banks throughout are much wider than those of the regos hitherto made here, to make them thoroughly secure; and although the rego is an exceptionally long one, I anticipate little trouble from slipping banks during the wet season." I desire also to draw your atteution to the paragraph in the report in regard to the poppet-heads, which had to be completed before the shafts could be commenced, for the reason given in the report, no large timber could be got in from the usual sources in the neighbourhood. Mr. Chalmers persuaded a neighbour to send his steamer 240 miles down the River Das Velhas to endeavour to obtaiu a supply. In loading the first load a man was killed, when the whole of the crew abandoned the enterprise. Mr. Chalmers persuaded the owner of the steamer to lend her to him. When she was sent down in charge of Mr. Morgan, one of the company's *employes*, he succeeded in bringing up a load or two, when the unusual dry season so shallowed the water of the river that she grounded, and so brought this mode of obtaining the timber by the river to an eud. In this dilemma Mr. Chalmers abandoned the hope of being able to construct the poppet-heads of timber, and he took himself to the old mine pumps. The work was carried on day and night without cessation until completed. It will be seen that we have been able to collect enough gold to more than pay all expenses, both at Morro Velho and Cuiabà.

RAILWAY.

One great difficulty the company has had hitherto to contend with is the land transport, especially for heavy machinery. This is about to be overcome entirely, for we learn that the railway is likely to be completed to Sabara, some 20 miles from Morro Velho, before Christmas, and next year quite up to the company's property on the Rio das Velhas. The chairman concluded, amidst cheers, by proposiug the adoption of the report and accounts.

Mr. F. TIMEWELL ROGERS: I second the motion. The directors in their report have done their utmost to lay before you the exact state of the company, and I hope you will agree with them in thinking that as far as it goes their accouut of their stewardship is very satisfactory. The chairman has entered so ably and fully into all matters of detail that I can add but little to them, and, therefore, I will simply second the motion.

CLOSING OF THE LISTS.

Mr. LYNE: May I ask when it is intended to close the list for the applicatious of shares in the new company. It seems hardly fair to the orginal shareholders to keep the list open indefinitely. If you cannot tell the meeting when it will be closed, perhaps you can tell the position of affairs why it cannot be closed.

The CHAIRMAN: The directors at present do not think it advisable to close the list, and uothing is to be gained by doing so. Old shareholders may have reasons for not taking up their shares at present, and we think it unfair to shut them out altogether; they are entitled to some consideration as shareholders in the old company, and therefore at present we do not intend to close the list.

Mr. LYNE: Will there be any time fixed?

The CHAIRMAN: Not at present.

A LIMIT REQUIRED.

Mr. RICHARD DONOGAN: It strikes me that there should be some limit of time within which these applications will be received, otherwise it will be a case of "heads I wiu—tails you lose." If it is left open it is in the power of persons to abstain applying for their shares so long as the present rates of value are current in the market, and should anything of a better character turn up they will immediately come in, whereas they would stop out if no favourable circumstance turned up. I do not mean to impute that you have not yet performed your duty, but I think a time should be arrived at before long at which you will exclude those whose apparent object it is only to eome iu at the last moment, in the event of the company being successful. (Hear, hear.) We do not want to tie your hands, but only to establish a corrective against the possibility of anybody coming in unfairly.

Mr. FREDERICK TENDRON (director): I think the directors are indebted to both speakers for bringing this matter forward. There is a strong feeling on the part of the board that they

WOULD NOT LIKE TO DEAL HARSHLY WITH ANY SHAREHOLDER

who finds a difficulty in meeting the calls that are to be made. There are certain arrears, and I hardly think that feeling exists so much towards the shareholders who have not yet come in. I think it is a question to be settled between the liquidators of the old company and the directors of the present company, and certainly if some shareholders are kept back with the idea of "heads I win and tails you lose," they may find that if there are heads they will lose, and if there are tails we will win. The time will come when they will have no longer the option, but when any value in their old shares will be realised for them (if there is any value), and the property in the new company will be sold to those who will come in and pays the calls. It is essential for us that we should have the whole of the share capital taken up, but there are many shareholders who would be glad to buy the shares of those who do not come in, and it will be better for them when the moment comes that they should accept something for their old shares than find that they are forfeited, and that they have nothing for their old shares, and no right to come into the new company. I do not think anything will tend to briug in those shareholders who have not yet applied than

THE MOST MASTERLY REPORT

that has been issued to you by the directors from Mr. Chalmers. It is only by carefully reading that masterly report, and that of Mr. Hinton, the engineer, that you can have some idea of

THE ENORMOUS AMOUNT OF WORK

that has been carried out at Morro Velho during the short time the present company has been in existence. The most earnest desire that the shareholders can have is that Mr. Chalmers' health will continue as good as hitherto, and that he will be able to devote his whole energies to the carrying out of this great work. I do not think it was possible for us to have anticipated that so much surface work would have been done so soon, and that we should be ready at present to commence sinking. (Cheers.)

In reply to a question by Mr. Wytt,

Mr. TENDRON said he did not think it would be advantageous to the company at present to discuss its relationships with the owners of the Newbery-Vautin process.

A SHAREHOLDER: We are expending a good deal of money on preliminary expenses, and I shall be glad to know if we have enough capital to carry out the development of the mines upon the original plan.

Mr. TENDRON: Have you not used the wrong term? The preliminary expenses amount in all to only about 300*l*., and if there is one thing more than another upon which we congratulate ourselves, it is that we have carried the

SUCCESSIVE CHANGES ALMOST WITHOUT EXPENSE,

that is, with the exception of the Government duty, and the most modest bill of our solicitors, Messrs. Wilkins, Blyth and Dutton.

The CHAIRMAN: I meant preliminary expeuses at the mine.

Mr. TENDRON: Do you suppose that the rego aqueduct can be made without heavy cost? To incur that with other expenditure for a definite purpose was the object of the re-coustruction of the company. We are pushing on the work as fast as possible, and hope to make the calls earlier than we expected. The essential thing is to get the work through as fast as possible,

The SHAREHOLDER: Will you have sufficient capital in hand to reach the lode?

Mr. TENDRON: That is rather a crucial question to put so soon. I think we have showu the work is going on very well, and with a most commendable degree on energy. (Cheers.)

The motion was carried unanimously.

RE-ELECTIONS.

The CHAIRMAN proposed the re-election of Mr. Tendron as a director.

Sir JOHN SWINBURNE, M.P. (director), seconded the motion, which was carried.

Mr. DONOGAN proposed the re-elcction of the auditors, Messrs. Deloitte, Dever, Griffiths and Co. at a remuneration of 30 guineas.

The motion was seconded, and carried unamimously.

GUARDIAN ANGELS.

Mr. RAWSON, in proposing a vote of thanks to the chairman, said: I see a map on the wall representing the ruins, or what is left of the great St. John del Rey Mine, but I am encouraged in looking at it by observing that above it is hung a picture representing guardian angels. (Laughter.) With the assistauce and by the watchful care of these guardian angels I am stimulated to believe that the mine will be resuscitated, and that we shall have before us a career of renewed prosperity. (Cheers and laughter.) With regard to the shareholders who have not come in, I would say, deal leniently with those who have not the money to pay the calls, but deal quite differently with those who have the money, and who are simply holding back that they may get some idea as to how the matter is goiug to turn out.

JUSTICE TO THE MANAGEMENT.

The mine is extremely well mauaged from London, and the manager abroad appears to be excellent. My vote of thanks is to the chairmau, the directors. and the manager abroad.

Mr. DONOGAN, who seconded the motion, referred to the map on which his predecessor had seen the remains of the mine, but in this double lighted room he thought the shareholders had seen very little because the map was almost invisible. (Laughter.) Personally, he had no doubt that they would get down to the lode again, and would realise every expectation held out when these works were arranged.

The motion was seconded, and carried by acclamation.

The CHAIRMAN: I am very much obliged for the confidence you have put in us, and for the very pleasant way in which you have allowed us to carry through the busiuess.

The meeting then ended.

WHEAL KITTY.

THE DUES QUESTION AND THE EXTENSION OF THE SETT—CALL OF 5s. PER SHARE.

A SPECIAL MEETING of the adventurers in Wheal Kitty was held at Tabb's Hotel, Redruth, this week.—The purser (Mr. Joseph Teague) presided, and there was a small attendance.

The CHAIRMAN, having read the resolutions adjourning the meeting on May 24th, submitted the report of the committee to confer with the lords' agents, which ran thus:—

Re extension of the sett and remission of the dues.—The committee beg to report that they have this day met the lords' agents on the mine, and the applications made were favourably received, both as to the extension of the sett and the reduction of the dues. As soon as they hear definitely on the matter, the purser will communicate the result to the shareholders.

Capt. W. TEAGUE remarked, with regard to the way in which the lords' agents had met them, that he should be only expressing the views of the committee if he said that they were received in a very favourable spirit, and led to believe that anything the agents could possibly do in granting the concessions they asked for they would do. The concession of 30 fms. to the north, which was not completed at the last meetiug, had now been confirmed, and they could drive 30 fms. north of the original boundary now, besides which they had the promise that the lords' agents would recommend a yet further extension of 20 fms. A similar tone pervaded the remarks made about the remission of the dues.

Mr. HITCHINS moved that a 5s. call be made, payable in July.

Mr. DAVEY having seconded Mr. Hitchin's motion, it was carried.

The CHAIRMAN suggested that the next meeting, on September 18th, should be held in Truro instead of on the mine, and the matter was left in his hands.

On the motion of Mr. WILLIAMS, seconded by Mr. DABB, the report of the committee was adopted, and the proceedings concluded with a vote of thanks to the chairman and the agents.

PRINCE OF WALES MINE.

A CALL OF 4s.—THE MINE LOOKING WELL.

A MEETING of shareholders in this mine was held at the Offices, Gracechurch Buildings, Gracechurch Street, on Wednesday, 26th June.—Mr. Alfred Thomas in the chair.

Mr. C. B. PARRY (secretary), read the notice convening the meeting and the minutes of the previous meeting.

AGENTS' REPORT.

22nd June.—We beg to hand you report for the general meeting to be held on the 26th inst., showing the work accomplished, together with your present position and future prospects. The sinking of the engine shaft has been continued on the course of the Prince of Wales lode. We are pleased to state that the shaft is down 9 fms. below the 155-fm. level, and the lode throughout has maintained a large and masterly appearance, and worth for the length of the shaft (12 ft.) 16*l.* per fm., being also its present value. The 155-fm. level east has been driven 11 fms., thus making the distance from shaft 47½ fms. on a lode from 3 ft. to 6 ft. wide, and worth for the whole drivage from 8*l.* to 12*l.* per fm. We are again taking down the lode here, and find it 5 ft. wide, presentiug a very fine appearance, and worth 12*l.* per fm. The 135 east is exteuded 7 fms., making the distance from shaft about 68 fathoms. The lode throughout the whole of this drivage has been of a productive character, varying in value from 8*l.* to 15*l.* per fm. The present end is showing a lode 5 ft. wide with a value of 10*l.* per fm. The 90 east has been driven 10 fms., which makes the distance from shaft 112 fms. We are also taking down the lode in this end and are pleased to say that we find it much improved, being 2½ ft. wide, producing rich stones of tin. We have not as yet been able to test its value, but are quite satisfied of its being a profitable lode. The three stopes in back of the 155, 135, and 115 are worth together 24*l.* per fm. In concluding our remarks upon the undergrouud department, we need scarcely remind you that you have a great amount of profitable ground laid open. You will also observe, as afterwards referred to, that all the surface works are well forward, and you will shortly be in a position to employ any reasonable number of men stoping the ground above-mentioned for increased returns, and we still recommend a vigorous and spirited development, believing it will shortly place the mine in a splendid position. Surface: The quarrying and carting of stone, building calciner house, condensing chambers and chimney, together with the new cleaning floors, are near completion. The whole of this work has been pushed with vigour, and we shall, in the course of two or three days, commence burning and preparing tin for market. In addition to the foregoing we have taken out the drawing engine, which had fallen into a very dilapidated state, and the loading had so failed we found it not capable of holdiug the engine in its place. New loading has been built, and the defective part of the engine made good; it is now doing its work well, and all machinery in the mine is working in a most satisfactory manner, being equal also now to the future output of the mine. We may also remark that the new pitwork referred to in the report for the last general meeting continues to work with great satisfaction.—S. ROBERTS, R. KNOTT.

The CHAIRMAN: Gentlemen, I shall make my remarks to-day as brief as possible, consistent with the important business before us.

THE ACCOUNTS.

With regard to the accounts, you will observe that we have a considerable adverse balance to meet. I am not myself at all disappointed with the amount of money expended, for I know full well, from the visits I have paid to the mine, that the money has been expended in a proper and legitimate manner, and anyone who would like to make any remarks upon that I hope will do so on this occasion. With regard to the credit side, I am disappointed, for two reasons. The first reason is that the only credit we have is 75*l.* 16s. 5d. for copper ore sold, as against the last amount of 440*l.*, and the previous one to that of 599*l.* This is easily explained, for since November last copper has been dropping. We got 6*l.* 10s. in November, 5*l.* 10s. in March, and only 2*l.* 15s. in April. The ore is of a like good quality, but this great difference between March and April was caused by the collapse of the ring known as the French Syndicate, which made a differeuce between March and April of at least 50 per cent. I must tell you that when copper dropped to this price, the tributers who had been working in the mine found it impossible to live upon the result of their work, and consequently they had to abandon it. The second disappointment is that we have beeu unable to make sales of tin. Upon the last occasion I refused to make any absolute promise, but I did hold out hopes that we should have been credited with one or two sales of tin. We have had weather of a very frightful description, with the result that for days together, and sometimes for weeks together, neither masons nor carpenters could have stood out to do the work. Gentlemen conversant with building will know that to do work in bad weather is simply money thrown away. We have an instance of this in works adjoining our own, where they deemed it advisable to continue building a chimney shaft in this weather; the result was an utter collapse of it, which lost them their money and their time, and might have involved loss of life. Therefore, I say, the whole work that has been done on this mine, although it has taken longer to do than we anticipated, has beeu done in a thoroughly consistent manner. I think that will explain the reason for not having anything more on our credit side,

THE NEW POLICY.

I will just take you back to last July. At the meeting held then we initiated the new policy in connection with this mine. It is barely 12 months ago, and I venture to say the work done for the money expended iu that time can be compared with anything done in the county of Cornwall. The mine had been for a long time without any renewals whatever, and everything was in a very bad state from the pumping engine down to the wheelbarrows. We have thoroughly put in repair the whole of the machinery. We have repaired the pumping engine, and put entirely new timber in the house, so that it is now working upon a consumption of coal equal to about two-thirds of what it was previously. Then, with regard to the drawing engine. When I was down there a few months ago it was absolutely unsafe. Orders were given that this engine should be taken out, and the whole of the foundations repaired. The cogwheels and apparatus in connection with the drawing gear were absolutely unsafe. These are all new, and now your engine is capable of drawing 100 tons of stuff a day from the bottom of the mine. We have purchased 36 heads of stamps. The axle of 16 heads is in position, and can go to work in a fortnight. We have made floors equal to taking the stuff from 40 heads of stamps, so that in a short time we shall be ruuning 40 heads. Then with regard to the calciner—we have also done the whole of that, and paid for it siuce the last meeting. I have a letter from Capt. Roberts yesterday, saying the calciner is actually at work. Therefore we hope in a short time to be in the market with our produce. All the alterations made to the engines have been the means of saving us at least 30 per cent. of coal. Underground we have thoroughly renovated the pitwork from the surface to the 155-fm. level. We have ventilated the mine by means of rises and winzes. We have laid open an almost unlimited quantity of profitable ground. Some idea may be gathered when I tell you that between the 135 and 155-fm. levels east I calculate there are

10,000 TONS OF TIN GROUND

to come away. In the future we propose to work the miue as we have hitherto done. We shall, however, have sales from now forward, so that we shall not have such heavy adversed balances in the future. At the same time there is a large amount of work still to be doue. We must build the floors for the other 16 heads of stamps. I am very pleased to call your attention to the fact that the miue is looking better than at any previous period, and I sincerely trust that gentlemen will see the necessity that there has been for the large expenditure that we have made, and that they will still aid us in bringing to a profitable state this mine, in which we all have so much interest. I beg to propose that the accounts be received and adopted.

Mr. WAGSTAFF: I have visited the mine, and from what I saw the works on the mine have been done in a most substantial manner. I think we have now turned the coruer in the Prince of Wales Mine. I am an original shareholder, and one of the oldest shareholders. I have belouged to it for 17 years, and I have never sold a share. I have faith in the mine, and I have faith in the captains, and I believe I shall be recouped and get my money back again. I beg to second the resolution.

The motion was carried.

A SHAREHOLDER: Do you expect the returns to pay costs?

The CHAIRMAN: I do when everything is completed, which I hope will be when we hold our next meeting. We have got thousands of tons of tin ground laid open and ready to take away, although it is not a very high grade.

THE CALL.

The CHAIRMAN: The next business is the unpleasant one of asking you to provide the ways and means. The loss is 2,466*l.* 8s. 11d., and the balance against the adventurers is 2,555*l.* 6s. 1d. By rights we ought to make a call of 5s., but seeing we have some tin, your committee recommended it shall be 4s. We cannot conceive how it can be less. I therefore propose a call of 4s., payable on 26th July, subject to the usual discount of 5 per cent.

Mr. DONNET seconded the motion, which was carried.

THE BANK ACCOUNT.

The CHAIRMAN: You remember at the last meeting we suggested to you that we should be allowed to overdraw the bank account. I pointed out to you then the reason for that. We followed out the policy upon which that recommendation was made as far as we could, but we ought now to have a larger overdratt, because by paying cash for the merchants' bills we save from 10 to 15 per cent, whereas the bank only charge us 5 per cent. Therefore we want you to authorise us to overdraw a larger amount, say 2,000*l.*, if some gentleman will propose that.

Mr. DONNET proposed that the committee be empowered to overdraw the banking account to the exteut of 2,000*l.* iustead of 1,000*l.*

Mr. SIMMONS seconded the motion, and said that after listening to the remarks of the chairman it would be very undesirable to tie the hands of the committee. He took this opportunity of sayiug that what Mr. Thomas had doue since he took the helm had been very much to the advantage of the company.

The motion was carried.

Mr. WAGSTAFF proposed a resolution declaring forfeited certaiu shares on which more than one call was due.

Mr. ANDREWS seconded the resolution, which was carried.

The proceediugs then terminated.

THE VICTORIA (LONDON) MINING CO., LIMITED.

A DIVIDEND OF 7½D.

A GENERAL MEETING of the shareholders of this company was held at the Offices, 57, Moorgate Street, on Wednesday—Mr. John R. MacDonnell (the chairman) presiding.

The SECRETARY (Mr. Ernest E. Webb) read the notice convening the meeting.

The CHAIRMAN: Gentlemen, we are assembled here to-day for one object, and that is to recommend you to sanction the

PAYMENT OF A DIVIDEND

of 7½d. on each fully paid-up share, and 6d. on each share with 16s. paid thereon. We have got plenty of money in hand, and we thought it would probably meet your wishes that this sum should be divided rather than kept in hand, as we are not likely to have to expend it on anything. We think it desirable that it should be divided, and, therefore, I shall move "That the shareholders hereby sanction and authorise the payment of a dividend of 7½d. per share on each 1*l.* fully paid-up share, and 6d. per share on each share with 16s. paid thereon, free of income-tax, payable on the 27th inst."

The Rev. ARTHUR F. SHEPPARD: I beg to second that.

The CHAIRMAN: I may mention that the payment of this dividend will leave us with a balance in hand for the moment of 150*l.*; at the same time we have some amounts on capital accouut—some 660*l.*—and we have some unclaimed dividends amounting to 75*l.* So that in fact we have a large balance at the bankers, and, having nothing to pay, I think we are perfectly justified in paying this dividend.

A SHAREHOLDER: Have you received auy advices from the mine?

The CHAIRMAN: Since the last meeting, at which I was unfortunately not present, having been detained by urgent private business, three letters had been reeeived from Mr. Bland, but we have had no adviee since the letter, dated April 15th, which was received about a fortuight ago. There has been a slight falling off in the yield, and they have been spending a good deal of money on machinery, and in improving the shafts. We have only had one remittanee since, and that is 150*l*., but I believe the prospects of the mine are looking well on the whole. At any rate we have sufficient money here to pay this dividend, and we see no reason why we should keep it in hand. We have got enough money for all we want, and we hope to get more.

Mr. G. A. PASSINGHAM: I should like to ask whether on this or on some future occasion the directors do not propose to make some provision for a

RESERVE FUND

when they are paying a dividend.

Mr. ALFRED CORBETT (deputy chairman): A very good suggestion. I have had the same thing in my mind.

Mr. PASSINGHAM: I think that with certain liabilities——

Mr. JOHN SCHOFIELD: We have no liabilities, and are not likely to have any.

Mr. PASSINGHAM: I think we may have calls.

Mr. SCHOFIELD: No, we shall not.

Mr. PASSINGHAM: When all our capital is exhausted it is desirable to make some provision in that way.

The CHAIRMAN: We have got 660*l*.

Mr. PASSINGHAM: But that is on capital account.

The CHAIRMAN: Yes.

Mr. SCHOFIELD: We have no expenses but capital expenses, except what is incurred in earring on the company here.

Mr. COBBETT: Then, again, we have here an item of unclaimed dividends, which represents 75*l*. 17s. 8d., and with this twelfth dividend there will be 125*l*. You see we have so many shareholders who do not come forward at all.

The CHAIRMAN: This is the first dividend we have paid for some little time. I think it is a very good suggestion, and if we should become prosperous, I think we ought to make provision for a reserve fund. At the same time you should understand that in Victoria they have got about 1,800*l*. of a reserve fund of their own, and they are not likely to spend all that. There is no fear of their making calls.

Mr. PASSINGHAM: If they are providing for a reserve over there, then I shall modify my opinion.

The CHAIRMAN: I think you may leave the matter in our hands. We will consider it before we recommend the payment of another dividend.

The resolutiou was then put to the meeting and carried unanimously.

Mr. PASSINGHAM proposed, and Mr. SMITH seconded, a vote of thanks to the chairman.

The CHAIRMAN acknowledged the compliment, and the proceedings then terminated.

THE NEW GUSTON CO., LIMITED.

A HIGHLY PROSPEROUS YEAR—ORE RESERVES BETWEEN LEVELS 3 AND 5—MINE NOW PRODUCING £6,000 TO £7,000 A MONTH.

THE second ordinary general meeting of the shareholders was held at Winchester House, Old Broad Street, on Thursday. The business of the meeting was to receive and consider the balance-sheet, the revenue account, and report of the committee of management and auditors for the year ending 31st December, 1888, to elect two members of the committee, in place of those retiring by rotation, also auditors, and to transact any other business which, under the articles, ought to be transacted at an ordinary meeting—Frederick P. Crowther, Esq. presided.

Mr. BEDFORD MCNEILL (secretary) read the notice calling the meeting, and the report of the direetors was taken as read.

ACCOUNTS EXPLAINED.

The CHAIRMAN: Gentlemen, I have to apologise for Mr. Stewart Pixley's absence to-day. He is prevented from attending at this meeting on aceount of private family matters, and he wished me to express his regret. Before commencing the remarks I have to make to-day, I want to call attention to two or three items in the balance-sheet The first one is the item of 210*l*. 19s. 5d. paid on account of claims against the Guston Silver Mining Company, Limited, being expenses in connection with the liquidation. I may say that I am calling attention to these points in aecordance with the arrangement made with the auditors. The second one is the mines development aceount and general expenditure at the mines as to 21st June, 1888, 858*l*. 11s. 2d.; that is an item whieh has been already charged to capital account, and was ineurred before the mine was re-opened by the present committee of management. The next item is 1,182*l*. 10s. 1d. which was the expenditure incurred by the present committee of management during a period prior to the mine becoming productive. It was for pumping out the water, and for repairs necessary for machinery, which had been lying idle for some considerable period—a new boiler and such similar items which are fairly chargeable to capital aecount. The third is the preliminary and general expenditure in London (230*l*. 10s. 6d.) up to June 21st, 1888. That item also refers to the old committee of management, and we think it fairly chargeable to capital. It was ineurred during the period the mine was in liquidation, and when the re-eonstruction was going forward. The next item is further expenditure from August, 1888, 895*l*. 17s. 9d. That was London expenditure prior to the mine becoming productive, and was fairly chargable to capital account. The Little Annie and Smuggler development expenditure to date, under option of purchase, is 324*l*. 8s. 6d. You will remember that we agreed when we bonded these properties to spend a certain amount in development, and that was part and pareel of the terms—324*l*. 8s. 6d.—and relates entirely to eapital aceount. The "4th July Claim," on account of purchase of land, is the purchase of a small piece of property adjoining the Gustou, which is necessary for a dumping ground for our refuse, and that is also chargeable to capital, and we propose to-day to ask you to give your cousent to all these items beiug charged to capital account.

THE MINE.

My next duty is to speak to you upon the subject of the mine. It is just 12 months to-day since the present committee took offiee, June 27th, 1888, at which time you will remember there was nothing going forward of any moment at the mine, and the re-eonstruction here had gone so far forward that something like 64,000 shares out of 100,000 had been applied for by the old shareholders. No work had taken place at that time, and we had only just consummated the arrangement with Mr. Geo. Crawford to watch over our interests generally in Colorado, and with Mr. Schwarz to look after them locally as mine superintendent, and having full charge of the works. During the period that has elapsed we have prosecuted work at the mine as vigorously as eireumstances would permit. The working shaft is only a prospecting shaft of very small dimensions, some 4 or 5 ft. by 6 in places, and our hoist being of very small power, we have had to work under eireumstances which have been against us. However, we consider the result of the working of the past 12 months exeeedingly satisfactory—(eheers)—resulting, as it has done, in the shipment up to the 15th of this month of about 1,130 tons of ore, producing, after payment of all expenses at home and abroad,

A NET PROFIT FOR DIVISION IN DIVIDENDS OF ABOUT 31,500*l*.,

which is equal to 28*l*. per ton of the net realised value for the ore. (Cheers.) In addition, and this is a most important point, to whieh I want to draw the special attention of the shareholders, beeause it goes to the eredit of the working for the past 12 months; there is also the ore in reserve between levels 3 and 5, which, after careful consideration, we consider will yield some 3,000 tons of high value. (Cheers.) You may make your calculations from the figures you have before of the past 12 months' working.

RESERVES.

The number of tons is given and the value, and you may work out for yourselves the value of those 3,000 tons—we prefer not to state it publicly. Whatever we think we thiuk for ourselves, and you can do so for yourselves. If you will make the calculation I think you will find it is exceedingly satisfactory, and we shall shortly reach the 6th level which will cut the ore shoot at about 388 ft. from the surfaee, or 100 ft. below the No. 5 level. Of these 100 ft. 85 were completed on June 15th, and the shaft is going down at the rate of about one foot per day. As soon as the 6th level is reached the work of drifting for the ore shoot will be proseeuted as rapidly as possible, and the reserves of ore between levels 5 and 6 will become available for extraction, and judging from the past (and we have nothing else to judge from) they will be large and valuable. So far as our experience carries us we judge that we have in Guston

A PHENOMENAL PROPERTY

(hear, hear)—which, as soon as the mine is properly equipped with a suitable working shaft and hoisting machinery, will be made manifest to all concerned. During the early part of the coming winter we intend to straighten and enlarge the present shaft, whieh we expect to accomplish in from 40 to 60 days. We have given orders for the new hoist, and the erection of the new buildings uecessary, which will be put up during the present summer and autumn. Meanwhile we shall continue to extract ore as rapidly as possible to provide dividends for the eoming half year. The points that are necessary for you to know are included in these remarks that I have made. I do not want to enlarge upou them, although there are one or two other items which might be touched upon, for instanee that of the law suit. As to the appeal by Messrs. Weston, which is still *sub judice* against the strongly adverse decision given by the Hon. Mr. Justice Kay, in the following words, "it was one of the most flagrant attempts to violate the rules of equity he had ever heard of." The Committee of Management await the result without fear. In the improbable event of the case going against us, we have ample funds to meet the maximum damages which might be awarded.

BONDED MINES.

The CHAIRMAN: The only other item I have to refer to is the question of the Little Annie and Smuggler claims. Our bond expires on 15th September. During the past six months we have rather sacrificed the dividend iuterests of the Guston Company, in order to earry forward the development of the Little Annie as rapidly as possible, and, in connection with this, we have instructed Mr. Schwarz to procure a diamond drill, which will assist him materially in carrying forward those developments with all speed. We are not able to judge as yet as to the advisability of purchasing these properties or not. There is no doubt a lower shoot which exists in the upper or adit level, but the adit level has fallen in, and we are not able, without considerable expense and delay, to put down a winze upon that ore body, but judging from the nature of the ground in the Little Annie, where we are running our drift, the prospeets of cutting it are very tangible, and that is as much as we ean state now. It only remains now for me to propose the first resolution, "That the balance-sheet and report of the committee of management for the year ending December 31st, 1888, be received and adopted." I have great pleasure, gentlemen, in proposing that resolution. (Cheers.)

Mr. PHILLPOTTS: I beg to second it.

QUESTIONS.

Mr. CRABBE asked a question as to the paymeuts to the committee of management and eonsulting engineer.

Mr. WALTER B. KINGSFORD: What is the present depth of the shaft towards the 6th level?

The CHAIRMAN: From the surface 373 ft.

Mr. KINGSFORD: How far does the 6th level go below No. 5?

The CHAIRMAN: 100 ft. We propose in the future to put in levels at distances of 100 ft.; hitherto the levels have been at irregular distances.

Mr. KINGSFORD: I suppose you can give no idea as to the probable time of striking the ore in the new claims?

The CHAIRMAN: Mr. George Crawford, our geueral manager, who is at present in London, proposes to return to Colorado very shortly, and the matter will be left very much to his decision when he is there, but we shall, of course, decide before September 15th. The indica-

tions have been favourable for some months of our cutting the ore-shoot, but these ore-shoots or pipes are so peculiar in their nature that you may pass within 6 ins. and not make a discovery, and afterwards have to drive in another direction and make it then. The favourable ground is wide, lying between two dykes, and the discovery may occur in any part of that ground. Of course, when you have a drift only 4 or 5 ft. wide, you may pass close to an ore-shoot and not get at that partieular drive, and have to get it in another, so that two or three months might elapse before you cut it. We had that in the case of No. 5 level; our first drift passing within a few feet of the shoot. We lost two or three months through not getting it at that exact point. We put a drift in in another direction, and cut it.

Mr. Crabbe: Money lent on securities, what is that?

The Chairman: That is our capital lent from fortnight to fortnight on ordinary banking securities with a full margin.

QUOTATION.

A Shareholder: Have the board taken any steps to get this company quoted on the Stock Exehange?

The Chairman: We have not done so yet.

Mr. Kingsford: Is there any reason you should not do so.

The Chairman: I do not know that there is. Mr. Reid can probably tell you more about that than I can.

Mr. Crabbe: We are quoted now amongst a lot of rubbish.

The Chairman: We shall always be that. (Laughter.) There are mines and mines.

Mr. J. C. Reid: This company was not originally publicly advertised, but I think that by aud by all difficulties can be got over. Other eompanies have quotations that have had similar disabilities.

The Chairman: If you will wait for another six months you will be able to go to the committee of the Stock Exchange with a stronger case than you have now. As to the item of fees to the committee of management and eonsulting engiueer. The sum charged includes the fees of the directors, and also those of the consulting engineer. In the articles of association the directors are designated committee of management. The consulting engineer, although not a member of the committee, is paid the same fee as a member of the committee. He is Mr. John Darlington. (Hear hear.)

The resolution for the adoption of the report and accounts was then put and carried unanimously.

TRIBUTE TO THE DIRECTORS.

Mr. T. E. Sykes, in proposing the re-election of Mr. Phillpotts as director of this eompany, said: I well know his great capability, and his great assiduity in the management of this and other eompauies. (Cheers.) I have great pleasure in proposing his re-election.

Mr. John Darlington: And I have equal pleasure iu seconding it.

The motion was carried unanimously.

Mr. Phillpotts: I beg to thank you very much for your kindness in re-eleeting me, and to assure you that nothing shall be wanting on my part to promote the iuterests of this company. (Cheers.)

Mr. J. J. Reid: I beg to propose the re-election of Mr. Dyson Weston as a member of the comuittee.

Mr. Kingsford seconded the motion, which was carried.

A DIRECTOR WHO HAS SEEN THE MINE.

Mr. Weston, in returning thanks, said: I am the only member left of the old committee, and the only member of the present eommittee who has been on the mine. I was there in 1885, and was strongly impressed with the value of the property and with its similarity to the Yankee Girl, which was then paying very large dividends. I was unable to get a bond of the Guston property. The owner said they had sold the Yankee Girl, but they would not sell the Guston until forced. The day when they were forced came when they had to provide pumping maehinery. I was then able to get the property, and have beeu conneeted with it ever since. My ideas of its value have been singularly borne out. (Cheers.)

Mr. J. C. Reid proposed the re-election of the auditors, Messrs. Monkhouse, Goddard and Co., at a remuneration of 26*l.* 5s. for the current year.

Mr. Walker seconded the motion, which was carried unanimously.

THANKS TO STAFF.

Mr. Weston proposed "That the thanks of the shareholders be given to Mr. George Crawford and Mr. Schwarz, the mining superintendents, for their able administration of the eompany's affairs in Colorado." These gentlemen have been conneeted for some years past with the Yaukee Girl Mine, and their experience of that coneern has been of great value to us in Guston which is almost identical in its ore-bearing character. We appreciate their services, and hope they will eoutinue them.

Mr. McIlwraith seconded the motion, becausc he felt sure the shareholders were safe in their hands.

TRIBUTE TO THE LOCAL STAFF.

The Chairman: Indeed we are. They have done good work for the company. Mr. Sehwarz has brought to bear upon the Guston mine the knowledge aud experience he has acquired in the "Yankee Girl" claim. It has been of great benefit to the shareholders, and when I first of all spoke to Mr. Crawford about becoming interested in this company it was with the understanding that he should give his assistanee in the development and care of it. He was able after he went back to America to obtain the sanction of the dirccors of the Yankee Girl to allow Mr. Schwarz to assume these duties for us. Mr. Crawford has cared for all our ores, and found a market for them (a very important matter), and has watched over the mine in all its varied interests. I am glad to support the resolutiou with these words.

The motion was seconded unanimously.

Mr. Crawford returned thanks, and said: I think

YOU ARE THE OWNERS OF A VERY VALUABLE PROPERTY.

I also congratulate you on your management in London. You are perfectly safe in their hauds. They are men who are anxious to do what is right, and to economise in all points, in order that they may give the largest possible dividends to the stockholders.

Mr. Sykes proposed a cordial vote of thanks to the chairman.

Mr. McIlwraith seconded the motion, which was carried, and with the brief reply of the Chairman the proceedings closed.

THE FRONTINO AND BOLIVIA (SOUTH AMERICAN) GOLD MINING CO., LIMITED.

IMPROVEMENT IN SILENCIO—NO DIVIDEND.

The half-yearly meeting of the shareholders of this company was held at Winchester House, on Wednesday, for the following purposes: —To receive the report of the directors, aud the audited statement of accouuts of the company for the six months ending the 31st December, 1888, and for other business.

Richard Donagan, Esq., chairmau of the company, presided.

Mr. J. Jameson Truran (secretary) read the notice calling the meeting.

REASONS WHY THE REPORT IS NOT QUITE SO GOOD.

The Chairman: As this is the half-yearly meeting, the only resolution is "That the directors' report now presented be received and adopted, and that the accouuts of the company to the 31st Deeember, 1888, having been duly examined aud audited, be now passed and allowed." In moving that resolution, I regret to say we do not come before the shareholders with so good a report as last half-year. The decrease in tons was only 227, but then last half-year comprised the regular dry season, and this half there ought to have been an increase in tons, which there was not, beeause the dry season practically extended over the whole of this half-year as well—coupled with the restrieted output of tons, has been a reduction in the average produce of gold dust per ton, owing to all the mines, except Cecilia, having yielded poor mineral.

THE DROUGHT.

The tributers' operations have also been restricted through the dry weather, causing a diminution in the royalties. The tributers feel the effeet of dry weather even more than we do, as their streams and mills are mostly small, which suffer more in proportion than the larger ones. In the cost has been ineluded the expense of many works of improvement, which have been in progress during the six months on the mines. Of course, much of these works were mere renewals, but some of them were new and extended works which might with fairness have been charged to capital. Under the above circumstances a profit was hardly to be looked for, and, indeed, the profit whieh is shown is attritutable to premium on exchange, which came out more favourably at the end of the half-year than the monthly estimates indicated. At to the current half-year, of which three months' news had reached us at the time of preparing the report, and one has arrived since, the period for the regular dry season has again come rouud, and coming after so long a period of dry weather, it resulted iu a severe drought, the like of which has not been seen for mauy years. The only wonder is that milling operations were not stopped entirely, and this was doubtless averted, simply because some water continued to flow down from the high lands. The tons erushed during the last four months have therefore fallen to a lower number than has been recorded (during peace in the eountry) sinee 1878, when the tons were less, but when the circumstances were altogether different. The advices received since the report was prepared announced that the drought has broken up, and as is usually the case at first, after a long period of dry weather the rains have been rather too heavy to be pleasant. However, we may fairly assume that this will only be upon the first coming of the rains, and that the weather has settled down, and that we have now before us a spell of good mill work by which all deficiencies of the past may be retrieved. An event since we last met has been the stoppage of the Salada Mine.

STOPPAGE OF SALADA.

That is the mine upon which this company was originally instituted. I do not remember, and I should be afraid to mention, how many tons there were to be got out of it, and how many ounces they were to yield. It was the mine that was to be worked by steam stamps, and a beam engine taken out in the early stages. Whatever was the mistake, the parties deserve credit for having got it up to the mines. When I was there and saw what the road was it filled me with wonder to thiuk how it was done.

A FIRST AND LAST EFFORT.

However it was doue, and the steam engine was set to work for a few weeks, in the course of which it ate up all the available fuel, exhausted itself in the effort, and has never gone since. (Loud laughter.) Its history is a memento of the past, and of the failure of human calculations. (Laughter.) In later years this mine was said to be worth 80,000 or 90,000 tons of ore, but the vision was dispelled when I weut there, and as there were no surface reserves, it was thought well to see what could be done by sinking on the lode. We did so, and at first indications were favourable, but they fell away later, though we went on till we got to the junction of the lodes, at which we were led to expect great things, but as a matter of fact they tapered away to almost nothing. It has now beeu demonstrated that these lodes of the Salada Mine, though they were rich in the upper portions, do not form a rieh junction below, but a thin and valueless lode. That is a great disappointment, but it is good that we found it out as soon as we did, for the junctiou might have been deeper down and further off, and we should certainly have gone to it. Expenditure there has uow stopped, and Salada is a thiug of the past. At last meeting a telegram received from Mr. Hodge was read announcing that he had cut a rich lode in the deepest level in Silencio, the telegram having arrived four days before the meeting. During the six months which have since elapsed the reports have, of course, been full of interest. It was cut on the 3rd December, in the 285-ft. level. There was an assay made on the 8th of a sample, which, after allowing that assays of samples are one thing and mill returns another, at all events showed that it was rich. January advices gave its width at 5 ft. 6 ins.; February advices 6 ft. 6 ins.; March, fully 6 ft.; and April, 3 ft. 6 ins. The advices also reported an improvement in the lode in the 220-ft. level, and that a rise from the 285 to the 220 looked well and was rich.

A LITTLE TABLE TO SHOW RESULTS.

	285 ft.	226 ft.	Rise.
November, 1838, before discovery	nil.	¼ oz. per ton.	—
Dec., discovery on 3rd	...1¼ oz. per ton	¾ „	—
January, 1889 ...	...2 „	1 „	Rise begun.
February, „ ...	...2 „	1 1/16 „	Rise going up.
March, „ ...	...1 „	¾ „	2 ozs. per ton.
April, „ ...	...1 „	¾ „	2 ozs. „

SILENCIO PROVIDED WITH MACHINERY.

This is before regular stoping has been established, and it shows the lode is productive between the levels. Stoppage of Salada was not an unmixed evil, as the Californian mill intended for Salada is being put up for Silencio, so that we may expect not only rich returns but plenty of them when the mill goes to work. In view of the large consumption of this mill when it goes to work, preparations are making to sink the shaft and drive a level below the 285 ft. I regret that on commencement of heavy rains early in May there was a rush of water through the old workings, which ran down the shaft and filled the lower levels. It was being pumped out, and would only cause a few days' delay; and in the meantime ore was obtainable from the 150 ft. from a reserve kept there for working in case of any accident below. At Cecilia the erection of Californian mill is going on nicely. It is very satisfactory to learn that all the heavy pieces have been got up to the mines, and apparently without any hitch. In view of the large consumption of ore which will be going on when this mill is at work, preparations are being made to sink the shaft deeper, to get at the lode at a lower point.

UNION OF MINES.

At Cordoba and Rosario, which have now been communicated, and are worked as one mine, the deep cross-cut from the Tigré Valley has got under the Rosario portion, and has intersected three distinct branches of a lode, the centre branch of which is 1 ft. 6 ins. wide, and of good quality. This is a great encouragement for going down below the present mine workings, which, with the cross-cut below, can be sunk easily, and for going upwards from the cross-cut. A very siguificant circumstance presents itself here. Rosario has its own 6-head mill, and Rosario communicates with Cordoba, and Rosario ores can easily be taken through the communicating level to the fine new 16-head mill of Cordoba; and yet we find that Mr. Hodge is quietly talking of constructing a tramroad from Rosario to Tigrito mill, which is a comparatively new mill, and has recently been furnished with au improved water-course. Does not this seem to indicate that Mr. Hodge who, in his letter of 24th April, spoke of being near the pay-shoot of Cordoba lode, and was then stoping from No. 5 level Cordoba – to keep Cordoba mill going night and day—sees his way to keeping Cordoba mill going on Cordoba ores, and that the Rosario mill will not be enough for Rosario ores, and that Tigrito mill must assist. At Tigrito matters look rather gloomy at preseut. The reserves have proved to be too poor to pay, and the ore now being worked is of low grade, but Mr. Hodge is constructing a shaft from No. 4 level to No. 5 level to faciliate operations, and is driving the latter level, and should that operation result in the discovery of ore anything like what Tigrito used to yield in times past, it may be deemed expedient to eoncert measures for exploring this mine in depth. Mention is made in the report of recent arrangements for extending tribute operations on mines which have been for many years in abeyance. This may lead to some discoveries, which may prove of importance. The Juan Criollo and San Pedro Mines are among those so recently let, and tradition appears to be in favour of there being good lodes there. We must be patient, and wait to see what this may lead to. One of our tributing operations is at El Salto. Altogether we may expect great extension of tributing returns when the tributers' mills are in full work.

INTEREST IN ANTIOQUIA.

The large interest of this company in the Antioquia Company may ere long become of value, and then it will become a matter for consideration whether a part of such interest should not be realised, and the proceeds applied in prospecting works on some of the unworked lodes which exist, or at all events are said to exist, on our own property. (Cheers.) You may remember that the interest of this company in Antioquia arose out of the sale of the Frontino Minc, and a subsequent advance of mouey. Of late months Antioquia affairs have considerably improved, and the mines seem to be in a fair way of yielding large returns, only it is necessary to set them to work. The directors of that compauy have made some advances towards their debenture-holders and creditors with the view to carrying out this object—that the profits of the mines may be devoted to their development. These negotiations seem to be in a fair way of being carried out. There are some two or three who still hold out, but we hope before long that their opposition will be overcome and that we may have a unanimous arrangement. When that is effected the interest of this company in Antioquia will assume different proportions, and we may be able to proceed so far as to put a separate value upon it iu the accounts.

DIVIDEND DEFERRED.

I must refer to the fact that at this meeting we are unable to declare a dividend. We have made a trifling profit, but not enough to pay a good dividend, and it would cripple us to divide it. We have the Californian mill to pay for, and the losscs of the first three months of the present year to meet. If it be the case, as we fully hope, that the drought which has so crippled us is permanently at an eud, and that we are going to have some ordinary weather, I think the ore is there in the different mines to be able to keep the mills going, and that we shall come before you six months hence with a very much improved condition of things. (Cheers.)

The Hon. F. C. DRUMMOND (director) seconded the motion, and it was carried unanimously and without discussion.

The CHAIRMAN: That is the only resolution.

A GRATIFIED SHAREHOLDER.

A SHAREHOLDER: I beg to propose a hearty vote of thanks to Mr. Donagan for presiding. I think the report most satisfactory, and it has greatly pleased me. I am satisfied the directors are doing their best, and I am equally satisfied the price of the sharcs is too low. (Hear, hear.)

The motion was carried unanimously, and the meeting was then brought to a close.

WHEAL GRENVILLE MINING CO.

THE MINE RETURNS TO THE DIVIDEND LIST AFTER MISSING ONE QUARTER.—THE WISDOM OF NOT DIVIDING PROFITS UP TO THE HILT.—THE EASTERN GROUND TO BE DEVELOPED.

A GENERAL MEETING of the shareholders was held at the Offices, 7, Union Court, Old Broad Street, on Thursday—Mr. Francis G. Lane in the chair.

A REGRET IN WHICH ALL WHO KNOW MR. GOOLD WILL SHARE.

The CHAIRMAN: I am sure you will be very sorry to hear that our chairman, owing to a very sad and a very sudden bereavement, is not able to attend the meeting to-day. He has lost his son, which has caused him very great grief—a grief in which we all deeply sympathise. (Hear, hear.) I will endeavour to do what I can towards the explaining the accounts which are before you, but I cannot promise to deal with them in the way in which your chairman has been accustomed to do.

Mr. D. JULYAN (the secretary) read the notice convening the meeting and the minutes of the preccding meeting, which were confirmed.

The report and accounts were taken as read.

A BRIEF RETROSPECT.

The CHAIRMAN: You will have noticed, from the resolutions which have just been read to you, that at our last meeting no dividend was declared. Such a thing had not happened for many years past, but the whole of the circumstances were explained to you at the time. The great quautity of rain that had fallen throughout the country caused the stoppage of our workings to such an extent that we were prevented from showing a profit. But I am happy to inform you that at the present time we present accounts, which I am sure will bo received with some amount of satisfaction.

WHAT THE ACCOUNTS SHOW.

We commenced the quarter with a balance in favour of the mine of 3,106*l*. 8s. We have sold during the quarter 111 tons 10 cwt. 16 lbs. of tin, realisiug, with carriage, the sum of 6,046*l*. 7s. 6d., or an average price of 51*l*. 2s. 6d. per ton, as against 95 tons 1 qr. 18 lbs. in the previous quarter, realising, with carriage, 5,334*l*. 5s. 10d., or an average price of 56*l*. 2s. 4d. per ton. You will perceive that we have lost through the drop in the price of tin, 1*l*. 19s. 10d. per ton, but through the extra quantity of tin sold, 16 tons 8 cwt. 3 qrs. 25 lbs., we have realised in cash 712*l*. 1s. 8d. more. On the other side you will find that the labour costs for the three months amount to 3,112*l*. 15s. 3d., as against 2,939*l*. 9s. 6d. in the previous quarter. Our merchants' bills this quarter amount to 1,661*l*. 5s. 1d., as against 1,868*l*. 10s. 7d. in the previous quarter, the total of the labour costs and merchants' bills for the quarter being 4,774*l*. 0s. 4d., as against 4,858*l*. 0s. 1d., or a saving of 83*l*. 19s. 9d. You will notice in the report that the number of persons employed is 320, as against 312 in the previous quarter. This, in a very great measure, accounts for the increase in the labour costs, and you have the benefit therefrom in the increased returns of tin. On the other hand, the saving in our merchants' bills of 207*l*. 5s. 6d. arises from our water charges having beeu less.

WE HAVE NOT BEEN IMPEDED IN OUR WORKING

as we were in the previous quarter, and our workings are now in what I may call a very excellent state of progress. The other charges, you will perceive, are lords' dues, 244*l*. 14s. 6d.; secretary's salary, &c., 37*l*. 10s. 10d.; and committee fees, 26*l*. 5s.: or a total of 5,082*l*. 10s. 8d. as expenditure, against 6,046*l*. 7s. 6d. for sales of tin. Now, gentlemen, it has always been our custom to charge in our quarter's accounts every item of expenditure. That course has always received the approval of the shareholders hitherto, and your committee have deemed it prudent to continue on the same lines. In these accounts, therefore, we have paid 170*l*. for an engine that has been purchased, the reason for which I will explain further on, and we consider that this 170*l*. should be deducted from the profit of the present quarter. Instead, therefore, of the accounts actually showing a profit of 963*l*. 16s. 10d., we propose deducting the 170*l*. paid for the engine making.

THE ACTUAL PROFIT—£793 16s. 10d.

This amount we propose now to deal with by a division amongst the shareholders. You will see, gentlemen, that our accounts are presented in what I may call an amended form. After some discussion with our auditor, we deemed it prudent to bring up the accounts as they are now put before you. We brought forward a balance of 3,106*l*. 8s., and we propose to place 3,000*l*. of that amount to what we shall call the eastern seetion reserve account, for the development of the eastern section of our miue. If you add the 106*l*. 8s., that will then remain, to the 963*l*. 16s. 10d., you will get a balance in favour of the mine of 1,070*l*. 4s. 10d.

THE EASTERN SECTION OF THE MINE.

For many years past we have brought before you at our meetings the advisability of developing the eastern ground of our mine, and we have always looked upon this 3,000*l*. aud the accumulations as a sort of reserve fund for that purpose. We propose to expend this 3,000*l*. by the sinking of a shaft in the new ground and by the erection of the engine which we have purchased, and we hope by the time we have reached probably a little more than 50 fms. in depth we shall have spent this sum. We do not propose that the profits which are now being made from the mine should be set aside for the working of the eastern ground at all. (Hear, hear). We propose that the profits shall be divided each quarter among the shareholders until the full 3,000*l*. has been expended. Of course, small balances of profits will be left at our meetings over and above what we divide. To-day, for instauce,

WE PROPOSE TO OFFER YOU A DIVIDEND OF 2S. 6D. PER SHARE,

which will leave 43*l*. 16s. 10d. towards another fund to accumulate, and it may so happen that by these accumulations we may get a fair sum which will enable us to go on with the development of the eastern section of our mine without interfering with the legitimate profits or with your dividends. (Cheers.) Our liabilities at the present time consist of 244*l*. 14s. 6d. for lord's dues. Deductiug from the special account 170*l*. for the cost of the ongine, we shall have a balance of 2,830*l*. to go on with, so that our balance of assets over liabilities amounts to 4,144*l*. 19s. 4d. at the present time. That is the amount of

cash which is at the present time in your bank. Now, gentlemen, I think I have explained the accounts as far as I possibly can. If, however, there is any point that you wish explained, I shall be only too happy to answer your questions.

THE POSITION OF THE MINE.

Now, as regards the report, at our last meeting we informed you that we had just then got free from the water which had kept us out of our workings below the 178-fm. level for some time. The profits for the first month amounted only to about 200*l*.; in the second month of the quarter they amounted to about 230*l*., and in the third month our profit amounted to about 530*l*.; so you will see that, after getting the water thoroughly out of the mine and enabling us to get into the various levels, we have been able to make increased returns and profits. I am happy to inform you that all our levels are productive. The 205, which is our bottom level at the present time, is worth 7*l*. per fm. The 190 west is producing low-priced tinstone; but we shall soon get into a run of productive ground again. The 178 east is in a productive lode, now worth 15*l*. per fm., and the 168 east is also worth 15*l*. per fm. Then, in the 150 west we have communicated with the winze in the 140, and we have laid open there a very nice piece of good tin ground, which is now available to be taken away, and can be worked to leave very good profits. As regards the various stopes, they are of about the average value, with just a slight improvement here and there, but of no very great consequence. On the whole, looking at the ends and the various points in operation, our agent says in the last paragraph of his report:—"The mine, on the whole, is looking well, and we hope by the appearance of the bargains to-day to increase our returns this quarter." I think I may go further, gentlemen, and say we calculate upon an increase of about 8 or 10 tons of tin in the coming quarter—(hear, hear)—so that with a fair price for our tin—if the present price is maintained—we shall be able to receive you at our next meeting with an even better grace than we are able to do to-day. I will now propose "That the statement of accounts now presented to the meeting, together with the agent's report, be received and approved, and that they be printed and circulated amongst the shareholders." (Cheers.)

Mr. W. BELLINGHAM seconded the proposition.

WELL DESERVED COMPLIMENTS.

Mr. J. C. BAYLEY: I am sure you will all agree with me that it is a matter of disappointment that our chairman should not be with us to-day, for all his explanations are invariably so lucid that we have a double pleasure—one in listening to his admirable speeches, and the other in carrying away with us all that he has placed before us so clearly. But whilst we regret his absence, and whilst we particularly regret the cause, I am sure we may congratulate ourselves upon his substitute. (Hear, hear.) I am sure Mr. Lane has placed matters before us in so clear a light that we can all feel almost as if we had been at the mine, and had been down and seen all that is going on there. We may fairly congratulate ourselves on the fact that the mine is free from water, and from all we can hear we may reasonably anticipate receiving very good reports in future. This enables us to increase the number of people we employ at the mine, and I have no doubt that in future we shall receive better dividends. The great point for us to consider is this question of

THE DEVELOPMENT OF THE EASTERN SECTION.

We hear that 3,000*l*. has been placed aside for this purpose, and I should like to ask what would be the entire amount necessary to entirely develop the new ground to the extent contemplated by the directors? Personally I feel inclined to coincide with the view that has been suggested to us, that as far as possible the development should be paid for out of revenue, and that we should be content with a less dividend if necessary, for I believe we should get the advantage in the increased value of the mine itself, and in the increased value that the public sets upon our shares.

Mr. DORE: I do not see that anything is said about the 150 east. I understood that that was our pioneer level.

THE CHAIRMAN REPLIES.

The CHAIRMAN: We are not driving the 150 end east. If you refer to the previous report you will find that that end is suspended for the present. Our agent considered it advisable to do so. We have already gone between 400 and 500 fms. from the shaft, which is a long way to go without any communication. Moreover, we are getting every fathom nearer the adjoining property, the water in which is pressing rather heavily against us. I think you will agree with me that it is advisable to leave the conduct of the development of the mine in the hands of our very able agent, Capt. Hodge. (Hear, hear.) With regard to Mr. Bayley's question, the chairman said it was proposed to sink the shaft perpendicularly to the 150-fm. level. They had bought for 170*l*. an engine which must have cost 800*l*. at least, which would serve the purpose of drawing and pumping. It would see the working down a considerable distance, and would ease the present pumping engine. The 3,000*l*. would probably last them a year, and after that the additional cost of the eastern working would not exceed 100*l*. a month. In the western ground they had got below the 205 level, and in a couple of months' time they would start the 225-fm. level.

In reply to Mr. WICKETT,

Mr. BELLINGHAM said the engine lately purchased would do all the work required of it with a very much smaller consumption of coal than if a larger engine had been bought.

Mr. WICKETT made an appeal on behalf of the Miners' Hospital, in reference to which the CHAIRMAN said the company already subscribed, besides some of the shareholders in it individually. If Capt. Hodge was of opinion that the company should subscribe a little more, the committee would no doubt do so. (Hear, hear.)

The report and accounts were then unanimously adopted.

THE DIVIDEND.

The CHAIRMAN proposed that a dividend of 2s. 6d. per share should be declared, which would absorb 750*l*., and leave 43*l*. 16s. 10d. to be carried forward.

Mr. GULLICK seconded the proposition, which was carried.

On the motion of the CHAIRMAN, seconded by Mr. W. H. BUMPUS, a vote of thanks was passed to Capt. Hodge and the other agents for the energy, perseverance and economy which they had exercised in the management of the mine.

A similar compliment having been paid to the chairman and committee of management, the meeting closed.

WATER-GAS PROVED A COMMERCIAL SUCCESS. A SAVING OF £10,000 PER ANNUM IN ONE WORKS ALONE.

THE BRITISH WATER-GAS SYNDICATE, LIMITED.

WATER-GAS.

The following extract from the *Times*, of January 2nd, 1889, relative to the manufacture and application of Water-gas, is reprinted for general information.

WATER-GAS.

"For many years past attempts have been made at intervals to produce what is known as water-gas—that is, gas resulting from the decomposition of water. Experimentally there have been several successes, but practically and commercially up to the present time, as far as we are aware, these have been only failures. These failures have mainly arisen from the difficulty experienced in separating the water-gas from the other products. This difficulty has now been overcome, not by one invention, but by the combination of the best features of several inventions having for their object the manufacture of water-gas. What is more, the patented inventions which have been combined in the new process are not those of one inventor or of one country, but represent several inventors and several nationalities—namely, England, Germany, America, and Sweden. The amalgamation of these various patents and the beneficial results which have accrued therefrom came about by reason of the exigencies of manufacture of corrugated boiler flues and press-flanged steel frame plates for railway rolling stock at the Leeds Forge Company's Works, Leeds. The metallurgical operations carried out there demanded fuel of a higher calorific intensity than could be obtained from either the generator gas of the Siemens' producer, or ordinary coal gas. Mr. Samson Fox, the managing director, therefore turned his attention to water-gas, and, having carefully considered the whole question, decided upon putting down a water-gas plant at the Leeds Forge. The works were begun on September 29th, 1887, and on March 29th, 1888, plant capable of producing 40,000 cubic ft. of water-gas per hour was started, and has since been in constant operation with perfect success, and without interruption. The gas produced gives every satisfaction, not only for metallurgical, but also for lighting purposes, the whole of the works being supplied with it.

"Water-gas is the result of a chemical re-action which takes place in passing steam through incandescent carbonaceous matter, and may be considered as the practical result on a wholesale scale of the ordinary laboratory experiment of decomposing water by passing steam through a highly-heated iron tube. In the water-gas apparatus the fuel, which at Leeds Forge is coke, is raised to a high temperature in a generator by the aid of an air blast. The blowing is continued for about 10 minutes, by which time the fuel has reached a dull red heat. During this period what is known as producer-gas is given off, and this is led away to a range of Lancashire boilers, where it is utilised in raising steam for the engines in the works. At the end of 10 minutes the valves are reversed, the air-blast being stopped, and the further exit of producer-gas to the boilers prevented. Steam is then admitted at the top of the generator for four minutes, and, passing down through the incandescent fuel, becomes decomposed, and a fixed gas results. This gas as formed passes away to a scrubber, where it is treated much in the same way as ordinary coal-gas. From the scrubber it passes to the gas-holder, where it is stored for use for metallurgical purposes in the works, such as heating and welding. For indoor illuminating purposes a portion of the gas is conducted from the gas-holder to the purifiers, where its purification is effected by means of oxide of iron. It will thus be seen that the process consists of alternately blowing the generator hot and making gas, and that a run of gas is made every 15 minutes, during which time the yield from each generator is about 17,500 cubic feet of producer-gas and 5,000 cubic feet of pure water-gas for heating and lighting purposes. The gas is also used most successfully for driving gas engines.

"The metallurgical purposes to which the water-gas is applied at the Leeds Forge are various. In the first place, it is used in the heating furnaces in the plate mill, where the steel ingots are rolled into plates for the manufacture of Fox's corrugated boiler flues. It is also used in welding these tubes and heating the plates for Mr. Fox's flanged frame-plates for railway rolling stock, and for his flanged boiler-fronts, besides which it is utilised in various other similar operations throughout the works. In the application of water-gas to the manufacture of Siemens' steel there is a marked improvement in the quality as well as the quantity of the product. With this gas 30 charges of steel per furnace per week can be turned out, as against 11 charges per furnace per week from furnaces of equal capacity using gas from Siemens' producers. Besides being used for metallurgical purposes, the offices and various parts of the works are lighted with water-gas, the burners employed being arranged on the Fahnejelm system. Burnt in the ordinary way, the water-gas gives a blue flame, but by suspending a comb composed of thin magnesia rods in the flame the filaments are quickly heated to a white heat, producing a bright glow light of high illuminating power, but which is neither unpleasant to the eye nor prejudicial to the sight. The heating power of water-gas was very great, as was demonstrated upon our recent visit to the Leeds Forge Works, where we inspected the method of its manufacture as well as that of its use in the various departments. To give one instance only, a piece of copper wire placed in an ordinary-coal-gas flame was only made red hot. A similar piece of wire placed in a water-gas flame issuing from a similar burner was quickly and perfectly fused.

"An important consideration in the adoption of any new system is, of course, its cost; and in this respect water-gas comes out well. Its production per ton of fuel is about 30,000 cubic ft., and with fuel at 8s. per ton, labour at 3s. 6d. per man per day, and the production going on continuously, it is found that the gas costs slightly less than 4d. per 1,000 cubic ft. The experience of nine months' working at the Leeds Forge has led to the conclusion, based on carefully-ascertained data, that the saving effected on the whole works is about £10,000 per annum. Looking at the advantages of water-gas for illuminating purposes, it is to be observed that, besides giving an agreeable light, it does not develop any noxious fumes, nor does it produce smoke; health and cleanliness being thereby preserved, and paintings, furniture, and decorations remaining uninjured. For lighting mansions this would prove a boon, while the producer-gas can be utilised for heating purposes. Similarly, a mill-owner laying down a water-gas plant for lighting his factory will obtain gaseous fuel for steam-raising purposes practically for nothing. For small towns also the lighting could be carried out with water-gas, the producer-gas being used for steam-raising and manufacturing purposes generally. Although the installation of this water-gas plant at the Leeds Forge is the first in England, the system is being largely adopted in America and on the Continent, both at steel works and for illuminating purposes."

In addition to the above extract, the following papers have recently commented favourably on water-gas.
